A recent paper by J. H. Clemes of the Institution of Civil Engineers, on the lixiviation of silver ores, refers largely to the manner of operations in Mexico, where in the lixiviation process of extracting silver the ores are roasted in admixture with sodium chloride, for the purpose of converting the silver salts into silver chloride, and, after being cooled, are leached with water for the removal of soluble impurities. They are then lixiviated with a cold dilute solution of sodium of calcium hyposulphite; the latter solution being used in Mexico. In this lixiviation the silver chloride contained in the ore is dissolved, and, by the addition of calcium sulphide, the silver is precipitated as a sulphide, which is dried in filters and is reduced to the metallic condition by fusion or by cupellation.

The plant for the lixiviation process comprises machinery for breaking and pulverizing the ores, roasting furnace, leaching and precipitating vats, and apparatus for treating the final product.

In northern Mexico the ores are almost always ground in a dry stamp mill. In the 40-stamp mill at the Yedras mines the ore—much of which arrives partially broken from the picking floors—is fed into two rock breakers in the upper part of the mill, and from them dropped into the ore bin, through sliding doors in the bottom of which it is run into cars.

The Yedras mines are situated about five days' journey from the coast, in a spur of the main Cordillera, at an altitude of more than 7000 feet above the sea level, and all freight has to be carried to them on pack animals. The battery posts are made of thoroughly seasoned timber. The feed side and the front of the batteries below the line of the braces are unobstructed, so that the automatic feeders, the mortars, and the pump conveyors are readily accessible. Instances of the employment of the double mill for dry stamping are to be met with. In this type of mill two parallel lines of battery posts are set facing each other, and are united by heavy tie beams braced one against the other. This mode of construction gives a strong and steady battery frame, but for dry crushing purposes it is attended with disadvantages.

The best weight for stamps appears to be between 950 and 1000 pounds, when, as is nearly always the case, the preliminary breaking of the ore is limited to passage through a rock breaker set to crush 1½ to 1¾ inches. Whether the practice of breaking the ore to a much smaller size before feeding it into the batteries, and of using light stamps for the final pulverization, would sufficiently improve the physical condition of the pulp to justify the increased complexity of the mill is a matter worthy of investigation. In one or two instances, where a somewhat coarse grade of crushing sufficed, roller crushers had been used in Sonora for grinding ores. The results obtained had, however, not been entirely satisfactory. In one or two excellently built mills the crushers, when submitted to the test of continuous hard work, had failed to supply the furnaces with the amount of fine meal required of them. The roll crusher, although without a rival as a reducer of ore to a small gravel size, had but a limited capacity when used as a fine pulverizer. So that if roll crushers are to be successfully employed for the production of fine meal, for such purposes as those of the leaching process, the principle of graduated reduction in a series of machines must be thoroughly applied. In view of the wear and tear of the rolls and sieves, it is doubtful whether any cheapening of the operation of crushing would be brought about by substituting rolls for stamps. The advantage to the lixiviation process would be the improved condition of the crushed ore, both for chloridizing purposes and for the filtering vats.

The chloridizing roasting is the most important and expensive part of the manipulation. It is usually carried out in long reverberatory furnaces, divided into several hearths. In the cooler parts of the furnaces a large part of the sulphides is converted into sulphates, and, in the hotter parts, the chlorine necessary for the chloridization of the silver salts arises from the mutual decomposition of these sulphates and the common salt added to the charge. The chief requisites for good roasting are carrying out the operation in a highly oxidizing atmosphere, and at the lowest practicable temperature. When ores are roasted with an insufficient supply of air reactions occur in the roasted mass after discharge from the furnace, and particularly after being washed with water, which interferes with the extraction of the silver. The loss of silver which occurs in roasting is affected more by the temperature at which the operation is carried on than by any other influence.

The ore is leached in large circular vats. The first leaching with water has to be thorough, since any soluble impurities which are not removed enter the chemical solution used in the second leaching. The solvent employed in the second leaching or lixiviation is a dilute solution of calcium hyposulphite. Operations at the new works were begun with a solution of sodium hyposulphite, the strength employed being ten or fifteen parts of the crystallized commercial salt in one thousand parts of water.

The rate of filtration in the vats depends on the physical condition of the ore pulp, so that the mechanical preparation of the ore has to receive special attention. The pulverized ore should be in the condition of fine meal, as free as possible from dust. When base and refractory ores are treated rapid solving with dilute solutions is very desirable. Under these conditions a minimum quantity of the salts of the base metals is extracted with the silver. Besides silver chloride, various salts of silver, such as silver antimonate and silver arsenate, are partially or wholly soluble in solutions of hyposulphites. The precipitation of the salts dissolved by the hyposulphite solution is effected by a strong solution of calcium sulphide, which is freshly prepared as needed. At places where caustic soda is readily obtainable there is good reason to believe that the earlier practice of using sodium hyposulphite as solvent and sodium as precipitant was more economical.

The precipitate obtained from pure ores is often converted to the metallic condition by fusion in crucibles with scrap iron and borax. The product from base ores is, however, largely mixed with impurities, and is refined in German refining furnaces. Furnaces of ample dimensions are used in order that the sulphides might be mixed with a large amount of litharge. The rich lead obtained is refined in an English test furnace. The precipitation is sometimes so conducted as to furnish two grades of sulphides. The precipitate, rich in silver from the earlier stages of leaching, is treated by fusion or cupellation, and the poor variety, from the later stages, is shipped to smelting works.

The process successively treats a wide range of ores which contain too much impurity to be reducible by roasting and amalgamation. The cost of working either process is much influenced by local conditions, but if the nature of the ore is such as to require a chloridizing roasting the silver contained in it could be more cheaply extracted by a solution of hyposulphite than by means of mercury. Ores which contain a small percentage of copper are treated by the Patera process with excellent results, and the rapidity with which the use of the process is extending in Sonora is partly due to the fact that nearly all the silver ores found in that State are accompanied by some copper mineral.

Considerable loss of silver takes place in the operation of chloridizing roasting. The fine ore dust which escapes from the furnaces is mostly recovered, but a large portion of the fume escapes. The flues which conduct the furnace gases from the furnaces to the stacks are generally too small in sectional area. The current in them is too rapid, and the fume has a poor chance to settle. For the development of the process the reversal of this state of things is to be desired.

In reduction of cost, as distinguished from the avoidance of loss, the greatest room for improvement occurs in the roasting. The more extended use of furnaces in which the stirring of the ore is effected by mechanism, or the adoption of reverberatory furnaces of very large dimensions, would undoubtedly decrease the cost of this part of the operations.

## The Adventures of a Mining Item.

A few weeks ago an item appeared in the "Concentrates" column of the MINING AND SCIENTIFIC PRESS of San Francisco relative to the finding of placer gold after the heavy spring rains in a certain famous placer district of California, where such an occurrence is not uncommon at this season of the year. Shortly after the publication of the item in the coast journal it was stolen by a Denver newspaper, and the words "Cripple Creek" substituted for the name of the real locality. Finally, the London *Financial Review* printed the garbled paragraph and the *American Gold Mining Record* of Chicago copied it, commenting as follows:

"One of the most recent instances of exaggeration which have come to our notice concerning Cripple Creek may be found here. It is from the London *Financial Review* and reads as follows:

"'Since the rains of the first weeks of this month in Cripple Creek, coarse gold and nuggets are being picked up at various points in the gulleys and ravines. When surface gold is brought to light by the mere action of rainfall, it is pretty clear that immense wealth is somewhere about in that self-same region.'

"This is all right, with the exception of a few minor details, which are inaccurate. There have been no rains in Cripple Creek for several months past, there has been no coarse gold or nuggets picked up as a result of these rains or as a result of anything else except hard work with drill and dynamite, and the surface gold isn't brought to light by the mere action of the rainfall. Having said this, it gives us pleasure to heartily concur in the last statement of the *Review:* 'That there is immense wealth somewhere about in that self-same region.'"—Cripple Creek, Col., Prospector.

## A Paraphrase of an Old Saying.

TO THE EDITOR:—In the course of the article on Rhodesia (in your issue of the 28th ult.), which Mr. St. Auburn made so interesting alike by the literary style which characterized it and the information which it contained, there is a reference to the old saying, "Gold is where you find it." It may interest your readers to know one of the earliest forms of the story in which it has been at times enveloped. I say one advisedly, because "in the days of old Rameses this saying had paresis."

In July, 1851, when the rush broke out at Ballarat (Australia), Governor Philip, accompanied by his staff, visited the diggings. As he guided his horse amid the holes so liberally scattered over the surface of the hills at Bunninyong, he pulled up occasionally to exchange greetings with the 'boys.' By and by he found himself talking to a Cornishman of more than average intelligence, so he put to him a question which many have asked since, "And where do you think the gold came from, my man?" The old fellow standing in the prospect hole, leaning on his shovel, scratched his head and replied: "Wheer it it is, theer it is; and wheer it ain't, theer be Oi!" That is the epitome of geological statement and mining realization.

Yours faithfully,
Denver, Col., April 5th. T. A. RICKARD.

## Lead Statistics for 1895.

The returns for the calendar year 1895, as received by the Division of Mining Statistics of the United States Geological Survey, show that the production of lead in the United States during the year was as follows: Total production of desilverized lead, as shown by the return from all refining works, was 201,992 net tons in 1895 as compared with 181,404 net tons in 1894. This desilverized lead included 6,244 tons of hard lead. Desilverizers reported that 51,613 tons of their product were obtained by refining foreign base bullion in bond. Of this quantity 17,282 tons were exported. The production of soft lead in Missouri and Kansas in 1895 was 39,890 tons.

The following is the estimate of consumption in 1894 and 1895, net tons:

| SUPPLY. | 1894. | 1895. |
|---|---|---|
| Product, desilverized lead | 181,404 | 201,992 |
| Product, soft lead | 37,686 | 39,890 |
| Imports, foreign refined lead | 8,200 | 22,947 |
| Stock, domestic, Jan. 1, 1894 and 1895 | 7,496 | 8,586 |
| Stock, foreign in bond, Jan. 1, 1894 and 1895 | 3,302 | 7,181 |
| Total supply | 238,088 | 280,596 |
| DEDUCT. | | |
| Foreign base bullion refined in bond and exported | 29,000 | 17,282 |
| Lead in manufactures exported under drawback | 950 | 2,000 |
| Stock, domestic, Jan. 1, 1895 and 1896 | 8,586 | 9,557 |
| Stock, foreign in bond, Jan. 1, 1895 and 1896 | 7,181 | 9,865 |
| Total deductions | 45,717 | 38,704 |
| Leaves apparent home consumption | 192,371 | 241,892 |

THE occurrence of ice in the comparatively low latitudes of Cape Horn and the Falkland Islands is noticeable. The ice has originally formed part of the great barrier which, with very few breaks, surrounds the vast Antarctic continent, rising to an average height of from 150 to 200 feet above and sinking from 1100 to 1400 feet below the level of the sea, and having, moreover, a thickness of something like 1200 or 1500 feet. It is a solid perpendicular wall of ice, formed by the descent over the low lands into the sea of the ice and snow which form on the mountains inland, and when the forefronts are pushed into depths of about 300 or 400 fathoms large stretches are broken off and float away northward with the current. When they start on their aimless career they may be miles in extent; and though, as a rule, they break up by collision and erosion, it is not at all unusual to encounter an island miles long in the neighborhood of the extreme ice limit. For instance, the Coldinghame in this region passed about 200 bergs, one of which was ten miles long, The Cutty Sark, again, in latitude 50 south, longitude 47 west, found by cross bearings and distance run that the east side of one berg which she encountered was nineteen miles long. At first the masses are straight, flat-topped and horizontally stratified—altogether unlike those met with in the north. By the action of the waves they are cut at the water's edge into coves and caverns of a blue color. Then, as they collide or get melted away at the base by the action of the water, they turn over and show to the wandering mariner fantastic shapes. As they travel farther north, they become smaller and still more strangely shaped and ultimately melt away.

A UNITED STATES JUDGE has decided that natural gas piped from Canada under the Niagara river is a crude mineral product, and therefore exempt from duty.

AN inch of rain falling upon an area of one square mile is equivalent to nearly 17,500,000 gallons, weighing 145,250,000 pounds, or 64,844 tons.

## Assays of Copper and Copper Matte.

Discussion of the Results presented at the Florida Meeting of the American Institute of Mining Engineers.

W. M. Courtis, Detroit, Mich.: Except for free-gold ores, I have always believed in scorification. I think the crucible assay gives silver low. We found this out at the Wyandotte works in assaying Silver Islet ore. The mine managers made us, and also the check assayers, run one of the duplicates by crucible. As we took the mean of twelve assays for ore running from 700 to 10,000 ounces of silver per ton, they soon found that the crucible assay reduced the average result. So it was left out, and scorification was employed for all the assays.

Cabell Whitehead, U. S. Mint, Washington, D. C.: After studying, in connection with my own experiments, the results reported by the various assayers co-operating in Dr. Ledoux's plan, I have no doubt that the results obtained by the combination method are too low, and while this loss can be greatly reduced by using dilute acid, I have been, up to the present time, unable to devise any method of preventing it entirely. The results show that scorification gives about one-tenth of an ounce per ton more gold than the combination method. I consider this difference greater than it should be if dilute acid be used, but even a few hundredths of an ounce is not to be disregarded, when the total amount present is usually less than half an ounce.

In the case of silver the results are not so conclusively in favor of scorification. While the figures obtained are fully up to, and in some cases beyond, those given by the combination method, the additional work of assaying slags and cupels, as well as the doubt concerning the purity of the buttons, would suggest the desirability of a less laborious and more accurate method. While a second cupellation with a "proof" greatly reduces the chance of error from impure buttons, I am not sure that it entirely removes that chance, as the fire assay of silver is far from satisfactory.

I am inclined to believe that the combination method as modified by "J" leaves little to be desired. The advantages are, first, the use of bromide instead of chloride as a precipitant for silver; second, there need be no correction for loss of silver in slags and cupels (the amount of silver cupelled being not more than five or ten mg., these losses may be disregarded without introducing an appreciable error); third, a larger sample can be taken than is possible with scorification.

In a large copper works, recently visited, I observed a great improvement in the method of parting small amounts of gold. The buttons are placed in small test tubes, and twenty c.c. of dilute nitric and (1:7) was found in each. The tubes were set in a beaker of cold water, and was then put over the lamp and brought to boiling. With acid of the strength specified the gold did not break up, but retained the shape of the button, remaining as a black ball. The weak acid was now poured off and 20 c.c. of 32° B. acid was added, and the water in the beaker was boiled for ten minutes longer, when the gold was washed and taken out in glazed porcelain crucibles. When this method is used it makes little difference how small a proportion of gold the buttons contain.

H. Van F. Furman, Denver, Colo.: The results as presented by the different assayers taking part in the investigation are of general interest to those engaged in gold and silver assaying, and should result in benefit, even if they do not lead to the adoption of some standard method for the assay of the material under consideration.

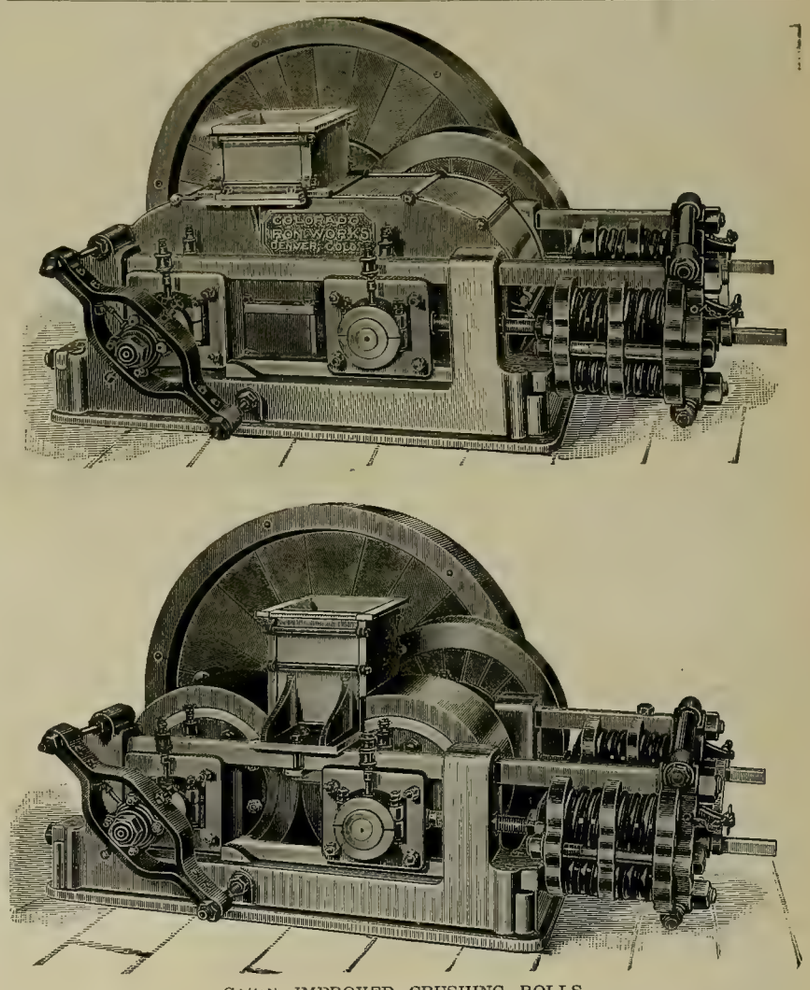
The wide divergence in the results as reported shows that an investigation of this nature was timely. Through analysis and discussion of the results it appears to the writer that much may be gained, and it is hoped that the discussion may be full.

That some of the reported results are unquestionably too high and others too low is apparent. Without going into a complete analysis of these, I venture to point out some possible sources of error.

1. Some of the assayers have stated that the test-lead and litharge used were free from silver. The writer does not believe that any commercial test-lead or litharge in the market is entirely free from silver. Gold is rarely present; but silver is invariably present, at least in the experience of the writer. The lead which I am using at present shows 0.3 mg. of silver in 100 grammes. This would be equal to about 133 oz. of silver per ton, reported in the ordinary scorification assay of an ore or matte, when $\frac{1}{10}$ A. T. of the sample was taken. This lead is sold by one of our standard dealers and is made by one of our oldest and most reliable refining establishments. I am informed that the lead was treated with zinc seven times in order to extract the last traces of silver. Every one who is familiar with zinc desilverization knows that it is impossible to remove the last traces of silver, even should the zincing be continued almost indefinitely. In order to determine the silver in the test-lead it is not sufficient to take one A. T. and cupel it. More frequently than otherwise the result would be no button of silver. From 100 to 300 grammes of lead should be scorified until a lead button of not over 3 grammes is obtained. This button is then to be cupelled quite cold for silver. The same is true of the litharge; but the ordinary litharge usually contains more silver than the test-lead, and its silver contents are often unevenly distributed.

Another cause of too high results, where the proper precautions are not taken, is the imperfect elimination of the base metal on the cupel. This is especially the case with material high in copper, as is instanced by some of the reported results in this case, where the silver buttons were shown to contain over 3 per cent of copper. The only safe rule is to eliminate nearly all the copper from the lead buttons prior to cupellation, or to run a synthetic proof and make corresponding deductions, as was done in some of the instances reported. Should the lead buttons contain considerable copper, the latter method is at best only an approximation, as it is impossible to estimate closely the amount of copper present. In all cases the cupel should be pushed back into a hot part of the muffle, just before the "blick."

Another source of error, probably more common than is generally supposed, is due to the cupel used. If the cupel is made of too coarse bone-ash, or has not been compressed sufficiently, it is liable to be porous, and the cupel absorption will be quite heavy. I notice in one case reported that 15 ounces of silver (to the ton of matte) was recovered from the cupel; certainly an excessive amount. The writer uses XX bone-ash, and gives the cupels such pressure that when thoroughly dry they may be dropped from a height of about 3 feet without danger of breaking.



Another important point is to heat the cupel to the temperature of the muffle, and when it has been thus heated, open the door for a few minutes before dropping in the lead button. This serves to destroy any organic matter which the cupel may contain, and which might cause the button to "spit."

Another important point, and one to which the writer has more than once traced differences in assays, is the inaccuracy of the milligramme weights ordinarily sold by the dealers and manufacturers. It is extremely difficult to obtain sets of these weights which are concordant among themselves, and are exact subdivisions of a gramme. Two instances of this have recently come to my notice. A set of gold-assay weights from 1000 (= 0.5 gramme) to $\frac{1}{1000}$ (=0.5 milligramme), consisting of 20 pieces, was ordered from a prominent manufacturer. On receipt of the weights, I found that the 1000 weight was not only not exactly 0.5 gramme, but that there was quite a wide difference among the individual weights. Some of these weights were too heavy by quite 0.3 milligramme. The weights were returned to the maker with the request that they be made correct. When I received them again from him, I found them more nearly correct, but some were still so far from accuracy that I had to readjust them. Of over 100 riders recently examined, and which were marked 1.2 milligrammes, every one was found to be too light. The weights as purchased should never be used until they have been subjected to a thorough test and found to be correct.

In addition to the set of my own results contained in the report presented to the Institute by the Secretary, the following determinations, made on the same material after sending in my statement of assays and methods, may be of interest:

| Material. | Silver, Oz. per ton | Silver, Oz. per ton, average. | Gold, Oz. per ton | Gold, Oz. per ton, average. | Copper, per cent | Copper, average. |
|---|---|---|---|---|---|---|
| Matte. | 133.6<br>132.5 | 133.05 | 2.25<br>2.30 | 2.275 | 54.28<br>51.13 | 54.20 |
| Copper. | 153.3<br>153.2 | 153.25 | 0.28<br>0.26 | 0.27 | 97.65<br>97.23<br>98.08<br>97.65 | 97.65 |

(*To Be Continued.*)

CAZIN IMPROVED CRUSHING ROLLS.

## Improved Cornish Crushing Rolls.

From Designs by Franz Cazin, M. E.

The Colorado Iron Works, of Denver, Colo., have lately introduced important improvements in ore crushing rolls, commonly termed "Cornish rolls." They are from plans by Mr. Franz Cazin, M. E., and are designed to meet all requirements, but are especially adapted for very fine crushing, as is usually necessary in cyanide, chlorination and bromine processes of ore treatment.

In the construction of these rolls the main frame is cast in one solid part, insuring a perfectly rigid machine under all conditions. Rolled steel tires or shells are used, which are far superior to any cast metal shell made, the texture of the steel being so evenly pressed in, being rolled to shape, that it is impossible for any soft spots to appear, as usually happens to cast shells when crushing hard ores. The shafts are forged under steam hammer from steel blooms, and are much tougher and more rigid than when made of rolled steel or iron bars. The journal boxes are universal—that is, the journal boxes proper are pivoted in box frames in such manner as to always conform to shafts however much more one side of the rolls may be fed than the other. The Cazin end adjustment is applied on one end of roll shaft, by which same may be adjusted longitudinally to provide for the even wearing of roll faces. This appliance is of great value as, when shells wear down with use, the faces are kept smooth and a uniformly crushed product is maintained until new shells are needed. It is very simple and can be manipulated instantly while machinery is in motion and without removing housing; an advantage over the old style adjustments, which involves the stopping of machinery, taking off housings, changing parts, etc., etc.

Heavy wrought-iron guide bars are provided above and below which carry the universal boxes; they also extend through the corner posts at one end and carry the springs on the two sides of the machine. The springs are in cages, of which there are two, each being independent of the other and set in constant spring tension high enough to crush the hardest ore without any sliding movement of the boxes, they yielding only when some hard unbreakable substance, as a hammer, gad, bar or pick point (which might get between rolls by accident) passes through. The guide boxes take all the working strain, the main frame simply furnishing rigidity and carrying the working parts in position and alignment. Where high speed and fine crushing are desired the rolls are housed in to prevent the escape of dust. Solid built wood pulleys are furnished with these rolls unless otherwise ordered, as they are much stronger and last longer than any other kind. It is generally admitted now by progressive millmen that bolted rolls are more efficient than when geared. The two pulleys are placed on one side of the machine, and on removing the housing every part is easy of access without danger. These rolls are manufactured in five sizes, viz:

| | | | | | |
|---|---|---|---|---|---|
| 20 | inches | diameter x | 12 | inches | face, |
| 27 | " | " | 14 | " | " |
| 36 | " | " | 16 | " | " |
| 40 | " | " | 16 | " | " |
| 54 | " | " | 8 | " | " special. |

This company has issued a sixteen page pamphlet, "Explaining Ore Crushing," which will be mailed to interested parties on application.

# Electrical Progress.

### Chlorination vs. Cyanide.

Mr. E. R. Holden of Colorado suggests a new process for making chlorine at less than one-tenth of the present cost by means of bleaching powder and sulphuric acid. He says the cost per ton of ore is now 80 cents, and by the plan he suggests it can be reduced to 7 cents per ton of ore. He proposes to utilize the immense salt beds in Utah, worth there say $10 a ton, transport the same to points in Colorado, where there are immense water powers unused, use this water power to generate electricity, "which has the power of decomposing the chloride of sodium, or common salt, from which the chlorine escapes in the form of a vapor and is then condensed into a liquid form, after which it is ready to be placed directly in contact with the high or low grade ores of the States of the West." Ores to be treated by chlorine must be free from zinc, copper, arsenic, antimony and lead. He claims to save one-half the silver in the ore, and instances an ore containing $6 gold and $6 silver, and says he can recover $5 gold and $3 silver. Pyrite must be roasted, but this is now done by the Pearce turret roaster at from 35 to 65 cents per ton. He claims for chlorination a higher extraction than by cyaniding, which on ores from $15 and upwards amounts to a large loss, being the difference between a recovery of 90 to 98 per cent and that of 80 to 85 per cent. He practically admits the superiority of the cyanide method on very low grade ores, say from $6 to $10, providing they can be treated without roasting, but declares that the large cyanide works in operation at Florence on Cripple Creek ores are putting in roasters and eventually will roast all their ore. He argues that the success of the cyanide method in South Africa argues nothing for the treatment of American ores, as the conditions here are different and are changing with the depth of the mines. As to the cyanide mill at Mercur, Utah, he claims that a higher extraction could be secured by chlorination at a less cost per ton. Mr. Holden figures that crushing for the cyanide method costs 20 cents per ton more than for chlorination; that there is a difference of 7 cents per ton in precipitation in favor of chlorination, and adding $1.50, difference of extraction, and royalty, 50 cents per ton, makes a total difference of $2.27 in favor of chlorination. It is not likely that all of Mr. Holden's claims can be proved.

If anyone, in looking over articles on electric railways in the German language, should come across the word strassenbahnwagenuntergestelle, he need not be alarmed or discouraged nor be afraid to use it in good society. Instead of getting at the subject directly, as is done in English, this single word relates quite a little story—a sort of riddle of which you are expected to guess the answer. The story is briefly as follows: In about the middle of the word we find that the object referred to has some connection with a car, and, returning to the beginning, it appears that this car is intended to run on rails (as cars usually do, by the way); that these rails are in the streets of a city, and that the car is supported on some structure. Near the end it is explained that this supporting structure is below, and not above, the car, and, finally, it is added that it refers to the apparatus in general and not to any one form in particular. With the aid of this description it will not be difficult to guess correctly that the German writer would have said trucks instead had he been privileged to use the English language. It seems to us that this verbal machine is somewhat overcompounded.—Electrical World.

J. B. Schalkenbach, the organist Polytechnic Institute, London, has invented and constructed an electrical orchestra. An organ with two keyboards and a number of stops is connected by electric wires with a large number of musical instruments, which are distributed over the space usually given up to the orchestra, and kept in place by various stands. While a chair is located next to each instrument, the only man in the entire orchestra is Schalkenbach himself, who takes a seat at his organ, from where he conducts, so to speak, his mysterious musicians. The entire arrangement is mechanical and electricity is the agent doing all the work.

The long distance telephone used at the *Transcript* office is in a small room that is separated from the composing room by a thin wooden partition. Yesterday while an attache was receiving a telephonic message from Sacramento our pressman began to "plane down" a form. The striking of the mallet upon the planer produced quite a sound. Almost instantly the gentleman at Sacramento inquired: "What is that infernal pounding?" The pressman was requested to cease his tattoo, and the message from Sacramento was received without interruption. It seems strange that although the party who was causing the noise stood fully 20 feet from the telephone, with a partition intervening, the vibrations produced operated upon the sensitive instrument to such an extent that the pounding was not only plainly heard at Sacramento, sixty miles distant the way the wires run, but actually interrupted the party who was talking at that end of the line.—Nevada City Transcript.

Acting Secretary of the Interior Reynolds this week denied the application of the Electric Power Company for right of way for canals across the San Gabriel reserve in California on the ground that the law restricts the right of way through public lands or reservations to canals or ditches for purposes of irrigation. The company claimed that its application should be approved for the reason that the canal was located and partly constructed before the land was reserved, but the Secretary is of the opinion that there is no authority in law for approving the application.

At Alameda, Cal., the expert employed by the Municipal League to report on local electric matters last Monday gave a detailed account of what the electric light plant has cost the city. He calculated that the plant had cost the city, charging interest at the rate of 5 per cent, $49,112.61; without interest, $41,059.50. An inventory of the plant shows it to be worth $50,170.57. He estimates that it has cost Alameda about $1,000 a month to operate its electric light plant and that during 100 months the net loss to the city has been $112,842.

A new subject for photographers is the flames of explosives. Several of these pictures have been published in Vienna, an extremely beautiful one, it is said, having been furnished by the demon gunpowder. Some materials, nitro-glycerine and gun-cotton, send out large flames, while others give short flames of an entirely different character. A remarkable connection is found to exist between the size of the flame and the relative safety of the explosives.

The property of the Victoria Electric Railway and Lighting Company, including the franchises, was sold at auction last Saturday. F. S. Barnard of the Consolidated Electric Railway and Lighting Company of Vancouver secured the property for $340,000.

The owners of the North Star mine in East Kootenay, British Columbia, contemplate installing an electric tramway from the mine to the river landing at Delgardno, a distance of twenty miles.

A bill to grant a franchise for an electric railway through Yellowstone park has been reported adversely by the Senate Committee on Territories.

The San Francisco and San Mateo electric railway was sold last Saturday to J. A. Buck and N. Ohlandt for $300,000. It cost $925,000 to build.

# Scientific Progress.

Heibling has invented a process for producing alumina from clay in a form absolutely free from silica, and readily convertible into sulphate and other aluminic salts. Such a process may be extremely valuable, as the manufacture of the salts of alumina is largely on the increase. The clay is incorporated with a mixture of equal parts of ammonium and potassium sulphates in the proportion of three molecules of ammonium sulphate to each molecule of alumina. The mixture is pressed into the form of hollow bricks and is heated in a furnace to 270 to 280° C. Gaseous ammonia and acid ammonium sulphate are given off at this temperature, while acid potassium sulphate is formed and combines with the alumina of the clay to form alum. The alum is leached from the bricks with water and freed from iron by recrystallization. The insoluble silica which remains behind may be employed in the manufacture of cements. By spreading out the powdered alum in thin layers on shelves arranged in a vertical tower, on passing over it the warm moist ammoniacal vapors from the brick oven the alum is transferred into alumina, which retains the form of the original powder while ammonium and potassium sulphates are obtained as side products.

By forming on the surface of iron and steel a double carbide of hydrogen and iron, which is extremely hard and adhesive, protection of the metal from rusting is said to be insured. This is a French process, and the treatment is effected in a pair of gas retorts, set side by side, and raised to a temperature of from 600 to 700 degrees, Cent. The articles in this case are placed in a retort for about twenty minutes, when a current of hydrogen is turned into the retort and kept on for forty-five minutes, a small quantity of naphtha being now introduced, the supply of which is kept on for ten minutes. After this, the naphtha is shut off, a current of hydrogen is turned on for fifteen minutes longer, when the process is finished. All that remains is to cool the retorts down to 400 degrees Cent., and as soon as this temperature is reached the retort lids may be taken off and the product removed. The coating thus produced has a bluish color, and is stated to be so adherent to the metal that a treated bar can be bent through an angle of forty-five degrees without disturbing it.—The Tradesman.

Oppermann, in his German patent for galvanizing aluminum with metals, cleans the surface very carefully and places the article in a bath consisting of a solution of a mercury salt in potassium cyanide. Then he washes in water and makes the article, the cathode in a solution of the metal to be precipitated in the ordinary bath used for galvanizing. The addition of a little ammonia to the purifying bath is of assistance. Gomes coats metals with aluminum or aluminum alloy electrically by placing them in a bath consisting of 10 aluminum tartrate, 0.5 ammonium chloride, 100 water. The temperature of the bath is about 26 to 40° C. If the anode is insoluble the bath must be emptied and fresh aluminum tartrate dissolved. If aluminum is the anode, the bath should be kept entirely or weakly alkaline. Four to ten volts or more are required for the deposition of the aluminum.

Some singular experimental results connected with the mobility of metals, according to *Nature* have been obtained by Prof. Roberts-Austen. Many experimenters, especially Prof. Graham and Lord Kelvin, have studied the diffusion of gases and saline solutions, and Prof. Roberts-Austen has measured the rate at which certain metals will penetrate each other. He finds that solid gold, for instance, will diffuse into and move about slowly in lead, even at the ordinary temperature of the air, and with considerable rapidity if the lead be warmed, though far from melting. Evidence as to the presence of wandering atoms in a solid possesses much interest now that views as to the nature of metals and other solids have been extended by the discovery that certain rays of light will penetrate them.

Lord Kelvin declares Maxim has solved three out of the five problems of artificial flight. The two remaining ones, Dr. G. H. Bryan points out, have been now solved by Lilienthal and Pilcher, and all that remains is to combine the advantages of the two forms of apparatus in a single machine.

An expedition, headed by Professor Schaeberle, will be sent from Lick Observatory to observe the total eclipse of August next in Japan. The expenses of the party will be met from a fund provided by Colonel C. F. Crocker, one of the Regents of the University of California.

A chemist of Rouen, France, has succeeded in producing from acteylene a distillation of alcohol which can be sold as low as five cents a gallon. Its exhilarating effect is equal to that of the ordinary alcohol, and it is used to adulterate cheap wine.

# Mechanical Progress.

The ingenuity of H. Y. Castner, the young American whose remarkable inventions in the production of sodium and in electrolytic processes have made such a marked effect upon manufacturing industry, continues to be manifested in his patents. It is to be regretted that the chemical manufacturing industry of the United States has not reached a sufficient degree of development to allow of inventors like Mr. Castner being kept at home. One of his late English patents on the production of cyanides claims a direct combination of carbon, nitrogen and a metal, the latter being prepared in a particular way. The reaction takes place at a very much lower temperature and produces a much greater yield when instead of the metal carbonate or hydroxide are used. The reaction is carried out in a vertical iron retort which stands in a furnace. A filling tube in the form of a syphon connects with the tube of the retort and through this melted sodium flows. At the bottom of the retort is an emptying pipe also provided with a syphon, through which the melted cyanide is drawn off. Side pipes near the top and the bottom of the retort allow of the introduction of nitrogenous gases, while an automatic cover on the top of the retort allows of the introduction of small coal or other solid materials; so the process goes on without interruption, in which case nitrogen is conducted through it, or the retort may be filled with broken porcelain, iron or similar materials, in which case a mixture of nitrogen and hydrocarbons are brought into action. In a subsequent patent instead of introducing nitrogen into the retort, ammonia gas is used so that the nitrogen may be utilized in the nascent state. One of the most remarkable instances of the great progress in manufacturing chemistry is the ease with which large amounts of substances are now produced and handled which a few years ago were considered as rarities. By the Castner process sodium is now produced at a low price and handled in any amount, so that the full value of its immense chemical activity may be taken advantage of.

Edison has been warning experimenters with the Roentgen rays to be careful of their eyesight. He reports that his eyes were very sore after working several hours with the fluorescent tubes, but he is not yet certain that this result is entirely attributed to the X rays. An almost similar experience, however, is now mentioned by Dr. W. J. Morton, who reports that he sees brilliant flashes of light after he has discontinued work. As Dr. Morton has been for many years an indefatigable worker in electrical experimentation, and has never suffered in any way from the constant use of various kinds of electric light, he is

strongly inclined to the belief that the X rays are injurious to the eye. The latest contribution to this feature of the Roentgen rays comes from Mr. Tesla, who says: "When working with highly strained bulbs I frequently experience a sudden, and sometimes even painful, shock in the eye. Such shocks may occur so often that the eye gets inflamed, and one cannot be considered over-cautious if he abstains from watching the bulb too closely." Mr Tesla sees in these shocks a further evidence of large particles being thrown off from the bulb.

BLUMENBERG'S new process of manufacturing chlorate of potash from the chlorine by electrical action is about to be put into practical operation upon a large scale by a recently organized Chemical Construction Company, which will begin in July to manufacture chlorate of potash by Blumenberg's process at Niagara Falls, N. Y. The company will use immediately electricity from the famous tunnel amounting to 500-horse power daily, and is under contract to take at the end of a year 2500-horse power. The immediate output of the factory will be one ton of chlorate of potash daily. The company is building two structures. The electrical current will be introduced into the smaller building by means of copper bars four inches square, and there, by rotary transformers, will be converted from an alternating to a direct current. Thus transformed it will be carried to the second story of the larger building and introduced into tanks containing a solution of chloride of potash in water. The solution will be thus electrolized, and, as a consequence, oxidized into the desired chlorate, with important by-products. The chlorate will be run into tanks on the first floor, crystallized and packed for shipment. The electric current will be used at a low voltage. The chloride is now obtained from Germany, and is worth $25 to $30 a ton. It is expected, however, that deposits of the chemical will be worked in this country.

AN ingenious application of the well-known transparency of very thin metallic films has been utilized in the German patent of Alfred Rost on the production of silver mirrors. The deposition of the silver upon glass plate is stopped before too great density has been obtained. The glass is then washed and dried and coated with a colorless lacquer. The mirrors thus obtained have some curious properties. They reflect the image and yet are transparent. The rays of light which fall obliquely are reflected, while those that fall at right angles pass through. These transparent mirrors appear to be well adapted for a number of practical uses and doubtless will be found valuable for advertising purposes.

AN alloy which may be used to replace gold for certain purposes is composed of 94 parts of copper and 6 parts of antimony. The copper is first melted and then the antimony is added. When the metals are melted some magnesium carbonate and calcium carbonate are added which increase the density. The alloy can be hammered and soldered like gold. Nitric acid does not affect the color. In Germany it is quoted at about two marks per kilo.

CEMENTATION steel may be made by placing an electric current of 35 ampers and 2.5 volts through steel rods packed in charcoal. The temperature rises to about 1,000° and after three hours the negative rods are deeply cemented with carbon.

THE merits of the MINING AND SCIENTIFIC PRESS have made it an authority in its particular line and one of the leading publications of the West.—Inyo Register.

THE MINING AND SCIENTIFIC PRESS is considered the ablest edited mining paper in this country.—Oakland, Cal., Times.

## The Real and the Unreal Business Paper.

By an Advertising Expert not Connected with any Journal.

Imitation is the order of the day.

Imitators are everywhere.

The real and the unreal live side by side.

The good and the bad are neighbors.

There are trade papers which trade on the trade, and have nothing to trade with.

First-class trade papers make money.

All first-class men are successful.

All honest men succeed.

Dishonest men try to, and sometimes do.

There are papers masquerading under the names of legitimate publications which are nothing but advertisements bound together in pamphlet form.

There are so-called trade papers which have no circulation, and which cannot get any circulation.

There are trade papers run by men who know nothing about the trade they claim to represent.

The impression that all trade papers are successful have thrown upon the market numerous illegitimate publications which attempt to float on the water which has passed, and to sail by the wind of others.

The trade paper which is a trade paper contains part advertising, part original matter, part clippings, and is of interest and benefit to its readers, and such a trade paper is obliged to have circulation.

There is many a trade paper with part of its circulation in the form of sample copies, but that does not seriously handicap its advertising value, for each sample copy is sent out as a means to obtain a new subscriber, and each sample copy reaches people of its trade, because it would not pay to send sample copies to folks of any other class.

The trade paper which is all sample copies is illegitimate—it has no right of existence.

The trade paper which contains nothing but puffs is not worthy of consideration.

The trade paper which has all of its reading columns for sale, and sells nearly all of its reading matter space, is worthless as an advertising medium.

The trade paper can legitimately speak well of its advertisers—it ought to—the advertisers expect it.

The trade paper which speaks ill of those who do not advertise in its columns is a trade paper which has no standing, and which is worth little.

There are trade papers in this country which are nothing more or less than blackmailing sheets, which the Government ought not to transmit through the mails, and which are a detriment to the trade they represent, and to the honesty of the craft.

The legitimate trade paper, the trade paper of character, and the trade paper which pays the advertiser, is the trade paper which carries a large amount of advertising, for such advertising is as valuable to the reader as the reading columns themselves. These pages of advertisements present pictures of progress, and tell the buyers what is best to buy as well as where to buy.

The legitimate paper prints legitimate reading notices.

It speaks well of its advertisers, but it is not a paper of puffs—it is a paper of news and comment, simply the right combination of all that which makes up a first-class publication.

The trade paper can be known by the quality of its representatives.

First-class advertising men work for first-class papers.

Beware of the trade paper which has a different rate for every advertiser.

Look out for the trade paper that puffs everybody.

Look out for the trade paper which has a "Seeing-it's-you" concession for everybody.

Look out for the trade paper which does not stand on its own dignity and say to the advertiser: "My space is merchandise. If you want it, you must buy it as you buy your clothes or your shoes."

Second-class advertising men work for second-class papers.

The representative of the legitimate trade paper is a gentleman—a man worthy of your confidence.

When he calls he is entitled to your consideration, and should be given an audience.

You should discourage the illegitimate trade paper.

It is your business to encourage, with your money and your interest, the trade paper of character, for it is as much a part of your business, and is as necessary to your business as your desks and your counters.

This Clever Analysis of the Real and Unreal Business Paper is copyrighted by Mr. NATH'L C. FOWLER, Jr., "Doctor of Publicity."

TO THE STOCKHOLDERS OF THE SOUTH PALOMA GOLD MINING COMPANY, LIMITED:

Notice is hereby given that by resolution of the Board of Directors of the corporation, adopted on the 21st day of March, 1896, a meeting of the stockholders of the corporation was called for the purpose of increasing the capital stock to the amount of two hundred thousand dollars, to be divided into one hundred thousand shares of the par value of two dollars per share, and of determining the disposition to be made of the increased capital stock; and it was resolved that such meeting shall take place at the principal place of business of the corporation being the same building where the Board of Directors usually meet, to wit: No. 222 Sansome street, room 17, in the City and County of San Francisco, on WEDNESDAY, the 10th day of June A. D., 1896, at 11 o'clock in the forenoon of that day.

Dated San Francisco, 2nd of April, 1896.

JOHN A. WRIGHT, President.

CHAS. WEBB HOWARD, JR., Secretary.

# Practical Information.

### Manner of Packing an Important Matter.

Machinery builders who intend to cater to foreign buyers, especially to those in very far-off countries or in countries accessible only by round-about routes, will serve themselves, says Albert Spies in *Cassier's Magazine* for April, if they will have an eye to the way in which their goods are packed for shipment. English builders are almost proverbially careful in this respect, with the result that what they ship generally reaches its destination in good order, and will operate satisfactorily when put to work, while the products of their less painstaking competitors — often Americans—come to the purchaser battered and broken, perhaps, with possibly some parts missing, and become at once annoying provocations to the man who wants them, and wants them in a hurry, with no time to spare to send perhaps thousands of miles for a duplicate piece, or even a new machine. There can be but one result from such an experience—the careful shipper will secure the bulk of the trade, even though his machinery may not be the best nor the lowest in price. The time which he saves for the purchaser, and the an noyance from which he relieves him, more than make up for the difference.

Take the case of an ordinary engine to go say to South America. The English builder will fix the engine to heavy skids, and build what will be, practically, a substantial house around it, strong and secure against all possible battering of a long voyage and rough handling. When this engine reaches its destination there is little to be done to get it into shape for work. Everything is complete and in good order. The American builder, per contra, will, in most cases, secure the engine to the lightest skids that he thinks can be made to stand; a flimsy bit of timbering will go around the outside, and the governor, perhaps, will be wrapped up in some brown paper and tied on with a bit of string. Then the whole thing will be sent off with a trust in Providence that, unfortunately, does not always work in favor of the buyer. The engine is almost certain to suffer in transit, or the governor to be lost, and the builder's or shipper's reputation likewise. What is true of engines is true of all other machinery. The far-away purchaser naturally will prefer those goods which come to him with the least effects of travel wear and tear, and which can be put to work with a minimum of trouble and loss of time. There is a lesson in this which the export machine builder should heed.

---

LITHIUM is a rare but widely diffused metal resembling potassium and sodium and remarkable as being the lightest known solid not containing air, its specific gravity being only 0 59, or a little more than half that of water. Some interesting compounds have been announced by Guntz, a French chemist. It is the first substance known to absorb nitrogen gas at ordinary temperatures, lithium proving to be capable of absorbing it rapidly at a temperature below dark red. Deslandres has verified the discovery and made use of it in separating argon from the atmosphere. Continuing his experiments and wishing to heat some lithium in an inert gas, Guntz raised the metal to a bright red in a current of hydrogen, when, to his astonishment, the whole took fire and burned up, depositing a white powder. Analysis showed the powder to be hydride of lithium. It is more stable than previously known hydrides of the alkali metals, and when treated with water it yields the remarkable proportion of one-fourth of its weight of hydrogen, or more than 300 gallons to the pound.

---

IT was Dr. John Hopkinson who first drew attention to the fact that when illuminating gas is burnt in a gas engine to drive a dynamo, much more light is produced, if incandescent lamps are used, than can be produced by burning the same quantity of gas in burners in the usual way. Such a statement seems anomalous; but it is not only true that more light can thus be gotten, but that one can buy city gas at ordinary rates, burn it in a gas engine and light his house with electricity more cheaply than he can with the same gas direct or with electricity bought from electric light companies at usual meter rates.

---

ACETYLENE GAS is believed to have one of the most abominable odors devised by chemistry, a fact urged in its favor, as it can be detected at once when it escapes. M. Moissan, who discovered it, says, however, that the pure gas, made from pure crystallized carbide of calcium, has an agreeable etheric odor, which he has inhaled in small quantities without inconvenience. When the carbide is obtained with impure coal and lime, it may contain sulphides and phosphides of calcium, and in that case the stench is nauseous.

---

EXPERIMENTS lately made in England show that, if a ball of solid iron is lowered into a mass of liquid iron by means of a metal fork, the ball at first sinks to the bottom with the fork. But in a few seconds it leaves the prongs and rises to the surface, where it continues to float until it melts. The rising is explained by the expansion of the ball, due to heating, whereby it becomes, bulk for bulk, less dense than the molten metal.

---

"THE miner's inch is a perfect analogy for the ampere," says T. O'C. Sloane, discussing the analogue of the ampere. "The head of water represents the E. M. F., the aperture the resistance, the rate of flow (the miner's inch) the ampere."

---

A RECENT writer on "profit-sharing" says that the plan may work all right in good, prosperous years, but it fails in hard times, when the business is run at a loss.

557,869.—WAGON BRAKE—A. Pirch, Los Angeles, Cal.
557,715.—DRAFT REGULATOR—H. Stutsman, Portland, Or.
557,926.—BATH TUB—S. F. Williams, San Diego, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order. American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

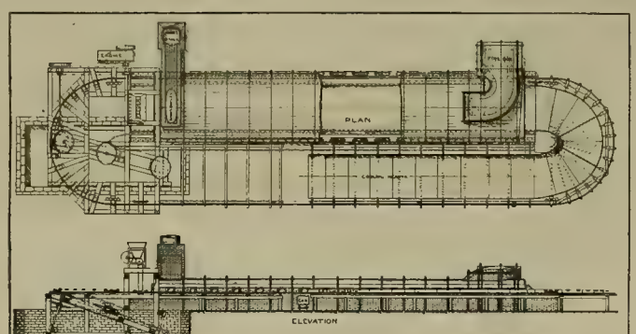
## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AIR VALVE FOR WATER PIPES.—August H. Schierholz, San Francisco, Cal. No. 557,343. Dated March 31, 1896. This invention relates to that class of air valves or water pipes which prevent the accumulation of air in high points of pipe lines, which accumulation of air would seriously interfere with the free flow of the water through the pipes, and also to a mechanism which allows the air to enter the pipe in case of breakage in lower places in the pipe line, thus preventing the collapse of the pipe through the vacuum thus formed. It consists essentially of an inward opening vertically movable valve, a casing containing the valve with guides through which the valve stem is slidable, a radially slotted chamber within the stem having a passage therefrom to the outer air, a valve movable in the chamber controlling said passage, wings extending from the valve through the radial slots in the stem, a float exterior to the stems connected with the wings and valve, and a spring surrounding the upper end of the main valve stem, with nuts adjustable upon the stem whereby the tension of the spring is regulated.

GAS ENGINE.—John F. Daly and Wm. F. Corson, assignors to the Union Gas Engine Company, San Francisco. No. 557,493. Dated March 31, 1896. This invention relates to improvements in gas or explosive engines, and its object is to provide such improvements that it may be applicable to engines of large size, in which two or more cylinders are used, with a common crank-shaft for propelling vessels or for other similar work. It consists essentially of a hollow base plate so shaped as to fit the timbers and run of a vessel having an air passage through it, pillow-blocks cast with the base plate to support the crank shaft, independent frames or standards bolted to the end of the base plate and enclosing the pillow-blocks, these frames extending upwardly and forming a support for the cylinders. One of these frames has an air passage through it coincident with the passage in the base-plate, and the cylinders above have a surrounding air space coincident with the passage through the frames, and means for connecting the air passage with a carburetor so that the air circulates freely around the cylinders and oscillates in keeping them cool while it is at the same time heated before passing into the carburetor. By means of a suitable valve the air may, if desired, be drawn directly into the carburetor without passing around the cylinders. The cylinder heads are cast with all the necessary ports and passages and valve chambers in a single piece adapted to be fitted upon the heads of the cylinders, and suitable surrounding passages are made through which water may be circulated to keep the parts cool. The pistons of the air and water pump are fixed to the same piston rod so as to be reciprocated simultaneously, and a suitable connection is made from the air pump with a whistle which is used for signals whenever necessary. A receiver may be employed in which the air under pressure may be stored for this purpose to be used when the engine is not running. The air pump is water-jacketed and receives its supply from the water pump. The cylinder head has exhaust passages common to both cylinders and intermediate between the two. The valves are actuated by cams upon a counter-shaft driven from the main shaft by a train of gearing and two different forms of cam faces are formed upon the peripheries of the exhaust valve cams, these cams being movable so that either face may be employed. One of the cam faces serves to open and close the exhaust valve regularly when the engine is in full operation, and the other cams are so constructed that the exhaust valve will be held open for a considerable portion of the stroke, while the engine is being started, and the back pressure is thus reduced until a revolution or two of the engine is effected so that the regular operating ones are brought into service. By means of intermediate mechanism between the crank shaft and the propeller shaft the motion of the propeller may be reversed or stopped without stopping the engine.

PENCIL SHARPENER AND POINT GUARD.—Joseph Kraker, San Francisco, Cal., assignor to Charles J. Wagner, same place. No. 557,402. Dated March 31, 1896. The object of this invention is to provide a pencil-sharpening device, with a means for always retaining it upon the pencil and advancing it as occasion requires during the sharpening, so that the device remaining on the pencil will serve to protect the point and prevent breakage. It consists of a thin sheet of steel blank bent to form an elongated cone at one end, the apex of the cone being cut diagonally and on one side, having an open slot formed therein, the base of the slot being intersected by a transverse cut made between the base and the cylindrical portion, so that the sharpened edge of the slot may be slightly bent inward to form a cutter. Screw-threads are formed in the interior of the cylindrical portion of such diameter, so as to engage the exterior surface of the pencil to hold the device thereon and cause it to advance longitudinally when turned upon the pencil, and the exterior surface has milled edges, or rings, struck up to form a hold by which the device may be turned upon the pencil.



BOILER.—Martin P. Boss, San Francisco, Cal. No. 557,354. Dated March 31, 1896. This boiler is one of those in which an annular series of water tubes encircle the fire chamber, which has within it a water column, communicating with the chambers in which the water tubes terminate. The main object of this boiler is to provide a means for obtaining ready access to the tubes. This object is accomplished by rendering the tube chambers easily separable.

## H. F. Brown's System of Mechanical Roasting Furnaces.

The illustration herewith gives one of the modifications of the Horace F. Brown roasting furnace, especially adapted for the roasting of concentrates where a comparatively small capacity is required.

This furnace is the same in principle as the Brown horseshoe furnace, as far as the application of heat and the protection of the stirring mechanism are concerned.

The protection of the mechanical appliances employed for rabbling the ore is really the essential feature of the Brown system of furnaces, and consists in a construction of the brickwork of the

furnace so arranged as to form a protection for the driving cables and traveling carriages, by means of a slotted wall, the rabbling being accomplished by suitable rabble points attached to an arm which projects through the slotted wall, and extends over the bed of the furnace. By this simple means the tracks, cables and other driving mechanism are so thoroughly protected that they are not affected in any manner by the heat or gases of the furnace.

The first furnaces embodying this principle were built by the inventor in 1891 at the Cortez mines, limited, Nevada, and in the fall of the same year at the Argo Smelting Works, near Denver, Colorado, and the merit of the invention was at once recognized by the leading metallurgists of the country.

Dr. Richard Pearce of the Argo smelter expressed himself as being very much astonished that, with all of the time, money and talent that had been expended within the last fifty years, no one had thought of so simple a remedy for overcoming the difficulties of mechanical roasting long before, and as a compliment to the ingenuity of Mr. Brown the slotted wall system of construction became the essential feature of the Pearce turret furnace, which, while differing slightly in details of construction and operation, is identical in principle with the Brown system of furnace construction.

Several furnaces have been devised embodying the principle of the Brown slotted wall construction, among the latest of which is the "Ropp" furnace, now in use at the Selby smelters.

The adoption of the slotted wall system in this manner by some of the leading metallurgists of the country is a high endorsement of its utility and efficiency, very gratifying to the originator of the principle.

There are now twenty-four of the Brown roasting furnaces in successful operation, covering nearly the entire range of metallurgical work, and representing the experience of several years of constant application in improving and perfecting the same by actual work.

A large furnace, substantially on the plan shown in the accompanying illustration, has recently been erected at the chlorination works of the Golden Reward Mining Company, Deadwood, South Dakota, for roasting the refractory or what is locally known as the "blue ores" of the Black Hills country. All previous attempts of roasting these ores have been by Bruckner cylinders and White-Howell furnaces, and it has been found impossible to get the ores properly oxidized so that a high extraction by the chlorine process was possible.

The difficulty in the White-Howell system of furnaces seemed to be the lack of time to which the ores were exposed to the proper degree of heat, and in the Bruckner cylinders it was found impracticable to regulate the heat and to get the proper surface exposure to get a uniform oxidization of the ore. All these objections are removed in the Brown furnace, as ample time is given and a perfect oxidization of the ore secured.

The results have been very gratifying, as the average work of the furnace is upwards of sixty tons per day, roasted down to three-tenths of one per cent of sulphur, requiring the labor of two men each twenty-four hours and six cords of pine wood, the ore being automatically cooled and delivered to the elevator at the same time at a total cost of less than 50 cents per ton for labor, fuel, power and repairs.

The operation of the furnace will be very readily understood by referring to the illustration. In general terms the Brown system of furnaces can be considered as cable railways, each stirring carriage representing the ordinary cable-grip car. The driving mechanism is identical in principle with that employed for driving street railway cables.

The ore properly crushed is charged into the automatic feeder. This feeder is so arranged that, after delivering the required amount of ore to the furnace hearth, it is automatically thrown out of gear and is again set in motion by the passage of the stirring carriage, so that any required amount can be fed in, and, being governed by the stirring carriages, the furnace can never become overloaded.

The ore is gradually drawn through the furnace, being stirred as often as the nature of the material requires, and is automatically discharged on to a cooling floor, over which it is advanced in the same manner as in the furnace, until sufficiently cooled for delivering to chlorination barrels or leaching tanks.

The cooling hearth can be brought back parallel with the roasting hearth, as shown in the illustration, or carried out to pass over store-bins, feed-hoppers or other receptacles, as may be required, there being no arbitrary fixed shape for the ground plan.

This flexibility is one of the peculiar features of the Brown system of furnaces and is of great advantage in adapting the furnace to local conditions, and also in automatically cooling and delivering the calcined product direct to the charging hoppers, or barrels, or leaching tanks, without extra cost or loss in dust.

While simplified so that it can be furnished at a minimum cost, the Parallel furnace contains all the improvements and requisites of the larger furnace, and in proportion to the square feet of roasting area will have equal capacity.

A furnace erected complete, including stack, having a capacity from 10 to 20 tons per day, depending on the nature of the material to be roasted, can be erected at a total cost of from $3500 to $4000, depending on the accessibility of the location to railroad transportation.

It is especially adapted to the "sweet" roasting of concentrates for after-treatment by chlorination or kindred processes, as the advancement of the ore can be so completely regulated as to insure a uniform and completely oxidized product.

The cost of roasting per day will be largely governed by the amount roasted, as it requires the same labor to attend to a ten-ton furnace as to a furnace that will average sixty tons per day. Basing the cost on a ten ton plant, there would be: two furnace men (at $2.50 each) $5; about 1¼ cords of wood (at $2.50 per cord) $3.25; oil, power and repairs, 50 cents; or a total of 87½ cents per ton.

On the same ore, with a furnace averaging sixty tons per day, the cost would be only about 30 cents per ton.

The perfection of mechanical roasting furnaces has gone very far towards solving the question of the economical reduction of low-grade ores.

In all processes now in general use the first condition necessary is the perfect oxidization of the ore, and, owing to the low grade of many of our largest deposits, the question of cost to properly oxidize the ore has been of paramount importance, which question has been practically settled by the perfection of the type of mechanically-stirred furnaces illustrated herewith. *

# TRANSMISSION OF POWER.

## HASSON & HUNT,
MECHANICAL AND ELECTRICAL ENGINEERS.

Consulting Engineers for
SACRAMENTO ELECTRIC POWER AND LIGHT CO.
NEVADA COUNTY ELECTRIC POWER CO.
LOS ANGELES RAILWAY CO.

310 PINE STREET, SAN FRANCISCO. BRADBURY BLOCK, LOS ANGELES.

## Great Reduction in Light!

## IMPERIAL
## Automatic Gas Machine

**Produces a Beautiful Light.**

The difference between the brilliancy of light produced from gasoline gas and from coal gas is 3 to 1. The gasoline light is clear and soft, rests the eyes and brings comfort to the home.

The latest and most perfect Automatic Gas Machine now in use, particularly for illuminating private dwellings in the country, as well as residences in the suburbs of a city or town, public institutions, asylums, hotels, etc. The light is steady, soft, bright and pleasant to the eyes and can be furnished at an expense of but eighty cents per 1000 feet of gas. It is much safer than coal oil lamps, which are so dangerous to have in the house on account of an explosion.

These Gas Machines are perfectly safe, and free from any danger whatsoever. Every modern house built for gas should have one of these machines. No public institution should be without one. I have no hesitancy in saying that there is no other gas machine in the market that can compete with mine as to prices, and they surpass as to perfection in all its requirements.

For supplying gas for gas stoves for cooking or heating these gas machines have no equal. Address

**JACOB SCHRIEBER,**

A CHEMICAL ASSAY OUTFIT. Anyone can use it. Chemicals enough for 100 assays with each $25 outfit. J. W. PETTEE, Sole Manufacturer, 907 17th Street, Denver, Colo.

# Mining Summary.

## Bullion Production of California for 1895.

The statistics of bullion product of California for the calendar year 1895 have just been forwarded from the San Francisco Mint to the Director of the U. S. Mint at Washington for publication in his annual report on the "Production of Gold and Silver in the United States." By permission of Superintendent Daggett, the statistician, Charles G. Yale, who collected the data, furnishes the following statement showing the gold and silver yield of the State by counties for 1895:

| COUNTY. | Gold. | Silver. | Total. |
|---|---|---|---|
| Amador (1)..... | $ 1,391,929 40 | $ 1,089 00 | $ 1,393,018 40 |
| Butte..... | 697,260 85 | 8,935 53 | 706,196 38 |
| Calaveras..... | 1,717,916 14 | 77 00 | 1,717,993 14 |
| Del Norte..... | 8,250 00 | ..... | 8,250 00 |
| El Dorado..... | 700,101 31 | 447 68 | 700,548 99 |
| Fresno..... | 47,249 00 | ..... | 47,249 00 |
| Humboldt..... | 92,635 20 | ..... | 92,635 20 |
| Inyo..... | 92,142 28 | 188,329 23 | 280,471 51 |
| Kern..... | 231,433 31 | 46,064 28 | 277,497 59 |

| San Diego..... | 344,807 57 | 600 00 | 344,907 57 |
| S. Luis Obispo. | 3,000 00 | ..... | 3,000 00 |
| Santa Barbara.. | 4,000 00 | ..... | 4,000 00 |
| Shasta..... | 781,686 32 | 28,417 20 | 810,113 52 |
| Sierra..... | 694,469 67 | 106 96 | 694,576 63 |
| Siskiyou..... | 950,006 43 | 177 30 | 950,183 73 |
| Stanislaus..... | 26,481 50 | ..... | 26,481 50 |
| Trinity..... | 1,166,745 13 | 1,257 28 | 1,168,002 41 |
| Tulare..... | 16,320 00 | ..... | 16,320 00 |
| Tuolumne..... | 666,754 15 | 312 62 | 667,066 77 |
| Yuba..... | 111,482 34 | ..... | 111,482 34 |
| Unap'r'ned (2). | 53,786 17 | 11,153 83 | 64,940 00 |
| Totals ..... | $15,334,317 69 | $599,789 70 | $15,934,107 39 |

(1) Based on returns at San Francisco Mint.
(2) "Unapportioned" includes product of single mines, etc., in counties so as to conceal their identity; and also includes estimates of product of properties known to be working, but from which no returns were obtained.
Counties not mentioned in this third list (95) made no returns for 1895.

In 1894 the yield of gold of the State was $13,923,281.89, and that of silver was $297,331.55, a total of $14,220,613.44. A comparison of these figures shows that the gold yield of 1895 increased over that of 1894 by $1,411,035.80, and the silver product increased $302,458.15, a total increase of precious metals in California over the previous year of $1,713,493.95. In 1893 the gold yield of the State was $12,422,811.60; in 1892, $12,571,900.57. For purposes of comparison is appended the gold and silver product of California for 1894:

| COUNTY. | Gold. | Silver. | Total. |
|---|---|---|---|
| Amador..... | $1,331,916 54 | $280 27 | $1,332,196 81 |
| Butte..... | 473,672 65 | ..... | 473,672 65 |
| Calaveras..... | 2,119,365 67 | 5,182 80 | 2,124,548 47 |
| Del Norte..... | 8,000 00 | ..... | 8,000 00 |
| El Dorado..... | 396,707 67 | 356 00 | 397,063 67 |
| Fresno..... | 8,202 00 | ..... | 8,202 00 |
| Humboldt..... | 41,326 00 | 13 86 | 41,339 86 |
| Inyo..... | 52,638 91 | 83,640 00 | 136,278 91 |
| Kern..... | 310,706 91 | 39,700 00 | 350,406 91 |
| Lassen..... | 35,283 00 | ..... | 35,283 00 |
| Los Angeles.... | 34,500 00 | ..... | 34,500 00 |
| Madera..... | 167,791 60 | 180 00 | 167,971 60 |
| Mariposa..... | 153,707 51 | 38 75 | 153,746 26 |
| Merced..... | 762 50 | ..... | 762 50 |
| Mono..... | 358,824 46 | 11,549 12 | 370,373 58 |
| Monterey..... | 8,000 00 | ..... | 8,000 00 |
| Nevada..... | 1,830,154 80 | 475 51 | 1,830,630 31 |
| Placer..... | 1,831,214 52 | 664 37 | 1,831,878 89 |
| Plumas..... | 499,358 83 | ..... | 499,358 83 |
| Riverside..... | 93,322 50 | ..... | 93,322 50 |
| Sacramento..... | 70,326 00 | ..... | 70,326 00 |
| San Bernardino | 130,419 78 | 148,242 89 | 278,662 67 |
| San Diego..... | 266,408 73 | 189 60 | 266,598 33 |
| San Luis Obispo | 1,200 00 | ..... | 1,200 00 |
| Shasta..... | 667,436 68 | 5,032 31 | 672,468 99 |
| Sierra..... | 604,721 54 | ..... | 604,721 54 |
| Siskiyou..... | 760,781 83 | ..... | 760,781 83 |
| Stanislaus..... | 26,368 50 | ..... | 26,368 50 |
| Trinity..... | 1,012,665 84 | 325 00 | 1,012,990 84 |
| Tuolumne..... | 547,448 06 | 1,072 16 | 548,520 22 |
| Yuba..... | 107,480 20 | ..... | 107,480 20 |
| Unapportioned | 32,568 66 | 388 91 | 32,957 57 |
| Totals ..... | $13,923,281 89 | $297,331 55 | $14,220,613 44 |

From the above it will be seen that, comparing '94 and '95, there was last year an increase and decrease in the gold yield of the several counties named herein as follows:

| COUNTY. | Increase 1895 over 1894. | Decrease 1895 from 1894. |
|---|---|---|
| Amador..... | $61,101 86 | ..... |
| Butte..... | 232,523 73 | ..... |
| Calaveras..... | ..... | $406,555 83 |
| Del Norte..... | 250 00 | ..... |
| El Dorado..... | 303,485 32 | ..... |
| Fresno..... | 39,047 00 | ..... |
| Humboldt..... | 51,295 24 | ..... |
| Inyo..... | 144,192 60 | ..... |
| Kern..... | ..... | 72,909 32 |
| Lassen..... | ..... | 10,283 00 |
| Los Angeles..... | ..... | 11,150 00 |
| Madera..... | 54,352 14 | ..... |
| Mariposa..... | 62,883 20 | ..... |
| Merced..... | 737 50 | ..... |
| Mono..... | 267,227 33 | ..... |
| Nevada..... | ..... | 40,414 65 |
| Orange..... | 144 00 | ..... |
| Placer..... | ..... | 226,971 47 |
| Plumas..... | 103,863 74 | ..... |
| Riverside..... | 191,333 50 | ..... |
| Sacramento..... | 75,546 75 | ..... |
| San Bernardino..... | 72 107 63 | ..... |
| San Diego..... | 78,309 24 | ..... |

| Yuba..... | 4,002 14 | ..... |
| Unapportioned ..... | 31,982 43 | ..... |

### Amador.

Thirty miners are at work underground at the Newton copper mine, three and one-half miles from Ione, prospecting under a three months' bond to ascertain the extent and character of the ore body.

*Record:* The hoisting and other machinery for the Central Eureka (formerly Summit) mine arrived at Ione this week. As soon as the machinery is placed in position the work of cleaning out the old 800-foot shaft will be commenced. One hundred feet of it has already been commenced.

### Butte.

Eight men are working underground at the Osgood mine at Bangor.

The tunnel is steadily being driven ahead at the Golden Butterfly mine.

Thirteen men are at work in the Golden Summit mine.

Shaw, Watkins and March have opened a quartz vein west of Kanaka Peak and near the Middle Fork of Feather river. They expect in a short time to have a mill upon the property.

W. Treat has forty men and eleven teams employed in his mine on the west side of the Feather river. There is nearly twenty feet of rich soil to move before pay gravel is reached and this is being done with teams, scrapers and wagons. A large spot is being cleared off and when this is done the bottom gravel will then be washed.

### Calaveras.

The Gwynn shaft is down 1132 feet. They expect to sink the shaft 1500 feet before prospecting for the ledges.

A contract has been let to put up a hoist at the Bund & Bennet mine on the San Andreas road.

In the Bovee mine the ore now being milled is taken from the stopes on the 100-foot level. The mill is running day and night.

*Echo:* Pumping out the Bald Hill mine at Albany Flat is going on for inspection by a company intending to purchase.

The Jones mine, at the mouth of Carson creek, daily yields about six tons of sulphurets, which average $50 per ton.

*Prospect:* E. K. Stevenot of the Calaveras Consolidated mines at Robinson's Ferry has five men at work cleaning out and retimbering old works, and the mill has been moved to a more convenient site on the river. This property was sold by Mr. Stevenot to an English company who ran a tunnel 1400 feet and did a large amount of other work, but owing either to lack of knowledge in mining or mismanagement, the mine did not pay. Mr. Stevenot's faith in the property was never shaken, and when the company had finished with it, he bought it back, and the work now being done is only preparatory to beginning operations on a large scale.

### Del Norte.

C. Goodrich, near Gasquet's, has recently sold to a Chicago man his property, comprising about 400 acres of gravel. S. K. Higgins, of Chicago, a representative of the company, is now in San Francisco. He will run four giants and put on a large force of men.

### El Dorado.

(Special Correspondence)—The Philadelphia, fifteen miles southwest of here, owned by J. J. Crawford, is reported sold to-day to an English syndicate.

L. Hoag has plodded for years on a property seven miles west of Placerville, on which he has stoped, tunneled, "shafted" and drifted to the amount of several thousand feet. He has many tons of good ore ready for milling and a very large ledge uncovered from foot to hanging wall, a distance, he maintains, of 300 feet. He owns nine claims.

Antioch and San Francisco people have organized a company to be known as the Blanchard Mining Co., and have bonded and begun development work on 160 acres of ground obtained from the Judge Blanchard heirs. The first shaft is about 160 feet, and the work is going ahead at a lively pace.

S. C. Lewis of San Francisco has bonded one of the several claims owned by W. H. Reinbold near Garden Valley and will continue the development work to greater depth.

A 60-horse power engine and a 75-horse power boiler are being placed on the new Salisbury mine for hoisting and milling power.

The old Tullis mine, famous in its day as a rich producer though under crude methods, is again receiving attention. Work was started quite recently in rehabilitating this property, whose story, truthfully told, reads as the fairy tales of old. This is owned by a stock company, among whose members are Morehouse & Huff of San Leandro and D. W. C. Morgan of Placerville.

The 4000 feet of pipe for compressed air power to the Big tunnel having been successfully laid, a new pump placed in position and other improvements made, during which time the stamps were hung, new life and activity are moving the mill and machinery about the Gentle Annie group under the supervision of Supt. Parlow, who, with John Melton, is also a part owner in the property.

Favorably known from California through Nevada, New and Old Mexico to New York and London, is Col. D. H. Jackson, who for twelve months past has traversed this county with pick, mortar and pan, and bonded a few properties, one of which he developed and recently sold to Monroe Salisbury, and two that he is developing quite extensively (on the mother lode) has proven himself a John the Baptist in El Dorado's mining world. He ties up nobody's property except to develop it. His reliability and steadfastly persevering qualities, coupled to his success, have endeared him to the people here.

John Melton, interested in the Brown Bear, Trinity county, in the Gray Eagle, Grizzly Flats, twenty-six miles east of here, and in the Gentle Annie, two miles from town, is among those doing good work for the mines of El Dorado.

O. S. Buckbee, who for years has had charge of the mining interests of the Wilmans Bros. at Monte Cristo and Everett, Washington, and latterly in Tuolumne county, reached here last week to manage the interests of the same firm on Weber creek, this county.

Monroe Salisbury is giving his personal attention to the active work in progress on his recently acquired Salisbury mine.

Placerville, April 15th.

### Mariposa.

*Gazette:* The Dorse mine near Hornitos is in active operation. Burleigh drills are used throughout the mine in the development work. It is expected that the owner, Charles E. Stuart of Ohio, will build a mill in the near future.

R. B. Stockton, of the Santa Rosa mine, has been running a ten-stamp mill on ore piled up on the dump. It is paying the owner a good sum. As soon as the rock is all worked, the mill will be closed down and the sinking of the shaft 200 feet deeper will be commenced.

Quite a number of men are working on the Mariposa Grant, and all are said to be doing fairly. Ludwig's old five stamp mill has been torn down and moved to the Lura LaGrande mine at Hazel Green. A new mill is to be built at Mount Ophir to work the ores of the Grant.

The prospective purchasers of the Washington, No. 9, Pool and Quartz Mountain, known as the Mose Rogers group, were in Hornitos last week looking over the property. H. H. Clark of Horseshoe Bend was there to meet the gentlemen, who, should the deal be consummated, will use electricity as their motive power.

The Tendron mine, at Whitlock's, is running steadily, under the able supervision of A. G. Briggs. The working expense of this mine is about $8000 per month. A two-compartment shaft is being sunk, the 500-foot level having just been reached. William Johns, the general manager, has just made a tour of inspection of the property and is well pleased with the outlook.

### Nevada.

At the annual meeting of the stockholders of the Champion Mining Company the following officers were elected: G. Kartschoke, president; H. Mohr, vice-president; F. Zeitler, superintendent; A. Wilhelm, J. Assion, J. S. Schuster, J. Moock, J. S. Ott, directors.

Walter Turnbull, President of the Gold Mining Exchange, has bought the Sebastopol mine.

*Transcript:* In the Gold Point mine, Grass Valley district, present operations are going on below the drain tunnel, and the last crushing paid $14 per ton, exclusive of the sulphurets.

### Placer.

*Sentinel:* Supt. Gassaway of the Mayflower intends to make an upraise in the main tunnel, when a larger force of men will be employed.

D. N. Kent, representing the Horseshoe Bar Mining Company, will work their claim near Michigan Bluff extensively this season. A force of men is now engaged in repairing the ditch, which is to furnish power for hydraulic elevators. More than a year ago this company drove a tunnel, which takes the water from the river and conveys it for about one mile.

Eighteen men are employed at the quartz mine at American Bar and the ten stamps are dropping continuously. Alfred Dixon has a force of men engaged at his Center mine, near Deadwood. The Hidden Treasure mine at Sunny South is operated on the most extensive scale of any drift mine in California. Between five and six hundred cars of gravel are mined and washed through the sluices each day. Supt. H. T. Power informed the *Sentinel* that the company has 200 men on the payroll. Thirty men are engaged in development work on the property. An upraise is being made in the Dam tunnel at a point 6,000 feet from the surface to reach the white gravel. Mr. Power thinks that if prospects hold up to present indications, the company would be able to work a total force of 400 men. Supt. Felix Chappellet Jr. says that the tunnel to tap the channel at the Eureka mine is now in over 700 feet. The company expects to make the upraise into gravel during next September or October. The Eureka Company owns more than six miles of channel and will be able to work from 300 to 350 men when they are ready to breast gravel. This, with the increased operations at Hidden Treasure mine will give employment to more than 500 new miners on the Forest Hill divide.

### Plumas.

*National-Bulletin:* Dr. J. P. Welch has secured an extension of his option on the Glazier mine, on the North Fork, after making a payment of about $6,000.

Standard & McGill are making extensive repairs on the Kittle mill at Rouud Valley, preparatory to the resumption of crushing ore from their large mine in North Canyon. Before closing down last fall, this mine yielded big returns, about $14,000, in the month of October.

The usual force of men is employed at the Plumas Eureka mine.

### San Diego.

Samples of rich copper ore have been received in San Diego from mines in Picacho district, on the Colorado river, owned by a company in which G. L. Jesselyn of San Diego is interested. The specimen shows the ore to be at least 75 per cent pure copper, and it carries enough gold to pay for being worked.

S. W. Dorsey, who is becoming largely interested in mines at Picacho, has filed in the recorder's office notice of his purchase from J. M. Mendivil and others of all their right, title and interest in the Apache, Control, Eastern California, Western Pacific, Golden Casket, Mina Rica, Rica Tierra, Gold Seal, and Mars southeastern extension, with millsite.

At Julian the Owens Mining Company has opened a ledge at the 350-foot level, two feet wide, which shows free gold. Fifteen men are continuously at work.

H. E. Holland has sold his third interest in the Elevada mine to V. E. Shaw, of San Diego, for $6500.

On the desert in the eastern portion of the county, the headquarters of the Chucauwalla district is the mine of the Sterling Gold Mining Company, where a ten-stamp mill costing $27,000 is being erected. The company owns several mines in a group and have sunk several shafts to a depth of 75 and 100 feet, enough to show something permanent. Near by this mine is the Bowlder mine, down 100 feet, and the Granite, down 100 feet, with a crosscut 75 feet across the ledge. The Buckeye mine, three miles away, is owned by Dr. Kellar, of Los Angeles, and is down 80 feet.

### Shasta.

*Free Press:* The case of George W. Meyers vs. the Empire Mining Company in which Meyers sued for $2800 damages, a writ of ejectment and restitution of his mines, mills and premises and that the provisional injunction issued and served on October 22, 1895, be made pepetual, and in which said case the defendant, the company, denied the allegations of the complaint and demanded judgment for damages against the plaintiff in the sum of $20,519 on account of false representations made to the company, was submitted to the court without argument, whereupon the judge ordered that a judgment be entered in favor of the plaintiff, Meyers, for restitution of the premises, mill and mines and that the provisional injunction be made perpetual.

The Original Quartz Hill gold mine is yielding good ore, which is being crushed in the 20-stamp mill of the Calumet Mining Company at Calumet spur. On Monday last a cleanup was made, and a gold brick about a half-inch in thickness shipped to the refinery.

### Sierra.

AROUND SIERRA CITY.—Eleven men are working at the Sierra Buttes quartz mine. The Butte Saddle has hired a new crew of miners to replace those recently discharged. An upraise and drift is being run on the Roman ledge, which mine has been bonded by Mr. Copeland. The Rising Sun and Early Dawn Companies are still putting down their incline—now 200 feet in length. They have plenty of gravel and find an occasional rich pay streak. Six men are working at the Northern Belle quartz mine, recently purchased by I. Copeland. An upraise is being made from the lower tunnel of the Bigelow quartz mine to the upper one, to be 280 feet long. The work has been contracted for by Hansen and Cox at $2.50 a foot.

*Messenger:* In the northern part of the county no work is being done in the St. Louis mines. There is a general stoppage of work in the Scales' claims. J. H. Thomas has ten men hydraulicing La Porte. Operations have been temporarily suspended at the Belle Union drift mine. A number of men have been temporarily laid off at the Thistle shaft. There is a lull in mining matters in Gibsonville at present.

### Siskiyou.

*Journal:* Work is resumed at the Columbia mine, near Scott Bar, long idle.

The Gum Boot mine on Mill creek, owned by A. and C. Simon, has started up.

The hydraulic miners in the vicinity of Oro Fino anticipate fully as long a run this season as last. Although the fall of snow in the high mountains has not been as heavy as usual, still the cold weather we have had has served to keep the snow from melting too rapidly. During the last storm considerable new snow fell on the mountains, which is also of great benefit. All the hydraulic mines are in full blast.

### Trinity.

AT TRINITY CENTER.—The Oro Fino quartz mine and mill, the property of the Strode brothers, has started up.

G. L. Carr is working three shifts on his quartz mine. He has been making the mine pay with an arrastra, but this has been discarded for a stamp mill.

A force of men is running a tunnel on the Big Bonanza King, in which W. Vollmers and E. Ellery are interested. As soon as spring opens in earnest, the mine will be run full blast. There is a fiv-estamp mill on the property.

The Nash Company on Coffee creek have put in a pumping plant.

At Minersville, at the H. G. M. Co., the new flume which crosses the bedrock of the Lappin mine on a trestle 36 feet high, is to be completed shortly. Thirty men are employed.

*Journal:* From the Highland mine, opposite Taylor's Flat, Pelletreau & Hedges are taking out $200 a day.

At Vance's Bar Wallace & Harrington are preparing to run a tunnel on the lower end of their drift mine.

At Cox Bar Geo. Tinsley is drifting on leased ground near Manzanita Flat and is taking out from $6 to $10 a day.

*Expositor:* E. and J. Jones, two placer miners holding a claim three-quarters of a mile north of Coarse Gold, found a nugget last week weighing five and one-twelfth ounces. In 1893 a nugget of the value of $700 was taken from the same mine.

### Tuolumne.

OLD TUOLUMNE MINES, AND FUTURE PROSPECTS.—(Special correspondence)—It is at last beginning to dawn upon us, beyond the question of a doubt, that capital is seeking and investing in our mines. The demand for paying properties and good prospects is greatly on the increase, owing chiefly to the rich developments now being made on the mother lode, as, for instance, the daily output from the Rawhide mine, now operating entirely by electrical power very successfully; the immense discoveries in the App, at Quartz mountain, of ore bodies of high grade; the Jumpers' continued richness of large slate

and quartz veins, yielding auriferous rock of highest grade. The Rappahannock has just encountered and is developing great bodies of payable ore, 38 feet so far as crosscut at the 350 level and no hanging wall in sight. Gold shows freely in the quartz and slate, similar to Rawhide, and in some places is of great richness. A personal visit to the mine so testifies. Naturally, it will take some time to systematically open up this newly discovered shoot. The same has been found on the 100-foot level, but its width has not yet been determined, as crosscutting for footwall is now in progress. Here, also, the same class of rich ore is found as in the lowest level. The above showing indicates that a rich and payable mine will be found as deeper developments are made. There are many other mines along the mother lode in this county, between the Stanislaus and Tuolumne rivers, that are mining successfully on the same rich belt; that it would seem there is an unbroken chain of most valuable properties continuously located between the two rivers named; that Tuolumne as a great gold producer is assured, not only on the mother lode, but in the upper belt, as for instance, the Golden Gate with its twenty-stamp mill and complete chlorination plant, turning out golden bars a dividend payer as regular as the end of the month comes around; the Belle View, its ten-stamp mill pounding out monthly profits of no mean order from its large vein; the Dead Horse, 1400 feet deep, steadily paying; the Black Oak group's ten-stamp mill crushing rich rock, value largely in bare ore; the Keltz, a steady payer, with fifteen stamps; the old Soulsby mine vigorously being worked; the Mountain Belle, now crushing; the rich Star mine, on Rose creek, continuously crushing with their new ten-stamp mill. The ore is exceedingly rich, the richest being sent to the Selby Co., San Francisco, for special treatment. One carcarload (R. R.) produced $16,000 recently. The Star is equipped with a perfect reduction plant; concentrates are shipped to San Francisco. The Ham and Birney, running a ten-stamp mill all the time, with good payable results. It is needless to recapitulate other mines, but will sum up thus: We have twenty-five mines carrying mills aggregating 281 stamps; 140 of the above have been added since the Rawhide was opened. From what has come to my personal knowledge, there will be several mills added this summer to those already built. Referring back to the mother lode, I must state another decided advantage we possess is the fact that 600 feet in width generally covers all that is most valuable on this great fissure; for instance, on the footwall is west vein, the boulder center vein, east vein and the east stratified series at hanging wall, are mostly found on one location, being in such close contiguity and continuity. Hence the mother lode veins are consolidated, so to speak, in close proximity; thus the shoots are richer, for it is a well-known fact that contiguity of veins produce richer deposits than if isolated and separated by ungenial rocks. The formation of mother lode is black or blue mineral slates, being intersected and paralleled by eruptive dikes, diabase, diorite, etc., which are genial for gold; the quartz veins being interpolations between the slates and eruptive rocks, of larger or lesser degrees, gaining in size as sunk on. Serpentine is generally the main footwall.

Admitting Tuolumne is all that I claim for it, nevertheless capital is needed, and it is the duty of all who have their own interests at stake and a general desire to help the county, to see that incoming capital is fostered, not driven away and deterred from investing in our mines. Only the other day a large deal would have been consummated but for the avariciousness of some of the owners of a group of mines. The buyers came but were peremptorily informed one of the group had been sold, then demanding an immense advance on the original price as previously agreed upon. The buyers would take nothing but the entire group, would not tolerate the excessive demand and left disgusted with Tuolumne; thus the sale collapsed, and capital was turned out of the county. But for this contretemps $250,000 would have been paid down as the initial payment. Such an unwise course is much to be deprecated, and is manifestly unjust to capitalists who were so desirous of locating and investing here. Two hundred and eleven millions of dollars have already been extracted from this county; the major quantity came from the erosions by time from our quartz veins. This placer or alluvium enriched thousands, yet some of the old quartz mines produced millions of the above amount in free gold, but until later years the sulphurets or base ores were not worked. The knowledge of treatment was not known; there was a lack of the proper appliances in the early days of quartz mining. The sulphurets were looked upon as valueless and allowed to run to waste. All this is changed; everything of value is worked for all there is in it. Inventors are vying with each other to produce the most perfect method of saving and concentrating the base ores.

Capital is about convinced that this country has its merits auriferously. French and English coin is being placed with a certainty of coming our way at last. Our golden regions are but scratched over. The output of our Utica, Kennedy, Champion, Rawhide, etc., mines is of sufficient evidence to warrant investment. The area is large and the opportunities are unequaled. ARGUS.

Sonora, Cal., March 31, 1896.

### NEVADA.

The *Silver State* says: L. J. Crook has discovered a large deposit of cinnabar ore in a spur of the East range, about forty miles south of Winnemucca. The ore has been thoroughly tested and found to contain quicksilver to a per cent that leaves no doubt as to the value of the discovery. There are three different grades of the ore, the richest of which is in appearance exactly like that of the cinnabar found in the quicksilver mines at New Almaden, Cal.

#### ESMERALDA COUNTY.

Ex-Governor Colcord is having some Esmeralda Con ore of Aurora worked at Bodie by the cyanide process. If the result is favorable, a cyanide plant may be erected at Aurora and its mines started up again.

#### LYON COUNTY.

Two carloads of copper ore from the Dunlap mine near Soda have been shipped to Empire for a test.

### OREGON.

Baker City *Democrat*: The Exploring Syndicate of Mines and Mining Company, of France, represented by E. L. Giroux, resident agent and manager, has started mining operations at Clark's Creek on an extensive scale. Arrangements are being made for equipping the mines with pumps for the purpose of sinking to bedrock with a view of putting in a bedrock flume, starting at the mouth of the creek and running up to the old town. This will give fall to carry off all the gravel and debris washed by the giant hydraulics and enable the bed of the creek as well as the hill sides to be washed down.

The practicability of a bedrock flume in these mines has been one of certainty for many years, but the absence of the necessary capital to carry out such a project has been lacking until the present time. The syndicate having all the money necessary at its command the successful carrying out of this modern project for mine operation is assured.

#### JOSEPHINE COUNTY.

W. J. Strong, superintendent of the Waldo copper mine says that an increased force will soon be put at work there.

Pollock & Phillips of Jump-off-Joe district lately cleaned up $175 from an eight-days' run with an arrastra.

Development on the Yank ledge in Galice Creek district is progressing. The rock is very hard to work, but the prospects are good for the uncovering of a large deposit of low-grade ore.

Hougham and Stanley, lessees of the Braden mine in Kane's Creek district, recently sent the result of crushing 52 tons of ore to the mint at San Francisco. They expect to realize $500.

Gold Hill *Miner*: It is quite a sight one sees along the river between Gold Hill and Grant's Pass. The mining camps are thick and men at work on every gravel bar, picking, shoveling, panning and rocking. Most of these claims are worked on a small scale and with a limited force of hands. One claim—a large bar of twenty acres or more—is being worked by Dr. W. H. Flanigan, of Grant's Pass. The doctor has placed an engine and pumping plant on his claim and is working just as fast the water will allow. The water as yet is too flush in the river to admit of the best results on these claims.

### WASHINGTON.

Jno. Davenport, owner of the Daisy, Jerome Creek district, twenty-four miles east of Palouse, is going to put in a five-stamp mill.

At Methow, Griggs & Durr report a rich strike in their Friday claim—"solid sulphurets running thirteen ounces in gold."

### BRITISH COLUMBIA.

Wm. Kirkup of Revelstoke and G. J. Atkins of Chicago have organized the French Creek Hydraulic Mining Company—capital $2,000,000—for the development of placer properties in the big bend of the Columbia in British Kootenay. The head office will be in Spokane.

Nelson *Tribune*: While Canadians are looking wistfully towards Kootenay as a promised land, Americans are gobbling up the mines that promise large returns in the future. The War Eagle at Rossland is a good showing for a great mine, and were its output smelted in Canada and the matte refined and made into golden coins and copper wire in Canada, surely Canada would be none the loser. But this is not likely to happen. D. C. Corbin of Spokane has the mine bonded, and if he takes it up every ton of ore from the mine will be smelted in the United States, and that country will be just that much enriched at the expense of Canada. Mr. Corbin controls the Spokane & Northern railway, a branch of which is to run from Northport to Rossland, and in acquiring the War Eagle he is getting tonnage for his railway.

The Hall mines tramway has been cut in two, and is now in successful operation, delivering from 125 to 150 tons of ore at the smelter daily. The smelter's successful working is best shown by the weekly shipments of matte. The weekly shipments are worth $25,000 on an average, which means that the company is clearing close on to $75,000 a month. Eighty-odd men are employed at the mine, twenty-odd on the tramway, and about fifty around the smelter.

### ALASKA.

Under date of March 25, a miner writes from Dyea, Alaska. "Dyea is 100 miles north of Juneau and the fare is $10 cabin, no steerage. All freight is $4 per ton. On account of the heavy winds which prevail at Dyea, steamers cannot always go to that place; being frequently obliged to stop at Hames Mission twenty miles distant, until the weather is favorable. The Willapa anchored at this place for two days on her last trip. From Dyea there is a strip of water which runs directly north and south for sixteen miles; and as there is no wharf at the above place steamers are obliged to unload with small boats; and this can only be done in fair weather. Indians charge $5 per each canoe load of freight taken from the boat to shore. The Willapa will unload your freight free of charge from shore to the store, a distance of three miles, freight costs $5 per ton; and great care must be exercised in order to get your goods off the beach, as the water is very shallow, and the tide comes in very fast. From the store to Sheep camp, a distance of fourteen miles, freight costs four cents per pound, and from Sheep camp to the Summit, a distance of three miles, freight costs five cents per pound; so that one ton of freight would come to $198.75 from Seattle to the top of the Summit. No Yukoner goes in with less than one thousand pounds. One's fare and his outfit would cost $121 to get to the top of the Summit to say nothing of the first cost which is from $75 to $100. No person should think of going to the Yukon with less than $500, as any one can see from the above figures. The above is only the cost at this end. Some of this cost can be reduced by doing a part of one's own packing. But it is impossible to do it all, as it would take a person all summer to do it * * * It costs $1 each to get letters from Dyea at present, so correspondng is expensive. To-morrow we leave Dyea for Circle City a distance of 860 miles."

The Alaska-Willoughby Gold Mining Company has levied an assessment of 20c, delinquent May 25.

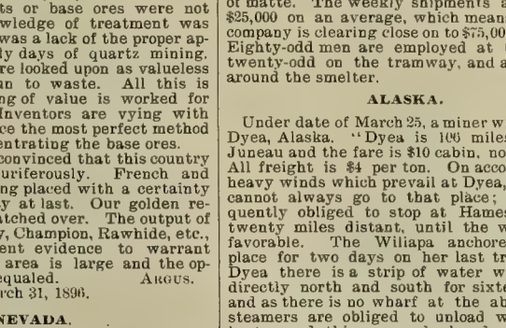
The March report of the Alaska-Mexican mine on Douglas Island, Alaska, shows 7262 tons of ore milled and 126 tons sulphurets treated, the last yielding $6,122. The gold product for the month was $21,761, expenses $13,139. The ore averages $3 per ton.

### IDAHO.

Judge Beatty of the United States Circuit Court has rendered judgment in the case of the Tyler Mining Company vs. Charles Sweeney, Frank R. Moore, Kennedy J. Handley, J. Quackenbush, Alexander Ross, John Pressley, Frank Hyatt, the Last Chance Mining Company, the Idaho Mining Company, and the Republican Mining Company.

"It is now ordered and adjudged," says the decision, "that the plaintiff do have and recover of the Idaho Mining Company and the Republican Mining Company the possession of those certain premises described in the complaint and in said agreed statement of fact, to wit: that certain ledge or vein of rock in place containing valuable minerals having its apex within the limits of the Tyler mining claim, with the right to follow as against the Republican and Idaho mining companies such vein upon its descent into the earth to any depth between the two perpendicular planes, prolonged in their own direction, which pass through the two parallel end lines of said Tyler mining claim, even though such vein in its downward course shall extend outside the vertical side line of such Tyler mining claim and under the Republican Fraction, the Last Chance Fraction and the Skookum Fraction mining claims, which are claimed by said defendants, the Republican and Idaho mining companies.

"And it is further ordered and adjudged that the plaintiff, the Tyler Mining Company, take nothing against the defendant, the Last Chance Mining Company, but that said Last Chance Company is entitled to the possession of all the premises and mining ground and claim and the ledge and ores therein in controversy in this action which lies between the planes which descend vertically from those two lines of the Last Chance mining claim which were located as its side lines, and as the same are now described in United States patent for said Last Chance claim."



It is further ordered that as to the other defendants the action is dismissed.

"There is nothing in this judgment," says F. L. Clark to the Spokane *Review*. "It is substantially the judgment which was rendered several months ago by Judge Beatty, and reported at the time in the Spokane *Review*. It appears to me that this is a more explicit statement of the relation which the Tyler bears to the Republican Fraction. I suppose it is a step taken by Judge McBride to advance this case. The Republican Fraction claim is owned by the Last Chance Company. It is of comparatively small value and has no relation to the main ore bodies. The point to be litigated is whether the Tyler has any extra lateral rights whatsoever, which point the Supreme Court says was a very interesting one, but not necessarily before it at the time the court rendered the decision in favor of the Last Chance Company.

"This is a very interesting legal point, the question of extra lateral rights, but it is now, so far as we are concerned, a legal battle, as everything that is of substantial value we have won.

"The decision is a victory for the Tyler, so far as it covers the ground owned by the Republican Mining Company and the Idaho Mining Company," said Mr. McBride, attorney for the Tyler company. "I still think the Tyler is entitled to recover the vein in the Last Chance ground, but this is a question for the future."

A study of the following diagram is essential to an understanding of the fine legal points involved in this most interesting case:

The decision turned on the question of priority of location. It having been decided that the Last Chance had priority, the Tyler people are estopped from following the vein into the Last Chance ground. But the Tyler having priority over the Republican Fraction and the claims of the Idaho Mining Company, is allowed to follow the vein into their ground. There still remains to be determined, it appears, the question of ownership of the vein after it has passed through and out of the ground of the Last Chance.

The insurance adjusters are through fixing the amount to be paid the Tiger & Poorman Consolidated Mining Co. on account of the recent fire. The total insurance on the property actually in the fire was $112,000. It is estimated by parties conversant with the matter that the company will receive about $80,000 from the insurance companies. H. L. Frank says the consolidated company will start in at once to replace both concentrators, and nothing but the latest improved machinery will be used. The mines are flooded up to the 600-foot level, but no trouble is experienced in handling the water above that level.

The Standard is daily shipping 12 cars of crude ore to the mill at Wallace, which make about one-fourth of that amount after concentration. The Campbell tunnel is in about 1460 feet.

### UTAH.

*Tribune*: The Bennett amalgamator, that three weeks ago began to convert the sands of Green river into gold bullion, has met with an accident and is temporarily idle. The ponderous machine with which its daring inventor has started out to revolutionize the handling of placer ground was earning, it is said, $5,000 a day when the old engineer had occasion to make way for a new one, who succeeded a few days ago in burning out the dynamos. The result was the hasty shutting down of the amalgamator that the damage might be repaired. It is expected that it will soon resume.

Twelve and a half tons of silver bullion, valued approximately at $375,000, will shortly be shipped from the Eureka Hill. No shipment has been made from the mine since January 1st, the bullion product accumulating all the time until the immense amount mentioned is on hand. The bullion contains a small percentage of gold that will bring it up nearly to coin value. The shipment, while not large enough to fill a car, is as extensive as would be permitted. This, it is said, will be the largest and most valuable single car shipment ever made from a mine in Utah, and, the *Tribune* believes, in the world.

The *Tribune* hears that the propositions for the reduction of the Golden Gate ores have been favorably passed upon by Capt. De Lamar, after the ores had been submitted to Chicago and New York chemists, and that upon the return of H. A. Cohen the big 500-ton mill that has been talked of will be erected on the Golden Gate.

### WYOMING.

At Sheridan, a force of six miners is being worked on the tin claims by the owners, Messrs. Cosslett & Holgate. Three shafts are being sunk and in all the ore looks richer as depth is attained. One hundred pounds of the ore from the bottom of the shafts has been brought in and will be sent to Carraway, the Government assayer at Omaha, and Ledoux, of New York, fifty pounds going to each. Upon the reports from this ore will depend the future working of the claims.

### MONTANA.

The stockholders of the Comanche Mining Co. hold a meeting in Butte to-day to ratify the sale of the company's property to the Boston & Montana for $200,000.

Twelve men have been put to work at the Silver Bow shaft No. 1, one of the Butte & Boston Co.'s properties.

Men also began work on the old chutes at the Tunnel, mine one of the Boston & Montana properties, and the *Inter-Mountain* is reliably informed that the Butte & Boston smelter will hereafter be kept running on Boston & Montana ore.

A judgment by default for $364,451.07 principal and $16,398.29 interest has been obtained by J. C. Perkins of Boston against the Butte & Boston Mining Company. The amount represented the company's floating debt.

The Anaconda Company has expended many millions in the purchase and development of mines and the erection and operation of its smelters and refinery; it numbers on the payroll 5,000 employes. Ninety-nine mines have been acquired during a period of fifteen years. Those most extensively developed are the Anaconda, St. Lawrence, Mountain Con., Green Mountain, High Ore, Poulin, Pacific and Neversweat. The deepest of these is the Anaconda—1,500 feet; on the others the shafts are from 600 to 1,200 feet deep. Upon the Green Mountain and Neversweat, hoisting plants, capable of sinking 3,000 feet, are being erected at a cost of a quarter of a million dollars. On all the principal mines of the company hoists are in operation, daily lifting to the surface from 3,000 to 4,000 tons of copper ore. The ore bodies vary in width from 20 to 100 feet, and are considered inexhaustible. The Anaconda properties combined are now producing 105,000 tons of copper ore a month, from which it is estimated 110,000,000 lbs. of copper will be extracted, which, at an average of ten cents a pound, foots up $11,000,000. The ores are shipped for reduction from Butte to Anaconda, where two large smelters and the newly erected refinery, are located. They treat 200 carloads of ore per day, hauled over the company's road, 28 miles long, built in 1894. They consume 450 tons of coal and 500 cords of wood per day, and 1,000 tons of coke per month. They use 2,000,000 feet of lumber per month for improvements and repairs, and 100,000 fire brick. The ore is crushed by direct-acting steam stamps, dressed in the concentrators, roasted in revolving calciners, and reduced in matting furnaces to the form of pigs containing 65 per cent copper and varying amounts of silver and gold. The electrolytic refinery does the rest. It cost $1,000,000. The total capacity of the two smelters is 4,500 tons. J. B. Haggin of San Francisco, the

Hearst estate and Marcus Daly own the Anaconda mines and plant. Mr. Daly is general manager.

The *Northwest* says the force on the Drum Lummon mine at Marysville has been very greatly reduced, at least 200 men having been laid off in the last few weeks.

### SOUTH DAKOTA.

(Special Correspondence).—The Deadwood and Delaware Smelter Co. has notified the contractors at their limestone quarries near Englewood that in the future they will require just double the amount of rock they have been having. This rock is mixed with ore before the charge is put into the stacks and the additional amount required has been necessitated by the recent increase in the capacity of the smelters.

Deadwood, Black Hills, April 10, '96.

(Special Correspondence).—The owners of the Egyptian mine have closed a contract with the Ingram custom mill for an extended run on their ore. The development crosscut in the mine has opened up a large vein of ore, running $6.50 free milling and $6 per ton in concentrates. The cost of mining and milling being but about $2.25 per ton, the ore will pay a handsome profit.

Keystone, Black Hills, April 10, '96.

(Special Correspondence).—About a week ago the drift on the 600-foot level of the Highland mine broke into a body of ore assaying $600 per ton. They have now crosscut the vein 20 feet and a sample taken from the face of the ore yesterday assayed $1100 per ton. This is undoubtedly the richest ore ever encountered in this mine. The mine is owned by the Highland Mining Co., a very close corporation, and is under the same management as the Homestake Co.

Lead, Black Hills, April 10, '96.

(Special Correspondence).—Returns on the car of ore shipped from the Sunnyside mine to the Kansas City smelters gave the owners $49.80 per ton. The expense of shipment, treatment, etc., being but $11 per ton, the owners made a nice profit. Work has been commenced on ore bins and a pump and hoist will be put up at once, preparatory to extending the development shaft on down.

Hill City, Black Hills, April 10, '96.

### COLORADO.

Telluride *Journal:* The recent strike on the Commercial is the latest sensation, in the Saw Pit district, and as development work progresses and the chute is more extensively opened up, the mineral improves both in quality and quantity. The ore lying on top of the lime contact is now five feet in thickness, and the whole assays from average samples 20 ounces gold, 78 ounces silver and 30 per cent lead per ton. There is said to be enough of this character of ore blocked out to last eighteen months, shipping one carload per day.

Pueblo *Chieftain:* Mining in the Ouray region is going ahead actively. The tunnel of the United States Depository mine is now 1300 feet long and about to tap the vein, which will yield ore of 700 ounces silver. The recent strike of 13 inches of 174 ounces silver and 2 ounces gold ore in the Nevada has proved to be continuous as development goes on.

Colorado Springs *Gazette:* It would appear that the recent strike made in the Mollie Gibson was as unexpected to the management of the company as it was to the general public. The work of drifting for a known ore-chute at the eleventh level was going on when the find was made, which consisted of some valuable but not very large quantity of ore. The known ore body which was being drifted for is supposed to be some 120 feet distant from where the recent strike was made. From this chute some $250,000 or $300,000 worth of ore was taken in the workings above, and the eleventh level will cut it at a depth of 100 feet below the point where the last ore was taken from. It is, of course, the intention to cut the chute at greater depths. The eleventh level is about 900 feet from the surface. The ore chute in question is the one that was first opened up on the Smuggler, but which faulted into Mollie Gibson ground.

The *News* says that leading miners of the State, D. H. Moffat, W. S. Stratton and the owners of Leadville's Little Johnny, have taken hold of the low grade problem. The Moffat cyanide-chlorination plant at Florence is to reduce 450 tons per day. Mr. Stratton is building on the Independence a 200-ton-per day chemical plant. The Little Johnny owners have ordered machinery for a 100-ton mill. These plants are to be under the control of educated experts.

Cripple Creek *Mail:* One hundred and twenty men are now employed at the Victor mine. The mine is working a larger force and shipping more ore than at any time in its history.

The highest system of water works in the world is to be constructed this spring in Altman. The altitude is about 11,000 feet. The main pumping station will be located at Grassy, a mile and a half below and 1,000 feet lower than Altman. A second station will be placed 750 feet higher than the first and will throw the water into tanks above the town. The water is for domestic use and for fire purposes. It is the purpose of the company to furnish light and power for the mines on Bull hill. Superintendent M. S. Walker has charge of the construction.

The north half of the Colorado City, located in the saddle between Bull hill and Battle mountain, was sold Monday for $65,000 cash to the Golden Fleece Mining and Milling Company of Hinsdale county. The mine was being operated by Charles M. MacNeil and E. Lyman White, who secured it by purchase last summer for $45,000.

### NEW MEXICO.

Silver City *Sentinel:* At Mogollon, the Maud S. Company is working mostly on the 300 and 375 foot levels. The mill is running full time; ten stamps being employed on the free milling ore and five stamps on the base ore; the base ore is being concentrated. Over twenty men are employed on the Maud S. mine, and in the mill two shifts of twelve men each are being worked. Work on the Grey Hawk mine, which is under the control of this company, is also being pushed ahead.

### ARIZONA.

The Arizona and New Mexico company's smelter at Ivanhoe is running full blast again, upon the copper ores of the district. A large part of the ore reduced comes from leased mines of the Santa Rita Company.

E. Hilty is working the bars of the Colorado river by the Barnhart amalgamator process, and the Prescott *Courier* says he is making a success at saving the flour gold which fills the bed and bank of that stream. A great deal of money and labor have been expended in years gone by to save this gold.

At a recent meeting of the board of directors of the Prescott Mining Exchange Col. Brodie was elected president and S. Hill secretary.

*Gazette:* A check arrived on Saturday from El Paso in payment for a carload of ore from the Eclipse or Luke mine, in the Bradshaw mountains, seventy miles north of Phœnix. The car of ore weighed 21,756 pounds, and after expenses of reduction were taken out, the owners received $4,294 31. This is $394.77 per ton at 68¾ cents per ounce, the price received.

### LOWER CALIFORNIA.

*Lower Californian:* Goldbaum and Pegot have contracted with Canas to work the old Castillo mine in the Real. It was this mine that made the town of Real del Castillo, and Canas was one of the men who originally worked it. The old works are down 250 feet, but for the past eight years it has been idle.

## Coast Industrial Notes.

—Boring for oil at Coalinga, Fresno Co., has so far resulted in developing two 40-barrel wells.

—The first freight shipment over the Corral Hollow road was made last Monday. At present two and a half miles of track are laid daily.

—The directors and stock trustees of the San Francisco and San Joaquin Valley railroad have determined to float $6,000,000 worth of bonds.

—Three vessels are here loading redwood for Europe, where our "California cedar," as they call it there, is in demand in the manufacture of fine cabinet work, lead pencils, etc.

—Lincoln, Placer Co., will put $20,000 in water works. The water will be supplied by the South Yuba Water Company and piped two and a half miles from their main into the town.

—C. P. Huntington is now credited with intention to buy the Atlantic and Pacific Railway at foreclosure sale, extend it to Sapulpa, Indian Territory, and there connect with the St. Louis and San Francisco railway.

—The McCloud Valley Railroad Company has incorporated in Siskiyou county, to start at Mott and extend into Squaw valley, tapping the timber belt in the eastern part of the county; capital stock, $1,000,000; stockholders, J. Palmer, J. A. Davis, D. E. Miles, W. J. Branstetter.

—Three of the largest olive orchards in the world are being planted in southern California. The largest grove is that of A. McNally, who has men at work laying out a 400-acre olive grove near Fullerton, Orange county. He will plant 40,000 trees. In the vicinity of Colton, B. Stevenson has 340 acres now being prepared. D. E. Emery, recently of Oakland, is having 240 acres of olives planted near Whittier.

—Since 1863 there have been built at the railroad shops in Sacramento 73 locomotives, 8 officers' cars, 174 baggage, mail and express cars, 2,321 flat cars, 105 passenger cars, 53 tourist and emigrant cars, 3,066 box cars, 245 refrigerator and fruit cars, 265 cabooses, 133 combination cars, 103 furniture cars, 283 coal cars, 10 snowplows, 10 ice flanges and 275 other cars, unclassified, making a total of 7,131 cars built. During that time there has been paid for labor $31,100,000 and for material $50,500,000.

## Personal.

W. A. CLARK has returned to Montana from Europe.

J. V. KEELEY has returned to his mines in Vanderbilt, Cal.

PROF. LANDES of Seattle has been appointed State Geologist of Washington.

JNO. W. GRAY, the Oakland mining engineer, has returned from a ninety days' business sojourn in New York.

MAJ. DAVIS AND CAPT. GILLETTE of the U. S. Debris Commission are now making personal inspection of the Feather and Yuba rivers.

## Recent Mining Dividends.

THE War Eagle paid a 5c dividend, $25,000, last Saturday.

THE Montana Ore Purchasing Co. paid a regular dividend of $1 per share, payable April 15th. This dividend is at the rate of 48 per cent per annum.

THE Cariboo Gold Mining Co. paid its ninth dividend of $7000 on the 6th—1 per cent on its capital stock—which makes $63,000 paid by this company in thirteen months.

THE Boston & Montana Co. has declared a dividend of $2 per share, payable May 20th, making a total of dividends declared and paid by the company to date of $4,025,000. The stockholders' annual meeting will be held April 30th.

## Recent California Mining Incorporations.

El Progreso Gold Mining Company, San Francisco; capital stock, $100,000, $25,000 subscribed. H. B. Sharps, Berkeley; J. Francis, P. H. Coward, C. Bovone and A. H. St. Marie, San Francisco.

Rosedale Gold Mining Company, San Francisco; capital stock, $1,000,000, $2500 subscribed. J. M. Fletcher, J. N. Wells, J. H. Sivers, T. P. Ross and A. A. Hobe, San Francisco.

American Gold Mining Company, San Francisco; capital stock, $750,000, $260 subscribed. J. M. Taylor, T. T. Greaves, C. B. Taylor, Oakland; T. E. Boeskenvogan, Gonzales; P. C. Dow, San Jose.

Henshaw Gold Mining Company, San Francisco; capital stock, $10,000,000, $2500 subscribed. E. M. Adams, J. M. Downer, M. R. Phillips, M. B. Kellogg, San Francisco; C. Brier, Oakland.

Etna Development Company, Etna, Siskiyou county; capital stock, $30.000, $15,350 subscribed. J. Parker, C. W. Nutting, J. Stephens, G. L. Hungerford, E. Miller, A. S. MacLellan, Etna.

Hilda Gravel Mining Company, San Francisco; capital stock, $100,000, $25 subscribed. S. Bigelow, Sierra City; L. Bocqueneraz, J. Phelan, P. Bellemans, R. Phelan, San Francisco.

Baker Gold Mining Company, San Francisco; capital stock, $10,000,000, $2500 subscribed. Same parties as Henshaw G. M. Co.

Webb Gold Mining Company, San Francisco; capital stock, $10,000,000, $2500 subscribed. Same parties.

Cascade Mining Company, Chico; capital stock, $2000, all subscribed, with B. Cusick, J. H. Mansfield, H. B. Reed, J. D. Sproul, H. Greenland, Chico.

Lockwood Consolidated Gold Mining Company, San Francisco; capital stock, $2,000,000, paid up $500; W. W. Barrett, J. E. Warren, C. M. Broadbent, B. J. Wise, San Francisco, J. M. Haven, Oakland.

## Commercial Paragraphs.

The Consolidated Kansas City Smelting and Refining Company has just completed very extensive copper refining works at their general refineries in Argentine, Kansas, and are now putting on the market 1,000,000 pounds monthly of the highest grade ingot copper. The addition of these copper refineries now makes the whole system of refineries at Argentine one of the largest, if not the largest, in the world for the extraction and separation of the precious metals from lead and copper. Their total for 1895 will be in the neighborhood of 15,000,000 ounces of silver, $5,000,000 in gold, 120,000,000 pounds of lead and 12,000,000 pounds of copper. The magnitude of this company's business is indicated by its dealings with railroad companies. During the year 1895 they paid out in freight charges to railroad companies the sum total of $1,769,000. The total number of cars of freight handled was 26,000.

Their refineries at Argentine are drawing the bullion product from their own reduction works at Leadville, Colorado, and El Paso, Texas, and are refining the bullion for smelters in Magdalena, New Mexico, Salt Lake City, Utah, Tacoma, Washington, and the Union Works at Leadville. They are drawing products of cyanide, chlorination and other mills located in all the western mining districts. The ores smelted by their reduction works are drawn from all the western States, from the Province of British Columbia and from all the mining districts of Mexico. The business of this company has grown rapidly in the last five years, and its interests and influence are rapidly increasing throughout the western mining world.

## Practical Books for Practical Men.

*A catalogue of Text Books and Industrial Works, 68 pages, free! New pocket catalogue containing all the latest and most important books on Steam, the Steam Engine, Mechanics, Machinery, Mechanical and Electrical Engineering, 40 pages, free!*

# For Sale.

The Finest and Most Complete HYDRAULIC PUMPING PLANT in California, entirely New, Large Capacity, Fully Equipped, including 25,000 feet of 11½-inch pipe. WILL BE SOLD CHEAP. For further particulars address,

**G. B. KIRKBRIDE,**
**139 So. 5th St.,**
**PHILADELPHIA, PA.**

## Engineer Wants Position.

Has had marine, stationary and locomotive experience. Best of references from present employer and others. Address W. M. BROWN, Jr., Mechanical and Erecting Engineer, 974 Center St., West Oakland, Cal.

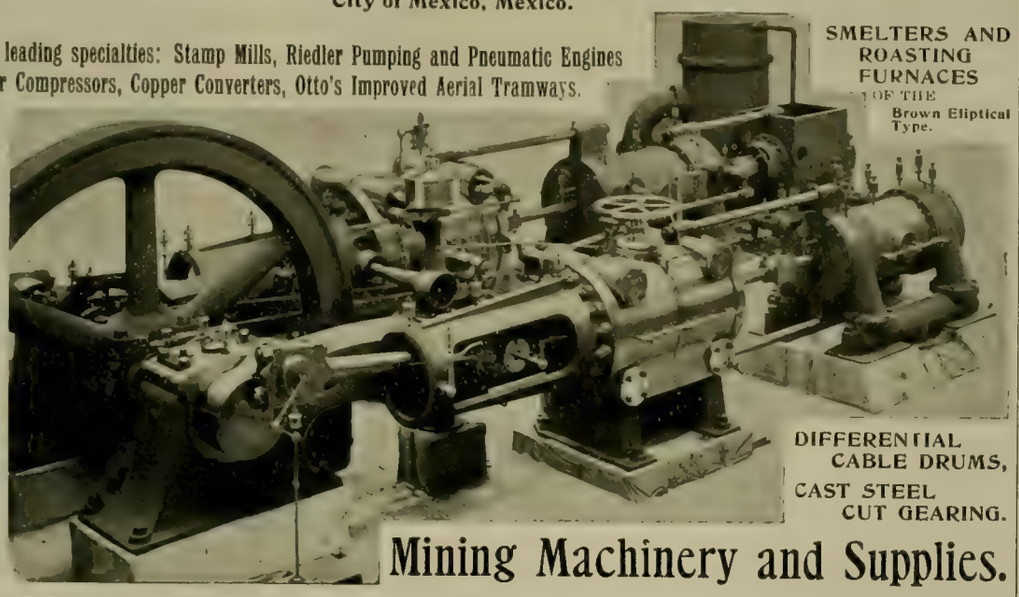
## STAMP MILL WANTED.

Will give one-third of a good milling proposition for a small stamp mill to operate on the property; enormous quantity of ore in sight. For particulars address **Box 53, Jackson, Cal.**

This doesn't happen every day. You can't expect it more than a few times in a lifetime. No one is going to agree and guarantee positively to save you 30 per cent or else no pay unless they know what they are about. You can't expect people to say, "You need not pay for this until you have proved our guarantee," unless they intend to do all that they claim. As a matter of fact, we do more than we claim. We guarantee to save 30 per cent, but actually we save a good deal more.

Have you ever heard of a Double Pipe Air Compressor? It has one disadvantage. It needs twice as much piping as is needed with the ordinary makes of Air Compressors. On the other hand, it has more real, genuine advantages than you can shake a stick at. It will do the same work as the ordinary Air Compressors, such as are in general use throughout the mines on this coast, on 30 per cent less power. We will guarantee this and prove it to your satisfaction, else you need not pay for the Compressor. It weighs less than half as much as the ordinary Air Compressor. It costs less for freights and is more easily carried up into the hills. It shows the same high efficiency at all altitudes, high or low. It takes no more fuel to do the work if located on the highest peak of the Sierras than it would take if located at the sea level. It enables you to buy a smaller boiler than you can use with any other Air Compressor to do your work. It does not overheat the air at the Compressor and freeze it at the rock drill. In short, it is the ideal Air Compressor. It has been tried in practice, and we can show you the highest recommendations and endorsements. We sell it on a strict, positive, iron-clad guarantee. If your power costs you anything, you want the Double Pipe Air Compressor, because you can buy it on a guarantee that it will run on 30 per cent less power than any other make of Compressor. If you have to take a Compressor to your mine over bad roads, you want the Double Pipe Air Compressor, because it weighs less than half as much as any other Compressor. It is cheapest to buy, cheapest to run, cheapest to transport, cheapest to carry anywheres. For pumping it beats the world. You can run it with steam or water.

Write to the Pneumatic Power Co. for further information. If you are in the city and want a compressor, call and see them. They will show you the Double Pipe Air Compressor in operation. Remember you run no risk. We claim wonders, but we have to perform wonders in Air Compression, or else you don't have to pay for the machine. We are ready. Are you?



Pneumatic Power Co., 306 Pine St., Room 10, San Francisco, Cal.

## MILLS BUILT WITH GUARANTEE OF SUCCESSFUL OPERATION.

## KENDALL GOLD AND SILVER EXTRACTION CO.

The Kendall Process is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.
*The Kendall system is covered by patents which this company will defend.*
The American Cyanide Gold and Silver Recovery Co., organized in Denver more than a year ago to introduce and operate the Kendall Process in several States, have closed contracts with some ten mines for the use of this process after exhaustive comparative tests with the ordinary plain cyanide method.
Capt. De Lamar has adopted the process at his Nevada mines, where a 250-ton plant is being completed. He writes that he is saving 95 per cent of his gold values, and regards the Kendall Process as the cheapest and best he is aware of for the treatment of gold ores.
*All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.*
Owners of mines and reduction works can obtain full information on application to

HENDY - NORBOM ORE CONCENTRATOR.

Office of ORLEANS MINING COMPANY, GRASS VALLEY, CAL., Dec. 12, 1895.
*Mr. John O. Norbom, San Francisco, Cal.*—DEAR SIR: Replying to your inquiry regarding the working of your Concentrator, I take pleasure in stating that the machine is doing excellent work. The curve springs give the machine a very gentle motion, which makes it mechanically perfect. We are saving our sulphurets very clean and lose a trace only in the tailings. The machine takes pulp from five stamps, handling about nine tons per twenty-four hours with ease. Our ore carries from 3½ to 5 per cent of sulphurets. The latest improved belt gives good satisfaction; it has now run about five months. I expect it will last about fifteen which speaks well for canvas belts. As for little attention and easy working, I can recommend it to any person as being the best machine I have ever used. Wishing you success, I remain, yours truly. [SIGNED] C. A. BROCKINGTON, Superintendent.

Office of FEDERAL LOAN MINING COMPANY, NEVADA CITY, CAL., Dec. 10, 1895.
*Mr. John O. Norbom, San Francisco, Cal.*—DEAR SIR: Your Concentrator, which has been in use in our mill for the last six months, is still doing excellent work. At present we are running the pulp of ten stamps on one machine, without seeming to be overloaded. I can recommend the machine to do all and more than you claimed for it. Yours truly, [SIGNED] J. VINCENT, Superintendent.

## STAMP MILLS!

Triumph Concentrators, Hendy-Norbom Concentrators, Rock Breakers, Hydraulic Mining Machinery, Challenge Ore Feeders, Steam Engines and Boilers, Hoisting and Pumping Machinery, Water Wheels.

## DEWEY & CO., Patent Solicitors, 220 Market St., San Francisco.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will have inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S. F.

Standard Silver-Lead Water Jacket Smelting Furnace.

Equipped with Arch-Bar System of Mantles, insuring rigid and strong walls. No cracks.

SAVE MONEY

BY USING

## THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

**Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines,** using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

| | |
|---|---|
| Coal Gas, ten hours' run, 1000 feet | $2 00 |
| Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c. | 1 25 |
| Coal Oil, ten hours' run, 7½ gallons @ 10c | 75 |
| Crude Petroleum, asphaltum base, 16 gallons @ 3c | 48 |
| Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c | 65 |

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon—21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

# Market Reports.

## The Markets.

SAN FRANCISCO, April 16, 1896.

The improvement reported last week in trade circles seems to be more pronounced, but in the agricultural districts it is of a hand-to-mouth character. From the gold mining districts the call for goods is not only large but seems to be enlarging in scope. Traveling salesmen returning from Amador, Calaveras and Tuolumne counties say that there are more miners at work than for many years past, while the mining sections are being overrun by prospectors. As the snow disappears in the other mining counties a similar state of affairs is looked for. Many mines are being experted by mining engineers in the interest of expected buyers. Hardly a day passes but one or more transfers are made. These transactions inspire the belief that this State has entered on a large mining boom. Iron workers in this city state that they are working on more orders than for years, while bids are being asked on considerable new work. The work is largely for structural purposes, but considerable is being done in turning out machinery and material for railroads.

In the local money market there seems to be a general easing down, due to fair to good crop prospects, active mining, more money offering, a steady improvement in business and more activity in manufacturing circles. From the East authentic advices state that general business is improving and that a more hopeful and confidential feeling is beginning to set in. Foreign money is still offering fairly free. Speculation at the East also seems to be increasing and enlarging. Our leading exchanges appear to take a more roseate view of the situation and that a new era of prosperity is being entered on.

**New York Silver Prices.**

NEW YORK, April 16.—Following are the closing prices for the week:

| | Silver in London. | Silver in N. Y. |
|---|---|---|
| Friday | 31 3-16 | 68¼ |
| Saturday | 31½ | 68⅜ |
| Monday | 31⅛ | 68 |
| Tuesday | 30 13-16 | 67⅞ |
| Wednesday | 30⅞ | 67½ |
| Thursday | 30 15-16 | 67⅝ |

| | Copper. | Lead. | Iron. | Tin. |
|---|---|---|---|---|
| Friday | 10 75 | 3 05 | 11 00@13 50 | 13 30 |
| Saturday | 10 75 | 3 05 | 11 00@13 50 | 13 30 |
| Monday | 10 60 | 3 05 | 11 00@13 50 | 13 25 |
| Tuesday | 10 60 | 3 05 | 11 00@13 50 | 13 25 |
| Wednesday | 11 00 | 3 05 | 11 00@13 50 | 13 25 |

The local bullion, money and exchange quotations current are as follows:

| | |
|---|---|
| Commercial Loans, % per annum | 7@8 |
| Commercial Loans, prime | 6@8 |
| Call Loans, gilt edged | 7@8 |
| Call Loans, mixed securities | 7@8 |
| Mortgages, prime, taxes paid by lender | 6@8 |
| New York Sight Draft | par |
| New York Telegraphic Transfer | par |
| London Bankers' 60 days | $4.88 |
| London Merchants | $4.86 |
| London Sight Bankers | $4.89½ |
| Refined Silver, per oz., 1000 fine | 67½c |
| Mexican Dollars | 54½@55½c |

SILVER.—On Tuesday there was quite a slump in the London market. It is stated this was in sympathy with a rapid decline in India exchanges. The latter is said to have dropped by reason of the rains having set in there, which invariably causes a lessened movement in cereals, but the latter is reported in small stock. The expected new-season tea demand for silver has not materialized as yet. There are those in trade who think that the call for silver from this source will be less this year than it was last year owing to so much money being disbursed by both Japan and China in foreign countries which may give more exchanges. Judging from the quantity of quicksilver taken by Mexico there must be increased silver mining in that country. Since Tuesday the markets at the east and abroad have gradually strengthened. In this city a light inquiry is reported by sellers.

MEXICAN DOLLARS.—The market, in sympathy with silver, was sold lower. The demand is said to rule moderate for the season. The market is quoted at from 54¾ to 55½ cents.

COPPER.—At the close the markets at the East are reported firm at an advance. This is due to foreign buyers being compelled to pay more so as to have their orders accepted. Speculators at New York are said to have placed considerable at 10¾ to 10⅞ cents for May and June delivery, but at the close they demand more money. If these sales are from short sellers the market may do still better before they are able to secure enough to cover their over-sales. The consumption at the East and abroad continues heavy.

The market is quoted as follows:

| | |
|---|---|
| Bolt | ½ & 5-16, 20c; ⅜ and larger, 17c |
| Lake Superior Sheathing | 20 |
| Ingot, jobbing | 13 |
| Ingot, wholesale | 12 |
| Sheet copper | 17 |

LEAD.—Eastern advices report weak and dull markets. A New York exchange just to hand reports that "3.05c apparently the best price obtainable for common domestic in single carload lots, and few if any buyers for large quantities at over 3c for delivery this month or next."

The market is quoted as follows:

| | | | |
|---|---|---|---|
| Pig | 3 75 | @ | 4 00 |
| Bar | — | @ | 4 15 |
| Sheet | — | @ | 5 50 |
| Pipe | — | @ | 4 75 |

SHOT.—There is nothing new to report.

The market is quoted as follows:

| | | | |
|---|---|---|---|
| Drop, sizes smaller than B, per bag of 25 lbs | | | $1 40 |
| Drop, B and larger sizes, | " | " | 1 65 |
| Buck, Balls and Chilled, do. | " | " | 1 65 |

TIN.—The local market is slow for about all kinds. At the East pig is reported in fair movement, but foreign offerings keep the markets more or less easy. The production of tinplate in this country has grown to remarkable proportions. Several new plants have been added to the list, which brings the estimated output of American plate up to over 5,000,000 boxes. This large output is stopping the importation of foreign, owing to our manufacturing being able to get pig at the same price foreign manufacturers do, while steel and iron can be had for less money.

The market is quoted as follows:

| | |
|---|---|
| Pig, per lb | 14½c |
| Plate, I C coke, heavy, per box | $4 25 |
| " " " light, " | 4 10 |

ANTIMONY.—The market is steady at 9 cents as an outside figure. New York mail advices quote 7⅞@8c for Cookson's, 6⅞ for Hallett's and 6¾c for Japanese, from store.

QUICKSILVER.—We are informed that the export movement has been quite free so far this year.

The market is quoted as follows:

| | |
|---|---|
| Home trade, per flask | 39 00 |
| Distant points up north | 38 00 |
| West coast of Mexico, for export | 34 00 |

POWDER.—So far this year the demand shows an increase over that during the corresponding time in 1895.

The market is quoted as follows:

| | |
|---|---|
| Hercules, No. 1, per pound | 11½c |
| " No. 2, " | 8½c |

BORAX.—The market is firm, and quoted as follows:

| | |
|---|---|
| Refined, in car lots | 6⅛ |
| Refined, in sacks | 5⅞ |
| Powdered, in car lots | 6⅛ |
| Concentrated, " | 5⅝ |

COAL.—Unseasonable weather has caused a large consumption for household purposes. The demand for steam coals also shows an increase. The market, while reported fairly active, is no higher. Some attention is being attracted to the coal fields in Alaska, which are reported by experts to be large and can be mined at a very small cost. This coal is used for both household and steam purposes.

COKE.—The market is quoted as follows:

| | | | |
|---|---|---|---|
| Gas Companies' | — — | | — — |
| English, to load | 9 00 | @ | 10 00 |
| " spot, in bulk | — — | @ | 8 50 |
| " in sacks | — — | @ | 9 50 |
| Cumberland | — — | @ | — — |

LUMBER.—There is a continued free export movement reported from all lumbering camps. The demand in this State is said to be increasing.

The market is quoted in this city from dock or yards as follows:

| | | | |
|---|---|---|---|
| Redwood, Fluming | 16 00 | @ | — — |
| Pine | 13 00 | @ | 18 00 |
| Spruce | 25 00 | @ | 30 00 |

NAILS.—The market is reported strong, with good demand ruling.

The market is quoted as follows:

| | | | |
|---|---|---|---|
| Wire, carloads, basis per keg | | | $3 07½ |
| " jobbing, " " | | | 3 20 |
| Cut, carloads, " " | | | 2 82½ |
| " jobbing, " " | | | 2 95 |

IRON.—The consumption of pig in this city is the largest on record, owing to about all iron workers running fuller than for years past. The Eastern markets seem to be firming up. As reported by an Eastern exchange, this "is attributed to the props put under the market, first by coke manufacturers, later by the iron-ore men, and finally by the soft-steel men. That production is considerably in excess of requirements is evidenced by an increase in stocks of something over 50,000 tons last month. Stocks are now 718,244 tons, which are larger than at any time since March, 1894. One of the encouraging signs is moderately large railroad orders at the advanced price. The latest example of this was 12,500 tons of steel rails booked by Colorado Fuel & Iron from the Union Pacific.

Our market is quoted as follows:

| AMERICAN. | To Arrive. | Spot. |
|---|---|---|
| Sloso | $21 00 | $23 50 |
| Thomas | 22 00 | 23 50 |
| Salisbury | 30 00 | 33 00 |
| **ENGLISH.** | | |
| Barrow | $21 00 | $23 50 |
| Gartsherrie | 21 50 | 23 50 |

## Mining Share Market.

SAN FRANCISCO, April 16, 1896.

The depression reported in last week's issue was continued throughout the past week. While prices did not go off so very much, yet the market was made to look sick, but not near so much as were dealers financially sick on the long side. The latter, who were on a margin, were either forced to sell all or else a part of their holdings, while many with cash shares sold. Where these shares drifted is an open question, but it is quite evident that few outside dealers have had the temerity to buy much in the face of assessments being collected and more to be levied. If they have gone into the hands of small pools it ought not to create surprise if the latter should "patch" up their differences temporarily for the purpose of promoting a small bull movement, so as to unload the bulk of, if not all, their long holdings. This can be done by bull points sedulously circulated, and also through interested write-ups in the press. While saying this, it must be admitted that the work which has been done, as well as that being done, justifies better prices for shares in several of the mines than they are selling at now. Taking the Comstock list as a whole, and it averages less in price than for fully three years, it is the history of the Comstock that when there is a low range of values it is only a question of time when the market receives support, and under stronger manipulations is made higher and more active. Even if a change for the better does set in, it is not at all unreasonable to affirm that the market will "run away." This opinion is grounded on the belief that large moneyed men are not operating, and until they come in openly and above board no pronounced bull movement can be brought about in the absence of two or more dividend paying mines, for moneyed outside men can not be drawn in as buyers without some assurance of getting part, if not all, of their investments back. Sentimental or large speculative trading seems to have seen its best day. It has been killed in the house of its friends, largely through the management of some of the mines, and also that after each small bull movement prices recede before the year passes to a lower range of values than that which ruled at when it was started upwards.

From the Comstock mines our advices, taken as a whole, are of more encouraging character, yet they do not justify investment buying, only trading for small turns, unless a large body of ore is developed in two or more mines. In the Alta group the only work reported continues in Alta, where they seem to be playing hide and seek with the Keystone ledge. The last official letter states they are saving a little ore, which will do to mill if a sufficient quantity is found and extracted. In the Gold Hill group Belcher has milled 336 tons of ore, returning gross over $7000; Seg. Belcher milled 114 tons, gross yield over $3100, while Confidence milled 107 tons and Overman 100 tons, but the returns have not as yet been reported. In the above mines a few tons continue to be raised, but the quantity is small and the grade only fair. The work in these mines is about the same as heretofore made public. In Crown Point the most active work is under way. In working to the east on the 800-foot level a two-foot vein was cut assaying from $15 to $25 a ton. These are the highest assays reported by this company for many a long month. On the 700-foot level a west drift has been started. A report is current that there is to be a contest for the control of this mine at the next annual election. On the 200-foot level in Confidence some exploiting work is being done. The joint west drift of Confidence, Challenge and Con. Imperial is being extended at the rate of a little over one foot a day. The material encountered seems to be slightly more favorable. The work in Alpha is still of a procrastinating character. The long west drift in Bullion and that in Gould & Curry are being extended as fast as possible, considering their length and the ground through which they are being run. In Potosi, Chollar and Savage active work is still the order. Judging from the official letters, every promising vein or indication is followed up in the hope of finding something of value. In prosecuting the work some ore is extracted and raised, but which is not enough to meet current expenses. In Hale & Norcross active work seems to have been inaugurated, but the better informed do not expect that a large body of ore will be developed, and, unless this is done, assessments will be in order, for, so far as we can learn, there has been no material reduction in expenses. Some ore, now said to be a little over 200 tons, is being milled. This was extracted by the former management. Best & Belcher advices state that the work is on the same levels heretofore reported. The work in Con. Virginia is being carried on on several levels, but that being done on the 1000-foot level attracts the most attention. The better-informed miners say that the work is not very far from the point where they expect to strike ore. These persons are quite hopeful that it will be found, but as to the quantity and grade they will not commit themselves. In Ophir and Mexican there is no essential change in the work. In the former they are working westward on the 1000-foot, probably to take advantage of any improvement that might be found in Con. Virginia on that level. The work in both Union and Sierra Nevada continues to attract attention. As yet the ore found is of no value for extracting; still better things are expected as the work is pushed forward. In Utah they have found one-dollar ore. Even this must be some comfort to shareholders, for it shows that something besides assessments can be run into. In Andes fair work is being done, but no change in material is reported in official letters.

On the Brunswick lode attention continues to be centered on the work in Occidental. Quite a body of $7-ore has been found on the 650-foot, but this will not pay until the Comstock tunnel can be utilized. If this ore is found to be of higher grade on the 750-foot level, it will cause work to be prosecuted still lower down. The work by the other companies on this lode is now largely of an exploitive character.

From the Bodie district there is nothing new reported officially. In Bodie active exploiting is still the order. The controversy over the control of Bulwer is, at this writing, still in court, but a decision is expected any day as to which contending party gained control at the last election. This decision is expected to rule on the relative value of proxies and certificates of stocks for voting purposes.

The following illustrates the changes of the week:

| MINES. | Apr. 9. | Apr. 16. |

# Assessment Notices.

GOULD & CURRY SILVER MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Virginia Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees held on the twenty-fifth day of March, 1896, an assessment (No. 78) of Fifteen cents (15c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary at the office of the company, Room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-eighth (28th) day of April, 1896, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on, WEDNESDAY, the 20th day of May, 1896, to pay the delinquent assessment, together with the cost of advertising and expenses of sale. By order of the Board of Directors.

ALFRED K. DURROW, Secretary.

Office, Room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

---

OCCIDENTAL CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Silver Star Mining District, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 2d day of April, 1896, an assessment (No. 22) of ten cents (10c) per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of May, 1896, will be delinquent and advertised for sale at public auction, and unless payment is made before will be sold on THURSDAY the 28th day of May, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURROW, Secretary.

Office, Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

---

CHALLENGE CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Gold Hill, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 27th day of March, 1896, an assessment (No. 21) of Five Cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 35, third floor Mills Building, corner Bush and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of April, 1896, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on WEDNESDAY, the 20th day of May, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

C. L. McCOY, Secretary.

Office, Room 35, third floor Mills Building, corner Bush and Montgomery streets, San Francisco, California.

---

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California. Location of Works, Inyo, Inyo county, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 30th day of March, 1896, an assessment (No. 28) of ten (10c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 323, Phelan Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of May, 1896, will be delinquent, and advertised for sale at public auction, and, unless payment is made before will be sold on THURSDAY, the 4th day of June, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

M. A. CAHN, Secretary.

Office, Room 323, 5th Floor, Phelan Building, San Francisco, California.

# DELINQUENT SALE NOTICE.

GOLD BAR CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice. There are delinquent upon the following described stock on account of assessment (No. 3) levied on the Tenth (10th) day of February, 1896, the several amounts set opposite the names of the respective shareholders as follows:

| Names | No. Cert. | No. Shares. | Amt. |

And in accordance with law, and an order from the Board of Directors, made on the 10th day of February, 1896, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Nos. 37 and 38 Crocker Building, San Francisco, California, on FRIDAY, the 10th day of April, 1896, at the hour of 2 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

E. C. GODFREY, Secretary.

Office, 37 and 38 Crocker Building, San Francisco, California.

## POSTPONEMENT NOTICE.

By resolution of the Board of Directors of the Gold Bar Consolidated Mining Co., the day of sale for the above delinquent stock was postponed until SATURDAY, May 9, 1896, at the hour of 2 P. M., at the office of the Company, Room 38 Crocker Building, San Francisco, Cal.

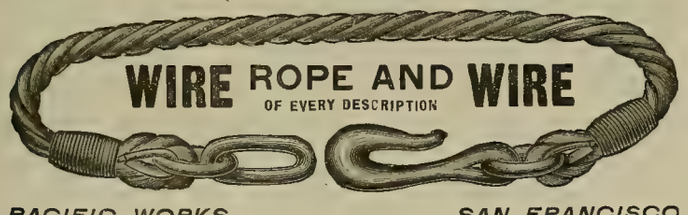
E. C. GODFREY, Secretary.

# TRUSTEE'S SALE

## IN SIERRA COUNTY.

On TUESDAY, APRIL 21st, 1896, at one o'clock P. M., at the front door of the Court House in Downieville, Sierra county, California, I will sell at public auction, to the highest bidder, for cash, all of that certain mining property, mills, machinery, boarding houses, tools, water rights, dams, etc., of the well known Young America mine, which consists of four contiguous patented claims and other locations; and also about 150,000 tons of tailings stored near the mine, and rich in free gold.

This sale is made by me as Trustee, and to make the sum of about $12,000.



Full information concerning the property and a full description thereof will be furnished on application by letter, or otherwise, to me at 230 California street, San Francisco, or to my Attorney in said matter, Frank R. Wehe, whose address is Downieville, Cal.

JOHN BERMINGHAM, Trustee.

# GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 66, Placerville, Cal.

WASHBURN & MOEN MFG. CO.

# THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

## MINING AND SCIENTIFIC PRESS,

220 Market Street ..... San Francisco, Cal.

### *Assaying.—Part I—Gold and Silver Ores.*

Second edition. By C. H. Aaron. Embraces 150 12-mo pages, with illustrations, well bound in cloth; 1889. Price, postpaid.....$1 00

### *Assaying.—Parts II and III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.*

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

### *Notes on Assaying and Assay Schemes.*

By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

### *Prospector's Field Book and Guide.*

By H. S. Orborn.....$1 5

### *A Practical Guide for Prospectors and Miners.*

By C. W. Moore. With numerous illustrations.....$4 75

### *The Explorer's and Assayers' Companion.*

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

### *Aaron's Leaching Gold and Silver Ores.*

By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

### *Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.*

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid.....$3 00

### *The Lixiviation of Silver Ores with Hyposulphite Solutions.*

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

### *Modern Copper Smelting.*

By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated.....$5 00

### *The Metallurgy of Gold.*

By M. Eissler. Profusely illustrated.....$5 00

### *Losses in Gold Amalgamation.*

By W. McDermott and P. W. Duffield.....$2 00

### *Electricity in Mining.*

By Sylvanus P. Thompson..... 80 cts.

### *Practical Treatise on Hydraulic Mining.*

By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, postpaid.....$5 00

### *Practical Hydraulics.*

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

### *Hydraulic Gold Miner's Manual.*

By T. S. G. Kirkpatrick. With plates and cuts.....$2 25

### *Manual of Hydraulic Mining for the Use of the Practical Miner.*

By T. E. Van Wagenan.....$1 00

### *The Sampling and Measurement of Ore Bodies in Mine Examinations.*

Well printed on fine paper, with plates; complete. Price, postpaid.....25 cts.

### *Manual of Mining.*

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

### *A Text Book of Mineralogy.*

Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

### *Manual of Determinative Mineralogy.*

With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth...$3 50

### *Metallurgy of Silver, Gold and Mercury in the United States.*

Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7

### *Metallurgy of Silver, Gold and Mercury—Continued.*

Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50

### *Notes on the Treatment of Gold Ores.*

By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

### *A Practical Manual of Minerals, Mines and Mining.*

By H. S. Osborn.....$4 50

### *Matte Smelting—Its Principles and Later Developments, with an Account of the Pyritic Processes.*

By Herbert Lang.....$2 00

### *Cyanide Processes for Gold and Silver Ores.*

By E. B. Wilson, E. M. 12mo., cloth.....$1 50

### *Practical Metallurgy and Assaying.*

By A. H. Hiorns.....$1 50

### *The Practical Metal Worker's Assistant.*

By Oliver Byrne. Illustrated.....$5 00

### *Quartz Operator's Handbook.*

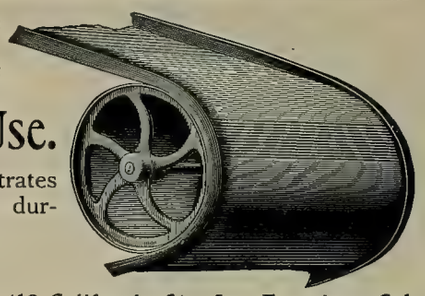
By P. M. Randall.....$2 00

### *Assayer's Guide.*

By Oscar M. Lieber.....$1 50

### *Assayer's Manual.*

By Bruno Kerl. Translated from the German by Wm. T. Brannt. Second American edition, edited and enlarged by F. Lynwood Garrison. Illustrated.....$3 00



### *Manual of Assaying—Gold, Silver, Copper and Lead Ores.*

By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid.....$2 50

# Improved Ore Concentrator Belts. PATENTED.

(RIFFLED OR SMOOTH.)

## Suitable for all Ore Concentrating Machines in General Use.

These belts with slight riffles at intervals, *will save* a greater percentage of valuable concentrates *than any other vanner belt.* Our new style flanges on the edge of the belt make it much more durable than any other. Send for circular and price list.

THE BLASDEL IMPROVED ORE CONCENTRATOR BELT CO.,

H. G. BLASDEL, Jr., Manager. Cable Address: BLASDEL. Haywards Building, 419 California St., San Francisco, Cal.

# RISDON IRON WORKS.

Office and Works: Cor. Beale and Howard Sts., San Francisco.

## River Reclamation in California.

The 150,000 square miles of California would seem to make unnecessary the reclamation of any part of it, but gold miners who can afford to buy fruit if allowed to work their mines create such a demand in territory contiguous to their claims that great tracts of fertile bottoms in the Sacramento river are being put in condition for profitable horticulture. At Grand Island, as elsewhere, this work is being done on a large scale.

There has been also in recent years an improvement in pumping machinery. It is two-thirds cheaper than it was. All the pumping plants are now placed on concrete foundations, so as to prevent that oscillation which is so destructive to the life of machinery.

The pumping plant at Ryde Landing on Grand Island, and several other pumping plants in the various reclamation districts along the Sacramento river, have been put in by the Byron Jackson Machine Works of San Francisco. The test of the pumping plant at Ryde Landing shows the coal consumption to be 2.14 pounds per indicated horse power per hour. Ratio of actual work performed to one horse power of engine, 59 per cent. This is equal to pumping one acre foot of water for a ten-foot lift (that is, water enough to cover one acre one foot deep) with 37 pounds of average Green River coal, which, at $6.50 per ton, makes the cost for fuel per acre 11 cents.

This firm has manufactured some very large irrigating pumps all over the State. There are 17,000 acres in Sacramento county on Grand Island, and these were being reclaimed in 1894 according to the modern method. Some very extensive works were put in at Ryde's Landing in the same year, and a dredge and a ditcher were employed in cutting a drainage ditch extending all around the island, half a mile from the levee. This ditch is eighteen miles long, twenty-five feet wide and six feet deep. The pumping plant placed in concrete in 1894 at Ryde's Landing, by the Byron Jackson Machine Works of San Francisco, has a guaranteed capacity of 30,000 gallons, with a maximum of from 40,000 to 50,000 gallons per minute. The seepage water is conveyed to the river in 44-inch pipes. The engine used in working the pumps is a cross-compound condensing engine, guaranteed to run on two and a half pounds of coal per horse power per hour. It maintains a steady vacuum of twenty-six inches.

INTERIOR VIEW, BYRON JACKSON 200 H. P. PUMPING WORKS, GRAND ISLAND.

40,000 GALLON PUMPING PLANT, RYDE'S LANDING, GRAND ISLAND, SACRAMENTO RIVER.

The thorough reclamation of land is an expensive undertaking, but the cost is nothing when compared to the value added to the land by reclamation. Thus, it cost $25 per acre to reclaim the land on the Tyler Island; but after reclamation it is valued (with an eye to the county assessor) at $100 per acre for bare land and $500 per acre for land planted to fruit. But none of the orchards are for sale, and this suggestive fact is the best criterion of its value. The cost of reclaiming land on the river generally, taking in the good and bad places, ranges from $25 to $50 per acre.

The pumping plant on Randall Island is of 10,000 gallons capacity per minute; that on Merritt's Island, 30,000 gallons; Senator Johnston's, 15,000 gallons; and the district two and one-half miles below Isleton has a pumping plant of 20,000 gallons capacity. The pumping plant on Tyler Island is of a capacity equal to that of the largest.

In the Brannan Island reclamation district an assessment of $5 an acre was levied for five years to maintain the levees. The work in the spring of 1894 was nearly complete at a cost of $3 per acre, and the result is a strong levee four feet higher than the flood-water mark of 1890, the highest high-water mark ever noted on the river at that point. The seepage on this island is so slight that no pumping works are required.

The system of building high levees, extensive drainage ditches and constructing plants to pump away the seepage water to reclaim the rich bottoms along the Sacramento river subject to overflow, has proved to be eminently successful, and it is, therefore, expected that by the year 1900, at the furthest, there will not remain an acre of unreclaimed land in Sacramento county. There were in the year 1894 about 80,000 acres of such rich unreclaimed lands.

---

The U. S. Circuit Court of Appeals has overruled the State Supreme Court in the litigation between the Waterloo M. Co. and the Doe estate. The former located a claim in Calico district, San Bernardino Co., but did not immediately stake it out. The latter simultaneously filed on the same location and began monumenting. The Waterloo representative did likewise and finished his monuments twenty days after his location. The Doe estate claimed that the Waterloo people had failed to perfect title; the latter claimed that they were entitled to a reasonable time. The Doe estate held the ground; the Waterloo Company brought suit to dispossess. They were beaten and appealed to the Supreme Court, which confirmed the lower court's decision. The U. S. Court now decides in their favor, holding that twenty days was "a reasonable time."

## A Revival of River Mining.

One of the noticeable effects of the growing interest in gold mining is the renewal of mining on a large scale in the beds and bars of the rivers in the mining counties. For over twenty-five years past these deposits have been an insignificant source of gold yield. It has been considered that they were worked out in the early mining days, and since then they have been abandoned to the Chinese. The more thorough search now being made for gold is disproving this supposition, and operations by white men are increasing in number and extent. Considerable sections of river bed were never mined at all by the old miners, having been buried beneath the tailings from hydraulic and drift mines.

These places are now available by reason of the disappearance of the tailings down stream, exposing the original stream bed gravels. At other points improved mining methods and facilities are making it possible to mine ground successfully that could not be profitably exploited in the early mining days. The tailings from hydraulic and drift mines have restored a portion at least of the gold contents in sections of the rivers that were thoroughly worked out in early days. These can now be remined at a profit.

New operations by white men are particularly noticeable on the American and Bear rivers. On the latter stream, where it leaves the foothills above Wheatland, a very extensive deposit of rich channel gravel has been developed buried beneath the tailing deposits. It covers several hundred acres and is mined by drifting from shafts about 100 feet in depth. The water to be pumped is easily handled, and so rich has the gravel prospected in the preliminary exploration that it will be mined on a large scale this summer. On the American river the new activity is even more marked.

Below Michigan Bluff and Forest Hill, in the Middle Fork, several claims will be worked this year that have been untouched for years. Between Auburn and Folsom several new operations and reopenings of old claims are being made. The North Fork ditch, built in the '50s for the mines of Rattlesnake Bar, has been cleaned and restored to its original capacity during the past winter; and coincident with its restoration, the old mining activity is being developed. The increased water supply under pressure has made it possible to use power machinery, and several hydraulic elevators are to be put in to work claims that could not otherwise be mined. One of these new enterprises at Horseshoe Bar will use 800 inches of water for pumping by elevators, and the mining ground of proved value in the claim, it is estimated, will require ten years to mine out. Several other claims will use power and be mined on a large scale. Some idea of the significance of these operations can be realized from their probable annual output, which will be over $150,000—all of this from a section of river that has not yielded that amount as the aggregate of the last twenty years of mining. Some of the owners of fruit farms bordering on the river have successfully mined the tailings in the river by sluicing. The yield per hand employed has averaged $1.50 a day—a return considerably above that of the wages of farm labor.

These operations are especially desirable from a mining standpoint in that they are in a new field. It has been considered that there were small or no possibilities of profit in the reopening of the supposed worked-out shallow placers. The success of these enterprises will prove an incentive to a more careful examination of this class of deposits than they have yet received from the new blood and money coming into gold mining.

## A Final Decision.

This week the U. S. Supreme Court denied the petition of the Providence Mining Co., of Nevada Co., Cal., praying for a writ of certiorari in the case on appeal between that company and the Champion Mining Co. The case has attracted considerable attention by reason of the general application of the issues involved.

On August 13, 1894, in this city, in the U. S. Circuit Court, Judge Hawley made a decision limiting the Providence rights on the contact ledge to a bounding plane drawn through the original end lines of the Providence patent, being the line marked on the several diagrams fixed by the court. This decision, together with explanatory illustrations was published in full in this paper in its issue of Aug. 25, 1894. From this decision the Providence Company perfected an appeal to the U. S. Circuit Court of Appeals, which latter tribunal on Feb. 4, 1896, practically affirmed Judge Hawley's decision, Judge Ross delivering the opinion of the Appellate Court. The Providence Company then applied to the Supreme Court of the United States for a writ of certiorari to have that tribunal review the decision of the U. S. Circuit Court of Appeals, which the Supreme Court has refused to do. The denial of this application results in a practical affirmance of Judge Hawley's original decision, and fixes permanently the end line plane bounding the rights of the two companies on the contact lode approximately as contended for by the Champion.

The main principle decided by this case, of general interest to the mining world, may be epitomized by a quotation from Judge Hawley's decision, which stands as the law of the case:

"When the end lines of a mining location are once fixed, they bound the extra lateral rights to all the lodes that are thereafter found within the surface lines of the location.

"It necessarily follows that the end lines of the Providence survey must be considered by the court as the end lines of any and all other lodes or veins which lie 'inside of such surface lines.' Otherwise endless confusion would arise in the construction of the statute. End lines would have to be constructed in different directions if the separate lodes or veins found within the surface lines did not run parallel with each other, and the result would be that these lines extended might give to the owners of the claims a greater length along the lode as it extended downward than they had upon the surface.

"If the same end lines which bound the extra lateral rights of the Providence surface survey apply to the contact vein and to all other veins, if any are hereafter found, then no such difficulty can arise. This is the rule that applies to all locations made after the act of 1872, and it ought not to be presumed that Congress—by its grant to prior locators—intended to give greater rights to them than were given and granted to subsequent locators under the same act."

In a former decision of the U. S. Supreme Court in the case of the Iron S. M. Co. vs. Elgin M. Co., it was decided that the same end lines bound all extra lateral rights as to all veins or lodes within the surface boundaries of the claim. In delivering that opinion Justice Field, speaking of the rights of locators of mining ground to follow the lode in its depth, said: "It often happens that the top or apex of more than one vein lies within surface lines, and the veins may have different courses and dips, yet his right to follow them outside of the side lines of the location must be bound by planes drawn vertically through the same end lines. The planes of the end lines cannot be drawn at right angle to the courses of all the veins if they are not identical."

## A Gratifying Communication.

The following is published verbatim. It is from one of the best known miners in California and is suggestive. Apart from the gratifying nature of his remarks as applied to this paper, the letter shows that earnest personal effort will overcome the most adverse conditions. The writer of the following prepared himself, so that when the opportunity offered he was able to go ahead:

TO THE EDITOR:—Noticing an article a short time ago in the MINING AND SCIENTIFIC PRESS in regard to the usefulness of the California State Mining Bureau, etc., I wish to add my experience in relation to it and also to state that there is another very important factor of usefulness and value to the California miner. Quite a number of years ago I was glad to get a job in the mines at "pushing car," breaking rock or any work such as a common laborer could do. Accidentally I ran across a copy of the MINING AND SCIENTIFIC PRESS containing an editorial describing the great possibilities of young men who would enter the field of mining, even as common miners. I became interested; saw miners all around me, mostly foreigners, who had good positions, receiving good wages and salaries, and some of whom could hardly write their names; but they were excellent miners.

I determined to see if I could not get out of the rut I was then in and do better. I had had considerable experience, but thought opportunities was what I needed most; so I subscribed for the MINING AND SCIENTIFIC PRESS and watched for the opportunities. Through the PRESS I learned of the State Mining Bureau, and, obtaining a copy of its eighth annual report, eagerly devoured its contents.

The opportunity soon came along in the shape of an offer to take charge of a certain department of mining, in which I never had had a day's experience. However, I accepted the offer, and, with the aid of the eighth annual report, carried it through successfully. From that day on I have advanced step by step, until to-day I am superintendent of one of the largest mines in the State.

In all of my experience, which has been varied, I have realized that there is always something to learn, and for one to learn up-to-date mines he must study and read up on the subject continually, and by taking the MINING AND SCIENTIFIC PRESS and following its advice he can get there.

AN AMERICAN MINER.

A good many such letters are weekly received and are gratefully appreciated. Occasionally criticisms are made on acts of commission or omission, the course of the paper, etc., which are also gladly noted and are of value. A paper usually gets praise or blame, just as it merits either, and the judicious use of both is always acceptable.

The reference "American Miner" makes to the State Mining Bureau is a just individual tribute to a State institution that, rightly managed, is of considerable value to the commonwealth.

A BILL which provides for the establishment of a Department of Commerce and Manufactures was introduced in the United States Senate on March 9th by Senator Frye and was referred to the Committee on Commerce, in whose hands it now rests. This measure is one of great importance to the manufacturing and commercial interests of this country, and there is need for vigorous and immediate support of the bill by those whose interests it directly affects. To secure any action by the committee or to obtain even a hearing upon the bill, it must be demonstrated to the members of the committee that the business men of the country are in favor of such legislation. Efforts have been made on several occasions during the past ten years to secure the enactment of laws providing for the establishment of a department in the Federal Government especially devoted to the commercial and industrial interests of the country. Lack of general appreciation of the necessity for such a department and the absence of organized support have caused the failure of such movements. With the extraordinary rapid growth in the manufacturing interests of the country there has come a broader understanding of the importance of the suggested new Government department and a wider recognition of the necessity for its establishment. The crowding of additional functions upon the existing departments from time to time has also served to emphasize the need for measures of relief for the established executive branches of the Government. At no time, however, has public interest in the creation of a Department of Manufactures and Commerce been so strongly marked and so emphatically expressed as at present. This is due to the active support which is being given to the present move-

ment by several of the most influential organizations in the United States, which have taken the matter up simultaneously and with the determination to urge upon the public and upon Congress the importance of the proposed new department. There are three, and only three, creators of wealth in this State—the miners, the farmers and the manufacturers. The farmers have a Cabinet department; the miners and manufacturers should each have a similar representation in the councils of the nation. Every dictate of wise national policy favors such extension of Cabinet representation. California is directly interested in this measure, and if our prominent miners and manufacturers will communicate with Senator Frye in this matter they can aid in securing such requisite recognition.

## Concentrates.

THE week's rains have been just what the hydraulic miner wanted.

TRINITY COUNTY has recently made up nearly $200 for the California State Miners' Association.

THE Comstock is one of the very few mining towns where a miner's day's wages buys a barrel of flour.

OVER 2500 mining claims have been recorded in Camp Floyd district, Utah, in the past eighteen months.

THE Salt Lake *Tribune* is twenty-five years old: it is one of the newspapers essential to thinking men.

THE Los Angeles Mining Exchange has started with one hundred charter members and flattering prospects.

THE February output of gold in the Transvaal, S. A., is officially declared by the Chamber of Mines there to be 167,018 ounces.

BUYERS of mining stocks would always do well to first find out if the title to the mine is legally vested in the corporation issuing it.

IN '95 California and Colorado produced over $30,000,000 in gold, about as much as the entire United States yielded five years before.

TWENTY years ago to-day, April 25, 1876, Ophir sold for $58.25, Gould & Curry $17.50, California $79, Con. Virginia $76.50, Chollar $101 and Bullion $50.25 per share.

ANOTHER dreadful explosion of giant powder occurred in Montana last Saturday, this time in the Broadwater mine at Neihart, thirty sticks exploding, killing seven miners and wounding six others.

THE miners of Florence district, Idaho, have decided unanimously upon the location of a new town a quarter of a mile south of the old town of Florence on Summit Flat. The new town is to be called "New Florence."

A YEAR ago the statement was made herein that when the value of the gold yield of the world for '95 was made up, the United States, as in the past, would have first place. It is now evident that it will hold that pre-eminence in '96.

THE Redstone quartz mine, Blue Canyon, Placer county, has been sold to a Philadelphia company who will add five stamps and two concentrators to the mill, and talk about putting in twenty more stamps about a quarter of a mile lower down the river.

NEWS of grave import comes from Bulwayo, South Africa, of the advancing Matabeles on the English and American miners there. Several Shasta county men are in that region: among others, W. St. Auburn, J. D. Cassely, Jno. Shehe and Thos. Burke.

LINA is the name of the new town which has just been organized on the Nevada side of State Line district in Lincoln county. It is but a few hundred feet on the Nevada side, but affords the best location for a townsite to be found thereabouts.

COL. CALEB DORSEY was shot and instantly killed by his mining partner, John T. Newcomer, at Italian Bar, twelve miles from Columbia, Tuolumne Co., last Tuesday. It was a personal quarrel between two fiery old friends, with the usual tragic result.

CONTRARY to supposition, the old Mayflower, one of Placer's great producers, is far from being exhausted. Felix Chappellet says that recent developments from an upraise on the south side of the main tunnel ensures 8,000 feet of new ground for the company.

DISMAL tales come from the icy north of misery and destitution among unprovided men who went to search for gold in Alaska. This paper has repeatedly pointed out the folly of entering that country unless fully prepared to meet hardship, privation and probable disappointment.

THE mining clause of the British Columbia Assessment Bill as now amended reads 1 per cent on assessed value. This to be assessed on ore or mineral bearing substances at the mine as determined in case of dispute by a smelter reduction or refinery returns. No ore is to be taxed unless removed.

G. W. WILLIAMS of Boise, Idaho, proposes to utilize superheated steam in hydraulic mining on the Snake river, and expects, by passing the earth and sand through the steam, to save the fine gold without stamps, grinding or mercury. Efforts in that direction have hitherto been unsuccessful.

AUSTRALASIA shows a gold yield for '95 aggregating $42,647,271, an increase of $2,874,635 over '94. Since the discovery of gold in New South Wales that country has yielded an aggregate value in gold of $205,947,326. Since the discovery of gold in California, this State to January 1st, '96, has yielded a value in gold of $1,269,115,604.

A LEADING mining engineer who modestly requests that his name be withheld, in renewing his subscription takes occasion to say that "every mining man is proud of the appearance of the MINING AND SCIENTIFIC PRESS and the valuable place it fills." Commendation from those whose good opinion is worth having is one of the strongest incentives to deserve and retain it.

RECENTLY W. S. Stratton, the Colorado millionaire mine owner, bought 100,000 shares of stock in a Cripple Creek company with a $2,000,000 capitalization—the Little Puck G. M. Co.—with this agreed stipulation: "You promise me never to sell mining stock to any person who is not amply able to lose the money he invests, in case the mining adventure should turn out adversely, without distressing him." The stipulation does him credit, but, it is possible, possessed of such sentiments he at times feels lonesome.

SPOKANE, WASH., calls for a reconsideration of the ruling which requires the payment of duty on the gross weight of ore shipments in which the value of the lead exceeds the value of the silver, claiming that the effect of this ruling will not be to keep foreign lead out of the country, but will compel the mine owners of the Kootenay country to build smelters on the British side of the boundary.

THE amount of pure silver in the American silver dollar has not changed. It remains at 371.25 grains, but the number of grains of pure gold have fluctuated. From 1792 to 1837 there were 24.75 grains of pure gold in a dollar. From 1834 to 1837 the number of grains were cut down to 23.20. From 1837 to the present time the mint puts 23.32 grains of pure gold in a dollar. In every $2,000 of silver coined there is added one pound of copper.

IN these days of new ten-million-dollar mining incorporations, with "fully paid" stock, that term "fully paid" is most of the time a fiction that has its only justification for existence in a legal technicality of sufficient elasticity to conveniently cover what is ofttimes a manifest fraud. The merit of a mining proposition is evidently in inverse ratio to the bombast of the prospectus, and under present circumstances the "fully paid stock" announcement requires scrutiny on the part of possible investors.

A WASHINGTON DISPATCH says Senator White is inquiring into the speedy patenting to the railroads of 260,000 acres of land in the Redding district, and, if the facts are as claimed, it may cause trouble for the Land Office. The charge is made that at once, upon the expiration of its sixty days' notice, the agricultural claimant telegraphed to Washington for a patent, and one was issued without waiting for the proper papers by mail. The haste made, it is believed, was to frustrate the possible passage of the Mineral Land bill.

ACCORDING to recent statistics the aggregate mineral and metal production of the United States for 1895 was $628,689,505, an increase over 1894 of $84,226,503, or 15½ per cent. The gold yield was 2,205,612 fine ounces, with a total value of $46,830,200; the increase over 1894 was $7,068,995, and keeps the United States in the front rank as a producer. Silver was 46,331,235 ounces, with a value at present figures of $30,254,296, a decrease of 3,515,640 ounces from 1894. Pig-iron production amounted to 9,446,308 long tons, giving the United States first position as a producer.

MEMBERS of the U. S. Debris Commission, have been making recent extended observations through northern and central California. At last Monday's meeting the Liberty Hill Mining Co. of Nevada county, and the Polar Star Mining Co. of Placer county, were authorized to raise the dam in the Bear river, in the vicinity of Dutch Flat, twenty-five feet. The original appropriation for the maintenance of the commission is exhausted, but the appropriation bill now going through Congress had, last Monday, an addition made to it of $15,000 for current expenses of the commission, which will be available after July 1st.

A TELEGRAM from Tirey L. Ford says that the outlook is good for favorable action on the Mineral Land bill, which still awaits the pleasure of the Senate. U. S. Senator Stewart of Nevada and U. S. Senator Mitchell of Oregon, for personal and powerful reasons are opposed to it, and, being from neighboring States, their opposition has more influence than if the reasons were as well understood in Washington as they are here. Since the Sacramento *Record-Union* in its issue of the 2nd. inst., made its adroit argument in favor of the bill as a corporation measure, the true friends of the bill have been more anxious than ever as to its final fate.

THE Pelatan-Clerici process of extracting gold and silver is the invention of Louis Peletan and Fabeizio Clerici. It is the property of the General Gold Extracting Company, limited, of London. The treatment consists of a single operation. A vat, the bottom of which is composed of amalgamated copper plates, and in which is a metallic stirrer, is filled with crushed ore, tailings or slimes, mixed with a solution of cyanide of potassium, common salt and other reagents. The stirrer is then set in operation, thoroughly mixing the sludge, through which an electric current is passed. The particles of metal are consequently kept in constant connection with the cyanide and the gold and silver dissolved and afterward electro-deposited on the amalgamated plates.

A SUMMARY of the mineral production of Canada during 1895 has been issued by the dominion geological survey. The returns, several of which are estimated, show a total of $22,500,000, the largest previous return being $20,900,000 in 1894. Coal has still the leading position, the output being $7,774,178, gold ranking second with an output of $1,910,921. Following the lead of gold the metals are: Nickel, $1,360,984; silver, $1,158,633; copper, $949,229; lead, $749,966; iron ore, $238,070; and mercury, $2,343. Petroleum ranks next to coal in the non-metallic products, the output being $1,201,184. In the same class the other leading products are: Natural gas, $423,032; asbestos, $368,175; gypsum, $202,608; salt, $180,417; coke, $143,047; mineral water, $111,048; and pyrites, $102,594.

IT may not surprise old miners, says the *Review*, to learn that gold has been found in paying quantities in the Peace river country far north tributaries of that stream produce every year large sums of placer gold. John Cameron, a merchant at Edmonton, Saskatchewan, says every year the old miners start out with a supply of provisions and come back in the fall with evidence of good placers. Gold has been found on the McKenzie river under the Arctic circle. In fact, gold seems to have been distributed all over the northwest from Rainy lake to Alaska, and now when it is said that discoveries have been made in the Birch hills, near Prince Albert, Saskatchewan, it occasions no surprise. For many years gold has been taken from the bars of the Saskatchewan and its tributaries. But no quartz has been found in the Rocky mountains from whence this stream takes its course.

AT A special meeting of the Executive Committee of the California Miners' Association in the rooms of the Union League Club in this city last Wednesday evening, Mr. Chas. G. Yale was the deserving recipent of a series of resolutions engrossed and mounted, expressive of the just appreciation in which his work for the association is held by that organization. The resolutions were unanimously voted by the association at its annual meeting in Pioneer Hall, last November, and were last Wednesday presented to Mr. Yale by Jno. M. Wright, who in his presentation speech, paid due tribute to Mr. Yale's zeal and efficiency in forwarding the principles and purposes of the organization, and in giving his services at all times for the advancement of its interests. Mr. Yale's modest response disclaiming having done more than what he felt was his duty in the matter was fittingly supplemented by the remarks of President Neff and others who bore witness to the value of his services from the incipiency of the organization.

THOS. MEIN, general manager of the Robinson Gold Mining Co., Johannesburg, South Africa, furnishes a voluminous and detailed report of the workings and condition of that mine, the expenses, etc., for the year ending Dec. 31, '95. Fifty new stamps were added during the year, which cost $205,000. During the year there were mined and milled 140,655 tons of ore, yielding a value from mill of £431,666, from concentrates by chlorination £61,723, and from tailings by cyanide process (75,825 tons) £72,553, a total yield of 157,208 ounces, worth £565,942. Compared with the figures for '94, there was a falling off of 4 dwts. 14 grs. per ton in yield and 16s 11d in value. Milling expenses were 3s 10¼d per ton; mining and milling, 19s 1½d per ton in '95; £1 1s 8½d in '94. During the year 247 Europeans were employed and 1332 Kaffirs, the average weekly wage being 14s 6d, exclusive of food. The output for February, '96, is also given as follows: Stamps at work, 120; running time, 25½ days; tons crushed, 14,075 tons; tons per stamp per diem, 4.6; gold produced, 8866 ounces; gold from concentrates by chlorination, 1038 ounces; bullion from tailings, cyanide process, 1714 ounces; bullion from slimes, 1317 ounces; total, 12,935 ounces. Capt. Mein is about to return and is expected at his home in Oakland next month.

A BOSTON concern is advertising "The Old Glory Gold Mining & Smelting Company," and claims to own property in Idaho. It is quite a scheme: "Authorized capital $5,000,000; controls six great proved ore deposits; sample ore assayed up to $36,000 in gold per ton, 4,000 ounces in silver and 20 per cent copper; the company is formed to do a great mining and smelting business—not simply sell stock; stock is all held in trust for the benefit of the treasury; one of the mines produced ore assaying $36,000 per ton in gold, and tons of ore from it have been sold at $3000 per ton. A Boston banker visited this mine, studied it with all a business man's sagacity for six months, saw its wonderful wealth, talked with men who worked in it. He says: 'I believe it is worth $10,000,000 right now.' A near neighbor on the same belt (ten miles from there) has produced $10,000,000 and we never heard of a mining man who was familiar with both properties that did not claim our property to be much superior. The Alpine group shows a great ore body sixty feet thick, rich in gold, silver and copper. The ore assays from $15 to $600 per ton, specimens run into the thousands." These people seem to have a good thing—too good to touch. Still such games must find players or they wouldn't run.

DISCOURSING of Mercur, Utah's mineral-bearing zones, G. H. Robinson says that the rock may be characterized as limestone, stratified and more or less impure, interstratified with clay slates, as the Oquirrh mountains are only a range of high hills in the midst of a desert country. This range was formerly sea-bottom; subsequent upheavals caused the rock to form a great curve or arch, with its major access north and south, and the subsequent readjustment of rock masses has caused many faults and folds in the strata. In the vicinity of the Mercur mine the rock strata now lie nearly flat, with a general strike of north 45 degrees west, magnetic, dipping toward the northeast and having an inclination of 17 to 30 degrees under the horizon. The great longitudinal faults of the country are formed in lines approximately north and south, which is evidenced by the escarpment exposure and precipitous slopes on the west faces of the hills, with long, easy slopes leading to the east. Such a fault appears to the east of Mercur and the Golden Gate properties, and is marked upon the surface by a general depression. The gold-bearing strata will in all probability terminate abruptly on the dip in this fault, and if found farther east will be at some different elevation, probably at a higher altitude. The strata themselves before reaching the fault will be found upon a constantly increasing dip until it will terminate in a vertical fissure or faulting plane.

AS HERETOFORE EXPLAINED in detail, the pending River and Harbor bill in Congress makes appropriation of $250,000 jointly with similar amount already appropriated for the same purpose by the State of California. After considerable telegraphing this week and last week between San Francisco and the national Capitol and congressional committee discussion, the following paragraph has been inserted in the House bill in place of the original one: "For the construction of restraining barriers for the protection of the Sacramento and Feather rivers in California, $250,000; such restraining barriers to be constructed under the direction of the Secretary of War in accordance with the recommendation of the California Debris Commission, as contained in executive document No. 16 (H. R.), Fifty-third Congress, second session, pursuant to the provisions of and for the purpose set forth in section 25 of the Act of Congress of the United States, entitled 'An Act to create the California Debris Commission and regulate hydraulic mining in the State of California,' approved March 1, 1893: Provided, That the Treasurer of the United States be and he is hereby authorized to receive from the State of California, through the Debris Commissioners of that State, or other officer thereunto duly authorized, any and all sums that have been or may hereafter be appropriated by said State for the purpose set forth, and said sums, when so received, are hereby appropriated for the purposes above named, to be expended in the manner above provided." Tirey L. Ford, who has had charge of the interests of the miners in the matter, says that the changes from the wording of the appropriation as it passed the House were made that there might be no question as to what use was to be made of the contemplated restraining barriers, specific reference being made to the recommendation of engineers composing the California Debris Commission, as contained in their report for the year 1893. All reference to Sections 23 and 24 of the Caminetti Act is stricken out, and a reference to Section 25 only left, that section being based upon the proposition of protection of the Sacramento and San Joaquin rivers' systems. All reference to hydraulic mining is thus eliminated and the rights of the hydraulic miner with reference to the proposed works left for future consideration and determination. Another change relates to the proviso contained in the item and is intended to make the Federal Act more in harmony with the State Act. It is believed that the changes made in the Senate Committee in the item will be agreed to by the House and become law.

# CALIFORNIA MINES AND MINERS.

## Name, Character and Location of Mines in This State—Name and Postoffice Address of Owner, Superintendent or Agent.

"I want a list of the going mines of the State." "Can you send me the names of the mine superintendents in the State?" "I would give $20 for the address of some of the mine owners." These are a sample of letters and verbal requests daily received in this office. For some time the MINING AND SCIENTIFIC PRESS has been trying to get something like an accurate list—an approximate answer to the multitude of requests therefor. The difficulty of such a task is probably best understood by those who have tried it. Finally, after many months, the following has been prepared. It is by no means perfect, and accuracy is not claimed for it; names are probably in the list that are incorrect; other names which should appear do not; yet, on the whole, it is believed that it has sufficient merit and value to warrant publication herein.

The manner of preparation was as follows: Every local mention of a mine, its owner, superintendent or agent, was clipped from the local paper containing it, lists were prepared of the various counties and those names placed therein, personal knowledge of mines and miners was utilized, recent official records in the office of the State Mining Bureau were carefully copied, and from these and other sources lists of the several counties were written out. Attempts have been intelligently made to verify the list thus prepared, with the result that several hundred names have been erased, so that so far as possible the list is freed from errors, and is believed to be of great value. Any mine owner or superintendent whose mine or address is not on this list can, if desired, have the mistake corrected by notifying this office.

The above is intended to be explanatory of the time, effort and expense given to this work. Several who have known of its progress have urged that the list be published in book form, and advertised for sale at $4 or $5 per copy. But the request from old patrons of the paper have been so general that it was deemed best to adhere to the original idea and publish it in these columns.

The mines, names, etc., in the State will appear by counties, alphabetically.

### AMADOR COUNTY.

| NAME OF MINE | Character of Mine | No. of Men Employed. | Location. | Name of Superintendent or Agent. | Address. |
|---|---|---|---|---|---|
| Anita | Gold quartz. | 10 | Jackson | P. Reichling, Supt. | Jackson |

# Scientific Progress.

## The Microscope as Used in Mining.

(Specially Reported for the MINING AND SCIENTIFIC PRESS.)

On the 15th inst., at the rooms of the Microscopical Society, 432 Montgomery street, San Francisco, Cal., J. A. Edman of Plumas delivered an address on "The Microscope as Used in Mining." He said:

It is not necessary to look backward many years to remember the time when the microscope as an instrument of research and scientific investigation was confined to a few of the learned professions, to a limited number of the most advanced thinkers and workers in natural science, to physicists, physiologists, botanists and a few chemists. To most of us here present it was once seldom seen, and still less appreciated, as an instrument of precision. Later, with the advance of optical science and improved mechanical methods, it became the familiar and constantly efficient instrument not only in the schools and halls of science, but in many departments of manufacturing industry, to which it gave a precision and certainty never before attained. To-day we find it in every civilized country, the aid of the teacher, the guide of the philosopher, the scientist and the practitioner, the counsellor of the manufacturer, the aid of the engineer and constructor, the beneficent adviser of the farmer, and last, but not least, the guiding light among the hitherto empirical practices of the metallurgist and the miner.

And not only this. But the cares and worries of the business man have been lightened when he made it the companion of his leisure hours, and its kindly light brought him near to Nature's heart and opened to his vision the power, wisdom and perfection of the Creator.

Not long ago an eminent member of this society gave you the history of the origin and development of your favorite instrument to its present high state of perfection, and showed its application in solving the problems of geology, dealing with the upbuilding of the earth and the constantly recurring cycles of decay, reconstruction and change in our plains, valleys and mountains. Although but a comparative novice in the use of your favorite instrument, perhaps I may be entitled to continue the story and tell you tonight some of the truths it has taught me in one of the oldest, and even today one of the most important, industries of California, that of gold mining. In this I use the term in its broadest sense as applied in the Pacific States, where mining also includes the metallurgical processes for the reduction of our ore, usually called milling, and the separation of the gold from the enclosing gravels and sediments. For convenience I will divide the subject into two parts, the first concerning the physical conditions of our gold-bearing ores, including the various mill products; the second referring to the studies of the golden sands derived from our gravel deposits. It is true that the placers were first discovered and worked in this State, and from them the most of our wealth of gold was derived, but they have to this day remained the least observed and studied by our miners, as the sequel will show.

From the earliest days of quartz mining and milling in 1850, when scarcely any previous experience pointed the way and only the mill practice of Germany was available, if they had been known to our miners, all advance was based upon constant experimenting, which generally resulted in improved mechanical appliances, which finally developed into our present practices of milling, which yet in no sense can be said to be a system. All milling operations were, and yet remain, based upon the delusive belief that gold, being one of the heaviest metals, must always and under all conditions descend to the lowest level and become arrested by its affinity for mercury without any special effort of the operator to so modify the obstructions to the general law of gravity and chemical affinity as to permit of its full operation in the quartz mill and connected apparatus. This might have led to results had gold ores been uniform in character, had comparatively coarse grains of gold been enclosed in a simple rock or mineral, impervious to and not exerting a mechanical or chemical action on the mercury in use in amalgamation, could it be what the millman and miner dream of, so-called free-milling ore, a condition practically as impossible as for the physician to meet in his practice with a perfect man. In fact, our gold ores occur in all conditions and combinations, from the hard, white and crystalline quartz to the crumbling, brown-black sand of manganiferous ores; from the tough carbonaceous hornstone of the mother lode to the soft and yielding talcose slates from the altered diabase; from the hard quartz brought from the deepest mines, sparkling with crystals of pyrites and galena, and in spite of its richness scarcely exhibiting to the unaided vision a trace of metallic gold, to the crumbling and dusty limonites of our decomposed surface ores, where the gold may range from visible grains and crystals to the microscopic dust that almost floats in the air.

No classification of mill processes in accordance with physical conditions has yet been evolved, and cannot be attained without calling the microscope to our aid. What, then, does it teach and will prove to any earnest investigator? That in nearly all its ores the gold generally occurs in infinitely small particles, diffused unevenly both in the rock matrix and in the sulphides and other combinations and elements; that in most instances this diffusion is to the ordinary observer almost incomprehensible, although familiar to the student of micro-organisms. In the few slides I have brought here to-night you will find the diffusion of gold in quartz beautifully exemplified in a sample from the Diadem mine, where the size of the gold particles frequently reaches one twelve-thousandth of an inch diameter, and generally averages below one two-thousandth inch; and another from the San Jose de Gracias mine, in Mexico, where the diffusion of both gold and silver reaches one thirty-thousandth inch. These are not extreme cases, although in many gold ores of California the size of grain only goes somewhat below one two-thousandth diameter.

The same condition is observed in the sulphides, and principally in the iron pyrite, the arsenical pyrite, and in galena, although here the diffusion does not reach the extreme sizes noted in silica. But here occurs another condition, as hostile to free-milling as that already cited, the chemical union of gold with sulphur, arsenic, selenium and tellurium, which my work has conclusively proven, although the fact has been disputed by many chemists and metallurgists. It is especially noticeable in arsenical sulphides and their decomposition products, in which latter the gold is precipitated in crystalline and arborescent forms, built up atom by atom from a precipitation of the soluble gold compound.

The greatest loss in milling may be stated as due to the diffusion of infinite gold particles in the quartz, not set free by the usual processes. Noting that the common practice of gold milling has fixed upon forty-mesh screen in batteries as a limit, or an average size of one-fortieth inch diameter of grain, to which the ore is reduced, it is readily perceived that much gold still remains enclosed in the sands in a condition not available for amalgamation, and, by reason of its low specific gravity, not amenable to amalgamation.

A close study of amalgams and related products proves that amalgamation of both gold and silver is essentially a chemical union, and not a simple solution of gold in mercury, as the resulting products always combine to an amalgam in equivalent proportions and form crystals that are modifications of the cubical system. The three forms I have met with—the acicular, the prismatic and the octahedral—are exhibited by slides I shall place before you, in each of which the percentages of gold and mercury differ, containing the most mercury in the order given. In each case the mercury has been eliminated from the sample by solution in dilute acid, as the original amalgams are generally too fragile and deliquescent to be made into mounts.

My work has illustrated that time is an element in all amalgamation, graduated according to size of gold particles, and that the general law holds good, that the best condition for amalgamation obtains when proper proportions of gold and mercury are present to form the two last named varieties of gold amalgam.

Amalgamation is also seriously affected by the form of the rock particles in the pulp, and by capillary attraction, which fully explains the causes of flouring of mercury and the impossibility of successfully amalgamating talcose ores without previous preparation. Here the microscope reveals the curious condition that the smooth scales of talc, microscopic in size, become firmly attached to the cleanest mercury and rapidly form a semi-transparent crust, preventing the contact of gold with the amalgamated surface of the plate.

Of this scum I have here available only a working mount, but the fact has been fully investigated. A very instructive mount of rich waste sands is also at your service, taken below the plate table of a quartz mill.

The foregoing facts explain the main causes of the great loss of gold yet occurring in milling operations, and also suggest the remedy, namely, a full investigation of the physical conditions of the ore before a plant and mill process are decided upon, instead of the ruinous practice of discarding an expensive plant or abandoning a mine, virtually made a failure by lack of skill and judgment.

Time forbids me to enter into the details of the amalgamation and cyanide processes, of which the latter especially most speedily demonstrates its effectiveness or its shortcomings under the microscope in conjunction with chemical analysis.

The most interesting study of the genesis of ore deposits will receive its solution through the patient and intelligent use of the microscope, in which direction my own very desultory and incomplete labors can only be presented to you by a few slides and ore samples.

When we enter the division of the gold-bearing gravels as found in California's surface and deep deposits, the results of erosion during several geological periods, it presents another wide field for microscopical research, and this chiefly in the auriferous heavy sands, which represent not a little of the values and the most interesting objects of study for the microscopist, as they contain virtually the heaviest and most imperishable minerals of the adjacent rock formations. In the black sands of the Pacific coast we meet not only the heavy metals generally obtained in mining operations, such as gold, gold amalgam, platinum and iridium, but also metallic copper, nickel and iron; next, many of the sulphides and arsenides of our lodes, such as pyrites, mispickel, bornite, galena, and finally a great variety of oxides and silicates, such as magnetite, chromite, limonite, ilmenite, cassiterite, zircons, garnets, tourmalines, epidote, corundum, beryl and diamond, the last generally in very minute grains. In size of grain these sands generally run below one-fortieth inch diameter, and a large portion are of microscopic sizes, the gold particles often averaging below the one-thousandth inch in diameter, and consequently not at all amenable to the usual processes of placer and hydraulic mining.

Of the gold, a portion of it is clean and bright; much of it is coated with the oxides of iron and manganese, with silica and lime sulphates, and also with sulphides and selenides, frequently so much so that the gold color does not become perceptible without previous preparation. The sulphide grains, generally very minute, are often rich in gold, chemically combined or mechanically enclosed, and, what is still more important, the magnetites, hemetites and chiefly the ilmenites contain metallic gold enclosed within the hard and lustrous grains of these minerals, as will be shown to you in some of the mounts submitted. Everywhere the constant progress of chemical action is present in the gravels in the leaching out, transposition and subsequent precipitation of both gold and other elements and minerals, in the presence of secondary deposits of silica, alumina and hydrated silicates, in sulphides and arsenides, and in the many and beautiful forms of precipitated gold in crystals, and in acicular and arborescent forms of wonderful variety, some of which can be shown you.

While these evidences of beauty, order and constant activity in Nature's great laboratory will ever delight the student of natural laws, they offer no small rewards to the miner and investor who may view them solely from a commercial standpoint. After extracting all of the visible values by ordinary mining operations, the black sand and the waste gravels from which they result always contain gold varying from a few dollars per ton up to and exceeding $5000 per ton for the richest black sands, with probably an average of $40 per ton for concentrated heavy sands. As the cost of concentration and extraction of the valuable contents will seldom exceed, and generally go below, $20 per ton, they promise great rewards to men of skill, energy and capital, and intelligently handled will add much to the wealth and progress of our State.

Looking back to the period when the geological survey of California was in progress under the able guidance of Prof. J. D. Whitney, some of the members present may recollect his prophetic words as to the future of our waste gravel deposit, and his suggestions as to necessary legislation on the subject, and taking up the two volumes of the "Auriferous Gravels of California" and noting therein the discussions on the physical features of the gravel deposits, you can readily recognize that my work is only a continuation of that by Whitney, Pettie and Goodyear, and that part of the problems confronting them have now been happily solved.

At the period referred to when the geological survey was discontinued, when our Legislature then, as frequently of late years, was controlled by lobbyists and pothouse politicians, all the great material laboriously collected by the survey was consigned to oblivion, and remains yet unused and inaccessible somewhere among the classic halls of Berkeley. Had the volume on economic geology as projected by Whitney been published, the doors of a vast treasure house would thirty years ago have been opened to the citizens of California, and the State would have been richer by at least three hundreds of millions of dollars.

I here take occasion to render on behalf of the miners of California a cheerful and well-merited tribute to Prof. Whitney, whose powers of perception, lucid reasoning, indefatigable energy and unerring judgment in regard to the economic geology of California have done more to make our placer mines known and appreciated than all the men of science that have but followed where he blazed out the trail.

To those of your society who, like Melville Atwood and Henry G. Hanks, have studied our ores and minerals, and also left honorable records and valuable aids to the miners of California, I tender their well-merited meed of honor, and will venture to hope that your society, while adding luster to California's record in the paths of science, will not forget the needs of our miners, the beauties, the uses and the silent teachings of Nature, as revealed in our rich and useful ores and gravel deposits, in our marbles and building stones, our borax, soda and salt deposits, our asphaltum and mineral oils, which form the substratum on which Nature has placed our plains and smiling valleys, our pure and ever-flowing streams, our grand forests and our heaven-reaching and snow-covered Sierras.

# Electrical Progress.

## Electric Rock Drills.

Electricity has been applied to mining in many forms: the MINING AND SCIENTIFIC PRESS has discussed and portrayed numerous practical electrical devices in metal mining, and this week depicts apparatus designed to successfully overcome existing obstacles in the application of electricity to mining drills. The rotary drill and the percussion drill have been brought per se to a high degree of efficiency. Steam, water power and compressed air have been successfully applied as motors, but hitherto some difficulty has been experienced in adapting electricity to this function. The Siemens & Halske Co., represented by A. Brooke-Ridley, 10 Front street, this city, claim to have solved the problem of satisfactorily connecting a rotary or percussion drill with any electrical system of power distribution. In soft rock the rotary drill does very well, and it is believed that the electric motor is ordinarily best adapted to the rotary drill. The reciprocating motion required for a percussion drill has tended to dissipate applied electric power in heat and lost energy.

After continuous experiment the firm of Siemens & Halske have constructed a machine which they claim meets the requirements of practice and which for the same amount of work uses only 25 to 30 per cent of the energy heretofore used in percussion drills. In practical operation, using 1 H. P., for instance, they claim that their machine has bored in hard granite in one minute a hole 1.4 inches in diameter and from 3.2 to 3.6 inches deep.

To do this they have employed the Stow flexible shaft, which consists of two main parts, the inner, power-transmitting part, which consists of a number of steel wire spirals, called the core, and the outer protecting casing. The core is provided at each end with solid terminals, which are supported in bearings provided in the casing, which consists of a steel spiral covered with leather and provided with terminals on the ends, which carry the necessary couplings. Under the expectation that the flexible shaft would be applicable to the percussion drill, the latter has been reconstructed and modified to make the method of driving both types of drills identical. The firm now assert that it is only necessary to attach the flexible shaft to either of the two types of drills in order to operate either.

The theoretical difficulties of the task having been solved by the construction of both drill types in connection with the flexible shaft, for practical use of the whole system the electrical part needed considerable attention. The truck used in factories for the conveyance of the electric motor did not meet with the conditions found in a mine; the motor was placed in a solid wooden box, armored with angle irons and provided with a steel cover and two handles. This box contained the motor, gear, starting rheostat, etc.

Figs. 1 and 2, which represent complete drilling outfits of the two types, also illustrate the motor box. It will be seen that the motor box has one opening for the connection with the flexible shaft and another on its rear end for the electric plug. After plug connection is made the current is turned on or off by means of a handle, which is operated in accordance with two sign plates, "On" and "Off." The bottom of the motor box is covered with galvanized sheet iron, which protects it against water. During the operation the cover of the box is always closed; this cover is so strong that it cannot be injured by men stepping or jumping on it. The iron cover, moreover, on account of its good heat-conducting qualities, permits the warm air below to cool off. In the beginning the motor box was constructed only for direct current. As in rock drill installations, electric energy has to be transmitted usually over longer distances, the practical demand was for higher voltages, and a motor of 1 H. P., 330 volts, with cumulative winding, was built. The series winding was added to the shunt for the purpose of quicker starting. Motors of 110 and 220 volts were also built. The result of many experiments and measurements gave 1 H. P. exact 75 per cent commercial, or 84.8 per cent electrical, efficiency. Grease is used for lubrication; it is impossible to use self-oiling bearings, as the motor box must very often stand in inclined positions.

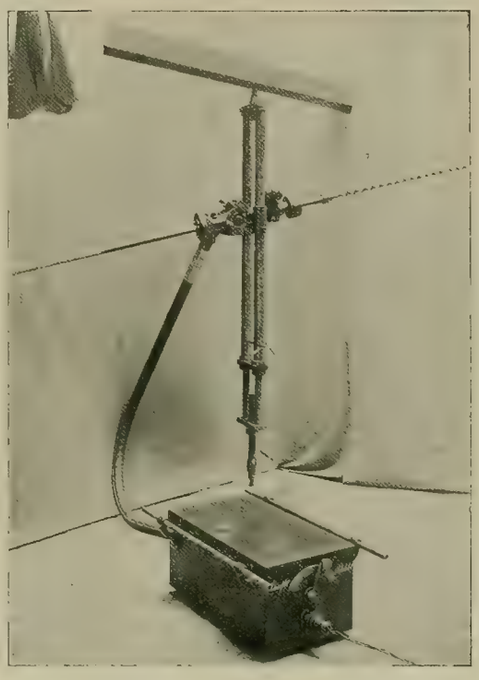

FIG. 1.—SIEMENS & HALSKE ROTARY DRILL.

The method of connecting the motor box with the electric service wires has been carefully worked out. The device permits connections to be made without having the workmen touch any non-insulated part of the conductors, and do not require the use of any screwdrivers or similar tools; they are also adapted for use in driving entries and other necessary mining operations. The conductors are usually fastened on the walls of the drift, near the roof, and are carried near the face of the drift, where the connections between main conductors and motor box are made by means of flexible conductors, which latter have to be reeled back before a blast. In order to reduce the drop of potential, the copper conductors are made of a large cross section, usually No. 9 to No. 5, B. W. G., while the flexible conductor for the sake of light weight and flexibility is usually made of conductors No. 15 to No. 13, B. W. G., cross section. There are, of course, two conductors in a direct current system and three conductors in a multiphase system. The connection between the main and the flexible conductors is made by means of a wall connection box; this contains a safety fuse for each pole. To this connection box is permanently attached a short piece of rubber cable, terminating on its free end in a plug. A small cap protects the plug when out of use. This cap is usually hanging alongside of the connecting box; when out of use the plug is put into the cap, and in this manner suspended from the wall.

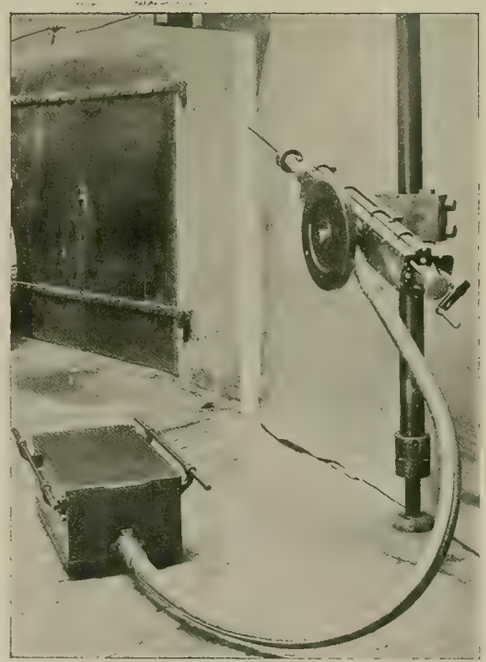

FIG. 2.—SIEMENS & HALSKE PERCUSSION DRILL.

In practice the rotary drill is supplied with exchangeable gears, which may be selected for each hardness of rock, so that the motor does not use more than from 700 to 800 watts at maximum feed; the pressure on the friction coupling is so adjusted that this maximum feed only occurs at normal hardness of rock. In case the drill meets harder strata the feed is automatically decreased, in which case the electrical energy is somewhat increased. Without exchanging the bit, the drill will bore a hole one meter (3.3 feet) deep.

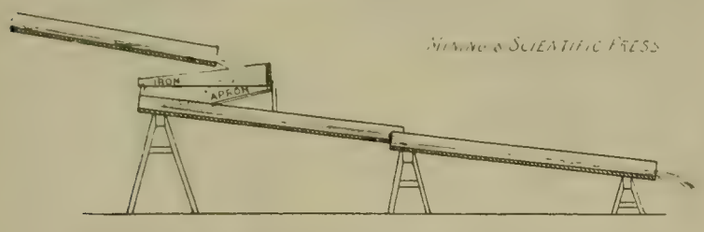
---

AT the Provo, Utah, power plant the flume will be about 1000 feet, with a fall at the terminus of 125 feet. It will be semi-circular, 6 feet 6 inches in diameter, and capable of carrying 5½ feet of water. The power will be 2000 H. P. The company will use the high potential alternating current, generated by the Westinghouse Company's two-phase system. Mr. Cramer, the engineer in charge, says the power, it has been proven by the company's plant at Telluride, Colo., can easily be carried thirty or forty miles. That plant runs four large mines, two smelters, and furnishes light for Telluride and Pandora.

---

CONCERNING the "invisibility" of the new light, Prof. Lodge's theory of retinal action is that the visual mechanism of the eye is sensitive to it, but investigators will grope so far as immediately seeing "the new light" is concerned. One explanation is that the dioptric media of the eye are very opaque to cathode rays. Still, a cathodal image can be thrown upon the retina from behind.

# Mechanical Progress.



## The Banta and Wink Process.

The following is published without present comment. A drawing has been prepared and a cut made of the machine according to description:

TO THE EDITOR:—The following is a complete description of the Banta and Wink chemical process for saving fine and floured gold, which I hope you will accord space in your columns for the benefit of every one interested in mining in this west half of America. The wood and iron work of a system consists of two boxes 12 feet long, 2 feet wide and 4 inches deep, and a tom or screen, which rests on top of the upper box. To make the tom, take two pieces of lumber 4 inches wide at one end and 8 inches wide at the other and 6 feet long; cut an end piece 18 inches long and 8 inches wide and nail together so it will be 20 inches wide outside. Then take a piece of No. 18 sheet iron punched with one-fourth inch punch one hole to every three-fourths inch surface same as rocker screens are punched. Cut the iron 20 inches wide by 6 feet long and nail it on the edge of the frame as nailed together, leaving the end open at the narrow end of sides; then make two more side pieces 4 inches wide at one end and 11 inches wide at the other. Nail them on to the outside of edge where iron is nailed on, giving them one inch lap, so as to get good nailing; let narrow end point the same way as those above them. Cut an end piece 28 inches long and 11 inches wide and nail it on wide end of sides so it will rest on the sides of the box to take the weight of the tom, and keep it from dropping down on the bottom; also take a strip 3 inches wide, 28 inches long, and nail it across at narrow end of sides, and just under end of sheet iron for the same purpose. Now cut a strip of wood 1 inch square and 20 inches long, and nail it next the iron at the wide end of sides and make an apron of wood 20 inches wide and 3½ feet long. Lay one end on to the narrow one-inch strip, and let the other end be just even with the edge of the two sides, so that when it sets on top of the box, and the sand and water drops on to the perforated iron, it will run through on to the apron, which will have a pitch of one inch to one foot, and will also change the direction of the current toward the upper end of the boxes and drop the sand and the water on to the bottom of the box, two feet from the end of the upper box, where the direction of the current is again changed in the boxes, thus forcing every particle of gold or sand to the bottom of the 24-inch boxes,

which are prepared in the following manner:

Take 1x4 inch vertical grained Puget Sound fir, or Northwest lumber, such as is used for the best floors, tongued and grooved; nail them on to 2x3 inch strips every two feet, and nail well with 6d nails so as to hold solid in place. Set the nails well down into the wood. Put sides of 1x6 inches; let the box be 4 inches deep inside. Close up the end of upper box with 1x6 inches same as

MACHINE FOR WORKING THE BANTA & WINK PROCESS.

sides. Narrow the end of upper box so that it will fit into the lower box; and, after completed, prepare the bottom as follows.

First close up the ends in a temporary manner, and soak them with water so they will not leak; then take our chemical solution, prepared in the following proportions: One gallon of water; one pound of pure potash; one-quarter pound of proto carbonate of iron; one-half ounce of alum; one-half ounce of sal ammoniac. Always mix in the above proportion; but in first preparing a system use four times the above quantity. Put it into an iron kettle and boil it thirty minutes; then pour it hot on to the bottom and let it stand one hour. Then if it has not all soaked into the wood, draw it off into the kettle and take a sharp pointed knife or other sharp pointed tool and scratch the entire surface of the bottoms of the boxes, straight across and diagonally, both ways, until the entire surface is rough. Keep the tool point sharp and at right angles with the bottoms while scratching and bear down hard. Keep the wood wet while scratching it; and when thoroughly done, sweep out the fiber that has been loosened. Boil more of the solution mixed as above, and pour it boiling hot into the boxes and let it stand and soak into the wood; then keep wet; put them full of water or let the water run over them. The potash and iron forms ferricyanide, and the alum and sal ammoniac helps it to crystallize on the fiber of the wood, forming a crystal which water will not dissolve. Ferricyanide of potassium has an affinity for gold, and attracts the fine particles and causes them to settle and gather in clusters on the bottoms of the boxes, and boxes prepared as above will handle thirty tons of sand per day and save 95% of all gold in the sand, no matter how rusty or greasy or how fine. Set the boxes on a grade of one inch to one foot and run the water one inch deep over the bottom. Never crowd enough sand through, so as to cause it to pack on the bottom of the boxes; put through just what the water will carry and keep in motion. When using regularly, scratch the bottoms every two weeks, and brush the fiber out clean and boil two gallons of the mixture. Pour it hot into the boxes and let it stand two hours; and if it has not all soaked in, draw it off, and keep it until wanted for the next charging of the boxes. To clean up the boxes, stop putting in sand, and push the tom back until the apron nearly touches the end of the box, so as to clear out all the sand in the upper end of box. Let just enough water run to keep the bottom covered; then take the tom entirely away, and take a stiff bristle or grass brush and begin at the upper end and brush down. Brush several times over the bottoms and take the gold up in a scoop or blower. If the gold is rusty or greasy when you wish to amalgamate it, put it in a pot and boil it in a strong solution of potash—one pound to one gallon of water. Put in enough quicksilver to amalgamate it and boil it thirty minutes; stir it continually while boiling; then pan it out and strain it through chamois skin. At the upper end of the second box put in a piece of astrachan cloth or Brussels carpet three feet long. After dipping it in a weaker solution of the chemicals, and letting it dry, wash the cloth every two days and run the concentrates back into the system, just before cleaning up next time. Brush the gold out of the boxes every evening; do not let the boxes go dry with gold in them, for it will float away when you turn the water in again. Any of the solution that is drawn off can be bottled up and used to renew the system the next time. The above system of mining, especially in black sand, is very successful, and you will find it much better than any other system now in use. It is not patented, and can be put up by any miner.

THE BANTA AND WINK CO. of CAL.
San Francisco, Cal., April 17, 1896.

## Assays of Copper and Copper Matte.

NUMBER II.

Discussion of the Results presented at the Florida Meeting of the American Institute of Mining Engineers.

The matte was first ground to pass a 120-mesh sieve; the material as received being entirely too coarse for accurate analysis or assaying.

The method employed for the determination of the copper in the matte was the cyanide titration method, essentially as described by "K," aluminum being used as a precipitant. The copper in the drillings was determined as follows: 1 gramme of drillings was dissolved in a flask with 10 c. c. of nitric acid (32° B), and the contents were heated until the red fumes had been expelled. The solution was then transferred to a 500 c. c. graduated flask and diluted with distilled water to exactly 500 c. c., and thoroughly mixed. 4 portions of exactly 100 c. c. (0.2 gramme) each were drawn off with a pipette, run into a 200 c.c. flask and 15 c. c. of strong ammonia was added to each portion. The solution was then titrated with a standard solution of potassium cyanide, each c. c. of which was equivalent to 0.005 gramme of copper. With each set of assays a blank assay should be run, using pure copper foil and the same amount of nitric acid, ammonia and water as in the regular assay. This is important, as the standard solution is liable to change in strength. The proof assay also presents the advantage that it is run side by side with the regular assays, and the same conditions are introduced in all.

A comparison of these results with those obtained by the electrolytic method would lead to the conclusion that the titration method is quite as accurate as the latter, if not more so. Thus, in the case of the copper borings, the difference between the highest and lowest of the four volumetic determinations is much less than in the case of the average electrolytic determinations, whilst the average of the four (97.65 per cent) is very close to the average of the electrolytic results (97.67 per cent). In the case of the matte, while the volumetric determinations are somewhat lower than the average of the electrolytic determinations, the writer believes that they more truly represent the amount of copper present. This matte contains some antimony and zinc, and doubtless other elements, which are liable to be precipitated with the electrolytic copper, and thus give too high results. I quite agree with assayer "N," who remarks "For such material (the matte) I do not believe electrolysis to be as good a method for determining copper as some others."

The assays for gold and silver were made as follows, the method being the same for both matte and borings. One A. T. of material is introduced into a No. 5 beaker and 100 c. c. of distilled water is added. The mass is stirred with a glass rod and 50 c. c. of nitric acid (sp. gr. 1.42) is added. As soon as the action of the acid has ceased 50 c. c. more of nitric acid is added and the solution is gradually heated until the red fumes have been expelled. The solution is now diluted with distilled water to 500 c. c. and allowed to stand several hours. After thorough settling, the solution is filtere off through a rather heavy 4½-inch filter paper; the water used in transferring the precipitate to the filter being generally sufficient to wash out the silver and copper salts.

To the filtrate, which should be perfectly clear, normal salt-solution (1 c. c. representing 10 milligrammes of silver) is added in slight excess. (To the matte 14 c. c. and to the borings 18 c. c. was added.) The solution is stirred, 10 c. c. of a saturated solution of lead acetate is added, and the solution is stirred again. Now, 2 c. c. of sulphuric acid (1 part concentrated acid and 1 part of water) is added, and the solution is stirred. After allowing to stand several hours, the precipitate is filtered off and thoroughly washed with distilled water. The filtrate should be perfectly clear. The filters are removed from the funnels, wrapped around the precipitates and placed in 2½-inch scorifiers, the paper containing the first residue being placed in the same scorifier with its corresponding silver-lead precipitate. The filters and precipitates are now dried by placing the scorifiers on a hot plate, and when dry the paper is burned by placing the scorifiers in front of the muffle. The scorifiers are finally pushed back into the muffle to destroy all the carbon and sulphur. To each scorifier is now added 5 grammes of litharge, 15 of test lead and one of borax glass. The charges are then scorified and poured, the resulting lead buttons weighing about 6 grammes. The buttons are cupelled so as to show feather litharge and are pushed back into a hot part of the muffle just before the "blick." After weighing, the buttons are parted for gold by flattening them, introducing each button into a small procelain crucible and adding nitric acid (15° B.). After all action of the acid has apparently ceased (it should be at boiling temperature) it is poured off and fresh acid of 32° B. is added. The gold is boiled in this acid 4 minutes, when the acid is poured off and the gold is washed twice with distilled water. After drying, the gold is annealed and weighed.

The writer quite agrees with assayer "D" that the combination silver assay is more accurate, and it certainly requires no more time or work than the scorification method, especially when, in the practice of the latter, the slags and cupels are saved and assayed for the absorbed silver.

J. N. Walker, Everett, Wash.: After reading the report of the various assays of samples of copper and copper matte presented at the Florida meeting, I wish to offer some further statements bearing upon the use of a proof assay. After determining by the scorification method upon the sample of matte received from the secretary, the commercial results, such as would be reported in the course of ordinary business, I extracted the silver from the scorifier slags of four sets of assays. No. 1 (slags from one scorification) gave me 0.3 ounce silver per ton. No. 2 (two scorifications), 0.6 ounce; No. 3 (three scorifications), 1 ounce; No. 4 (two scorifications, very cold), 0.8 ounce. This seemed to indicate clearly that with this grade of matte, the silver loss in successive scorifications was practically uniform.

The loss by absorption in the cupel appeared to me most serious of all; and I was led to believe also that this loss was the greater, the greater the porportion of copper in the buttons to be cupelled. Thus, the results from 3 buttons were as follows:

| No. | No. of Scorifications. | Copper in Buttons. Ounces Per Ton. | Silver in Cupel Ounces Per Ton. |
|---|---|---|---|
| 1 | 1 | 3 03 | 3 7 |
| 2 | 2 | 2 95 | 3 53 |
| 3 | 3 | 2 23 | 3 20 |

These cupellations were made at the same time and at the same heat, but the buttons were the product of one, two and three scorifications respectively; and the reduction in copper by successive scorifications is attended with a corresponding reduction in cupel absorption of silver. The elimination of copper by scorification, however, is not proportioned to the number of scorifications made. In my experience the second scorification is the most effective in this respect, though in the instance here given, the third has produced the greater diminution.

But the chief conclusion to which I have been brought is that the heat of cupellation has more to do with the loss of silver in the cupel than anything else. I give herewith some results of experiment in this direction, which, however, I regret to say were not checked by duplicates:

| No. | Scorifications. | Cupellation. | Silver. Ounces Per Ton. |
|---|---|---|---|
| 1. | Hot. | Hot. | 118.6 |
| 2. | " | Cold. | 128.2 |
| 3. | Cold. | " | 130 6 |
| 4. | " | Hot. | 120 4 |

The indication is clear that excessive heat in cupellation causes excessive loss of silver by cupel absorption.

After weighing my beads and also the silver obtained from the cupels and from the scorifier slag, I decided to cupel them again with a small amount of lead, and to run at the same time for comparison a pure silver button of about the same weight. The results was as follows:

A set of three buttons, resulting from two scorifications each, the first with 40 grammes of lead, and the second with 20 grammes of lead plus the button, weighed 39.5 milligrammes. The proof-button weighed 39.12 milligrammes. After cupellation of both at medium heat (the main point being to get rid of the lead and copper), the weight of the assay-button was 37.6, and that of the proof 38.1 milligrammes. The normal cupel absorption of silver, under the circumstances, was, therefore, as 39.12: 38.1 or 1.027: 1. Multiplying 37.6, the new weight of the assay-button after cupellation with 2 grammes of lead, by 1.027, we have 38.615 as the probable weight of the three buttons before this cupellation, if they had been pure silver. The difference between this and their actual weight, 39.5, is 0.885, a loss which cannot be fairly ascribed either to cupel absorption or to volatilization. Dividing it by 3, we have 0.295 milligrammes (or 2.95 ounces per ton for each button of original assay), as the loss of weight, due, in my judgment, to copper in the silver-buttons; and I therefore determined the actual amount of silver in the assay as follows:

| | | Ounces Per Ton. |
|---|---|---|
| In original average weight of button | | 131.6 |
| In scorifier slag | | 0.6 |
| Silver absorbed by cupel | | 3.53 |
| | | 135 73 |
| Less—Copper in button | 2 95 | |
| Gold in button | 2.34 | |
| | | 5 29 |
| Silver contents | | 130 44 |

In ordinary commercial practice, the copper in the button and the silver in slag and cupel would have been neglected, and the total weight of the silver-button, less the gold determined by parting, would have been reported as the result in silver.

Albert R. Ledoux, New York City: The variations among different assayers in report of these comparative determinations is what I expected, and emphasizes, more than any words of mine could do, the importance of our "getting together." In my opinion the differences exhibited are due to the choice of methods, and do not reflect upon the skill and care of the participants in this joint inquiry or "symposium." I trust that the discussion will be continued with the fullness and freedom which the subject deserves.

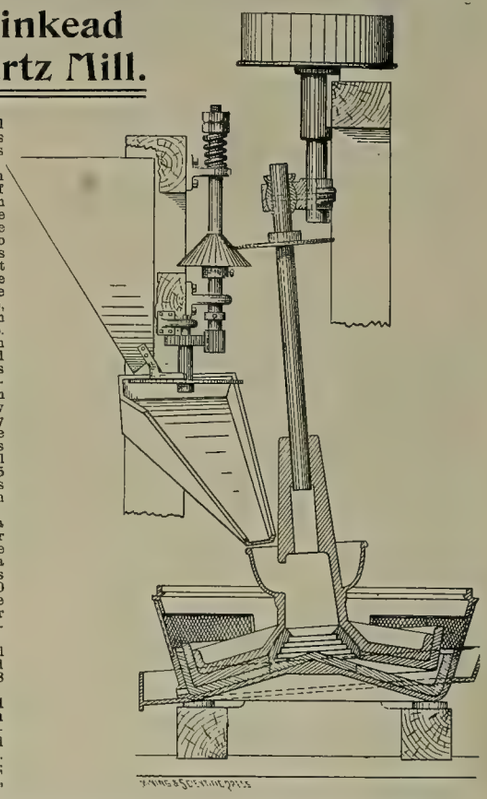
——Pacific Coast Agents for——

## THE DANIEL BEST CRUDE OIL ENGINE.

CAPACITY 2 to 200 HORSE POWER.



**The Cheapest Power Known—Invaluable Where Fuel Is Scarce.**

The most economical motive power ever invented, costing but 10 cents per H. P. per ten hours run, using crude oil. Cheap, safe, reliable and clean. Strong and simple to operate. Requires no engineer, and when you stop, all expenses cease, and no fire is left to endanger your building. Send for Illustrated Catalogue with full particulars, and mention the MINING AND SCIENTIFIC PRESS.

——Also Agents for——

## The Kinkead Quartz Mill.

This sectional drawing shows the main features of **The Kinkead Quartz Mill** which will do the work of five stamps with less than half the power, and can be built and put into operation for less than half the cost of stamps. The only wear is the shoe and die, which is less than that of one stamp. The cheapness in first cost and operation of this mill makes it possible to work with profit ores so low in value that they have heretofore been treated as waste. Each mill will crush 15 tons in 24 hours through a 40-mesh screen.

It requires a two-horse power Daniel Best Crude Oil Engine, at a cost of 10 cents per H. P. per 10 hours' run. There is no vibration or jar, and very little noise.

Engine and Mill can be set up and running in 48 hours.

**Price of Mill $1,000, f. o. b. San Francisco.** Feeders, Apron and Plates included. Weight, 2½ tons; heaviest piece, 1200 pounds.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ROTARY ENGINE.—W. R. Beer, San Jose, Cal. No. 558,144. Dated April 14, 1896. This invention relates to an improvement in that class of mechanical contrivances in which any medium under pressure is employed to propel pistons attached to, varied by and rotating around a central shaft or axis. The device being also applicable to those machines in which power is applied to drive the shaft and piston so that they may be used as pumps and water meters and for similar purposes. It consists of an exterior case having eccentric chambers fixed therein side by side, with their eccentricities diametrically opposite; a shaft extending through the heads of the case, disks fixed to the shaft intermediate between the eccentric chambers and exterior thereto, with spring actuated packing rings to form joints between the disks and chambers, piston carrying drums fixed to the shaft within the eccentric chambers, pistons sliding in radical channels in said drums and transverse bars fulcrumed in the intermediate disk between the chambers, the ends of said bars engaging with the oppositely placed pistons whereby the inward movement of one piston is transmitted to produce an outward movement of the corresponding one in the other chamber. The arms connecting the pistons are so formed as to tilt upon fulcrum blocks intermediate between the two chambers, these blocks being made adjustable to compensate for wear.

FLUSHING DEVICE FOR SEWERS.—Francesco Cavallaro, San Jose, Cal. No. 558,156. Dated April 14, 1896. This invention relates to a convenient means for flushing sewers and cleansing them from time to time. The sewer extending along in the usual manner has a man-hole with an open connection with the sewer, a cap-plate is permanently cemented around the opening and itself has a central opening into the sewer. A cover is hinged to one side of the cap-plate with swivelling locking bolts so that its opposite edge is confined, and a projecting flange is adapted to engage a corresponding groove or channel to form a joint between the cover and the cap-plate. A conical valve seat is formed in the central portion of the cover and vertical guide rods upon each side, upon which a correspondingly shaped valve with slotted guiding arms is slidable. From this valve is an upwardly extending rod or handle by which it may be opened and closed. A transverse slot is made in the cover plate with guding wings upon the upper side, and a gate is slidable in this slot having an upwardly extending rod and handle so that communication with the sewer pipe may be cut off or established. Through a suitable supply pipe the water is delivered into the man-hole and the gate in the sewer being closed, the man-hole will be filled and that portion of the sewer above the gate will also fill up. By opening the gate and the valve in the man-hole the water will rush down the sewer pipe and flush out the lower portion of it.

VENTILATOR CARS.—Louis Weinberger, New Orleans, La. No. 538,330. Dated April 14, 1896. The object of this invention is to provide a certain improvement in the ventilation of cars which are employed in the transportation of fruit and perishable products. It consists of a car having double floors and roof sections, with longitudinal passages extending there through openings in the ends of the car communicating with the passages between the floors and passages through the inner floor by which the air is admitted into the interior of the car. Gates or doors are arranged to be vertically slidable upon guiding rods, with means by which the doors are closed into the openings or raised and suspended to allow the air to enter, and valves cover the passages by which the air is admitted into the spaces between the floors, these valves being so constructed as to be opened by the pressure of the air from the outside and closed by a pressure from the interior so that air is admitted from one end of the car and prevented from escaping at the other. In conjunction with this are supplemental pipes or passages extending vertically down in the corners of the car and connected with adjustable wind funnels at the top and openings from the bottom of these pipes are made into the passages between the floors with diverging directing plates extending into the passages from the openings.

AUTOMATIC LETTER STAMPING MACHINE.—Clarence W. Ayers, San Francisco, Cal. No. 558,141. Dated April 14, 1896. This invention relates to a device for stamping letters and packages. It consists of a guide table over which the strips of stamps are adapted to pass, a slotted opening in the front of the casing through which the stamps are projected, a cutter blade fixed at the lower edge of the opening, feed rollers situated between the guide table and the opening and adapted to receive and advance the stamps, a gear and pinion by which one of the rollers is rotated, a pawl and ratchet mechanism engaging the gear so as to advance it, a vertically moving plunger having a fixed cutting blade corresponding with the one upon the side of the opening through which the stamps pass, a spindle connected with the plunger, a sleeve slidable upon the spindle having a lug which engages the lever, to first actuate the pawl and ratchet and feed mechanism so as to advance a stamp and afterwards engage the plunger and move that downward to sever the stamp and apply it to the letter or surface beneath. The letters or papers are placed upon a table by which they are advanced beneath the point where the stamps are to be applied. This table is mounted upon springs so as to be adjustable, and allow any thickness of letter or paper to pass. In conjunction with this device is a moistening roll with a means for supplying moisture thereto, and means for moving the surplus moisture.

HOT CORN HOLDER.—John D. Stanley, Honcut, Cal., assignor of one-half to Austin P. Merrill of same place. No. 558,224. Dated April 14, 1896. The object of this invention is to provide a simple, serviceable and convenient device for holding hot corn while eating the same. The device is composed of two opposing normally closed jaws, the shanks of which are parallel, with one guided and slidable on the other, a spring acting on the shank of the unmovable jaw and exerting a constant pressure against the article held between the jaws, and means, like a finger piece, whereby the movable jaw is slidably retracted in opposition to the normal closing action of its spring.

**Great Reduction in Light!**

**IMPERIAL Automatic Gas Machine**

Produces a Beautiful Light.

The difference between the brilliancy of light produced from gasoline gas and from coal gas is 3 to 1. The gasoline light is clear and soft, rests the eyes and brings comfort to the home.
The latest and most perfect Automatic Gas Machine now in use, particularly for illuminating private dwellings in the country, as well as residences in the suburbs of a city or town, public institutions, asylums, hotels, etc. The light is steady, soft, bright and pleasant to the eyes and can be furnished at an expense of but eighty cents per 1000 feet of gas. It is much safer than coal oil lamps, which are so dangerous to have in the house on account of an explosion.
These Gas Machines are perfectly safe, and free from any danger whatsoever. Every modern house built for gas should have one of these machines. No public institution should be without one. I have no hesitancy in saying that there is no other gas machine in the market that can compete with mine as to prices, and they surpass as to perfection in all its requirements.
For supplying gas for gas stoves for cooking or heating these gas machines have no equal. Address

**JACOB SCHRIEBER,**

# Mining Summary.

## An Appeal in the Imported Ore Cases.

Collectors of customs have received instructions from the Treasury Department to appeal the decisions of the Board of General Appraisers in the cases of the Guggenheim Smelting Company and the Balbach Smelting Company to the U. S. Circuit Court. The cases are of importance, as upon the ultimate decision of the court will, the smelters claim, depend whether foreign ores can be separated in bond in this country. The cases were test ones and have attracted much attention. Both concerns imported from Mexico base bullion, composed of gold, silver and lead, the lead being the vehicle for the precious metals, predominating largely in quantity, while the gold and silver were the components of chief value. The collector assessed duty upon the gross weight of the product as pig lead. The importers claim that, under section 21, paragraph 66, of the tariff, duty could only be assessed on the amount of lead found by assay. The Board of General Appraisers sustained the claim of the importers. If this ruling of the board should be reversed, it is claimed by the importers that it will drive the smelting of foreign bullion from this country, as bullion smelted in England and all the products imported into this country would be dutiable at only 1 cent per pound for the lead, while the gold and the silver would be free. The opinion of the Board of General Appraisers on this matter is in part as follows:

"The counsel for the Government takes exception to the jurisdiction of the board under instructions from the department contained in a letter dated Feb. 15 last, which he submits as part of the record. The department states in this letter: "I invite your special attention to the fact that these protests are not against the assessments of duties, but against the collection of the duties assessed and liquidated without protest, and, consequently, that the board has no jurisdiction. You are doubtless aware that the regulations prescribed under section 21 of the Act of Aug. 28, 1894, deal with the abatement or collection of the duties accruing on the warehousing entry of imported impure metals or ores, and not with the assessment of such duties, still less with any assessment of duties on the products, which were not imported as such."

It appears that the merchandise was imported Dec. 11, 1895, at Newark, N. J., from Tampico, Mexico. It was entered on rewarehouse withdrawal for consumption on Feb. 3, 1896. The entry was stamped "liquidated," Feb. 3, 1896, and the same day, after liquidation, the importers filed their notice of dissatisfaction, setting forth distinctly and specifically the reasons for their objection to the Collector's decision as to the rate and amount of duties chargeable upon the imported merchandise.

The protest is made under the exact circumstances and in the form described in section 14, Act of June 10, 1890, and fulfills all the requirements of that provision. In accordance with said section, the Collector transmitted it to the Board of General Appraisers, on duty at the port of New York, which board, the law goes on to say, "shall examine and decide the case thus submitted."

Section 21, Act of August, 1894, in its bearing on the present case, may be plainly construed as follows:

"Metals imported in any crude form, requiring smelting or refining, shall be removed from the vessel to the bonded smelter or refinery without payment of duties thereon. Each day a quantity of refined metal equal to the amount of imported metal smelted or refined that day shall be set aside for exportation, or it may be removed upon entry and payment of duties for domestic consumption, all to be under regulations prescribed by the Secretary of the Treasury."

Section 21 is substantially a reproduction of Section 24, Act of 1890. It is presumed, therefore, that the Treasury regulations on the subject dated Jan. 8, 1891, ss. 10,585, are still in force. It is provided in these regulations (paragraph 4): "The appraisers will ascertain by proper assays the quantity of dutiable refined metal or metals contained in the crude metals or ores, as entered, and the quantity so ascertained will be noted in the warehouse entry and bond. Upon a withdrawal for consumption in the United States of any refined dutiable metals set aside and stored as the equivalent for the metals contained in the crude metals or ores smelted in such warehouse, duty will be collected on the corresponding quantity as shown by the original assay of such imported crude metals or ores, without any allowance for wastage."

If the gross weight of the bullion was dutiable, why assess duty by assay instead of by weight? Or why should the importer incur all the expense of maintaining a bonded warehouse and the required inspectors and bookkeepers, if in the end he had to pay duty on the gross weight landed?

It is a contention on the part of the Government that the bullion should pay duty by gross weight as landed, although merchandise deposited in bond is dutiable only at the weight ascertained upon withdrawal.

Were this contention correct, how should the article be classified? Certainly not directly as pig lead, when it is neither pig lead nor any one of the lead products enumerated in paragraph 165-7 and when lead is as far from being the component material of chief value. An experimental rate might be levied under paragraph 177 and section 3, or exemption might be claimed under paragraphs 423, 556 or section 4. But why consider the problem when section 21 and ss. 10,585 afford a simple solution?

The department regulation provides that upon the withdrawal of dutiable refined metals duty shall be collected upon certain corresponding quantities of dutiable refined metals as found by the Appraiser's original assay, or, briefly, that duty shall be assessed upon the dutiable metals as shown by the original assay.

We sustain the claim that the merchandise is dutiable only upon the lead contained in the bullion, which is withdrawn in the shape of pig lead, in accordance with section 21 and with the Treasury regulations on the subject."

### CALIFORNIA.

#### Amador.

Ten stamps are now running at the Gover mine; this number will soon be increased to the full capacity of the mill.

At Amador City the Keystone Company has over one hundred names on its payroll; the South Spring Hill consolidated mines are beginning to be operated again with a full crew of men.

Superintendent Burrington who introduced the use of petroleum as fuel at the Glover mine pronounces it a great success. His fuel is now costing him the same as wood at $4 per cord.

*Record*: The Argonaut shaft is now down 1220 feet, and they are still sinking, at present in gouge making 2½ feet daily. The Argonaut is the only mine that was ever sunk in the county nearly so deep as it is, without stations crosscuts or drifts.

The Median mine is paying well. With ten stamps of the South Spring Hill mill in operation they are paying up past indebtedness, sinking in another of their group of mines and reopening the South Spring Hill.

Recently the output of the Keystone has been better than for many years. They are catching up with their old indebtedness and intend soon to prospect the 1400-foot level.

*Republican*: Near Volcano, the Reward mill on the Clough place is closed down. The Fogus mine has also suspended operations. The Studhorse mine, formerly known as the old Tulloch, is now owned by Gillick and Lyle. They are sinking.

The Good Hope Mining Company proposes to increase the capital stock from 50,000 shares at $10 each, to 700,000 shares at $1 each.

The Oneida shaft is down 160 feet. Eighteen men are employed in sinking, in three shifts of eight hours each.

The first shipment of sulphurets from the tailing plant below the Zelia mill was made this week to the Selby Smelting Works at Port Costa. They are treated for $11 per ton, delivered at Ione, and it costs $3 per ton to haul to Ione, making the total cost of $14 per ton.

#### Butte.

It is now deemed probable that the gravel mine at Cherokee will soon be in operation again. This property has a record of producing $13,000,000 in gold. In the event of its immediate resumption, Butte's $700,000 gold yield in 1895 will be increased materially in 1896.

#### Calaveras.

Near West Point the Machu mine, which is operated by the Machu Gold Mining and Milling Company of Denver, Col., has men sinking the shaft and two shifts in the drifts taking out ore. The company has bought the Smith Ranch, the south extension of the Machu, at a reported price of $13,000.

At the Soap Root, near West Point, Capt. Somerville has in the bottom of the shaft, 100 feet deep, a four-foot vein, which assays well.

The Granite mine, which has not been worked in the past sixteen years, has recently been taken in hand by J. D. Morgan in the interest of the Granite Gold Mining & Milling Company. Eight men are at work repairing the mill and cleaning out the drifts. The ore is of the same nature as the Machu mine and will run from $3 to $25 per ton, which is all extracted through tunnels and run by cars into a ten-stamp mill run by water power.

Near Murphys the mine that J. S. Sublette located two years ago across the Stanislaus from "Colliers," and bonded to the present company, has a 3-stamp mill in operation upon it and is yielding good returns. The Iron Mountain Co. of Shasta is extensively interested in mining property, having bonded several mines of repute.

The Central Hill gravel mine is running day and night with a force of fourteen men, and with the use of powder to shatter the banks and with wheel and derrick great progress has been made. A partial cleanup of 50 feet of flume yielded $1600.

*Prospect*: At the South Paloma the shaft that was started from the surface has made connection with the one that was started in the tunnel, making the depth on the lead now 160 feet. Hoisting works and other necessary machinery are to be erected at once and then the work of sinking to the depth of 600 feet will be commenced.

The shaft at the Gwin mine is now down 1140 feet and is still being sunk at the rate of from 12 to 15 feet per week. The flow of water is about 14,000 gallons per day.

#### El Dorado.

(Special Correspondence.)—The Pine Hill, Company, composed of San Francisco people is progressing methodically in its work. The property is situated 15 miles west in the Jay Hawk district. The shaft is 208 feet, on a 20-foot ledge. The drifts to north, south, east and west are respectively 70, 50, 150 and 100 feet. The ledge between the walls is 90 feet and all mineralized.

Work on the Vulture, one mile north of town, owned by Deuch & Craddock, is progressing gradually. The tunnel is 100 feet, and the shaft, on the ledge, is 150 feet.

The disposition to give favorable terms to reliable parties for working bond and lease is gradually growing upon our people here who own mining grounds and lack capital for development.

A. S. Bosquit has bonded his interest in the Gardner mine near town to Fowler & Benson who will begin developement work with J. French, owner of half interest in the Gardner.

The incorporation of the Larkin mine, which took place last week, proves that the owners have succeeded in developing a promising property. They awaited incorporating until development work warranted this step.

A small cyanide plant for custom work, combined with an assay office, located in this town would be a paying investment.

Placerville, April 22, '96.

(Special Correspondence.)—The Baltic Mining and Milling Company has incorporated. Capital stock $30,000, fully paid. There are 30,000 shares at $1 each. Board of Directors: Goodwin George, L. M. Barnes, M. Hanahan, Placerville; L. M. Howard, San Francisco; W. B. Stuart, L. Thurwatcher, Aptos; W. H. Coover, Santa Cruz. The property consists of three claims 23 miles east of Placerville, one mile from the Blue Gouge now undergoing development work by Mackay & Head. It was worked twenty years ago with a cannon ball mill but abandoned for want of harmony. The present company after considerable prospecting and cleaning the tunnels are now drifting on the ledge, a 3 foot body of ten dollar ore. A ten-stamp mill is en route. There are 250 tons of ore on the dump. There is timber in abundance and 250 inches of free water the year round.

The Lady Emma Mining Company has levied an assessment of 20c per share, delinquent May 25th.

#### Kern.

Randsburg attracts attention. If one-half what is reported from there is one-half true it is a rich spot.

Garlock's eight-stamp mill at Cow Wells is running.

The owners of the Olympus have resumed development work. The Trilby claim adjoins it. The question of water has been a problem, but there are 1000 inches at Kane springs. Cudderback wells are an inexhaustible supply. There are 200 men in the camp.

#### Mariposa.

The Hites Cove people have suspended operations and discharged the force of men.

*Gazette*: The Merced Gold Mining Company are pushing work in all their mines. Drifting is being carried on quite extensively. Sinking at the Mary Harrison still continues in good ore. The mill is running steadily with good results.

In a few days a large force of men will be put to work in the Virginia mine. A new engine has been purchased for the hoist.

The Red Banks mine is being developed with a force of twelve men.

#### Nevada.

The Sebastopol gold mine of Grass Valley is listed on the Gold Mining Exchange; capital stock, $3,000,000, with 300,000 shares of $10 each; B. G. Lathrop, president; Walter Turnbull, vice-president; V. L. Turnbull, secretary and treasurer.

The Home Gold Mining Company has levied an assessment of 5 cents per share, delinquent May 18th.

The Peabody Gold Mining Company of Grass Vally has reorganized; president, J. J. O'Farrell; treasurer, Baron Von Schroeder; secretary, B. Natorp. Electric power will be used.

The *Union* learns the Electric Power Company proposes to work the river bottom of the South Yuba, between the dam and power house of the Electric Power Company —a distance of about three miles. When the Blomfield hydraulic mine was going the methods of saving gold were crude and gold undoubtedly washed down the river.

The Boyle gravel mine on Squirrel creek has been bonded to H. A. Moss and W. G. Scott of San Francisco.

The Allison Ranch Company have not yet decided what power will be used to work their mine.

*Union*: San Francisco and Eastern men have bought the Fortuna and Orleans mines. The Fortuna, or Live Yankee, as it is also called, is on the upper Grass Valley road. The Orleans is on Gold Flat. The owners will sink a new shaft on the Fortuna 1000 feet.

#### Plumas.

The Elizabeth Town Gravel Mining Company has incorporated in San Jose, to work a gravel mine; capital, $100,000; G. W. Hanson, F. H. Smith, G. H. Salisbury, P. Lanz and J. C. Hayes directors.

#### Riverside.

Dudley Porter and others of Haverhill, Mass., in a suit against J. M. Sigafus for $1,000,000 have secured a verdict in the United States circuit court for $330,375. The plaintiffs charged that the defendant sold them a gold mine in Riverside county, and misrepresented its character. The defendant claimed that the misunderstanding arose over the incompetency or the negligence of the experts employed by the plaintiffs to inspect the mine. They also claimed that the mine was mismanaged after the sale.

#### Sacramento.

The Golden Land Placer Mining Company has levied an assessment of 1 cent per share, delinquent May 20th.

#### San Bernardino.

E. J. Baldwin is credited with intention to reopen and develop his mine on Gold mountain, near Holcomb valley.

Thomas and Wood report a discovery of a deposit of borax, five acres in extent, sixteen miles north of Barstow, and show samples of the rock, which assays better than that taken from the mine of the Pacific Coast Borax Company at Calico.

#### San Diego.

The Chucawalla Mill and Mining Company has incorporated in San Diego: capital stock, $1,000,000; president, H. E. Crepen; secretary, A. Crepen; superintendent, H. Santee.

#### Shasta.

*Free Press:* Ellery brothers, on Kline gulch, recently ran through twenty-two and a half tons of ore, which gave a return of $6000. They have a tunnel 500 feet in length on the ledge at a depth of 100 feet. The ledge varies from 16 to 22 inches.

*Searchlight:* George Schmitt and Fred. L. Rahn, purchasers of the group of mines belonging to the Forbes estate, will put up mills and the necessary works to treat their ores. The mines are located near Newtown, about seven miles north of Redding, and the ledges are large and well-defined. There are eight claims in the group, including a good mill-site, with plenty of timber and water at hand.

#### Sierra.

R. B. Harper has bonded the Salinas and Mercer quartz mine ten miles east from Downieville from J. E. Freeman. There is a ten-stamp mill upon the property.

Near Sierra City, the Butte Extension quartz mine has a tunnel 370 feet long, which taps the ledge at a depth of 350 feet. At present a crosscut is being run to tap the foot-wall ledge which contains 25 per cent sulphurets, assaying well.

#### Siskiyou.

*Journal:* The weather during the past month could not have been more satisfactory to the hydraulic miners. The cold nights have prevented the snow in the high mountains from melting too rapidly, but it has been warm enough during the day to furnish a good supply of water, which has kept the giants in operation. The miners around Oro Fino and other localities are counting on having fully as long a season as usual. Some good work is being done in the hydraulic mines in this county.

The Espey, Hunter & Co. mine at Hawkinsville has been worked with greater success than ever during the past two months.

The Distlehorst Bros. will immediately begin work on their boats near Oak Bar for the new dredger which they intend putting in.

The Horse creek ditch has been completed and the mine is now in operation. They are running one giant with a 4-inch nozzle, having a 300-foot pressure. They have a 120-foot dump.

J. R. Garrett, at Hamburg Bar, a mile below the mouth of Scott river, is putting in a large wing dam.

#### Trinity.

Four teams are at Redding from the Altoona quicksilver mine at Cinnabar loaded with 150 flasks of quicksilver valued at $60,000. The present output of the mine is about six hundred flasks per month.

*Journal:* Ricard and McCue have sold the Bunker Hill quartz mine, in the vicinity of Lowden ranch, to Messrs. Harrison & Kolman of San Francisco, for $8,000, who will erect a stamp mill and put men to work in the mine at once. Work will also be commenced on the Grove quartz mine.

The Poker Bar Placer Co. will commence May 15th to rebuild the dam which was washed out last winter. The dam is to be 600 feet long, 9 feet high and will be substantially built in every particular. About forty men will be employed in its construction. The Poker Bar Placer Co. has been incorporated with a capital stock of $2,000,000.

The McKenney mines on Mooney gulch, above Lewiston, have been bought by the St. Helena Mining Co. Active work will commence as soon as the survey is completed, in digging a ditch six miles in length, from Papoose creek to the mine. A large force of men will be worked, and it is expected that the ditch will be finished and hydraulicking begun about the first of June. The Bank of St. Helena, Napa county, is one of the principal owners.

#### Tuolumne.

Supt. Geo. J. Smith of the Grant gold mine reports that the third tunnel has advanced over 4 feet the past week, being now nearly 150 feet in length. The quartz is darker, looking better and carries more sulphurets.

The Coast Development Company has levied an assessment of 3 cents per share, delinquent May 25th.

*Independent:* The output of the Rawhide is as great as ever. The Erin-go-Braugh is being developed by sinking a new shaft. Work is being pushed rapidly on the App mine, and the 20-stamp mill is running steadily. The New Era mine has been bought by P. G. Gow of San Francisco, agent for the MacArthur-Forest process. The Tarantula mine has been purchased by Hugh McDonald of the Alameda. It adjoins the Alameda on the north. At the Old Soulsby mine a 3-foot vein

has been uncovered in the new shaft, showing free gold.

Yuba.

The Hibbert and Burris mine at Browns Valley is to be known in future as the Faust Hill Claim.

## NEVADA.

ESMERALDA COUNTY.

J. M. McSwain is reported to have made a gold strike near Cambridge, on the East Walker river. He has a shaft twenty-six feet and a six-inch ledge of ore that assays $290 in gold. This ore is being hauled to the Gignoux mill which has started up. Prospectors are going in lively. McSwain discovered his prospect while riding through the canyon; his horse stumbled over a boulder which upon being pounded up gave a return of about $50 in gold. He then began to search for the vein and soon discovered it and sank the shaft. Gold has been known to exist in the hills of that section for years, but this is the first strike that has been made that has ever promised much.

HUMBOLDT COUNTY.

The Numa Mining Co., in Trinity district, has levied assessment No. 3, of one-half cent per share, delinquent May 23.

LANDER COUNTY.

The *Reveille* hears that the Austin Mining Company has located Kingston creek and Big creek, with the view of generating electricity with which to light up Austin, and that Supt. Stokes has gone over the survey of the N. C. R. R., south of Austin, with the idea of extending the road from Austin to the Colorado river. If these improvements are made, and the big tunnel into Lander Hill proves successful, that section of Nevada will experience considerable activity in the next few years.

LINCOLN COUNTY.

At De Lamar the new mill with a capacity of 200 tons a day, will be started May 1st.

M. Wilson, manager of the April Fool, has returns from ore sent to Salt Lake, which show a valuation of $100 per ton.

The Flagstaff, south of the town of De Lamar, has been developed during the season, and is expected to be the next contributor to De Lamar's output.

## OREGON.

BAKER COUNTY.

The Columbian Mining Company has incorporated, $1,000,000 capital; V. and L. H. McDowell and W. E. Grace; Baker City. The mining property is the Columbian mine in Virtue district.

JOSEPHINE COUNTY.

Blalock Bros. are piping with a good head of water at the head of Grave creek.

Twenty men are at work on the Hampton-Lewis placer. Three giants are at work.

JACKSON COUNTY.

Wells and Taylor have leased the Lucky Bart mine on Sardine creek, and have five men at work.

The Grants Pass *Courier* says: The Gold Basin Company expects to send a party of prospectors out to the works in May to determine whether the ground justifies any more expense. The work done out there last summer was mostly thrown away, as no proper survey has been made. Some $500 was expended in setting up a sawmill alone and at this writing the water for hydraulicking will have to be raised the enormous height of 2500 feet, which according to the last expert's report, needs ground that will prospect $1 to the cubic foot. No greater than 10 cents to the foot has thus far been discovered. The company is an honest one; has paid all bills and spent its money in good faith and it is to be hoped the ground will justify going ahead.

## WASHINGTON.

OKANOGAN COUNTY.

The Okanogan Gold Mining and Milling Company is incorporated, D. W. Henley, E. S. Williams, W. T. Stoll and C. E. Adams; capital stock $750,000; to develop the Small Hope, Grand, Triumvirate, Invincible, California, Tranquility, Virginia and Carson, which adjoin and surround Triune and Spokane claims at Golden.

## BRITISH COLUMBIA.

The *Review* hears that 12,000 tons of ore from the Slocan Star mine will go out over the Canadian Pacific to the Omaha & Grant smelter at Omaha. This ore is loaded on the cars at Sandon, taken to Nakusp, then loaded on the boat and carried to Arrowhead, and again loaded on the cars. This is a long way to take the ore, but the Canadian Pacific proposes to get their share of the tonnage from Kootenay. The contract is for the monthly delivery of 1500 tons.

In 1862, says the New Denver *Ledge*, the British Columbia Government offered a bonus of $5000 to anyone who would discover a gold quartz mine and prove that it would pay at a depth of twenty-five feet. S. T. Walker, now a resident of New Denver, while on his way from Cariboo to Yale in the fall of '61 found a quartz claim on Bald mountain between the forks of Keithley and Antler creeks, assays of which went $27 in gold. Thinking to obtain the bonus he returned with some men to where he had found the ledge in July, '62. Breaking through eight feet of snow they reached the ground on the 8th of July and commenced work. After paying $16 a day wages and sinking a shaft fifteen feet deep the pay streak disappeared, and Mr. Walker was out $3200. As it was the first attempt in the Province to develop a quartz mine Governor Douglas was in favor of paying the $5000, but the Government voted it down, and Walker received nothing except the satisfaction of being the first man to open a gold quartz lead in British Columbia.

## IDAHO.

The *Avalanche* hears that Gen. Manager Grothe, of the Poorman Gold Mines, Ltd., has sent in his resignation. Supt. Hutchinson, of the Trade Dollar, is now exporting the Poorman property for the London owners.

Kleinsmidt & Bro., of Helena, who are interested in Seven Devils copper mines, authorize their agent, Weiser, to contract for the hauling of 800 to 1600 tons of copper ore during the coming season from the mines to the railroad.

About two miles from Wallace a new mill of 100-ton capacity will be erected by Burke and Gies on the Formosa mine, southwest of the Gem mine. A nine-foot ledge of concentrating ore is uncovered a distance of 300 feet. The ore assays are said to give sixty per cent lead, fifty-three ounces silver and $5 gold, it being the first gold assay known on Canyon creek.

The Black Bear mine, above the Frisco, has been idle for many years. The sheriff will sell it on the 9th of May.

At Burke the insurance adjusters are still at work estimating the loss of the Consolidated Poorman and Tiger Company. It is considered certain that rebuilding of a large plant will commence next month.

The Standard is working eighty men, the Gem fifty or sixty and the Frisco 150 men. At present the Cœur d'Alene mines are employing about the same number of union men as non-union men; and while the union men complain considerably about the cut in wages, the hard feelings of a few years ago have cooled down.

At Murray the Arizona Hydraulic Mining Company is running full time. The face of the bank is now 90 feet.

At Thiard the Jenkins mill has been running on low grade ore without striking a pocket for some time. The management has had canvas tables put in to handle the tailings over again.

## UTAH.

Speaking of Mercur ore zones, Manager Robinson says the mineralized zone is a stratum of altered limestone, ranging from 6 to 85 feet in thickness, thoroughly impregnated with arsenic in the form of realgar and mercury or quicksilver in the form of cinnabar, carrying gold in varying quantities, ranging from a trace to several hundreds of dollars a ton. The apex, or vein, is generally rather flinty limestone, which is sometimes decomposed clayey material of yellow-ocher color, which usually assays from a trace to $3 a ton. In some places in the ore-bearing zone silica has been deposited as a replacement pseudo-morphic. The hanging wall is a black clay shale, the color being due to the carbon contained. This shale usually carries the coal fossils and sometimes carries a finely disseminated iron pyrites, which is not, however, arsenical. The shale is very fissile in character and contains enough lime so that when exposed to the atmosphere it quickly slakes away to clay. The foot wall of the zone is usually hard crystalline limestone, but it is not at all uniform. Holes and channels are formed where mineral solutions have replaced the lime, and in these channels the ore is generally of better quality than is the general average of the whole mass. In many places the workable zone has developed a thickness of twenty-four to thirty feet, and the average thickness of the ore bodies may be placed at fifteen to eighteen feet. The direction of the foot-wall channels may be stated as approximately parallel with the local dip of the strata. The appearance of the ore is yellow, brown, red brown, sometimes gray or black, and the limestone itself, when it is colored, usually carries good working values. The payable portion of the ore of the vein on the foot-wall side can only be determined by assay, while the hanging-wall side is distinctly marked.

The vein in the Mercur district is not a vein at all as the term is usually understood. A better name would be an inter-calate vein or mineralized zone of country rock. The Germans, recognizing this character of deposit, have given it the name of a "fahlband," meaning a rotten stratum. It is undoubtedly true that the silica occurs as a chemical replacement, and the only difference between the Mercur district and other localities farther south is that in the Mercur district the chemical intercharge is as yet incomplete. At the Mercur district the payable values do not always follow one stratum. There is evidence that there are at least three separate and distinct mineralized zones. It is also probably true that the whole area of the country will not be underlaid with gold-bearing rock in payable values, but that the shoots will assume definite boundaries with a trend lying between the walls in a definite and direct course. As to what this direction is at the present time has not been determined. There has been some discussion among mining men as to the probability of the ore-bearing zone at Mercur carrying with it extra lateral rights. From the general construction of the zone, and the fact that there is hardly an instance in the Mercur district where the letter of the mining law has been strictly complied with, it will be very difficult to enforce mining rights on the dip of the vein outside of the vertical boundaries projected.

The Park City *Record* severely condemns the Morgan mine at Hardscrabble; it has had tests made by five assayers. The analysis showed the rock to contain 63.822 silica; 32.68 specular iron (an oxide); 1.135 iron pyrites, making a total of 97.637 per cent. The balance, 2.363 per cent, was decided to be organic matter. These assays are all vouched for as being absolutely correct.

The *Tribune* has information that the Copper plant owners will resume by June 15th. Upon the smelter at the present time there has been expended between $300,000 and $400,000. To put the plant in condition that it may enter the market and compete for ores with a capacity for reducing them implies an expenditure of perhaps $30,000 on the plant itself; this, of course, not including the electrolytic feature for the refining of the product. At present the plant is provided with one furnace with two reverbatory furnaces which will enable it to handle over 100 tons of ore a day, while to increase this would involve an outlay of but about $25,000, which would then afford employment for over 100 persons.

## MONTANA.

The 100-ton concentrator plant of the Chicago & Montana Mining Company, near Libby, is finished. Supt. Lacoursier has a pressure of 205 pounds on the water gauge in the mill. The Snow Shoe mine, the principal one of the group, will supply 150 tons of ore daily.

THE ANACONDA DIVIDEND.—*Inter-Mountain:* The sensational event of the week in mining circles has been the declaration of the Anaconda dividend of $750,000.

It is the greatest amount ever declared by a Montana mining company.

We think it is the greatest dividend ever declared by an American copper company.

It is the greatest dividend ever declared on the Pacific coast since the Comstock days, if not since the discovery of the Comstock itself.

It is a wonderful thing for the city of Butte and the State of Montana.

It is a great credit to the management of the company and will probably not be objected to by the stockholders.

Beside, it will be repeated every four months.

In all respects the Anaconda is now the greatest mining enterprise in the world.

[The above is worthy of reproduction as illustrative of the importance of Pacific coast mining interests. Without detracting from the magnitude of the Montana dividend it is in order, however, to state that greater mining dividends have been paid and are now being paid. Twenty years ago, on the Comstock, one mining corporation alone, the Con. Cal. & Va., used to pay monthly dividends of $1,080,000. Greater dividends than $750,000 every four months are now being paid by one individual mine in this State.—ED. MINING AND SCIENTIFIC PRESS.]

## WYOMING.

Edholm & Aikin of Deadwood, S. D., are preparing to reopen and develop some old prospects made at Spring Hill in 1868. Three brothers were killed by the Indians and their mines have remained untouched until the present time. Work on the mines in the Copper Mountain district is progressing. The tunnel being driven on the Albion property is in 150 feet and in rich ore. On the Cœsus the tunnel is in 200 feet. The Gold Coin Mining and Milling Company is being formed, Messrs. Bracken, West and Morgan as incorporators, to work the Emma G., Clara B., King Solomon and Minneapolis prospects.

## COLORADO.

The Pike's Peak Tunnel Mining Railway is the name of a company registered at New York City that proposes to tunnel through the heart of Cripple Creek at the average depth of 2500 feet, and to pass under the Victor 4000, Portland 3500, Rebecca 3550, and Independence 3200 feet from the surface.

Work has begun on the chlorination works to be built at Colorado City by the Colorado Philadelphia Company. The *Prospector* says the daily capacity of the mill at the outset will be 200 tons, and the cost of the plant and site will be about $300,000.

At the Tomboy mine in San Miguel county a forty-stamp mill is ready to handle the ore of the company's purchase in the Gunnison gold belt. During the winter a force of men has been employed in sinking a shaft 250 feet and drifting 1000 feet on the ledge, a continuous ore body averaging about seven feet wide of $12 quartz.

AT IDAHO SPRINGS.—Because of the demand for milling facilities for the treatment of low grade ore, J. G. Roberts, manager of the Silver Age mill, has begun preparations for the erection of a 100-ton capacity mill, within the town limits at the point where Chicago creek empties into Clear creek. The water for power will be taken from Chicago creek.

*Mining Industry:* Platinum is reported to be found in the Annie C. C. mine, Swiftwater district, Chaffee county, at the rate of three ounces per ton. The ore of the Annie C. C. runs from $75 to $105 in gold, and the addition of platinum to the extent reported should add materially to the values. Just how the platinum occurs is not made clear. The chief ore of the Annie C. C. is a white sulphide of iron in white quartz.

*Mail:* The continued shipping of silicious ores to the smelters has created a demand for the dry ores of Cripple Creek that has made a heavy reduction in the smelting charges and will no doubt have a beneficial result in the production of the mines of the camp. Representatives of two leading smelters are now in camp making contracts with some of the larger mines for the treatment of their ores at $7 and $8 a ton. Efforts are made to keep the new rate secret and representatives are quietly making all the contracts they can at the reduced prices, and the agent of one the largest plants in the State will reach camp to-morrow to protect his company from the inroad that is being made by its competitors. This cut from $14 to $7 and $8 will undoubtedly stimulate production and at the same time make the smelters formidable competitors of the mills that have been getting almost as much for treating the ores as the new rates of the smelters. With a $7 smelter rate and a $5 freight rate it will be possible for some of the low-grade ores now going through the mills to be shipped to the smelters instead.

## NEW MEXICO.

GRANT COUNTY.

AT PINOS ALTOS.—*Enterprise:* The Golden Grant employs thirty miners working constantly on ore. The mill is turning out gold bullion and concentrates.

Spiller and McLean have twenty men at work on the Pacific company's claim on the Pacific vein. Ten stamps of the company's mill near Silver City are crushing ore.

A. Hersberger is working twelve men on the Western.

Eighteen men are employed on the Atlantic mine, sinking and crosscutting.

W. C. Chandler has twenty-six men at work on the first, second and third levels of the Mountain Key. The ore produced runs over two ounces per ton on the plates. The ore is being reduced at the Stanley-Martin mill.

## ARIZONA.

Dr. Theo B. Comstock, representing the Prescott Development syndicate of Glasgow, Scotland, has purchased the Elkhart mine at Chloride, Mojave county, twenty-five miles northwest of Kingman.

Positive denial is received of the alleged sale of the Casey mine, Dos Cabezos, Cochise Co. It is neither sold nor bonded.

The Golden Cross Mining Co., has organized at Yuma, Arizona; Mullins, Fuller and Hedges; capital stock, $10,000,000, amount paid up unstated. The articles of incorporation have been filed in San Diego, Cal.

## SOUTH AFRICA.

General Manager Mein reports the following operations of the Robinson company for February, coupled with statements of expenditure and revenue: Mine. Quartz mined, 14,075 tons.—Development. Drives, 693 feet; raises, 171 feet; crosscuts, 110 feet; total, 974 feet.—Main incline shaft (west): Fifth level. Driving west on south reef 16 feet.—Sixth level. Driving east on south reef 39 feet.—Seventh level. Driving west on main reef 40 feet; driving east on south reef 35 feet.—Eighth level. Driving west on main reef, 49 feet; driving on south reef 15 feet.—Ninth level. Driving east and west on main reef, 62 feet; driving west on south reef, 40 feet; raise, 39 feet; crosscut, 32 feet.—Tenth level. Driving west on main reef, 33 feet; driving east and west on south reef, 12 feet; raise, 37 feet.—Main incline shaft (east): Fourth level. Raise 55 feet.—Fifth level. Crosscut 29 feet.—Sixth level. Driving east and west on main reef, 60 feet; driving west on south reef, 31 feet.—Seventh level. Crosscut 49 feet.—Eighth level. Driving east on main reef, 36 feet; driving east and west on south reef 78 feet.—Ninth level.—Driving west on main reef 40 feet, driving east and west on south reef 44 feet.—Tenth level. Driving west on main reef 26 feet, driving west on south reef 37 feet, raise 40 feet. Total 974 feet.—Mill. Stamps at work 120, net running time 25½ days, tons crushed 14,075, tons per stamp per diem 4.6, gold won from above 8866 ounces 11 dwts.—Chlorination and cyanide works. Gold won from own concentrates (by chlorination) 1038 ounces, bullion from tailings (cyanide process) 1713 ounces, 13 dwts., bullion from slimes (Rand Central Ore Reduction Company, Limited) 1316 ounces 18 dwts., from own ore 12,935 ounces 2 dwts., gold from concentrates purchased (by chlorination) 1887 ounces 3 dwts. Total 14,822 ounces 5 dwts.

EXPENDITURE AND REVENUE.

Crushed 14,075 tons.

Working expenditure.

| | | Cost per ton. |

## NEW SOUTH WALES.

The Rothschilds have acquired a large interest in smelting works projected on an extensive scale for the treatment of silver ore from Broken Hill by the Ashcroft process. The company termed the New Sulphite corporation has purchased a site at Cockle creek, about twelve miles from New Castle, and works costing $290,000 are being erected, to employ 1600 men.

## Coast Industrial Notes.

—Last week the price of onions was $18 per ton, now it is $50.

—Newell Bros. are building a large soap factory on Army street, this city.

—Frosts have sent the price of grapes in Sonoma county up to $25 per ton—the highest for years.

—The track of the San Joaquin Valley road has reached the Merced river, which is now being bridged.

—A bill has passed both houses of Congress establishing a naval station on Goat island, in San Francisco bay.

—Southern California orange growers figure on a profit of $1.30 per box this season. Many groves produced from 200 to 300 boxes an acre.

—The Union Iron Works will expend $100,000 this summer in the construction of two buildings at the Potrero, an office building and an additional workshop.

—The Enoch Talbot is at Redondo loading oil for this city. At a recent meeting of the directors of the Los Angeles Oil Exchange a sale was made to the Arctic Oil Works of San Francisco of 9000 barrels.

—Oakland is sometimes charged with being a little slow, but the steamship Kodiac, for the Alaskan trade, 100 feet long, 22 feet beam, 9½ feet depth of hold, was recently built there in twenty-four days.

—Over nine years ago, March 3, 1887, Congress appropriated over $350,000 for the purchase of a site for a new postoffice in this city. The appropriation has since been increased and hope is entertained in some quarters that in nine years hence work may begin on the structure.

—Committees representing the Mechanics' Institute and the Manufacturers' and Producers' Association have about arranged a preliminary basis of operations to effect the union of the two organizations in an exposition of California products and manufactures next fall, under the joint management of both bodies.

—The U. S. Supreme Court this week decided that the Central Pacific Railroad Co. must pay taxes on the lands of its grant within the State of Nevada which have been surveyed but not patented, the costs for the survey not being paid, the taxation of such land being specifically authorized by act of Congress of July 10, 1886.

—The *Lumberman* reports that the total rail shipments of lumber from the State of Washington via the Northern Pacific, Great Northern and Canadian Pacific railroads in March were 762 cars as against 423 in March, 1895. The total number of cars of shingles was 1220, as against 1097 in March, '95, an increase this year of 239 cars of lumber and 123 cars of shingles.

—Five bushels of wheat are supposed to be required for a barrel of flour. According to a prominent California miller, by the new process four and a half bushels of wheat will make a barrel of fine flour. The figures are as follows:

| | *Per Cent of Wheat.* |
|---|---|
| Screenings | .04 |
| Finest flour | .12 |
| No. 1 flour | .25 |
| No 2 flour | .19 |
| No. 3 flour | .06 |
| Middlings | .20 |
| Bran | .14 |
| Total | 1.00 |

## Recently Declared Mining Dividends.

THE regular Alaska Treadwell dividend of $75,000 will be paid on the 28th inst.

THE Highland mine, South Dakota, pays its regular dividend of 25 cents per share this week.

THE Boston and Montana Mining Company has declared a dividend of $2 per share, payable May 20th.

THE Alaska-Mexican Mining Company, Douglas Island, Alaska, has declared a quarterly dividend of 10 cents per share, $18,000, payable on the 28th.

## Commercial Paragraphs

THE Dodge Mining Machinery Co., M. B. Dodge manager, have opened an establishment at 65 First street, this city, and exhibit a line of improved mining appliances.

Two 150x14 feet Ropp Straight Line Furnaces have been shipped to the Broken Hill Proprietary Co. by the Parke & Lacy Co. of this city. That firm this week sent a new plant to Monroe Salisbury, who is developing the newly purchased Salisbury mine near Placerville, El Dorado Co., Cal.

**No Intelligent Miner Should Be Without It.**

The MINING AND SCIENTIFIC PRESS gets more interesting every week. Last week's PRESS contains 32 pages. It is the only weekly mining paper in the State giving the general mining news of every district on the Pacific Coast, besides scientific and other valuable information. It is cheap at $3.00 a year. No intelligent miner should be without the PRESS. Georgetown *Gazette*, April 16, '96.

**"HISTORY OF CRIPPLE CREEK."**

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colorado.

## Personal.

PAUL FOREST is now foreman of the Crown Point mine, Grass Valley, Cal.

D. H. JACKSON of El Dorado, is in the city arranging for further mining developments.

C. H. MORGAN succeeds Capt. Nihell as superintendent of the Brunswick mine, Grass Valley, Cal.

EX-GOV. N. B. WILEY of Idaho will be superintendent of the Redstone quartz mine at Blue Canyon, Placer Co.

W. S. MORSE of Prescott, Arizona, has been appointed general manager of the Huautla Santa Ana S. M. Co., Morelos, Mexico.

THOS. COUCH, manager Merced Gold Mining Co., has deferred his proposed European trip, and is at present in Salt Lake City.

J. D. FARRELL has been appointed general manager of the mining interests in Slocan district, B. C., of A. E. Humphreys and W. H. Yawkey.

HENRY A. BUTTERS has returned to Oakland, Cal., from the City of Mexico, where he recently purchased the street railway system of the Mexican capital for $7,500,000.

H. C. PERKINS of Oakland, Cal., who is succeeded in the management of the Deep Level Development Co.'s mines, near Johannesburg, S. A., by Geo. Weber, will return home via London, arriving here about July 1st.

GEO. E. WEBER, another California miner who is adding to his fame and fortune in South Africa, has assumed the management of the Deep Level Development Co.'s mines near Johannesburg at an annual salary of $25,000.

CURTIS H. LINDLEY returned this week from Washington, where he made a successful argument before the Supreme Court of the United States, opposing the granting of a review in the Providence-Champion end-line litigation.

CAPT. THOS. MEIN, general manager of the leading mine at Johannesburg, South Africa, expects to leave there May 6th, for his home in Oakland, Cal., to arrive about June 15th. He is credited with being about $1,500,000 better off than when he left California.

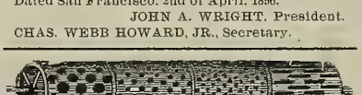
**All That Its Title Implies.**

An acquaintance of thirty-six years with the mines and mining industry of California, has made the MINING AND SCIENTIFIC PRESS, of San Francisco, all that its title implies. It is the best and most instructive mining journal in the world. And the valuable notice and space which it gives to the mines of El Dorado should be recognized and repaid by the liberal patronage of their owners.—Placerville *Democrat*, April 18, '96.

**A Wide Circulation.**

That master of mining journals, the MINING AND SCIENTIFIC PRESS, of San Francisco, Cal., in its issue of April 11, has an illustrated article on Cripple Creek by T. A. Rickard, State Geologist of Colorado. That the article will be given a wide circulation and do Colorado and this camp much good goes without saying.—Cripple Creek *Mail*, April 18.

**GOLD MINING PROPERTIES.**



Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 68, Placerville, Cal.

TO THE STOCKHOLDERS OF THE SOUTH PALOMA GOLD MINING COMPANY, LIMITED:

Notice is hereby given that by resolution of the Board of Directors of the corporation, adopted on the 21st day of March, 1896, a meeting of the stockholders of the corporation was called for the purpose of increasing the capital stock to the amount of two hundred thousand dollars, to be divided into one hundred thousand shares of the par value of two dollars per share, and of determining the disposition to be made of the increased capital stock; and it was resolved that such meeting shall take place at the principal place of business of the corporation being the same building where the Board of Directors usually meet, to wit: No. 212 Sansome street, room 17, in the City and County of San Francisco, on WEDNESDAY, the 10th day of June A. D., 1896, at 11 o'clock in the forenoon of that day.

Dated San Francisco, 2nd of April, 1896.

JOHN A. WRIGHT, President.
CHAS. WEBB HOWARD, JR., Secretary.

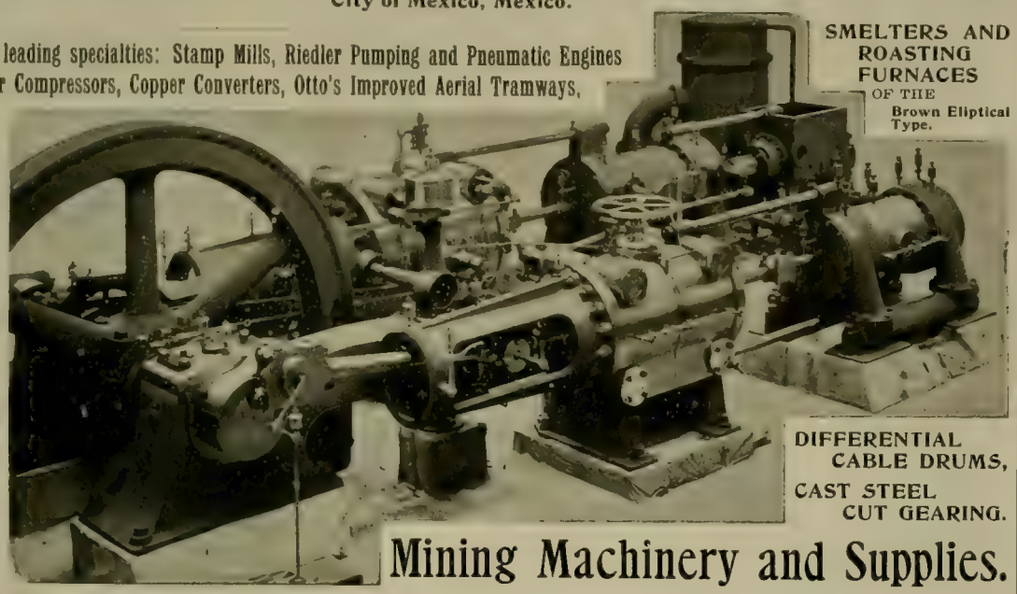
PENBERTHY INJECTOR CO., 130 Seventh Street.....DETROIT, MICH.
PARKE & LACY CO., Agents, 21 & 23 Fremont Street SAN FRANCISCO, CAL.

This doesn't happen every day. You can't expect it more than a few times in a lifetime. No one is going to agree and guarantee positively to save you 30 per cent or else no pay unless they know what they are about. You can't expect people to say, "You need not pay for this until you have proved our guarantee," unless they intend to do all that they claim. As a matter of fact, we do more than we claim. We guarantee to save 30 per cent, but actually we save a good deal more.

Have you ever heard of a Double Pipe Air Compressor? It has one disadvantage. It needs twice as much piping as is needed with the ordinary makes of Air Compressors. On the other hand, it has more real, genuine advantages than you can shake a stick at. It will do the same work as the ordinary Air Compressors, such as are in general use throughout the mines on this coast, on 30 per cent less power. We will guarantee this and prove it to your satisfaction, else you need not pay for the Compressor. It weighs less than half as much as the ordinary Air Compressor. It costs less for freights and is more easily carried up into the hills. It shows the same high efficiency at all altitudes, high or low. It takes no more fuel to do the work if located on the highest peak of the Sierras than it would take if located at the sea level. It enables you to buy a smaller boiler than you can use with any other Air Compressor to do your work. It does not overheat the air at the Compressor and freeze it at the rock drill. In short, it is the ideal Air Compressor. It has been tried in practice, and we can show you the highest recommendations and endorsements. We sell it on a strict, positive, iron-clad guarantee. If your power costs you anything, you want the Double Pipe Air Compressor, because you can buy it on a guarantee that it will run on 30 per cent less power than any other make of Compressor. If you have to take a Compressor to your mine over bad roads, you want the Double Pipe Air Compressor, because it weighs less than half as much as any other Compressor. It is cheapest to buy, cheapest to run, cheapest to transport, cheapest to carry anywheres. For pumping it beats the world. You can run it with steam or water.

Write to the Pneumatic Power Co. for further information. If you are in the city and want a compressor, call and see them. They will show you the Double Pipe Air Compressor in operation. Remember you run no risk. We claim wonders, but we have to perform wonders in Air Compression, or else you don't have to pay for the machine. We are ready. Are you?

Pneumatic Power Co., 306 Pine St., Room 10, San Francisco, Cal.



**STAMP MILL WANTED.**
Will give one-third of a good milling proposition for a small stamp mill to operate on the property; enormous quantity of ore in sight. For particulars address Box 53, Jackson, Cal.

## THE GOLD and SILVER EXTRACTION COMPANY, OF AMERICA.

LIMITED.

## MacArthur-Forrest Process.

CAPITAL, - - - £110,000 STERLING.

To MINE OWNERS and others having Refractory Gold and Silver Ores hitherto untreatable at a profit, the MACARTHUR-FORREST (Patent) Process of Gold and Silver Extraction offers a solution of the difficulty.

Advisory Board in the United States: Thomas W. Goad, Manager; Hugh Butler, Attorney; John F. Bell; P. George Gow.

California and Nevada Agency and Experimental Plant, 23 Stevenson Street, San Francisco, Cal. P. G. Gow, Sole Agent.

OFFICE: MCPHEE BUILDING, DENVER, COLORADO.

## MILLS BUILT WITH GUARANTEE OF SUCCESSFUL OPERATION.

## KENDALL GOLD AND SILVER EXTRACTION CO.

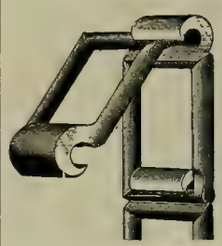
The Kendall Process is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

*The Kendall system is covered by patents which this company will defend.*

The American Cyanide Gold and Silver Recovery Co., organized in Denver more than a year ago to introduce and operate the Kendall Process in several States, have closed contracts with some ten mines for the use of this process after exhaustive comparative tests with the ordinary plain cyanide method.

Capt. De Lamar has adopted the process at his Nevada mines, where a 250-ton plant is being completed. He writes that he is saving 95 per cent of his gold values, and regards the Kendall Process as the cheapest and best he is aware of for the treatment of gold ores.

*All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.*



Owners of mines and reduction works can obtain full information on application to

**KENDALL GOLD AND SILVER Extraction Company,**

## SHEET IRON & STEEL PIPE

FOR TOWN WATER WORKS.

**Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.**

130 BEALE STREET, SAN FRANCISCO, CAL.

Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared or coating all sizes of Pipes with Asphaltum.

## The General Gold Extracting Co., Ltd.,

PELATAN-CLERICI PROCESS.

Patented in U. S. and Other Countries. Capital, £100,000.

London Head Office..... 8 Drapers Gardens.

Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.

Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.

F. CLERICI, Manager for U. S.

## PACIFIC REFINING AND ROOFING CO.,

153 CROCKER BUILDING, SAN FRANCISCO.

COAL TAR, Raw and Refined,
ROOFING AND PAVING PITCH,
ROOFING AND BUILDING PAPERS.

PAINTS of Superior Quality, for Boilers, Tanks, Bridges and Roofs.

WORKS AT POTRERO. CORRESPONDENCE SOLICITED.

## HORACE F. BROWN, CONSULTING ENGINEER.

Special attention given to preparing plans for the Chlorination and Bromine Processes of Treating Gold Ores.

PATENTEE { Brown's Complete Automatic Mill Process. Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces, Etc.

821-822 Manhattan Building, Chicago, Illinois.

## RUPTURE CURED.

Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absolutely without danger. Usually but a single treatment required.

# The Pelton System of Power

Represents the highest development yet attained in water wheel practice and affords the most simple, efficient and economical means of utilizing water for power purposes.

## Six Thousand Wheels Now Running,

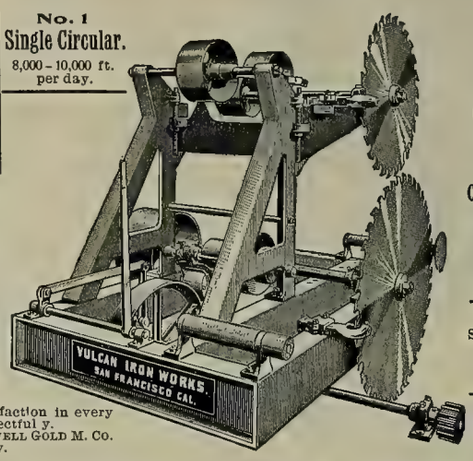
Aggregating over 400,000 horse power. Adaptation made to all conditions and every variety of service.

## Electric Power Transmission.

PELTON WHEELS are the recognized standard for electrical work and are running a majority of the stations of this character in all parts of the world.

Catalogues furnished upon application. Address

**THE PELTON WATER WHEEL CO.,**



121 MAIN STREET, SAN FRANCISCO, CAL.

# Portable Saw Mills.

**No. 0 Single Circular.** 4000 – 6000 feet per day.

**No. 1 Single Circular.** 8,000 – 10,000 ft. per day.

**No. 2 Double Circular.** 15,000–20,000 ft. per day.

Alaska Treadwell Gold Mining Co. SAN FRANCISCO, Feb. 20, 1896.

*Vulcan Iron Works,*

GENTLEMEN: Our Double Circular Saw Mill of about 20,000 feet daily capacity, for which you made plans and built the machinery complete, including a set of three 6-inch beam Vulcan Head Blocks, 60-inch opening, has given us complete satisfaction in every respect. Respectfully,

ALASKA TREADWELL GOLD M. CO.
A. T. CORBUS, Sec'y.

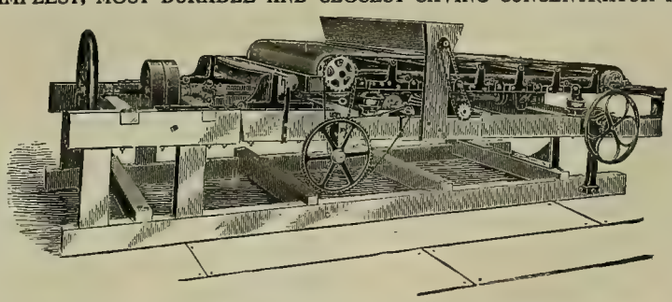
# The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.



NINETY-FOUR AND ONE-HALF PER CENT —SAVED— ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.

THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

# Market Reports.

## The Markets.

SAN FRANCISCO, April 23, 1896.

Cold and unseasonable weather the past week interfered with the distribution of goods. Although general trade is reported quiet, yet jobbers express themselves as looking for a better and more healthy business than for years past. Well distributed rains, combined with cool weather, have been of the greatest possible advantage to growing wheat. If present prospects for a large outturn to the acre are realized, it will admit of many old debts due from farmers to the retail trade being paid the coming fall. Frosts have unquestionably done considerable damage to some varieties of tree fruits, but this will not be an unmixed evil, for, with a less crop, better prices ought to rule for that which comes to maturity.

From the gold mining districts come confirmed advices of continued activity. More foreign and Eastern capital is being invested, which promises to enlarge as the season advances. New York mail advices are to the effect that considerable English, German and French capital is seeking investment in American gold mines. Referring to this the York York *Wall Street Journal* says: "A prominent firm received a letter yesterday, from London, from one of the leading houses there which has recently become interested in American mines, to the effect that London was directing its attention to American mines more than it had ever done before, and this disposition was stimulated by the South African troubles. West Australia has had a considerable boom and now it is believed that American mines will be taken up in earnest. Several prominent experts, among them noted South African miners, are coming to America this spring and will inspect gold mines in various localities. What they report will be accepted freely, and a large flow of capital to America is looked for."

With iron workers in this State business continues good for machinery, structural and railroad material.

Eastern advices state that the money markets are growing easier. This ease is shown in the disposition to place funds at slightly lower rates of interest, and also less scrutinizing of commercial paper. It is stated that with free exporting of grain in next month the ease in the money market will be more pronounced. European advices continue to state that money is more or less of a drug and investments are being sought, which is imparting a better tone to American securities, causing quite a perceptible advance in the more desired class on that market. In our own market there seems to be a growing ease as confidence increases that we have entered on a new era of prosperity.

### New York Silver Prices.

NEW YORK, April 23.—Following are the closing prices for the week:

| | Silver in London. | Silver in N. Y. |
|---|---|---|
| Friday | 31 | 67¾ |
| Saturday | 31 | 67¾ |
| Monday | 31 | 67¾ |
| Tuesday | 31 | 67¾ |
| Wednesday | 31 | 67¾ |
| Thursday | 31 | 67¾ |

| | Copper. | Lead. | Iron. | Tin |
|---|---|---|---|---|
| Friday | 11 00 | 3 05 | 11 00@13 50 | 13 35 |
| Saturday | 11 00 | 3 05 | 11 00@13 50 | 13 35 |
| Monday | 10 87½ | 3 05 | 11 00@13 35 | 13 40 |
| Tuesday | 10 75 | 3 05 | 11 00@13 35 | 13 40 |
| Wednesday | 10 75 | 3 05 | 11 00@13 35 | 13 35 |

The local bullion, money and exchange quotations current are as follows:

| | |
|---|---|
| Commercial Loans, % per annum | 7@8 |
| Commercial Loans, prime | 6@8 |
| Call Loans, gilt edged | 7@8 |
| Call Loans, mixed securities | 7@8 |
| Mortgages, prime, taxes paid by lender | 6@8 |
| New York Sight Draft | par |
| New York Telegraphic Transfer | par |
| London Bankers' 60 days | $4.88 |
| London Merchants | $4.86 |
| London Sight Bankers | $4.89½ |
| Refined Silver, per oz., 1000 fine | 67⅝c |
| Mexican Dollars | 54¾@55¾c |

SILVER.—The market has held steady throughout the past week. In this city the demand is light, but the East reports a continued fair export movement. From Europe press telegrams report that there is a movement to bring about an international bimetallic convention in the interest of silver. It would seem as if the time is approaching when such a movement can be inaugurated and carried to a success. This desired end will probably be hastened by the large and increasing output of gold, a decreasing output of silver and the general improvement in business which has set in abroad. In the United States the production aggregated as follows: Silver, 1894, 49,846,875 ounces, and 1895, 46,331,235; gold, 1894, 1,923,619 ounces, and 1895, 2,265,612. So far this current calendar year the output of silver is less than for the corresponding time of 1895, while that of gold is from 25 to 33⅓ per cent more.

MEXICAN DOLLARS.—The market has been quiet but steady. The export inquiry is not up to what it had been estimated it would be in this month. Dealers quote from 54¾ to 55¾ cents.

COPPER.—The market is essentially unchanged, but at the East it has shaded off, closing fairly steady. At the advance in New York the export movement slackened some and as the offerings increased buyers bid lower. The production in this country compares in tons as follows: 1893, 129,760; 1895, 142,543; 1895, 155,397. The exports for the first quarter of the year compare as follows in tons: 1894, 19,087; 1895, 14,196; 1896, 27,465. The statistics of European visible supply are remarkable, showing, as they do, a decrease to 39,540 tons, in the face of the late heavy shipments from the United States. A month ago the recorded visible supply was 41,000 tons, and that for February 15th about 43,990 tons. Spot stocks in the European markets were 40,420 tons two months ago, and 37,890 tons on March 15th, as against 36 240 tons on the middle of the current month.

The market is quoted as follows:

| | |
|---|---|
| Bolt | ¼ & 5-16, 20c; ⅜ and larger, 17c |
| Lake Superior Sheathing | 20 |
| Ingot, jobbing | 13 |
| Ingot, wholesale | 12 |
| Sheet copper | 17 |

COAL.—There is a continued free consumption of household, owing to cold and unseasonable weather. It is reported that the demand for steamer shows a slight increase, with the outlook promising a further enlargement as the season advances. The stocks on hand show a decrease, but this is offset by free offerings of cargoes to arrive, and for prompt shipment.

SPOT FROM YARD—PER TON.

| | |
|---|---|
| Wellington | $7 50@ 8 00 |
| Greta | 6 00@ 6 50 |
| Nanaimo | 6 50@ 7 00 |
| Gilman | 5 50@ 6 00 |
| Seattle | 5 00@ 5 50 |
| Coos Bay | —@ 4 50 |
| Cannel | —@ 8 00 |
| Egg, hard | —@13 00 |
| Wallsend | —@ 6 50 |
| Scotch Splint | —@ 7 50 |
| Brymbo | —@ 7 50 |

TO ARRIVE—CARGO LOTS.

| | |
|---|---|
| Australian | 5 25 |
| Liverpool Steam | 6 25 |
| Scotch Splint | — — |
| Cardiff | 6 25 |
| Lehigh Lump | 9 00 |
| Cumberland | 13 50 |
| Egg, hard | 10 00 |
| West Hartley | 6 50 |

COKE.—The market is quoted as follows:

| | |
|---|---|
| Gas Companies' | — — |
| English, to load | 9 00 @ 10 00 |
| " spot, in bulk | — — @ 8 50 |
| " in sacks | — — @ 9 50 |
| Cumberland | — — @ — — |

LEAD.—There is nothing new to report either in our market or at the East. The output of the mines in this country shows a steady decrease. In 1894 the production was 160,867 tons and last year 156,854 tons.

The market is quoted as follows:

| | |
|---|---|
| Pig | 3 75 @ 4 00 |
| Bar | — @ 4 15 |
| Sheet | — @ 5 50 |
| Pipe | — @ 4 75 |

SHOT.—There is nothing new to report.

The market is quoted as follows:

| | |
|---|---|
| Drop, sizes smaller than B, per bag of 25 lbs | $1 40 |
| Drop, B and larger sizes, " " | 1 65 |
| Buck, Balls and Chilled, do. " " | 1 65 |

TIN.—For tinplate there is a light demand at unchanged quotations. The consumption of American plate on this coast shows a large increase, while that of foreign has decreased correspondingly. Pig tin at the East and abroad was held fairly steady. The market is largely dependent on the price of silver.

The market is quoted as follows:

| | |
|---|---|
| Pig, per lb | 14½c |
| Plate, I C coke, heavy, per box | $4 25 |
| " " " light, " | 4 10 |

ANTIMONY.—The market is steady at 9 cents as an outside figure. New York mail advices quote 7⅞@8c for Cookson's, 6⅞ for Hallett's and 6¾c for Japanese, from store.

QUICKSILVER.—The market is quiet at steady quotations. The production in this country was as follows in flasks of 76½ lbs.: 1894, 30,440; 1895, 33,978.

The market is quoted as follows:

| | |
|---|---|
| Home trade, per flask | 39 00 |
| Distant points up north | 38 00 |
| West coast of Mexico, for export | 34 00 |

POWDER.—A continued fair demand is reported at unchanged quotations.

The market is quoted as follows:

| | |
|---|---|
| Hercules, No. 1, per pound | 11½c |
| " No. 2, " | 8½c |

BORAX.—The market is firm, and quoted as follows:

| | |
|---|---|
| Refined, in car lots | 6⅛ |
| Refined, in sacks | 5⅞ |
| Powdered, in car lots | 6¼ |
| Concentrated, " | 5⅝ |

LUMBER.—Advices from the lumbering camps up north state that the export movements so far in this year show a gain over the corresponding time in 1894. In this city the market is quiet but steady.

The market is quoted in this city from dock or yards as follows:

| | |
|---|---|
| Redwood, Fluming | 16 00 @ — — |
| Pine | 13 00 @ 18 00 |
| Spruce | 25 00 @ 30 00 |

NAILS.—The market is quiet but firm. The nail works at Oakland and in Washington are reported as running on full time. The company operating the two largest plants on this coast, while not in the Eastern combine, does not seem to work against it.

The market is quoted as follows:

| | |
|---|---|
| Wire, carloads, basis per keg | $3 07½ |
| " jobbing, " " | 3 20 |
| Cut, carloads, " " | 2 82½ |
| " jobbing, " " | 2 95 |

IRON.—A continued free consumption is reported on this coast, particularly by iron workers in this city. The market is essentially unchanged. The United States has grown to be the largest producing country in the world. Last year we made 9,000,603 metric tons of pig iron; Great Britain turned out 7,620,000 tons; Germany, 5,788,798 tons; France, 2,005,880 tons. A leading New York exchange says: "The prominent iron men, who are in the city, are particularly well pleased with the iron outlook. They say the business never was in better condition or position than it is to-day. As to orders, nearly all of the large manufacturers say they have more orders than at this time last year and are satisfied that the demand for and consumption of iron in its various forms will be as large or larger than last year. The Illinois Steel Co., for example, has order on its books for 140,000 tons more steel rails than at this time last year. It seems to be the universal feeling that iron interests this year would get a fair return on their output, and this output was certainly expected to be a very large one."

Our market is quoted as follows:

AMERICAN.

| | To Arrive. | Spot. |
|---|---|---|
| Sloso | $21 00 | $23 50 |
| Thomas | 22 00 | 23 50 |

ENGLISH.

| | | |
|---|---|---|
| Barrow | $21 00 | $23 50 |
| Gartsherrie | 21 50 | 23 50 |

## Mining Share Market.

SAN FRANCISCO, April 23, 1896.

The market under the lead of Occidental has been more active, yet disappointing to the operators long on the market, owing to each little strengthening being followed by a decline. Last Friday there was no outward indication of a strengthening in prices which caused some of the more venturous professional traders to sell short. On Saturday Occidental showed more life, and under a fair demand the price advanced, causing the entire list to firm up. Monday the market opened strong, active and higher, with Occidental selling at $1.45 and $1.50 a share, which was a gain of 100 per cent on the lowest price touched this month. The shares in the Comstock mines moved up from 5 to 15 per cent on Friday's sales. The jump in Occidental was due to quite a number of short sellers, principally in the Pacific Stock Exchange, filling. This they did owing to official advices that $2 gold ore had been struck. With their filling, some long realizing and a few selling short, the prices set back, carrying the entire line with it. At the decline Hale & Norcross sold down to $1.05 and $1.10, the lowest price for some time; Crown Point to 27 cents, Occidental and Ophir to $1.10 each, while the others sold off from 5 to 15 per cent on Monday morning's highest figures. On the declining market several professional traders gained courage and put out a line of shares, particularly Occidental. Wednesday morning the market for Occidental, Hale & Norcross and Ophir opened higher—the former at $1.30 and $1.35, and two latter at $1.20 and $1.25, with shorts the principal buyers, owing to reports of three feet of gold ore being struck in the former which assayed about $80 a ton. After this spurt prices shaded off again. At the decline there seems to be some hesitancy on the part of the professionals to put out a line of shares. The action of the market gives coloring to the belief that shares in several of the mines are well in hand, or else are under manipulation. The writer maintains the opinion expressed last week, that the range of values for shares in the Comstock mines is lower than the work in them warrants, and whenever this is the case, two or more small outside pools can combine and promote a small up-move at most any time, so as to unload on the more credulous. The shorts in Bodie and Bulwer have exhibited more activity with livelier fluctuations than for many months past, but what the moves have been based on it is difficult to say.

From the Comstock mines our advices, taken as a whole, continue of a fairly favorable character. Much of the dead work which has been under way for some time has given place to exploiting. In the Alta group, so far as official reports go, no work is being done outside of Alta. In the latter they are raising more ore, for last week's report gave the quantity at about twelve tons of fair grade. In the Gold Hill group Seg. Belcher and Belcher have increased their output of ore, but Confidence's and Overman's output is about the same as heretofore reported. In these mines, as also in Crown Point, fair exploiting work is being done. In the latter mine they are not following up, so far as officially reported, the two-foot vein of ore struck the preceding week, but down here the management is following up a 20-cent assessment, which will come to a head the last of next week. From Yellow Jacket it is quite impossible to obtain any reliable advices. The joint Confidence, Challenge and Con. Imperial west drift is out 500 feet. This drift is being pushed ahead at a very slow rate. In Confidence they are exploring from the raise on the 200-foot level and extracting a small quantity of ore each week. The yield of ore milled by Confidence and Overman returned in bullion a little over $2,000 each. In Alpha they are still at work on the 500-foot level. Work on the long west drift in Bullion is being pushed slowly ahead, as is that in Gould & Curry. These drifts will drain the west country. Official letters from Potosi, Chollar and Savage do not indicate any material change in the character of the work, which continues on two or more levels. In Hale & Norcross active work is again the order. They are exploring around the 900-foot level, while getting ready for active work on the 1100-foot level. In prosecuting the work a few tons of ore is being extracted, which assays more in silver than in gold. The work under way in Best & Belcher, Con. Virginia, Ophir and Mexican is being closely watched by the better informed miners. In Con. Virginia they are quite hopeful of finding ore on the 1000-foot level. What effect it will have on the market, if found, depends largely on the grade and quantity. In this mine they are raising and milling a sufficient quantity of ore each week to pay current expenses. In Ophir and Mexican the work to the west on the 1000-foot level in each mine is being pushed ahead, the formation beginning to show signs of a more favorable character. The work on the Central Tunnel level of Ophir is also being pushed ahead. From Union and Sierra Nevada and Utah work is being done on the levels heretofore reported and no essential change in the formation. In Andes exploiting work is said to have started.

From the Brunswick lode our advices are generally of quite an encouraging character. While the attention of miners and operators seems to be centered on the work under way in Occidental it ought not to cause surprise if in the near future attention is largely attracted to the work at another point on that lode. This opinion is hazarded on the commencement of active exploiting elsewhere with the material encountered of quite a favorable character. Work in Occidental is being prosecuted on three levels. That under way on the 650-foot level has encountered gold ore which assays higher than heretofore reported. Of necessity they will run out of ore if the work is still pushed forward, but which can be followed by drifting on that already found to find its extent and value. On the 750-foot level the material encountered is of quite an encouraging character and inspires the belief that the ore found above extends down to that level, but as to what will be its extent and value is, as yet, purely guesswork. The work being done on this lode by other companies is exploiting. They seem to be pushing for the ore found in Occidental with every expectation that it will be found, but how long it will take before the ore will be struck it is hardly safe to mention an opinion.

From the Bodie district the work being done in Bodie and Mono and Bulwer is on the same levels heretofore reported. So far as official advices go there is not much of an encouraging character for shareholders, yet in prosecuting the work an improvement may be reported any day.

The following illustrates the changes of the week:

## Assessment Notices.

GOULD & CURRY SILVER MINING COMPANY. Location of principal place of business, San Francisco, California. location of works, Virginia, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees held on the twenty-fifth day of March 1896, an assessment (No. 78) of Fifteen cents (15c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 69, Nevada Block, No 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-eighth (28th) day of April 1896, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on WEDNESDAY, the 20th day of May, 1896, to pay the delinquent assessment, together with the cost of advertising and expenses of sale. By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room 69, Nevada Block, No 309 Montgomery street, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 2d day of April, 1896, an assessment (No. 22) of ten cents (10c) per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 69, Nevada block, No 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of May, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before will be sold on THURSDAY, the 28th day of May, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

CHALLENGE CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Gold Hill, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 27th day of March, 1896, an assessment (No. 21) of Five Cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 35, third floor Mills Building, corner Bush and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of April, 1896, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on WEDNESDAY, the 20th day of May, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

C. L. McCOY, Secretary.

Office—Room 35, third floor Mills Building, corner Bush and Montgomery streets, San Francisco, California.

INYO MARBLE COMPANY OF CALIFORNIA. Location of principal place of business, San Francisco, California. Location of Works, Inyo, Inyo county, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 30th day of March, 1896, an assessment (No. 28) of ten (10c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 328, Phelan Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of May, 1896, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the 4th day of June, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

M. A. CAHN, Secretary.

Office, Room 328, 5th Floor, Phelan Building, San Francisco, California.

### ANNUAL MEETING.

The regular annual meeting of the stockholders of the Jamison Mining Company will be held at the office of the company, Rooms 50 and 54, No. 120 Sutter street, San Francisco, California, on MONDAY, the 4th day of May, 1896, at the hour of 2 P. M., for the purpose of electing a Board of Directors to serve for the ensuing year and the transaction of such other business as may come before the meeting. SAM W. CHEYNEY, Secretary.

Office—Rooms 50 and 54, 120 Sutter street, San Francisco, California.

California Enterprise.

Factory: Novato, Marin Co. California.

AMERICAN CONDENSED MILK COMPANY — WESTERN AMERICAN 99 BRANDS — SAN FRANCISCO

Main Office: No. 330 Pine Street San Francisco.

# THE BEST BOOKS

Are always the CHEAPEST. All the latest and best works on Mining, Metallurgical, Electrical and kindred subjects can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of Standard Mining Works and Scientific Publications.

MINING AND SCIENTIFIC PRESS,

220 Market Street ..... San Francisco, Cal.

### Assaying.—Part I—Gold and Silver Ores.

Second edition. By C. H. Aaron. Embraces 130 12-mo pages, with illustrations, well bound in cloth; 1889. Price, postpaid.....$1 00

### Assaying.—Parts II and III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

### Notes on Assaying and Assay Schemes.

By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

### Prospector's Field Book and Guide.

By H. S. Osborn.....$1 5

### A Practical Guide for Prospectors and Miners

By C. W. Moore. With numerous illustrations.....$4 75

### The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

### Aaron's Leaching Gold and Silver Ores.

By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men in cloth, postpaid.....$3 00

### Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid.....$3 00

### The Lixiviation of Silver Ores with Hyposulphite Solutions.

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

### Modern Copper Smelting.

By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated.....$5 00

### The Metallurgy of Gold.

By M. Eissler. Profusely Illustrated.....$5 00

### Losses in Gold Amalgamation.

By W. McDermott and P. W. Duffield.....$2 00

### Electricity in Mining.

By Sylvanus P. Thompson.....80 cts.

### Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc A very practical work for gold miners and users of water. Price, postpaid.....$5 00

### Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

### The Metallurgy of Silver.

By M. Eissler. Profusely Illustrated.....$4 00

### Manual of Hydraulic Mining for the Use of the Practical Miner.

By T. E. Van Wagenan.....$1 00

### The Sampling and Measurement of Ore Bodies in Mine Examinations.

Well printed on fine paper, with plates; complete. Price, postpaid.....25 cts.

### Manual of Mining.

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

### A Text Book of Mineralogy.

Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

### Manual of Determinative Mineralogy.

With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth...$3 50

### Metallurgy of Silver, Gold and Mercury in the United States.

Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7

### Metallurgy of Silver, Gold and Mercury—Continued.

Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50

### Notes on the Treatment of Gold Ores.

By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

### A Practical Manual of Minerals, Mines and Mining.

By H. S. Osborn.....$4 50

### Matte Smelting—Its Principles and Later Developments with an Account of the Pyritic Processes.

By Herbert Lang.....$2 00

### Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth.....$1 50

### Practical Metallurgy and Assaying.

By A. H. Hiorns.....$1 50

### The Practical Metal Worker's Assistant.

By Oliver Byrne. Illustrated.....$5 00

### Quartz Operator's Handbook.

By P. M. Randall.....$2 00

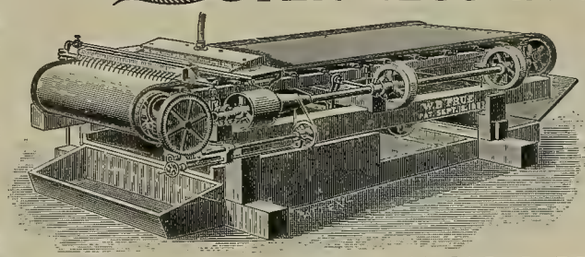
### Assayer's Guide.

By Oscar M. Lieber.....$1 50

### Assayer's Manual

By Bruno Kerl. Translated from the German by Wm. T. Brannt. Second American edition, edited and enlarged by F. Lynwood Garrison. Illustrated.....$3 00

### Manual of Assaying—Gold, Silver, Copper and Lead Ores.



By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 588 pp. Price, postpaid.....$2 50

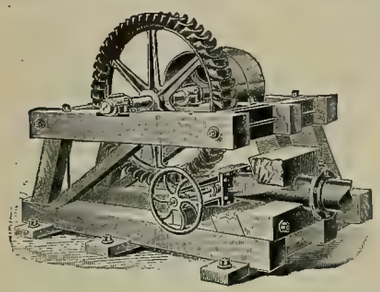
# FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.



For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.
" " " Improved Belt Frue Vanner..... 600, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 600, f. o. b.

JAS. S. BROWNELL, Western Agent FRUE VANNING MACHINE CO.
(Successor to ADAMS & CARTER), 132 Market St., Room 15, San Francisco.

## Largest Electric Power-House.

The third generator has been erected in the central station of the Niagara Falls Power Company at Niagara Falls, N. Y. As the generator is of 5,000 H. P. capacity, the same as the two previously installed, it makes the total installation in the power-house at present 15,000-horse power. This is to be increased by the addition of seven more generators, each of 5,000-horse power capacity, which will bring the installation up to 50,000-horse power, or just one-half the total capacity of the tunnel which acts as a tail-race in carrying the water from the mammoth turbines to the lower Niagara river. As yet it has not been decided just how these additional generators are to be erected, it being announced that the Niagara Falls Power Company has under consideration some suggestions of changes, which may eventually lead to placing the additional dynamos down in the big wheel-pit instead of in the power-house, as at present. This method of erection would save the expense of the 138-foot shafts which now connect the turbines with the generators.

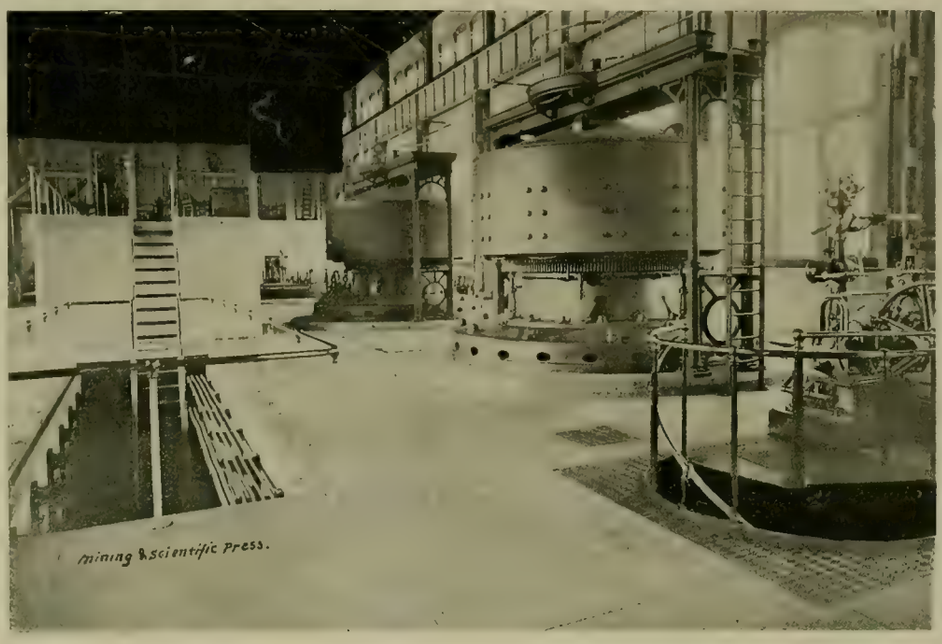

FIG. 1—UPPER WORKS OF DYNAMO NO. 1 IN THE POWER-HOUSE OF NIAGARA FALLS POWER CO.

FIG. 2—DYNAMO NO. 2 IN OPERATION IN THE POWER-HOUSE OF NIAGARA FALLS POWER CO.

This power-house of the Niagara Falls Power Company is the largest in the world, and the illustrations presented on this page (photographed and engraved especially for the MINING AND SCIENTIFIC PRESS) give a good idea of its magnitude and the manner of placing the great power producers. In the foreground of Fig. 1 is seen the upper works of dynamo No. 1. This machine was standing still when the exposure for the picture was made, and the rivets of its side are plainly visible. Just beyond it, however, dynamo No. 2 is seen in operation, making about 250 revolutions a minute, or something like 85 revolutions during the exposure for the picture. The steady manner in which it runs is well displayed by the excellence of the picture, and the reader will find it hard to comprehend that this machine at the time the picture was made was delivering such a mighty force as 5,000-horse power. Immediately to the left of dynamo No. 2 is seen the switchboard structure and the operator in charge. Placed on the switchboard platform are seen the instrument stands, one for each generator and two for the rotary transformers, while in front of each instrument stand is placed a cast-iron stand about 30 inches high, which carries the levers controlling the air for the switch cylinders. It also has other levers and wheels. To the right of dynamo No. 2 is seen the opening in the floor by which access is gained to the interior of the generator.

Beyond generator No. 2 is seen the foundation for dynamo No. 3. It represents the condition in which it was left at the conclusion of the labors of the company which had the contract for the installation of the 5,000-horse power turbines and connections.

Fig. 2 gives a better idea of the size of the Niagara dynamos, with one of them standing still and the other running. It also affords a fine view of the end of the switchboard structure and the subway beneath, in which pass the cables carrying power to the several factories that are supplied from this plant. It also gives a view of the entrance to the stairway leading to the elevator by which the descent is made into the wheel-pit.

On the 4th ult. it was just one year since Rudolphe Baumann, the Swiss engineer, moved the small hand-wheel which controls the first great turbine in this wonderful power plant. Instantly the field of the generator revolved. The movement was quiet and effective, and it told the civil, hydraulic and electrical engineers who had aided by their skill in building the plant, that their work was a thorough success. All that they had prophesied had been proven to be accurate. The mighty machines built to transform the energy of Niagara's water into electrical energy did their work well, and have ever since continued to do it on demand without injury or disappointment. It was a happy set of men that witnessed the successful test, and the year which has since passed has served to increase their admiration for the mammoth machines which work so perfectly. Since that day two more of these great turbines and their connected dynamos have been installed successfully. With the turbines and generators in place, all that remained to do one year ago was the construction of proper conductors to convey the electrical force to the point of application and use. This, too, has been successfully accomplished, developing much that is new in electrical science, so that to-day the lands of the Niagara Falls Power Company are enlivened by several busy factories, the growth of a year. Several of these have had extended mention in the MINING AND SCIENTIFIC PRESS, but briefly recalled they are a carborundum plant, an aluminum works, a carbide factory, a sodium and potash plant, while a chemical works is building.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Upper Works of Dynamo No. 1 in the Power House of Niagara Falls Power Co ; Dynamo No. 2 in Operation in the Power House of Niagara Falls Power Co., 353. Hydraulic Giant—Double Jointed, Ball Bearing, 357. Large Cable Made by the Washburn & Moen M'f'g Co., 359.

EDITORIAL.—Largest Electric Power House, 353. Bonding Mines; Forfeiture of Claims; Joint Exhibition of California Products, 354.

SCIENTIFIC PROGRESS.—An Improved Form of Hydraulic Giant; Theories to Account for Solar Energy; ' The Sun;" Curious Property of Potassium Uranyl Sulphide; A Great Invention, 357.

MECHANICAL PROGRESS.—Largest Cable on the Coast; Glass Houses; Compresses Pulp Fiber of Manilla, etc., 359.

ELECTRICAL PROGRESS.—Telephone Line from Leadville to Aspen, 359.

PRACTICAL INFORMATION.—Why Steam Fuses Soft Plugs; "Iron Tree;" Carbon in Food; Growth of Population in Europe; Novel Theory for Boiler Explosions, 359.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 362-3.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 370.

MISCELLANEOUS.—Concentrates, 355. Matte Smelting, 356. Selling Mines, 357. California Mines and Miners, 358. Assays of Copper and Copper Matte, 359. Notices of Recent Patents, 361. The Overland Monthly, 363. Coast Industrial Notes; Personal; Commercial Paragraphs; Recently Declared Mining Dividends; Recent Mining Incorporations, 364. Weather Report, 370.

THE Manufacturers' and Producers' Association and the Mechanics' Institute have about completed a mutually satisfactory basis on which to arrange for a joint exhibition of California products in the Mechanics' Institute Pavilion next fall—a happy solution of an industrial problem. In this regard it is in order to say that some day—how distant the day depends on ourselves—California industries will rise to the realization of their opportunities, cease considering this the back-door of the nation, and, facing around, stand at the country's front door, with all that that implies.

ACCORDING to programme, Senator Mitchell of Oregon this week opposed the California mineral land bill in the Senate by pressing his amendment that the State of Oregon be included in the measure, not in ignorance, but in defiance of the fact that his colleague, Senator McBride, had already introduced a separate bill, similar in intent, for his State. Senator Mitchell's solicitude is not for the Oregon miner, but for the corporate interests opposed to the passage of the California bill. This, fortunately, is well understood by the Senate and may neutralize his influence. The merits of the case are now so well understood in Washington that the whole question resolves itself into the amount of influence the corporation most interested in the defeat of the measure can bring to bear. We are more sorry than surprised to note the Oregon Senator's defection.

## Forfeiture of Claim.

Under date of April 20th, "A Subscriber" writes from Hassel, Montana :

Will you kindly interpret the co-partnership mining law as it is found in Section 2324, Revised Statutes. The point I wish to know is whether, in advertising a partner in a mining claim, he has ninety days after the expiration of non-forfeiture notice to pay for his part of assessment work or does his right expire with the ninety days' notice which reads: "If you fail or refuse to contribute your portion within ninety days after the publication of this notice, your interest will become the property of the undersigned." Your answer to this question will be recognized by this section of Montana as authority, as is everything seen in the MINING AND SCIENTIFIC PRESS.

The law requires that where any one or more of the co-owners of an unpatented mining claim fail to contribute due share of the required annual expenditure those of the owners who, desirous to hold the claim, shall have performed the required labor or improvements, shall give notice to the delinquent in writing, or by publication in some suitable newspaper once a week for ninety days, such written notice or publication to be made at the expiration of the calendar year for which the work was done. The delinquent so notified has ninety days from the date of the notice written and mailed to his last address, or ninety days from the first publication of the notice. If, at the end of the time, he fails or refuses to so contribute his just proportion of such expenditure his interest in the claim becomes the property of the other owner or owners complying with all the requirements of the statute. The ninety days begin with the first publication of the notice.

It is customary to give notice in writing, if the delinquent be a resident, care being taken to secure proof that such notice was properly sent, and in case he is a non-resident, publication is made in the paper issued nearest the claim, a copy of the paper containing the notice being mailed to his last-known address.

## Bonding Mines.

Bonding California mines is of considerable present prominence, and numerous requests are received for the proper form of a *pro forma* bond. It is not practicable to give any other than a general form. The special conditions of a bond vary with individual ideas and requirements. Any miner or prospector bonding his mine or prospect to any one should give the wording and tenor of the bond careful consideration. A contract is a contract, and it is always better to thoroughly understand and plainly set forth in black and white what is agreed to by both parties than to attempt any subsequent arrangement or interpretation after the bond is signed. While in the main prospective purchasers are bona fide, yet, occasionally a sharper can tie up a claim and its owner if the latter does not look closely at what he is signing. The following is an old form and is believed, in general, to be fair to both buyer and seller. It is, of course, subject to such individual changes as may be agreed upon by the parties interested.

This Agreement, made and entered into this ..... day of ....., 18—, by and between ....., of the town of ....., county of ..... and State of ....., known herein as the first party, and ....., of, etc., ....., known herein as the second party (or parties), Witnesseth, that the first party is the owner by proper location, recording and the necessary work thereon in accordance with the laws of this mining district and of the United States of America, of that quartz ledge or lode known as the ..... (here describe the location in detail), and that the same is free from any debt, lien, or claim; and whereas the second party is desirous of developing the same with a view to purchase: Now this agreement witnesseth that the first party agrees to bond the said mine to the second party for the period of ..... months from this date for the sum of ..... dollars, gold coin of the United States, on the following conditions (here insert the conditions as to the work to be done, or other details); and it is hereby agreed that at any time during the life of this bond the second party may demand, and the first party shall make, a good and sufficient bargain and sale deed for said mine, duly signed, sealed and acknowledged, and shall be delivered on the payment of the purchase price, the other conditions of this bond having been previously complied with, free from any debt, lien, or claim thereon. It is understood that the purchase-money may be paid in gold coin, or by certified check, certificate of deposit, or draft for gold coin on any solvent bank in.....; but if paid by a certified check, certificate of deposit, or draft, then the deed shall be held *in escrow* by ....., agent at ..... (or other person agreed upon), until in due course the check, certificate, or draft shall have been paid, when the deed may be delivered by ....., as agent of the first party, to the second party hereto. Should the second party fail in any of the conditions of this bond, then, upon demand of the first party, the second party shall surrender quiet and peaceable possession of the mine and appurtenances, free from all liens, debts, or claims.

It is understood and agreed that the words "first party" and "second party," as used herein, shall include and bind the assigns and legal representatives of the respective parties hereto.

Witness our hands and seals, at .. ..., the day and year first above written.

Signed in duplicate. ..... [SEAL.]
..... [SEAL.]

This should be duly signed, witnessed, acknowledged and recorded. It is also well for the owner, should he deem it necessary, to require "the second party" to give him a bond that no debts or liens or claims of any kind shall attach to the mine while so in bond, and if the owner posts conspicuously on the property a notice that he will not be responsible for any debt of any kind created or contracted by any one beside himself, it may occasionally save him and all concerned considerable bother.

In addition there is herewith presented another blank form of bond for mine. It is the one adopted by the Gold Mining Exchange of this city for its use.

Dated at SAN FRANCISCO, CALIFORNIA,.....189.....

.....being the owner.....of the mining claim.....and properly known as and called.....hereby covenant.....and agree.....that.....he.....will give to.....the right, privilege and option of purchasing the said above described mining claim.....and mining property, at and for the price and sum of.....Dollars, in gold coin of the United States, at any time within the period of.....days from and after the date hereof.

And.....agree to give.....the period of.....from and after the date hereof within which the said.....may survey and thoroughly examine said mining claim and property and may make such assays and working tests of the ores therein as may be requisite and necessary to determine intelligently whether the said.....will accept said offer of sale, and will purchase said mining claim at and for the price and sum above mentioned and described.

NOW THEREFORE THIS AGREEMENT WITNESSETH, That for and in consideration of the premises and the sum of.....Dollars, in gold coin of the United States of America, to the.....in hand paid by the said.....the receipt whereof is hereby acknowledged, the said parties to these presents have agreed as follows:

ARTICLE FIRST.

The said.....hereby covenant.....and agree.....to and with the said.....and.....executors, administrators and assigns, that at any time within the period of.....from and after the date of these presents, the said.....shall have the right, privilege and option of purchasing from the said..... the mining claim and property hereinabove described, by paying to the said.....on or before said last mentioned day, the price or sum of.....Dollars, in gold coin of the United States. .....Said payment of said purchase money may be made at the banking house of.....in the City and County of San Francisco, State of California, and an offer of payment to said Bank, for and to the credit of the said.....conditioned on the delivery of the deed mentioned in the next article of this Agreement, shall be deemed and regarded as equivalent to a tender to the said.....personally.

ARTICLE SECOND.

And the said.....covenant.....and agree.....that upon payment of said purchase price, as above specified, to the said Bank as above specified, within the time hereinabove specified, the said.....will forthwith make, sign, seal, execute and deliver to the said.....or to.....executors, administrators or assigns, a good and sufficient Deed of Conveyance of the said mining claim and property hereinabove described, free and clear of all incumbrances, and will put the said..... in quiet and peaceable possession thereof.

ARTICLE THIRD.

And the said.. ...covenant.....and agree.....that the said.....may immediately enter upon and have the right of possession of said mining claim and property above described, and may remain in possession for the purpose of examining, surveying, mining and prospecting the same at all times during the continuance of this agreement, and may sink such shafts and winzes, and run such tunnels, drifts and crosscuts, as the said.....shall deem necessary and proper to fully prospect said mine; PROVIDED, HOWEVER, and this permission is granted on the express condition, that the part.....of the second part will pay all the costs and charges and expenses of such work, labor, supplies and prospecting expenses.

ARTICLE FOURTH.

This Agreement shall extend to and bind the heirs, executors, administrators and assigns of the respective parties hereto.

ARTICLE FIFTH.

This Agreement shall terminate and be absolutely null and void on the.....day of. ....., A. D. Eighteen Hundred and Ninety.....at twelve o'clock noon, unless the said..... makes the payment of the purchase money, as described in Article First, on page one of this Agreement.

IN WITNESS WHEREOF, The parties to these presents have hereunto set their hands and seals the day and year in this Agreement first above written.

..... [SEAL]
Duly signed, sealed and delivered in the presence of ..... [SEAL]
..... [SEAL]
..... [SEAL]

The following is a third form of bond in present use by one of the most prominent mining operators in the State:

This agreement made and entered into this.....day of .....189.....by and between.....of the county of..... State of.....party of the first part and.....of the county of .....State of.....party of the second part,

WITNESSETH, That the said party of the first part hereby agrees that if the said party of the second part shall, on or before the expiration of.....from the date hereof, pay or cause to be paid to said party of the first part the sum of .....($.....) dollars in gold coin of the United States of America, he will, upon such payment being made, make, execute and deliver to said party of the second part a good and sufficient deed for the conveying and assuring to said party of the second part the title to all of th....certain lot, piece or parcel of land situate, lying and being in the county of..... State of.....bounded and particularly described as follows, to wit: .....

The said party of the first part further agrees that the said party of the second part, his agents, employes or assigns may at any time during said period of.....enter upon said premises and work, mine and prospect the same in such manner as he may deem best and mill any ore that may be taken therefrom (provided all work done thereon shall be done in a good, workman-like manner) and may place thereon (and remove at his pleasure) such machinery and fixtures as may be necessary for the convenient working thereof.

The said party of the second part hereby agrees that in the working, mining or prospecting of said premises he will not suffer or permit any lien to attach thereto for or in consequence of any indebtedness he may incur for labor, materials or improvements he may employ, purchase or place upon said premises during the said period of.....; and that in case he shall fail to pay or cause to be paid to said party of the first part the said sum of $.....within said period of.....he will at the expiration of said period of time quit and surrender to said party of the first part the said premises, and will within .....days thereafter remove any machinery and fixtures that he may have placed thereon.

It is mutually understood and agreed that the stipulations and agreements herein contained shall apply to and bind the heirs, executors, administrators and assigns of the respective parties hereto. In witness whereof the said parties have hereunto set their hands and seals the day and year first above written.

..... [SEAL]
..... [SEAL]
..... [SEAL]

Comparison of the three by the most casual reader will indicate wherein they differ and agree. Good intent is always assumed on both sides, but in each individual case everything should be written out in detail in duplicate and thoroughly understood at the time. Rightly used the system of bonding is of mutual value to all. Like other good things it has been abused. Bonding and development of a mine usually go together. Some men will only buy "a going mine:" in such cases a flat price is usually the only basis: more often a man or men with some money to invest that way will be willing or desirous to get hold of a property and see what is in it. It is to this latter class and the men with whom they deal that the matter in this article chiefly applies.

Viewed in the widest sense, nearly every mining

sale of any kind whether it be a hole in the ground or a million-dollar proposition involves a "bond," or an "option" of some kind, but in these cases the bond or option bears the same relation to the transaction as the abstract of title, or power of attorney in case of an agent or intermediary.

Any one desiring to use a bond will, it is believed, be able to find in the three all the requirements and practical information in any individual case.

## Concentrates.

GOLD MINING is the one present industry in which California has no competition.

THE Western Federation of Miners will meet at Denver, Colorado, on the 11th inst.

THE Pioneer Gold Mining Co., incorporated for $2,000,000, has been listed by the San Francisco Stock Exchange.

THE greater part of Ainsworth, B. C., on the west side of Kootenay lake, was destroyed by fire last Monday night.

THE entire townsite of Goldfield, in the Cripple Creek district, is reported sold to Eastern capitalists and Denver railroad men for $1,500,000.

MATTERS mining and otherwise look dismal in South Africa. In such countries circumstances follow the fortunes of war, and where fortunes may be made fluctuations must follow.

ON the 16th ult. four tons of dynamite exploded at the Alaska-Treadwell works, Douglas island, Alaska, blowing the watchman, W. Cota, to atoms and wreaking general havoc in that vicinity.

OF the total product of each laborer in the United States per capita, 20.18 per cent goes to labor, 55.08 per cent for materials, and 24.74 per cent to miscellaneous expenses, salaries, interest and profits.

FIRE broke out in the Standard mine at Bodie, Cal., last Saturday, on the 350-foot level. It was checked that night in time to prevent widespread ruin. The electric hoist machinery was partially destroyed.

THE Marysville *Appeal* says the prominent men of the Anti-Debris Association are no good and calls for their resignations. They say the *Appeal* threatened to "burn them up" if they didn't come up with coin.

THE Sunshine Mining Co. of Utah is stated by the *Tribune* to have bought of the Gold and Silver Extraction Co. of America the right to use their cyanide process "during the lifetime of the bonanza" for $119,000.

"SOUND MONEY OR SILVER" is the delightfully humorous headline of a solemn article in New York's leading financial journal, the humor lying in the assumption that "sound money" is synonymous with gold, alone.

THE trustees of the Golden Cross Mining and Milling Co. will sell the Golden Cross, Golden Crown, Golden Queen, Gen'l Miles, Sutton, Black Hawk, Leighton and Los Angeles mining properties, Hedges, San Diego Co., at Los Angeles, June 1st.

A RECENT landslide at the Carlisle mine, near Forbestown, Butte Co., carried away the sleeping house in which five men were asleep at the time. Four escaped; the fifth, Wm. Wolze, is missing and is believed to have been carried into the river and drowned.

A SYNDICATE has been formed in London to buy the Diadem and Edman mines in Plumas county, the basis of the sale being a report on the property by W. B Murdoch. The ore is low grade of considerable width, with spots of free gold and selenides of value.

TWO PORTLAND MEN wire that they have successfully shown gold in quartz by the cathode or anode ray. The same thing was done by Dr. P. M. Jones of this city some months ago. It is so far an interesting illustration of the new radiograph, but of little practical value to the miner.

THE HARRIMANS, of New York, propose to spend half a million dollars on the Golden Reward, South Dakota mine, in the enlargement of the reduction works. The mine turns out thousands of tons of ore that carries such a percentage of silver as to justify the erection of a smelter.

BY a huge caving in the ancient mines of Santa Eulalia, twelve miles from Chihuahua, Mexico, last Sunday, thirty Mexican miners were entombed. The mines had been worked for nearly 300 years and pillars of ore left holding up the roof of the drifts were recently cut away, with the natural result that the whole mass fell in.

THE fact that weddings are expensive in Circle City, Alaska, doesn't seem to hinder the course of nature. Harry Spence was married recently to Mrs. Kate Gilbert, and the justice taxed him six ounces of gold dust as his fee. Dust passes for $18 an ounce in the interior, which makes that a pretty good fee for one ceremony.

THE Young America mine in Sierra Co., advertised for sale in this paper, was sold by Jno. Bermingham, president of the Cal. Powder Works, last Thursday to David C. Green of Chicago for $13,100. The new owner has considerable money and will reopen the mine this season. It has paid big dividends and is considered to be a good property.

SPENCER & GOULD, Hopkins Creek, Plumas Co., now light their hydraulic mine by electricity, by a novel method. They tapped the main pipe near the monitor, inserted a 1-inch gas pipe reduced to ⅛-in. nozzle, the tiny stream playing on a 6-in. Pelton wheel attached to the dynamo, and though not a very extensive proposition answers all purposes.

SECRETARY OF THE INTERIOR SMITH has recently ruled that "a properly authenticated certificate of incorporation, filed by a corporation that is applying for a mineral patent, is sufficient proof of citizenship under the statute. It is not within the province of the Land Department to determine whether such a corporation is authorized under its charter to take patent for mineral lands."

THE Tombstone, Arizona, *Prospector* says: "A California capitalist named Moore was found dead on the desert near the Congress mine Tuesday. He had gathered considerable money and jewelry and was en route overland in a private conveyance to San Bernardino. The evidence shows that he was murdered, and it is supposed Mexicans followed him and committed the deed."

ABOUT two years ago this column contained a notice of a company of California mining men organizing to go to Buluwayo, South Africa, under the leadership of Andrew R. Hammond. There were about sixty Oakland and San Francisco men, and since their arrival they have met with varying fortunes. Mr. Hammond organized two companies in London—the Zambesi Gold Development Co. and the Hammond Matabele group. Word is now received that he and several others were waylaid and killed by Matabeles on their way last month from Buluwayo to the mines.

ACCORDING to Prof. S. F. Emmon's report, the gold production of Utah up to January 1st, 1896, reached a total of 265,600 ounces. Of this amount Tintic is credited with having produced 47.8 per cent, Bingham with 42.5 per cent, Ophir 2.2, Stockton 0.4, and Camp Floyd 7.1 per cent. Up to the date at which the professor closed his report 40 per cent of the gold product of Bingham is said to have been from the placers.

A RECENT decision from the office of the Secretary of the Interior is to the effect that an application for mineral patent must, at the time of application, or within the period of publication, file a certificate of the surveyor general showing an expenditure of $500 on the claim, and if the certificate so filed does not show such expenditure, additional time to make further improvements cannot be granted, but the entry allowed on such proof must be cancelled.

JOHN M. REYNOLDS, acting Secretary of the Interior, has affirmed the decision of the Commissioner of the General Land Office to the effect that a placer claim may be taken up by legal subdivisions and does not need to be staked or marked on the ground. The decision is an important one, as it interprets the law regarding the location of placer claims. It is held that the locator is not required to mark the boundaries of his claim when it is located on surveyed ground.

A JOHANNESBURG, SOUTH AFRICA, dispatch of April 29th represents the *Standard and Diggers' News* as saying "Barney Barnato, the Kaffir King, is very bitter concerning the sentences imposed upon Rhodes, Hammond and others at Pretoria, and is showing his resentment by closing all his mines and selling all his landed properties in the Rand. The people are paralyzed at the prospect, as the closing of the Barnato mines will throw thousands of men into the already overflowing ranks of the unemployed."

TALLON AND FREEZE, the two miners who recently made so good a record at the Butte, Montana, hand-drilling contest, are offering to drill any team in the world a double-handed contest for from $500 to $5000 a side. Some California miner will surely accept this challenge. The contest at the Midwinter Fair two years ago shows what can be done. The Amador *Ledger*, in a long article, suggests that the directors of the State Agricultural Society offer some prizes for such a contest at the next fair. 'Twould bring a crowd.

REGARDING the taxation of unpatented mining claims, Attorney-General Fitzgerald is of the opinion that they can be assessed and unpaid taxes held as a lien on the land to be collected in full by the State after the issuance of United States patent. That will doubtless do till another attorney-general files a contrary opinion. Meanwhile prospectors and locators can refuse to pay the taxes so assessed on unpatented claims and take the chances of being compelled to pay later on. It is largely a matter of individual opinion as to whether payment of taxes on undeveloped and unpatented prospects or claims shall be made or refused.

A COAL prospect is reported from the head of the lower Muddy Valley, Lincoln Co., Nevada. The formation was recognized in 1891 by the railroad corps of engineers when the Union Pacific Company projected its line of surveys across the county to the California line. Since then members of the survey party have kept the matter in mind, and the renewed talk now of railroad construction has caused them to send prospectors there. A seam has been found which burns in a blacksmith's forge and a shaft has been put down about 25 feet. Coal in that locality, where Utah, Arizona, Nevada and California come nearest together, besides furnishing fuel, would be a great thing for transportation and mining interests.

HELENA, MONT., ADVICES are to the effect that a war is about to be waged between the Eastern and Western producers of lead. The Eastern men are short many thousands of tons of the metal, and to be able to cover themselves at a figure not entailing a loss they are endeavoring to force down the price. The Western men, on the other hand, have plenty of lead and want the price up. To defeat the alleged scheme of the Eastern producers to lower the price of lead much below what it now sells at, the producers of Montana and Idaho are making arrangements to form a copartnership to greatly control the production of the same in their States. The producers of Missouri have been written to asking them to join the partnership. The Montana and Idaho producers claim that, with the co-operation of the Missouri producers, they can defeat the Eastern men. Unless the price of lead goes up materially before the date set for the opening of the war, the output of Montana and Idaho will be curtailed.

THE Salt Lake *Tribune* tells this. If it isn't true it ought to be: Mary Palody, a widow, has just left that city with $60,000. Many years ago she had two sons, who staked out and located the famous Utica mine in California. They finally sold out their interests for $60,000, and transmitted $20,000 to their mother in Illinois. Both of the boys finally died while prospecting for other mines. That was nearly eighteen years ago. With the disappearance of the boys all knowledge of the fact that to them was due a balance of $40,000 from the purchasers of the Utica disappeared, so far as the information at home was concerned. The owners of the Utica, that had in the meanwhile developed into one of the greatest bonanzas, stood ready to pay the balance, but having no knowledge that an aged mother was awaiting the return of her boys, didn't know to whom to pay it. And so it was that the money was allowed to remain in the Utica's gold box to the credit of the dead. A few months ago the mother was made aware of the fact that Utica, which in January last is credited with having produced $200,000, was indebted to her sons in the sum of $40,000. The owners of the Utica willingly delivered to her a check for the amount due her sons, which, with interest, amounted to the round sum of $60,000.

CRIPPLE CREEK, COLORADO, was swept by fire last Saturday, four business blocks in the middle of the town being burned. The work of rebuilding the burnt district immediately began and everyone was congratulating himself that things were no worse, when, on the afternoon of last Wednesday, the 29th ult., another fire broke out, apparently of incendiary origin, which, with a brisk wind and the absence of water, almost completely destroyed the town. Dynamite was freely used in efforts to stop the fire by blowing up buildings in its path and several lives were lost. Banks, hotels, stores, offices, residences and nearly all that comprised the town are in ashes and three thousand people left homeless. With the prompt generosity characteristic of miners, every surrounding community has afforded immediate assistance. The calamity is not irrevocable- it is an experience that has befallen every mining town, the mines are uninjured and the prosperity of Colorado's foremost gold camp is only temporarily checked. Mass meetings were held at Denver and Colorado Springs last Thursday to consider measures of relief for Cripple Creek. Secretary Jackson of the Denver Chamber of Commerce, who returned from the scene of the disaster, reported there were not enough provisions in the district to last twenty-four hours. This is a case where "he gives twice who gives quickly," and everyone everywhere who knows by experience what it means to be burned out in a mining town, will need no urging to promptly contribute to the relief fund.

A PRETORIA, South African Republic, dispatch appearing yesterday morning, says: The sentiment caused by the sentencing to death of Hammond, Rhodes, Phillips and Farrar, and the subsequent commutation of their sentences, has not worn itself out. Burghers of influence are flocking into the city begging the Government to totally abolish the sentence imposed upon the so-called reformers. It is reported that the Executive Court has decided to impose sentences of five years' penal servitude and at the expiration of that time banishment for life upon the four men named. In order to justify such severe treatment, the Executive Council refers to the record of the trial. Telegrams were put in evidence which, from the cipher key discovered in Jameson's baggage, proved beyond doubt the complicity of the British South African Company with the Johannesburg Reform leaders and with Jameson's raid. Hammond was evidently opposed to any breach of law, for in a telegram dated December 27 he condemned further prosecution of the contemplated movement. There is breathless astonishment here over the severe sentences that Judge Gregorowski has pronounced. After his sentence Mr. Hammond collapsed and was taken directly to jail in charge of his doctor and the chief jailer. The principal prisoners were driven to the prison with a strong police escort. The remainder walked the distance of half a mile, surrounded by a small detachment of artillery. The prisoners are very bitter, and say they were ill-advised in pleading guilty. Fully forty of them avow that they could have proved their innocence of connivance or participation, except in joining the movement late in the day, and signing the manifesto. A strong feeling exists that behind those standing in the dock were absent men far more guilty, who were plotting against the independence of the republic. Secretary of State for the Colonies Joseph Chamberlain announced in the House of Commons, London, on Thursday afternoon, that he received the following dispatch from Sir J. A. Dewett, British Agent at Pretoria: "The Boers themselves condemn the severity of the sentences and are petitioning for mitigation or free pardon."

TELEGRAMS have been flying between here and the national capital during the week regarding the status of the $250,000 appropriation for the restraining barriers. Last Saturday President Neff and Secretary Sonntag of the California Miners' Association wired T. L. Ford, their representative at Washington, that: "After thorough examination and discussion of the California Debris Commission reports to date, the miners of the California Miners' Association are firmly convinced that the passage of the so-called hydraulic appropriation clause, as now worded, being the clause adopted in committee on April 21, will work a grave injury to the hydraulic miners of California, and they would prefer that no appropriation at all should be made at this session if no change can be had. The appropriation as worded looks solely to the construction of a dam at De Guerre Point, and would result principally in benefiting the owners of that certain individual water right taken up at that place and intended to be especially protected by the act of the California Legislature entitled, 'An act to amend Section 1416 of the Civil Code of this State, relating to water rights,' approved March 23, 1895. The last report of the Debris Commission is against the building of a dam at De Guerre Point at present. See page 4064 Report of the Chief of Engineers, United States Army, 1895. The miners, believing that the works to be constructed should conform to the present views of the commission, as well as to the results of their future investigations, desire particularly that the appropriation clause shall read as follows: For protecting the navigable waters of the United States in the State of California, $250,000, to be expended in the construction of works for the restraining or impounding of mining debris, under the direction of the Secretary of War, in accordance with such recommendations and plans of the California Debris Commission as shall be approved by the Secretary of War for the purposes defined by section 4 of 'An act to create the California Debris Commission and regulate hydraulic mining in the State of California,' approved March 1, 1893; provided, that the Treasurer of the United States be and he is hereby authorized to receive from the State of California, through the Debris Commission of said State, or other officer thereunto duly authorized, any and all sums of money that have been or may hereafter be appropriated by said State for the purposes herein set forth. And said sums, when so received, are hereby appropriated for the purposes above named, to be expended in the manner above provided. The use of the word 'navigable' in lieu of the words 'Sacramento and Feather' is considered extremely desirable to prevent possible conflict, as regards the California appropriation, with subdivision 33 of section 25 of article IV, California constitution." The fact that a water right was located below the proposed DeGuerre Point dam by private individuals, et al., was generally known and commented upon about a year ago. It is hoped that the appropriation clause can be put in satisfactory shape, as much has been expected in this regard, and that the erection of dams, the site and construction shall be left entirely to the United States Debris Commission. It is worthy of note that the recommendations of the Commissioners five or six years ago in no way bind the future action of the Commission, if specific location be eliminated from the appropriation act. Secretary Sonntag says: "The California delegation at Washington did excellent work last Saturday when they eliminated the executive document, No. 16, H. R., Fifty-third Congress, second session, regulating hydraulic mining. If they will further eliminate document 267 and document 98, as referred to in section 25 of the Caminetti act, it will be a satisfactory bill."

## Matte Smelting.

NUMBER III.

Written for the MINING AND SCIENTIFIC PRESS by W. L. AUSTIN, Ph. D., Denver, Colorado.

In a former article the writer endeavored to explain the differences which distinguish carbonaceous and pyritic fuels, and mentioned some of the phenomena which are observed when these are employed, either singly or together, to generate high temperatures in the blast-furnace.

From the facts already given it is evident that in dealing with a fuel of such peculiar characteristics as pyrites, a radical departure from the general lines of coke-burning furnaces becomes a necessity.

For the present it is proposed to regard pyrites simply as a fuel, without reference to its absolute calorific power, or to the percentages of iron sulphide in a charge essential for good work.

Contrary to the statements made in Mr. Lang's book (see page 55), sulphides carrying iron and sulphur enough for smelting, with little or no coke or charcoal, are found in various places, and in such vast quantities that only these ores will be considered in these articles. The treatment of pyritic ores of low sulphur percentages may possibly be taken up later.

At Iron Mountain in Shasta county, where Mr. Lang is now erecting his plant, the ore is an unusually pure iron sulphide, with very little silica (about 5 per cent at the time of the writer's visit to the mine) and runs from $5 to $6 per ton in gold and silver, with about 5 per cent of copper. It is therefore a very basic smelting proposition, and silica, etc., must be added to the charge to insure a proper slag.

This ore it is proposed to smelt without calcination, and therefore it becomes of interest to note the style of furnace which is being put up for the purpose.

Mr. Lang in his book (see page 60), in treating of the most desirable type of furnaces for "cold-blast pyritic work" (II. (*a*), see table MINING AND SCIENTIFIC PRESS, Vol. 72, page 245,) recommends doing away with boshes, or a tapering stack, and using only vertical walls. One of his objections to boshes is that they collect obstructions, which are not readily removed; but as he proposes using brick stacks, it is an open question whether obstructions will not adhere to the hot brick walls and build out into the furnace from a prismatic shaft about as readily as though moderate boshes had been used. In referring to boshes on another page (see page 59) the author uses the following language: "The function of boshes in a furnace is well understood. They are to concentrate the heat and the chemical action within a small space, whereby intensity of combustion and reduction results. * * * We may infer from this that to remove the boshes so as to enlarge the zone of fusion horizontally would have the effect of diminishing the reduction of oxides and of volatizing sulphur, and consequently diminishing the production of matte." The quotation is given in full to assist the reader in understanding the author's position relative to boshes.

As Mr. Lang proposes using "a very great volume of air" "at the low pressure necessary," and recommends a Sturtevant fan-blower, and as he regulates the width of his prismatic shaft so "as to allow the blast to penetrate all parts," the inference is that the shaft will of necessity be rather narrow. Its narrowness is assumed because of one of the well known characteristics of a raw sulphide charge in a blast furnace, which is to gradually form a dense column, owing to the decrepitation and incipient fusing of the pyrites. Such a column is with difficulty penetrated by a moderately strong blast, and hardly at all by a weak one, unless a large percentage of fuel is fed with the ore. In the latter case the advantages of pyritic smelting are very much decreased, as has already been explained.

Mr. Lang proposes to make the length of his furnace proportionate to the "quantity of work desired" and to regulate its depth by the fusibility of the slags. The depth he states (see page 60) "need be but slight" where fusible slags are made.

He, furthermore, does not approve of the external well or forehearth, so generally in use in blast furnace matting as practiced in Colorado and Montana, and advocates in its place a removable interior crucible (see page 65). The idea of a removable crucible is old and such contrivances have probably been experimented with by many, but the writer does not recall ever having seen one in successful operation. A removable crucible of the dimensions necessary for a furnace of ordinary capacity (about 100 tons of ore per diem) is a very heavy and awkward piece of apparatus to handle even when entirely new, and before it has become incrusted and its brickwork saturated by heavy metals. It must have comparatively thick walls and bottom, to avoid the chilling of its contents, a misfortune which is especially apt to take place when the furnace is driven very slowly, although this mode of procedure is advocated in the book (see page 63).

After a furnace has been in operation for a time the space around and above the tuyeres becomes cemented to the crucible by fused material so that the whole is practically one structure. Now, as it is not necessary to remove a crucible except in case of serious derangements of the furnace (in which case the whole lower part of the apparatus, charge, hearth and crucible all become one solid mass) it would be interesting indeed to know how the changing of crucibles can be effected "with as much facility as the forehearths," assuming the furnace to be built of brick and having a capacity of from 100 to 125 tons of ore in twenty-four hours, which is common practice in smelting ores of the class found at Iron Mountain.

But Mr. Lang not only proposes doing away with boshes, tapering stacks and external wells, and discarding modern pressure blowers in favor of fans; he also prefers a return to brick as a substitute for the water-jackets which have now become so generally introduced. Quoting again from his book (see page 64): "It also follows from what I have said about the effects of the copious air blast, that water-jackets are not necessary in all cases to protect the furnace wall. * * * It is my firm conviction that water-jackets are used in many situations where brick or stone work would answer better." It is to be feared that not many metallurgists will agree with the author in his preference for brick versus water-jackets in blast furnace work; in fact the only probable case to make an experienced smelting man hesitate between these alternatives, if the matter were left entirely in his own hands, would be the absence of available water.

To sum up, Mr. Lang advocates for pyritic smelting, low, brick shaft furnaces, with vertical walls and limited tuyere section area (limited in breadth but indefinite as to length, which is governed only by "the quantity of work desired") and removable interior crucibles. In many of its characteristics this proposed furnace corresponds closely with the so-called Orford or Lake type of stack used by the Orford Copper and Sulphur Company at their works in New York harbor. The main point of difference between the two furnaces is, that Mr. Lang's has an interior removable crucible, whereas with the Orford furnace an external well is used. The Orford is also wider than Mr. Lang's, because, as the ore is calcined and the usual amount of coke is used as fuel, the charge is much more easily penetrated by the blast than where raw pyrites are smelted with a weak blast, and an economy of coke is aimed at by burning the sulphides.

In referring to the Orford furnace, a well-known writer upon metallurgical subjects once made the following statement: "The largest type of brick cupola as yet found *unmistakably practical and advantageous** will, therefore, be selected for detailed description, the accumulated experience of several years, and covering almost every grade and variety of copper-bearing material, having *emphatically demonstrated its economy and general superiority.*" The use of the word "superiority" here naturally implies superiority over all (?) other kinds of furnaces used in treating ores (material) similar to those mentioned. Some years later the same writer modified this statement to the following: "Although some 90 per cent of the copper blast furnaces in the United States are now water-jacketed, one progressive and thoroughly experienced concern, The Orford Copper Company, still uses the large brick Raschette furnaces that they introduced some twenty years ago. Such results as they obtain in these furnaces, which are now cooled in the region of the tuyere openings by means of water circulating in pipes embedded in the brick work, cannot properly be ignored. This type of furnace also demands so much care and skill in its management, that it forms a peculiarly instructive study."

The decided difference between the two statements is significant. Assuming the latter to represent more nearly the present status of the brick furnace, it is evident that this type is not altogether what it was first supposed to be, and that experience with it disclosed difficulties in its operation, for it is in fact no longer a purely brick furnace, but a defectively water-cooled one. The above strong endorsement of the prismatic brick shaft would assist Mr. Lang materially in his advocacy of that type of furnace, were it not for the subsequent modified statement by the same author, and for the further fact that the use of such furnaces does not appear to have met with the endorsement of those experienced practical smelting men who have made brilliant successes in treating ore by the matting process, for instance, at Bisbee and Jerome, Arizona, or at Butte, Montana, and elsewhere. The decided preference for water jackets on the part of such men should lead those contemplating the erection of brick or stone stacks to investigate the record made by such brick furnaces as have been built, and to ascertain upon what facts the high opinions of their supporters are based. It is also well to bear in mind that the history of mining in this country shows many instances where the erection of defective or unsuitable metallurgical plants has brought about results which have so discouraged the owners of what otherwise would probably have been profitable enterprises that they have abandoned the field in disgust. Water-jacketed cupolas are employed throughout the Western States and Territories—for instance, at Clifton, Morenci and United Verde in Arizona; at the Parrot works, the Butte & Boston smelter, the Butte Reduction Company's works in Montana; in fact, wherever copper ores are smelted and reverberatories are not used. It would almost seem as though the manifest advantages of the water-jacketed furnace are so paramount that the subject is no longer open to discussion. But brick cupolas have not been neglected by metallurgists. They antedate the water-jackets, the introduction of which was hailed as a great advance in blast furnace construction, and they have been given a fair trial in Western mining fields also; yet they are, as far as known, nowhere in use in this country to-day, except at the works already referred to, where the conditions of charge, etc., must be unusual to warrant their retention.

The facts regarding the use in the West of the style of furnace advocated by Mr. Lang are these: One of the Orford furnaces was put in at the works of the Butte Reduction Company, in Butte, Montana, some time previous to 1887. While it was in operation the writer had repeated opportunities of studying it, but upon a recent visit to Butte he found these works in other hands than those of the original owners. The Orford furnace had been torn down, and standing on its former foundation was a water-jacketed cupola which the manager of the works stated was giving every satisfaction. So in Butte, at least, it was demonstrated in a most practical manner that the brick cupola could not hold its own against the water-jacket.

Two others of these Orford furnaces (constructed like the one already referred to, with an air chamber for warming the blast placed in the bottom of the stack) were erected within the past few years at different points on the California copper belt. Whether their building was a direct result of such glowing statements of their superiority as that given above, the writer is not prepared to affirm. Neither of these furnaces is now in operation, although there is a bountiful supply of good ore within easy access of each, and at one of the works piles of coke laid in by the company are still unconsumed. The ore available at the two points mentioned is easy to smelt and sufficiently high in grade to be profitably treated, but the works are closed because the results obtained from these prismatic brick stacks were such as not to warrant a continuance of their operation.

There are, therefore, three separate instances of brick cupolas of the type recommended by Mr. Lang, having been built in recent years for working Western ores, and in each case a failure has resulted. They are the identical type of brick cupola so enthusiastically advocated by that other metallurgical writer already referred to. They are modern furnaces of large capacity, fully supplemented with all the necessary paraphernalia for successful smelting operations, and were presumably run by competent men. They did not fail from lack of capital to operate them, nor on account of "refractory" ores. Such warnings should not go unheeded. Whether any other specimens of the prismatic brick or stone stack have been put up in this western country within late years, the writer is not informed. There were at one time some stone furnaces at Eureka, Nevada, used for smelting lead ores, but they are not now in operation. They were constructed of rhyolite.

It is nothing unusual to find smelting works standing idle throughout the western mining districts, but there are usually good causes to be assigned for these conditions. Nor have brick furnaces a monopoly of such idleness, for many water-jackets can be shown which are not at present in operation. There is, however, no instance in this country in the writer's knowledge where a brick stack has replaced a water-jacket; and in the cases of the brick cupolas referred to above, the failures occurred in districts abundantly supplied with all the requisites for successful smelting operations. It seems strange at this late day, when the advantages of water-cooled surfaces in blast furnace smelting have been so repeatedly demonstrated, that the reintroduction of brick stacks with all their well-known defects should be again advocated, especially for pyritic smelting, for which they are least fitted.

Of course, it is true that there is a great variety of classes of fire brick, some of which are suited to one purpose, some to another, and that certain kinds will withstand the scouring action of a hot, basic, ferruginous slag better than others. But firebrick are expensive in most mining regions, especially those kinds which are most desirable for the purpose; and the repairs on a brick stack, once it has been put into operation, are enormous. Still, the cost of repairs is not so serious a matter as the interruptions which they occasion. When a furnace is laid up for repairs the pay-roll goes on just the same although there is no production of marketable commodities. One of the first requisites for the successful operation of a smelting plant is to keep it in continuous operation. With a low-grade ore, constant stoppages for repairs will kill almost any enterprise.

One of the greatest drawbacks to brick or stone

*The italics are the writer's.

furnaces is, of course, the burning out of the walls. Now Mr. Lang proposes to use "a very great volume of air" at low pressure, and such conditions, he states, produce (see page 64): "secondary effects, which have an important bearing on furnace construction. A good proportion of the blast fails to enter the charge to any distance, but finds its way to the surface by following up the walls where the charge lies loosest and producing a *cooling effect* there, which prevents fusion, while the excess of oxygen serves to *effectually roast* a proportion of the ore."

If Mr. Lang's premises are correct—that is, if that portion of the charge next to the walls lies the most loosely—then the weak blast, following the lines of least resistance, will of course pass out of the stack along the walls. Now, on page 53, Mr. Lang states: "I advocate and practice the method of feeding by layers, as in lead and copper smelting, while I attach little importance to exactness in placing the materials so long as they are in position to become mingled during the fusion." Therefore, as the blast passes up along the walls and comes in contact with the charge, mixed in right proportions for smelting, it might be assumed that a smelting will take place at these points, and, where the blast is strongest, there would naturally be the theater of the greatest chemical activity, and, consequently, the smelting would mostly take place in the vicinity of the walls. It is not very clear what Mr. Lang means by "a very great volume of air," but, evidently, he intends it to be sufficient to produce "a cooling effect" on the walls, that is, it is to be a great enough volume to prevent the smelting of the charge, which is to be blown cool, on the principle that a candle is blown out by an excess of air over that necessary to carry on combustion. But while the walls are blown cool, the charge is not to be similarly effected, for "the excess of oxygen serves to effectually roast a portion of the ore," and to roast an ore requires a very considerable degree of heat. It would seem that Mr. Lang is demanding a good deal of an air-blast when he requires it to exercise a selective action, such as leaving the walls cool and yet smelting (roasting) the next lying ore. Under the conditions Mr. Lang lays down, namely, a charge consisting of fuel and unroasted ore mixed, distributed in horizontal layers in a blast furnace, run by a weak blast of large volume, the writer would anticipate that the greatest smelting activity would take place along the walls. This would be all the more likely to occur if unroasted pyrites were a prominent ingredient in the charge, for, as already stated, they possess the characteristic of decrepitating to a great extent, producing a sand which packs in the charge and prevents the entrance of the blast. If, then, the blast follows the walls (of a brick or stone furnace) so does then smelting, and the scouring action of the slag rapidly corrodes them, and it is not long before they are burned through. The same burning through of the walls of brick furnaces takes place when the charge is too silicious and for other reasons; so that the operation of such stacks is a very delicate matter, and their use is not to be recommended where it can possibly be avoided.

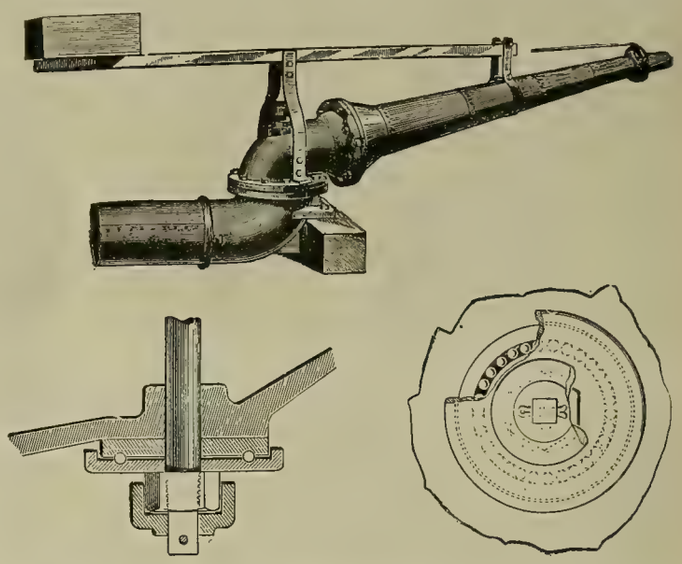
W. L. AUSTIN.

Denver, March 10, 1896.

### Selling Mines.

TO THE EDITOR:—The recent sale of the "Blair" suggests a few reflections on the subject which heads this communication. The "Blair" has been on the market for two years; nobody had any exclusive claim on it, but it was notorious the mine was for sale and the owner would recognize anyone who brought him a customer. It was the sweetest plum the capitalists of the curb had enjoyed in twenty years. Here was a mine with a vein 100 feet across, all going from $8 to $20 a ton (far surpassing the average value of the Utica and double its width) and fully 200,000 tons of ore in sight, ready for a mill, and the price variously stated at only $350,000 to $400,000. One would think that such a mine as this would be snapped up in ten minutes, but it was not. On account of the owner's known desire to sell, it is probable that no property on record was ever presented to so many men capable of buying it as this. Almost everybody on Pine and Montgomery streets who had any acquaintance in the East had sent them the "Blair," and these latter had presented it to every recognized New York promoter and capitalist in Chicago, Boston and New York—but all to no purpose. For some mysterious cause, people who were purchasing six-foot ledges of $7 ore, with perhaps only a few hundred tons exposed, had no use for a mine 100 feet wide, going $12 a ton, and with 200,000 tons all blocked out and ready for extraction. At last the company deputized one of their number to go East with a report, samples, abstract of title and power of attorney to treat without impediment should the occasion arise, and the result was the mine was placed in less than four weeks. Now, why did the sale in this case hang fire so long, and why did the property go off so quickly at last? Simply because there was no bond or option on it, or, in the place of such, no one authorized to act officially for the owners. Now it has often been urged, but cannot be too often reiterated, that in none of the great money centers like Boston, New York or London will the slightest attention be paid to any proposition for which the promoter has not a power of attorney or contract of some kind. They will not even read your reports nor listen to what you have to say. The reason for this is obvious. There is no class or syndicate of capitalists already formed and looking for mines anywhere. The sale of every mine is a singular and distinct operation by itself. When a banker or other capitalist accepts a desirable property, he sends an expert to look at it; if the report is favorable, he proceeds to organize a company to purchase, and this generally involved an outlay of from $10,000 to $75,000. Who would send an expert on the say-so of an irresponsible intermediary? Who would go to the enormous expense of getting up a company without a contract giving the time necessary for the work and fixing the price? It is useless to kick against the goad. If a man wants to sell a mine, he must submit to the requirements which govern the situation. Every great transaction that ever took place in this State or in the United States had a bond behind it. The Sierra Buttes, the Union and the Ilex, the Josephine, the Amador Queen, the Banner, the Feather River, the Holcomb Valley, and, latterly, the Iron Mountain, were not sold in any other way. These were all genuine deals, where the full price agreed on was really paid, and have nothing in common with the gas-bag sales so common in the newspapers, which either never took place at all or at the very best amounted to a small pittance down and a mortgage for the balance. The man, therefore, who will not give a contract, who says: "First come, first served," who dictatorily orders you to bring along your man with money, cash down, is sure to be left in a state of lonely blessedness, as far as the sale of his property is concerned. Of course, it will be urged that options have been given without number and nothing was accomplished by so doing. To this we reply that in such cases the bond was either given to worthless parties or the properties themselves had no value. A mine of first-rate excellence, that can stand close inspection, that is held at a fair price based on developments, can always be sold. This, however, is beside the main argument itself. No mine can be sold without the necessary bond, abstract of title and power of attorney, as so manifestly illustrated in the recent instance of the "Blair." This is the law in the premises and there is no appeal from it. Selling a mine must always be a case of the mule going to the trough—the trough will never come to the mule.

VIATOR,



San Francisco, April 25, '96.

## Scientific Progress.

### An Improved Form of Hydraulic Giant.

In view of the fact that hydraulic mining has measurably resumed its former prestige as one of the prominent and valuable industries of California, a contribution to scientific mining is herewith presented—the latest improved form of hydraulic giant, for which letters patent have been granted John H. Hendy, superintendent of the Joshua Hendy Machine Works of this city, for the United States and the Dominion of Canada, covering the Province of British Columbia. This device relates to monitors or giants used in hydraulic mining, particularly to an improvement in the bearings for the rotary or swiveled parts of such monitor or giant, by the adjustment of which the direction of the stream of water issuing from the nozzle can be changed at will.

The object claimed is the introduction of an anti-frictional bearing, by which adjustment of the nozzle-pipe is facilitated. When a giant is in use, the enormous pressure of the water flowing through the elbow is naturally exerted in an upward direction and against the upper bearing upon which the nozzle-pipe is horizontally attached.

HYDRAULIC GIANT—DOUBLE JOINTED, BALL BEARING.

The friction thus occasioned in the bearings of the ordinary double-jointed giant is so great that the angular movement is a matter of difficulty, and this introduction of a ball-bearing surface obviates this defect by materially lessening this frictional resistance.

In the cuts, it will be noted that the lower section represents the water-supply pipe as having an upturned, flanged end which is bolted to a similar flange on the lower part of the curved elbow above it. This elbow is formed with a ball upon which the nozzle-pipe is fixed adjustably to permit of its deflection in a vertical line. The nozzle-pipe and upper elbow are made adjustable by a rod passing through the elbow and an anti-frictional ball-bearing is provided which surrounds this rod at or near its top or upper part. This arrangement of ball-bearing plates, shown in the two small cuts, keeps the plates free from actual contact and hence they can never become set by rusting or other causes, and the friction incidental to the construction of the bearing plates of the old form of hydraulic giants is necessarily relieved to a very great extent by the interposition of this ball-bearing groove and the ball-bearing action thereby obtained. It is intended that the frictional resistance in the horizontal movement of the giant shall be decreased eighty (80) per cent and the torsional or twisting strain upon the king-bolt also materially relieved and the liability to crystallization and consequent breaking of the king-bolt thus precluded.

This ball-bearing arrangement can be attached at a comparatively small expense to any double-jointed giant.

These improved giants are built and furnished by the Joshua Hendy Machine Works, No. 42 Fremont street, S. F., who state that, though letters patent were granted but a few months ago, a large number have already been placed in successful operation.

THE theories in existence to account for solar energy—light and heat—are many, but the principal ones are seven in number: 1. That it is now giving off the energy imparted to it at its creation by Divine agency. 2. That it is burning up. 3. That it is caused by currents of electricity generated by itself. 4. That it is heated and supplied with fuel by stray comets running into it. 5. That a stream of meteoric matter is pouring into it from the regions of space, and the arrested motion is converted into heat. 6. That the mass remains constant and the temperature is maintained by a diminution in its size, the contraction, though slow, being sufficient to account for the phenomena, and slowly enough to keep up the present supply for millions of years. 7. That the sun's rotation causes a constant flow of gases from equator to poles with a rapidity sufficient to heat the gases, decompose them and burn them up. The sixth is the theory generally maintained by scientists now, but there is a growing belief that electric currents between the planets and the sun serve to, at least partially, maintain the temperature of the latter, though Prof. Schaeberle, in his recent lecture in this city on the Chili eclipse, distinctly stated the absence of all electrical indications during his observance of the eclipse.

THE first edition of Prof. C. A. Young's work on "The Sun," published in 1881, mentions twenty-one elements as having been detected by the spectroscope in the sun. In all of these 860 lines had been identified. The new edition of Prof. Young's book states that Prof. Rowland has now compared sixty elements with the solar spectrum, and established the existence of thirty-eight of them in the sun, being doubtful in regard to eight of the others. Of iron lines alone he has identified more than two thousand.

A CURIOUS property of potassium uranyl sulphide has been reported by M. Besquerel to the French academy. When excited to phosphorescence, this substance emits rays which last a long time—more than 160 hours—after phosphorescence ceases, which pass through paper, aluminum and copper, and which discharge electrified bodies like the Roentgen rays.

ONE of the greatest inventions ever added to the granite business is being given a test in Montpelier, Vt. The machine is for sawing granite; contains $4000 worth of diamonds, the total construction costing nearly $10,000.

# Mechanical Progress.

### Largest Cable on the Coast.

Herewith is illustrated the largest cable on the coast, as it appeared on the truck in transit through the city to be delivered to the Market Street Railway Company from the works of the Washburn & Moen Manufacturing Co., Nos. 8 and 10 Pine street, whose Pacific works are running full time, a portion of the establishment running night and day to fill orders. The cable illustrated is 31,000 feet in length, and, extended, would reach from Market street well out toward the Cliff House. It is 1¼ inches in diameter and weighs 100,000 pounds. Cable and truck make a gross weight of 130,000 pounds, requiring fifty-six horses to haul it. The transit of such an immense weight and such a cavalcade of horses through the crowded streets of the city is always an interesting sight to the thronging thousands, who pause to view the huge wide-tired wheels and the immense coils of wire rope that, like a gigantic python, encircle the drum in their steely folds.

Illustrative of the efficiency of this firm's Pacific works, mention may be made of a cable they have just delivered to the Oakland Cable Railway Co. for their San Pablo avenue line. The company received the order for the cable late Thursday afternoon and had the cable ready for delivery Monday afternoon following, thus turning out a $1\frac{5}{16}$-inch dameter cable, 29,500 feet in length, within four days from the receipt of the order. This cable weighs 65,000 pounds and was hauled to the railroad ferry by forty-eight horses. The intention was to drive on to the ferry with the truck, but the drivers found the truck was too wide to go on to the ferry; hence, it was necessary to load this cable on to a specially constructed flatcar for transportation to Oakland.

The company is supplying many of the large cables in use on the Pacific coast. At the present time their large cable machine is at work winding a cable for the Madison Street Cable Railway Co. of Seattle.

LARGE CABLE MADE BY THE WASHBURN & MOEN M'F'G. CO.

GLASS HOUSES of a very substantial kind can now be built. Silesian glass makers are turning out glass bricks for all sorts of building purposes, claiming for them such advantages as variety of shape, free transmission of light, strength, cheapness, and general adaptability. Where complete diffusion of light is needed, as in factories, conservatories, courtyards, etc., they are especially suitable.

COMPRESSED PULP FIBER of manilla, rope and similar stock appears to possess the proper consisency for a pad that is sufficiently porous to absorb oil and deliver it again to the parts of a rapidly revolving shaft bearing, yet impervious to wear, says an exchange. The need of a perfect form of oiling mill shafting, loose pulleys of machinery, heavy driving system of water wheels, etc., is obvious to all mill men. The loose-pulley problem is one of importance. Loose pulleys usually get heated first, as they are most constantly running. When a part of a mill is run by night, all the loose pulleys of idle machines in other departments are revolving, and as some of these are in out-of-the-way places, they often get heated and start a fire before discovered. Besides there is the wear of the shaft. This is overcome by inserting a paper pad in a slot in the shaft.

# Electrical Progress.

A DESCRIPTION by J. W. Dickerson of the running of a telephone line from Leadville to Aspen, Colorado, shows that telephone construction in the Rockies is not all plain sailing. It took two months to cover the entire length, 48 miles. In ordinary construction, the poles would be set 42 to the mile, but at certain points, where sharp turns were necessary, the number would sometimes be increased to 75 to the mile. The members of the construction gang had to be as expert as axmen as they were as linemen, for when timber was encountered a path of 200 feet on each side of the line had to be cleared in order that wires might not be broken when trees were blown over by the terrific blasts which at times prevail in that region. A great deal of the comparative slowness of the installation was owing to the inability of the workmen to labor in such a rarified atmosphere. At one point the wires were strung at an elevation of 12,000 feet above the sea level. In such an altitude the lineman soon becomes completely tired; after he has climbed two or three poles, he has to take a rest to recuperate his energies. The preparation of the holes for the poles, which would have been tedious in similar ground even in an ordinary atmosphere, was an especially slow and fatiguing operation. It was often necessary to blast a hole for the pole by the use of giant powder, and an ex-miner, who had had an extensive experience with explosives, was assigned to the job. The digging of one pole hole would sometimes occupy him for a whole day, working honestly. Over 300 pounds of powder were used on the line for this purpose. When the Continental Divide was reached, the poles had to be abandoned and the wires were placed in a submarine cable, which was buried in a two-foot trench for a distance of 7,600 feet. The advisability of abandoning aerial construction at this point was demonstrated by the experience of the company who maintain the Denver and Leadville line. At one point on that line, Mosquito pass, the poles were originally set 100 feet apart. As soon as the wires were covered with sleet they promptly snapped and the line was useless. Double the number of poles were then used, with the same result. The space between the poles was then reduced to 15 feet, but as soon as the sleet came the line was swept down flat. Eventually an underground cable was laid for two and a half miles and there has been no trouble since.

# Practical Information.

### Why Steam Fuses Soft Plugs.

"Will you please tell me," writes a subscriber, "why a soft plug will fuse when exposed to steam? Why does it not fuse in contact with water? Is not the water as hot as the steam?"

Yes, the water is as hot as the steam, but the plug must get hotter than either before it will melt. Tin, with which these plugs are usually filled, melts at about 450° F.—a temperature which could be attained by water only under about 350 pounds pressure. You cannot heat a plug while one end of it is immersed in water, much hotter than the water about it, for the water will receive and carry off the heat at one end as fast as it is absorbed by the metal at the other. Steam, however, while no hotter than the water, is not anywhere nearly so good an absorbent of heat. It would take about 700 times the volume of steam at 100 pounds to absorb the same amount of heat as a given volume of water, with the same rise in temperature. To do as effective work as a pint of water in keeping a plug cool would involve about 700 pints of steam, and the water can never get above the temperature of the boiling point at the existing pressure, while there is no limit to the temperature that the steam can attain. After the water leaves the plug the steam cannot absorb the heat as fast as it is absorbed by the plug at the fire end, so the temperature of the fusible metal rises above the softening point and it is blown out.—Porter.

AT a recent meeting of the Philadelphia Academy of Natural Sciences, Prof. Carter referred to a so-called "iron tree," discovered at Three Tuns, Montgomery county, Pa., imbedded in a sandstone quarry, about ten feet below the surface. The tree is about eighteen feet long, and the trunk is about eight inches in diameter. It has been completely turned to iron, and is composed mostly of brown hematite. A portion of the tree is of imperfect lignite, resembling charcoal. No doubt exists in his mind that it is a real tree, because knots were found, many of which had also turned to iron. "The phenomenon is accounted for," says Prof. Carter, "by the fact that the shales and sandstone in that neighborhood are covered with red oxide of iron, and sometimes with brown hematite, and it is supposed that the iron ore, which contains a coloring, was reduced by organized matter, and that it was made soluble in water containing carbonic acid gas. As the water holding the iron in solution came in contact with the tree, the iron was precipitated on the tree, and there was an interchanging of vegetable and mineral matter, so that the rocks were relieved of their coloring matter, and the tree took it up."

WITHOUT a proper amount of carbon in food, one suffers from cold, and is without energy. The foods that contain the largest amount of heat and energy (chiefly in the form of starch) are barley and rice. In 100 ounces of barley or rice 76 ounces are pure heat-giving or energy-producing materials. Next to these comes wheat, which contains 69 ounces of carbon in the 100 ounces; and, after that, figs and dates, but in these cases the heat and energy producing elements are presented in the form of sugar. One hundred ounces of the substances of either of these foods contain 66 ounces of heat and energy producing material. Next to these comes oatmeal with its 63 ounces, and after this the pulse tribe, peas and beans, which average from 50 to 60 ounces of heat and energy producing material in every 100 ounces.

REGARDING the growth of population in the various countries of Europe during the decennial period 1885–95, the aggregate increase was 29,922,800. Russia added 12,510,800 to her existing population; Germany, 4,522,600; Austria-Hungary, 3,502,200; Great Britain, 2,452,400; Turkey, 1,100,000; France, 67,100.

LIEUT. W. S. SMITH, U. S. Navy, advances a novel theory for boiler explosions, being resonance, the principle upon which the fiddler threatened to fiddle the bridge down if they did not let him cross. His argument in favor of the idea is, however, more ingenious than conclusive.

### Assays of Copper and Copper Matte.

NUMBER III.

Discussion of the Results presented at the Florida Meeting of the American Institute of Mining Engineers.

There is one question only here and there touched upon in the reports of the several assays which is bound to come to the front in business practice very soon, namely, Shall allowance for cupel absorption, volatilization or loss in slag be made in commercial reports of silver assays?

In copper assaying the returns aim to represent the total copper present; and the allowance for subsequent loss in smelting is fixed by an arbitrary and uniform agreement or usage between shipper and buyer or smelter.

In gold assays, likewise, the reported result is understood to show the total contents of gold in the sample; and the buyer is accustomed to receive one-eighth or one-quarter of an ounce per ton free, to compensate for loss in smelting, and also to pay for the remainder of the gold at less than its full value as refined metal (say 90 or 95 per cent. of this value, according to the agreement he may make).

But in the assay of copper or copper matte containing silver, it is probable that the reported value in silver always comes short by an ounce or two per ton at least, of the actual total contents in that metal, by reason of the general practice on the part of commercial assayers of ignoring the losses to which I have referred. The question is, whether this practice shall be continued, or whether the assay report shall be corrected by an allowance for this loss.

It seems to me that the matter is one to be settled primarily by agreement between buyers and sellers, rather than by the assayers who stand between them. But it is unquestionably important that whatever is determined upon should be adopted by all those interested in public sampling works or in the business of commercial assaying. Otherwise, there would be interminable disputes arising, not out of lack of skill or care in either party, but out of a difference in the rules of practice.

Pending the settlement of this question, it is highly advantageous that the nature and extent of such assay losses should be investigated, and that the most accurate and convenient method of allowing for them should be determined.

I feel greatly encouraged by the interest shown in this subject, and trust that the result will substantially benefit both the metal trade and the guild of assayers.

UNITARIAN LITERATURE sent free on application. Address Postoffice Mission Committee, First Unitarian Church, corner Geary and Franklin streets, San Francisco. Mention this paper.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colorado.

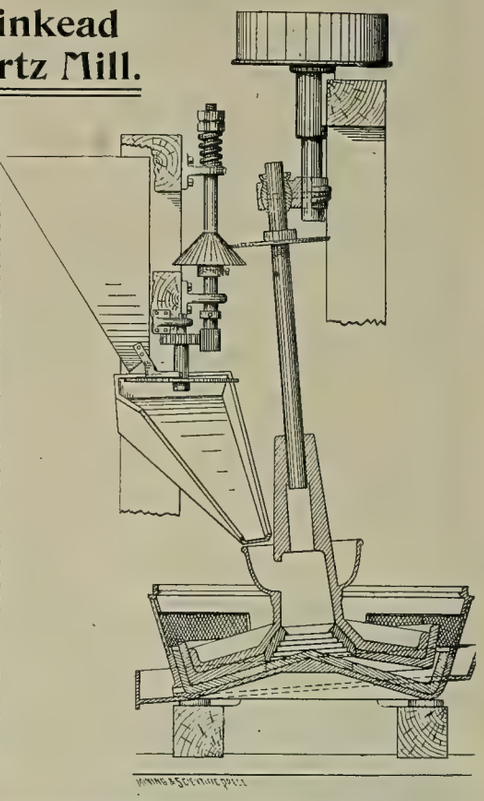
## THE DANIEL BEST CRUDE OIL ENGINE.

CAPACITY 2 to 200 HORSE POWER.



**The Cheapest Power Known—Invaluable Where Fuel Is Scarce.**

The most economical motive power ever invented, costing but 10 cents per H. P. per ten hours run, using crude oil. Cheap, safe, reliable and clean. Strong and simple to operate. Requires no engineer, and when you stop, all expenses cease, and no fire is left to endanger your building. Send for Illustrated Catalogue with full particulars, and mention the MINING AND SCIENTIFIC PRESS.

——Also Agents for——

## The Kinkead Quartz Mill.

This sectional drawing shows the main features of **The Kinkead Quartz Mill** which will do the work of five stamps with less than half the power, and can be built and put into operation for less than half the cost of stamps. The only wear is the shoe and die, which is less than that of one stamp. The cheapness in first cost and operation of this mill makes it possible to work with profit ores so low in value that they have heretofore been treated as waste. Each mill will crush 15 tons in 24 hours through a 40-mesh screen.

It requires a two-horse power Daniel Best Crude Oil Engine, at a cost of 10 cents per H. P. per 10 hours' run. There is no vibration or jar, and very little noise.

Engine and Mill can be set up and running in 48 hours.

**Price of Mill $1,000, f. o. b. San Francisco.** Feeders, Apron and Plates included. Weight, 2½ tons; heaviest piece, 1200 pounds.

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR THE WEEK ENDING APRIL 21, 1896.

558,629.—PRESERVING FRUITS, ETC.—C. F. Buckley, S. F.

558,548.—PICTURE HANGER—W. P. Cave, San Bernardino, Cal.

558,833.—WATER HEATER—G. H. Colt, San Jacinto, Cal.

558,645.—TRANSPORTING EARTH, ETC.—A. S. Hallidie, S. F.

558,879.—BASKET CARRIER—L. S. Manning, Oakland, Cal.

558 513.—FIRE LIGHTER—J. T. McDowell, Ellensburg, Wash.

558,510.—FURNACE—C. W. & J. A. Mohr, Spokane, Wash.

558,835.—POWER TRANSMITTER—F. Rademacher, Los Angeles, Cal.

558,639.—CAR COUPLING—D. J. Stevenson, Bakersfield, Cal.

558,625.—ADVERTISING CLOCK—R. G. Wenzel, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ROTARY ENGINE.—A. W. R. Berr, San Jose, Cal. No. 558,144. Dated April 14, 1896. This invention relates to an improvement in that class of mechanical contrivances in which any medium under pressure is employed to propel pistons attached to, varied by and rotating around a central shaft or axis. The device being also applicable to those machines in which power is applied to drive the shaft and piston so that they may be used as pumps and water meters and for similar purposes. It consists of an exterior case having eccentric chambers fixed therein side by side, with their eccentricities diametrically opposite; a shaft extending through the heads of the case, disks fixed to the shaft intermediate between the eccentric chambers and exterior thereto, with spring actuated packing rings to form joints between the disks and chambers, piston carrying drums fixed to the shaft within the eccentric chambers, pistons sliding in radical channels in said drums and transverse bars fulcrumed in the intermediate disk between the chambers, the ends of said bars engaging with the oppositely placed pistons whereby the inward movement of one piston is transmitted to produce an outward movement of the corresponding one in the other chamber. The arms connecting the pistons are so formed as to tilt upon fulcrum blocks intermediate between the two chambers, these blocks being made adjustable to compensate for wear.

PROCESS OF PRESERVING FRUITS, VEGETABLES, ETC.—Cornelius F. Buckley, San Francisco, Cal. No. 558,629. Dated April 21, 1896. This process consists in first innocuously sterilizing ordinary air, then in causing said air to serve as a vehicle for the vapor of an innocuous volatile sterilizing substance or compound, and finally, in causing said vapor carrying sterilized air to enter the compartment in which the materials to be preserved are confined, and to displace the ordinary air therein. The process also is one for sterilizing air, consisting in passing the air through a germ-destroying liquid or liquids and subsequently washing the same to remove the noxious products of such sterilization. The object of the process is to provide simple and practicable means for preserving perishable articles, especially fruit, vegetables and meat, so that they may be transported on long journeys and may be kept as long as necessary.

ADVERTISING CLOCK.—Rudolph G. Wenzel, San Francisco, Cal., assignor to Louis A. Robertson and Warren F. Mills, of same place. No. 558,625. Dated April 21, 1896. This invention relates to that class of advertising devices in which a series of cards bearing advertising or display inscriptions is operated by means of and in connection with a clock, so that said cards are successively exhibited. The device consists of a series of advertising or display cards, a driving mechanism for operating said series, a tripping and releasing device comprising a rotable stop bar and a pivoted lever to detachably engage the same for permitting the periodic operation of said driving mechanism, a clock mechanism, a cam in the clock mechanism and driving mechanism therefor, a retaining and tripping device operated by the clock mechanism for periodically permitting the operation of the cam and power transmitting connections between said cam and the tripping and releasing device of the card driving mechanism, whereby the latter is operated.

COLLECTING AND TRANSPORTING EARTH, ETC.—Andrew S. Hallidie, San Francisco, Cal. No. 558,645. Dated April 21, 1896. This invention relates to a means for collecting and transporting loose material, such as sand, gravel, earth, etc., by means of an endless moving wire rope, in conjunction with scrapers or excavators, which are hauled by the moving rope. The object is to provide an apparatus by which any loose material, such as sand, gravel, earth, etc., may be scooped up and transported from the point where it is taken to any other desired point. The apparatus consists of an endless traveling rope, hangers and buckets suspended therefrom, clips by which the hangers are connected with the rope, draft ropes extending from each clip to the bucket or hanger next in rear thereof, stations with pulleys over which the endless traveling rope is carried and mechanism whereby the pulleys may be adjusted up or down.

CAR COUPLING.—David J. Stevenson, Bakersfield, Cal., assignor of one-half to Henry Hellwegen, of Santa Rosa, Cal. No. 558,620. Dated April 21, 1896. This coupling is an automatic double hook coupler. It comprises essentially opposing draw heads, each having at its front and on opposite relative sides thereof a coupling hook, and each having an internal chamber, provided with shoulders, and a swinging gravity latch or tumbler, adapted to be seated against said shoulder, and to automatically engage the hook of the opposing draw head. Means are also provided for releasing the coupling from the side of the car.

# MINING AND MILLING MACHINERY.

**HENDY - NORBOM ORE CONCENTRATOR.**

OFFICE OF O'LEANS MINING COMPANY, GRASS VALLEY, CAL., Dec. 12, 1895.

*Mr. John O. Norbom, San Francisco, Cal.*—DEAR SIR: Replying to your inquiry regarding the working of your Concentrator, I take pleasure in stating that the machine is doing excellent work. The curve springs give the machine a very gentle motion, which makes it mechanically perfect. We are saving our sulphurets very clean and lose a trace only in the tailings. The machine takes pulp from five stamps, handling about nine tons per twenty-four hours with ease. Our ore carries from 3½ to 5 per cent of sulphurets. The latest improved belt gives good satisfaction; it has now run about five months. I expect it will last about fifteen which speaks well for canvas belts. As for little attention and easy working, I can recommend it to any person as being the best machine I have ever used. Wishing you success, I remain, yours truly, [SIGNED] C. A. BROCKINGTON, Superintendent.

OFFICE OF FEDERAL LOAN MINING COMPANY, NEVADA CITY, CAL., Dec. 10, 1895.

*Mr. John O. Norbom, San Francisco, Cal.*—DEAR SIR: Your Concentrator, which has been in use in our mill for the last six months, is still doing excellent work. At present we are running the pulp of ten stamps on one machine, without seeming to be overloaded. I can recommend the machine to do all and more than you claimed for it. Yours truly, [SIGNED] J. VINCENT, Superintendent.

# STAMP MILLS!

# Mining Summary.

## CALIFORNIA.

### Amador.

At the Zeila the water has made it necessary to lay off some of the men a few shifts this week. There is sufficient ore on hand to keep the mill going. A shed 36x40 feet is being erected at the Zeila blanket plant, in which will be placed six concentrators.

Sinking goes on at the Amador Queen.

At the Good Hope mine, near Jackson, the shaft is down 110 feet. At 70 feet levels were run north and south from the shaft in the ledge. Twenty tons of ore were taken out years ago and crushed in the Oneida mill at that time, without saving any sulphurets, the returns being $6.02 per ton. The old shaft will be sunk to a depth of 300 feet.

The South Eureka Company has paid off the last of the bond held by the Tanner heirs – $23,000. The ore comes from the 900 and 1050 foot levels. Sinking below the latter level progresses. The company employs fifty men.

The McIntire mining property has incorporated under the name of the South Keystone Consolidated. Active operations will begin this month. Three shafts will be simultaneously sunk at different points.

The *Record* says preparatory work for sinking the main shaft is being rapidly pushed at the Central Eureka mine.

The shaft at the Bay State mine is now down over 600 feet, and it is intended to open up an 800-foot level.

*Republican:* At the Kennedy mine they are sinking the shaft 200 feet deeper, which will take it down to the depth of 2200 feet, including the sump. About 150 feet of the sinking has been completed. The intention is to open up another level at 2150 feet. The mine has reached such a depth that the hoisting capacity is taxed to the utmost. To relieve this strain in a measure the water power is being erected at the foot of the gulch, which will give an additional pressure of 60 feet. The machinery is being put in place for this change, and when completed the hoisting power will be materially increased.

### Butte.

Snow covers the ground as low as Mountain House, 4500 feet altitude.

The tunnel in the Golden Butterfly is now in about 1200 feet.

The shaft in the Banner mine is now down almost to the 1000-foot mark.

In the Standard mine at Oregon City sinking the shaft from the 500-foot level began last week.

At Enterprise, Slater & Alm and G. W. Bothwell are each running a two-stamp mill. Burroughs, Moore and Brooks are each erecting a small quartz mill.

Lynch Bros. of Oregon City are opening a quartz mine near the junction of the North and Middle Forks of Feather river.

At Magalia four men are running a tunnel at the Bader mine and the same number at the Lucky John. Five men are employed at the Higgins mine in Nimshew. Twenty-five miners are at work in the Princess mine and about thirty five at the Magalia mine. T. J. Sparks is opening a new gravel mine on Little West Branch.

### Calaveras.

From Ponte's ranch, near Murphys, come reports of a gold strike of unusual promise.

The *Prospect* learns that preparations are under way to expand operations at the Thorp mine. The work of digging a twelve-mile ditch which will convey water from the south fork of the Calaveras to the mine is about to be commenced. A forty-stamp mill will be put up. In the mine the 500-foot level has been reached and the rock proves satisfactory. A forty-foot sump is now being sunk preparatory to crosscutting and stoping. The water is kept out of the mine with a Cornish and jack-head pump with a capacity of 250,000 gallons per hour. Ten men are employed down in the mine, working three eight-hour shifts. Five men are engaged on the surface about the works, and six are out on the hills around the place cutting wood.

The Blazing Star mine near West Point is being put in working order.

The shaft of the Gwin mine is now down 1160 feet.

Messrs. Buffert and Woods of San Francisco propose to soon start up the Lockwood mine.

Twelve men are working the Soap Root mine. The shaft is down 100 feet and a 4-foot ledge has been struck with good ore.

Col. Woodrow has bonded the Missouri mine near Angels and will sink the shaft 1000 feet.

The shaft in the Perrano mine, on the Carson road, is to be sunk to a depth of 500 feet by Salt Lake men.

At the South Paloma mine sinking will be pushed to a depth 600 feet.

At Machu mine near West Point twenty-five men are employed.

The *Prospect* says the water supply has so increased at the south fork of the Calaveras as to furnish power enough to run ten stamps at the Donnalan mill. The mill is kept going twenty-four hours a day.

At the old Granite mine the property is being put in shape in order to work again.

Philip Deidesheimer who recently bought the Spencer mine begins development this week.

In the Esperanza mine, at the 300-foot level, the lead is 75 feet in width from wall to wall and the ore is of good quality. The Mokelumne *Chronicle* says a $10,000 hoist capable of sinking 3000 feet is to be erected at once. Col. Robinson is superintendent.

The bond held by Livingston & Co. on the Empire mine expired last week; no payment has been made. An assay made of the sulphurets at the State University shows good values.

### El Dorado.

(Special Correspondence.) — A. E. Head is here to inspect development work in progress on the Blue Gouge properties. The new tunnel on the ledge has reached 200 feet and will be continued 200 feet farther. Another tunnel will be run 1000 feet north of that being opened at present.

The long continued litigation over the Lone Jack near Garden Valley has been adjusted. This property has a creditable history as a gold producer and it is encouraging to note that work will be resumed in the near future.

The sprightly little *Gazette* of Georgetown has long and perseveringly maintained a characteristically firm stand against many and strong odds in favor of El Dorado county as a fertile mining region. The *Gazette* has the proud satisfaction of seeing its good judgment verified and has added the laurels of victory to its good missionary work in the mining field.

John Skinner is running a tunnel on the old Fisk property one mile from town. The tunnel is 140 feet long and taps a rich ore body at a depth of 120 feet.

F. B. Rice has reached 140 feet, tapping a good ore body at forty feet. He is operating under lease on the Lemmons claim, about a mile from town.

M. Varozza has granted a bond and lease to Wm. Berry of Oakland for the old Barbara mine at Granite Hill, six miles west of town.

The old Kates mine on the Georgetown Divide, near the Two Channel Company, is being reopened as a drift property.

Richard Hosking is tunnelling and drifting on his property adjoining the old Pacific, within fifteen minutes' walk from the Court House, and meets with good success. He has for some years taken rich products from this property. He is aiming for the channel. In the course he is taking he will no doubt find the bench of the old Coon Hollow, famous in the days of hydraulic mining as a wonderfully rich territory.

Roberts, Gillinwater & Melton are running several tunnels, all on a ledge, on the Rosebud, near Brownsville. The ore is all high grade. This was operated years ago with an arrastra.

The rainstorm, so unusually persistent in its long continuance, has seemingly ceased, and strangers seeking deep mining properties are again coming in.

### Inyo.

The *Register* hears that a hill of phosphate has been located east of Alvord, by G. D. Rochford, representing Denver men. The principal source of this fertilizer is in Florida, and most of the phosphate used in southern California comes from there. The deposit now reported from Big Pine is said to carry 33¼ per cent of the necessary chemical.

### Kern.

The owners of the new prospects at Randsburg write to the Bakersfield *Californian* that the stories of the strike have not been exaggerated in the slightest. Their claim is called the Hector.

### Nevada.

Regarding the negotiations pending for the sale of the Sneath & Clay mine to French bankers, the *Transcript* believes that a transfer will be made. The mine has produced about half a million, plates and blankets being used in the mill, but no sulphurets were saved.

Messrs. Rapp, Engelbright, Waggoner et al have sold to F. W. Page and associates the Fortuna, formerly the Live Yankee, and right of way through contiguous property. Capt. Nihell will take charge of future work. A 1000-foot shaft will be sunk on the contact vein, crosscutting beginning at the 500-foot level.

### San Bernardino.

A strike is reported in the McHaney district, east of Banning, by the Eagle Cliff Mining Company, at a depth of seventy-five feet of twenty inches of ore.

### San Diego.

In the Picacho gold belt, says the *Sentinel*, are a large number of white quartz veins which carry no mineral whatever, the gold in that section being found in the porphyritic and schistose rocks, carrying a good per cent of silica in their makeup. Mining men not acquainted with this fact and accustomed to the white quartz veins in other mining regions which carry gold have been puzzled whenever they have visited Picacho and seen an entirely different formation and the mineral-bearing rocks of another character.

A small vein of copper carrying rock has been found in the Alcyon mine in the White gold basin, carrying free gold. It was only a stringer in appearance, four or five inches in width. Development shows a body of ore carrying gold, silver and copper.

Senator Dorsey has had a large amount of thorough prospecting and development work done on his twenty-six mines, with satisfactory results. Work will be prosecuted during the summer.

At Galanal, twelve miles west of Picacho, rich ore has been found in the Matilda, Silver Prince, Rainbow and Estrella mines.

### Santa Barbara.

Reports received of gold discoveries in the Santa Ynez valley, Santa Barbara Co., are to be largely discounted. A competent representative of this paper, who has given it recent personal observation, writes that the samples of rock (largely silicate of lime) submitted for examination carry no gold, and that whatever of value exists depends entirely on future development.

### Shasta.

The smelter of the Mountain Mines limited, has resumed. A private letter from Keswick reports excellent results.

### Sierra.

At the North Fork drift mine a 2200-foot tunnel has been run under the overlying lava, and a 375-foot crosscut shows paying blue gravel. An 800-foot flume has been built, and the company expects before long to handle 1000 carloads daily. In the South Fork mine a tunnel 1700 feet is expected to strike the ancient channel. Nearly 1200 feet of this tunnel is completed.

J. B. Wheeler of Manitou, Colo., is managing a New York syndicate which has bought a gold property, incorporated as the Crœsus Gold Mining and Milling Company, in Sierra county, twenty-six miles north of Nevada City. He tells a N. Y. reporter that it is a close corporation, only five stockholders, no stock for sale, and that he has run an experimental tunnel for 700 feet and struck ore at 500 feet.

### Siskiyou.

The Charles Hansen mine near Somes Bar, has been bought by Abner Gerrish.

*Journal:* The Distlehorst Bros. are ready to commence work on their boats as soon as the weather permits. Mining men are watching this enterprise with interest, as some are rather skeptical as to its success, while the Distlehorst Bros., who have worked their dredger in other streams, say they are satisfied there will be no trouble about its successful operation in the Klamath.

The miners on Hungry creek, Grouse creek, Elliott creek, Beaver creek and the head of Cottonwood creek, in the Siskiyou mountains, near the Oregon line, expect a good season.

Several claims of copper ledges have lately been located at the head of Indian creek, above Happy Camp, in this county, along the Coast range dividing Siskiyou and Del Norte counties, and also on the head of the Illinois river, which rises at the Del Norte and Siskiyou boundary, running northward into Josephine county, Or. The ledges also contain considerable gold and silver, and it is probable that other rich discoveries of gold and cinnabar may be found on the Siskiyou mountains near Preston's peak, at Copper lake. Copper lake evidently feeds the Illinois river and Althouse creek, running down the north side of the Siskiyou mountains into Oregon, and also Indian creek and Thompson creek, running southward into Klamath river near Happy Camp.

### Trinity.

*Journal:* The Altoona mine at Cinnabar shipped 94 flasks of quicksilver to San Francisco this week.

George Bach has sold his gravel mine, above Don Juan point, to Butte county men.

Carter, Montgomery & Tinsley have located 320 acres of gravel at Cox's Bar and will give the ground a thorough prospecting test.

Trinity Center is full of strangers waiting for the Berlin syndicate to begin operations.

The Brown Bear Mining Company of Deadwood have begun work in the old Lambert tunnel, the lowest one on the property, it being about sixty feet below the McDonald tunnel. A pumping plant will be put in to preserve the water for use in the mill.

On the new ditch from Big and Little Papoose creeks, in the Bolt's Hill district, sixty men are employed. F. Scironi has charge of the work. The ditch when completed will be twelve mines in length, and will convey the water of the above creeks to the mines on Mooney gulch, above Lewiston, recently purchased by the St. Helena Mining Company.

The Don Juan mine, owned by Charles L. and Wilbur A. Huestis, is turning out better than expected. They have a gravel bank that prospects 10 cents to the pan.

At the Highland placer mine at Taylor's Flat, the property of Peletreau & Hedges, the last cleanup from a six days' run netted twenty-three pounds of gold.

### Tuolumne.

*Democrat:* At the App mine there has been sunk a new incline three-compartment shaft on a 54 deg. dip, 270 feet, and an upraise driven from the 800 level to connect with it is already advanced 500 feet. Work has been stopped on the upraise and the connection will be made this month by sinking. They are also drifting south from the 200 and 800 to tap the old workings and commence stoping. The new twenty-stamp mill is going from the dump. There are at present 47 men on the payroll.

At the Rawhide sinking continues. Thirty-five stamps are kept dropping steadily. It is expected that the Tuolumne Water and Electric Power Company will soon be able to turn on the current for both the mill and hoist.

At the Dutch mine Supt. Trittenbach will put in four concentrators. Ten stamps are at work. Twenty-seven men are employed.

At the Punter, two and a half miles east of Sonora, Supt. Witney has ten men at work.

The Golden Rule hoisting machinery is almost completed.

*Independent:* The Marcus mine at Saw Mill Flat is being worked by two shifts.

E. C. Frisbee of Sonora has sold the Tarantula mine to H. McDonald of Alameda for $7000.

The Mountain Lily quartz mine, situated about six miles northeast of Columbia, is bonded for two years by Schoenfeld and Adler of San Francisco and A. S. Graham of Saw Mill Flat. Development will commence at once, with Mr. Graham as superintendent.

### Yuba.

At Brown's Valley the Dannebroge, superintended by J. C. Campbell of Brownsville, employs about forty men. Half of these are engaged in leveling off a mill site, others are putting a fifteen-drill air compressor in position and will soon be ready to start sinking by machinery. The mill for the present will contain only ten stamps. The Flag mine, about half a mile from the Dannebroge, has let a contract to sink the incline deeper. It is reported that the old Pennsylvania mine will be pumped out by the Dannebroge company as soon as its own mine is in good shape.

The miners in Brown's Valley mining district will elect a Recorder next Monday.

## NEVADA.

The Zirn-Schulz mill at Pine Nut has been running a week and the plates are covered with gold.

Manager C. H. Wilbur proposes to put in a concentrator with a daily capacity of twenty-five tons on the property of the Ophir Con. M. Co., Central, Nev.

### LINCOLN COUNTY.

The Pioche *Record* is publishing a notice of sale of the property of the Keystone Mining Company in Yellow Pine mining district, to satisfy judgments in the sum of $64,050.39, the sale to take place on May 19th.

The Lincoln Company, to whom the property was recently leased, has taken charge and are making an experimental run at the mill, and preparing to begin work on the 100-ton cyanide mill which it is proposed to erect near the mine.

### STOREY COUNTY.

The yield of the Belcher mine for the past week was 42 tons of ore, the average top car sample of which assayed $19.23 per ton.

The joint Confidence, Challenge Consolidated and Imperial west crosscut No. 1 from the surface tunnel is out 504 feet. The face is in hard porphyry.

In the Crown Point mine the west crosscut on the 700-foot level started from the main north lateral drift, 75 feet south of No. 1 crosscut, is out 40 feet. The face is all in quartz of low-grade. The raise from the south drift on this level is up 35 feet. The top is in quartz and porphyry of about the same appearance and grade as last reported. The south drift on the seventh floor of the raise on the 1100-foot level is now out 80 feet. The face is in porphyry and low-grade quartz.

The Segregated Belcher mine produced 21 carloads of ore averaging $22 67 per ton during the week.

The ore yield of the Savage mine for the past week was 52 carloads, of the average assay value of $22.67 per ton.

## OREGON.

Two hundred and twenty-five mining claims have been filed in McMinnville, Yamhill Co., during the last month. There is little being done in the way of mining, except at the Semmens lode, where work is going on day and night. They have run a 5x7-foot tunnel 20 feet into the lode, and sent a few tons to have a mill test.

Operations have been temporarily suspended at the copper mines in Josephine county pending investigation by experts. Less confidence is felt in the future of the Waldo mines than of those on the Illinois river.

## WASHINGTON.

The Red Hill Mining Company, fifty miles north of Leavenworth, has run a 50-foot tunnel, sunk a 15-foot shaft on the property and suspended until the 1st of June, or until there is less snow than at present. There is 16 feet of snow near the mouth of the tunnel.

E. C. Sterling, superintendent of the Blewett mines, in the Peshastin, tells the Ellensburg *Localizer* that the mill will be started up about the 1st of May on 1000 tons of ore, and will be employed during the summer most of the time.

W. T. Goode, on Chloride mountain, three miles south of Boundary, has gray copper ore running well in silver, $8 gold, 20 per cent lead, 3 per cent copper and 2 per cent antimony. Fifty locations have been made recently.

A contract has been let to W. J. Jackman to drive a 100-foot tunnel on the Edith Gillis, a gold property belonging to the International Mining Company.

On the 5th will be started up the hydraulicking works at Seven Mile.

The *Review* reports that Captain Fitch is building a boat at Wenatchee, to dredge the bars of the Similkameen and Okanogan rivers and the gravel to save the gold. The experiment will be tried in a few weeks. It is equipped with pumps.

Deputy Collector M. J. Maloney, talking about the opening of the Colville reservation says since the act was signed by the President he has received from five to fifteen letters per day asking for practical information. He believes that the west Kootenay mining district in British Columbia and the portion of the Colville district referred to contains great mineral deposits. Over 1500 locations have been made in the Colville reservation since it was opened. Perhaps one in 50 of these will prove a paying mine. Instead of every individual going plowing around prospecting in a handicapped manner, ignorant of the country and working for results in a blind fashion, it would be better for two or three or half a dozen to employ some experienced man to examine the prospects that have been made and report. As a rule prospectors are broke when they make their location and are only too glad to give an interest to have the property developed. Any country with such prospects attracts a mass of all kinds of labor and competition in labor is as sharp there as any place on the coast. Mr. Maloney says that during 1885, $54,000 was collected as duties on importations of ore at Northport. "The tremendous increase may be judged of from the fact that for the first months of this year alone the duties were $18,000, or one-third of all the previous year."

## BRITISH COLUMBIA.

The Rossland *Miner* is authority for saying that two new smelting plants will shortly be erected in the vicinity of Trail Creek; one, to treat both gold-copper and silver-lead ores, will be erected in connection with the C. P. R. on the Columbia river, either at Nakusp or Robson, or possibly nearer Trail. The other, which will be a matting plant, will be put up in connection with the Spokane Falls and Northern line. Both works will be erected by American capital.

From Rossland comes a report that M. Reilly, a prospector, while crossing a dry bed of the Columbia river below Trail creek discovered a boulder of ore weighing many thousand tons that assays $50 in gold.

Diamond drill prospecting at the Le Roi continues. At the 450-foot level the drill has disclosed to the west of the present shaft a body of ore 91 feet in extent. W. M.

Ridpath is manager of the Trail office of the Le Roi Company.

The Washington concentrator at Three Forks is expected to start up next week.

Eighty-five men are now employed at the Silver King mine at Nelson. The present output is about 80 tons daily. The upper section of the tramway handled 513 tons of ore in four days last week, working ten hours a day.

### ALASKA.

The Jualin Mining Co. are having the Fulton Engineering & Shipbuilding Works build them a ten stamp mill, which with the concentrators will be operated by water-power with 100 feet head, at their property at Berner's Bay, Alaska. The name of the company is made up from the words Juneau, Alaska, Indiana. The machinery will have to be carried two miles up the almost precipitous side of a mountain. The 1,000 pound stamps can be taken up easily, but a little difficulty may be experienced in pulling up the 5,500 pound mortar which will be taken in on skids and rollers. Judge Mellin of Juneau is superintendent.

### IDAHO.

At Mullan, Idaho, the Morning mine is reported to have compromised its differences with the Miners' Union and will hereafter employ union men. This is denied by the local paper.

The Trade Dollar mine at Silver City makes weekly shipments of bullion and also produces about a carload of concentrates each month, giving employment to 100 men.

The Blue Jacket, near Caldwell, has been sold for $4000. Baxter of Boise City has taken charge of Bishoprick's stamp mill at Pearl and will run it on custom work. The Leviathan mill run of ten tons at the Richmond netted $60 per ton in gold

Horn & Staples are loading an outfit for their placer mines on the Middle Boise, seventy miles from Boise. They will send up a pack train consisting of ten animals and a working party of ten men.

J. E. Branscombe has leased the Stemwinder mine, mill and tramway at Wardner and has put on men working the mine to its fullest capacity.

The Dubois *Enterprise* says the old Nicolia mining camp, which has lain comparatively idle for the past seven years, will make quite a respectable showing this year in the output of ore. The original Viola mine, owing to its being in litigation, will probably remain idle, but there are other mines in that vicinity which have produced sufficient ore during the past winter to justify the letting of contracts to freight the output to Dubois, where it will be shipped to Denver. The ore is low grade in silver, but runs from 60 to 80 per cent lead, and is of such a character as to make very valuable for fluxing and the owners realize nearly the full value of the lead.

The Wallace *Miner* reports that a new mill of 100 tons capacity is to be erected by Burke and Gies on the Formosa mine on Canyon creek, two and a half miles east of Wallace. The mine has a nine-foot ledge of concentrating ore running 60 per cent lead, 53 ounces silver and $5 in gold. The Black Bear mine is to be opened as soon as legal complications are settled. Between the Frisco and Black Bear mines twenty miners have formed a cooperative association, are developing a group of mines known as the Great Eastern, with favorable prospects. The Standard is working eighty men, the Gem fifty or sixty, and the Frisco one hundred and fifty. At present the Cœur d'Alene mines are employing about the same number of union men as non-union men.

The Idaho Chemical Gold Mining Co., supersedes the New Columbia G. M. Co. at Yellow Jacket. H. Armstead is general manager.

At Leesburg the Gold Dust Mining Co. proposes to put in a 20-stamp mill.

The Bunker Hill and Sullivan Mining and Concentrating Company at Wardner has received 300 feet of new cable for its tramway. The new cable will extend from the ore bins at the mine to the snowshed and will replace the portion of the tramway over the town. The general manager of the company says the tramway since it was put in, in 1890, has transported 450,000 tons of ore. Its operating expenses are represented to amount to 5 cents per ton.

### UTAH.

"Never in the annals of mining in Utah has there been so much ore blocked out as at present. Give us a fair price for silver, deliver us from the trust that is bearing lead, and, with the increased production of gold, I have no doubt of our ability to tie, if not surpass, the record of all time," says Col. E. A. Wall in the *Tribune*. "Concentration has done more, perhaps, in these hard times, to maintain the camps and afford employment for the miner than has any one thing connected with the art of mining up to date. The average reader, especially of the East, does not understand this. People don't stop to inform themselves that since the slump in silver in 1893, several tons of crude ore have been, by concentration, put into one, and that it is the mill that enables the miner to do this that has kept many of the camps alive. A good example of this is revealed at Park City, for, notwithstanding the magnificent bodies of marketable ore, the larger portion of the output comes forth in the form of a concentrate, and, if I am correctly informed, the new concentrator proposed by T. R. Jones for that camp will enable it to handle 500 tons of concentrating ore a day. All the while it has been a hard struggle for us, however, and not until the price of silver is restored will the wrong the great industry has suffered at the hands of the East be repaired."

*Tribune*: T. R. Jones, who is with his associates projecting the big concentrating plant at Park City, says that the company is not yet ready to release the details. From other sources it is learned that the plant will cover an enormous lot of ground and that the boilers alone will represent a plant of 460 horse-power. The concentrator promises to revolutionize the method of handling the sulphide ores of Park City and to render the operation of the present mills in that locality unnecessary.

### MONTANA.

The State of Montana, by William L. Hill, County Treasurer of Silver Bow county, has brought suit against the Anaconda Mining Company and the Anaconda Copper Mining Company for $59,450, principal sum for back taxes, and $5,950, 10 per cent penalty thereon, amounting in all to the sum of $65,150, with interest and costs of suit.

The travel from Troy to the Yahk gold camp is increasing three pack trains are busy packing in miners' tools and supplies.

### WYOMING.

The American Gold and Copper Mining Company commences active operations May 1st by running a tunnel on the Ray Boy, Copper Queen and McKinley lode, also in sinking a 200-foot shaft on the Helen and Prince of Wales lodes. The placer claims of the company will be worked to their full capacity. Louis Miller of Laramie, stockholder and trustee of the company, is manager of the properties.

The Buffalo *Courier* says a test run of the Burlington stamp mill demonstrates the richness of the conglomerate, as the plates saved from $3 to $10 in coarse gold, while the tailings treated with cyanide would yield as much more.

W. Goode, at Timber lake, in the Four Mile district, has a placer mine and will perfect arrangements for constructing a large ditch from Snake river to supply the claim with water. The surveys have been completed, and the estimated cost of the ditch, which will be over fifty miles in length, is $250,000.

### SOUTH DAKOTA.

(Special Correspondence.)—Henry Robinson, of Akron, Ohio, is here looking over the ground with a view to adding ore reduction works to his plant. When he built his present works he put in much more power than he needed with a view to adding something to it.

Custer, S. D., April 24, '96.

(Special Correspondence.) — The Hawkeye Mining Co. has started its forty-stamp mill on ore from the Hawkeye mine, thus adding one more to the list of contributors to our gold reserve. Before starting up the mill they put about 200 tons of ore in their bin, so as to have a little lee way.

Pluma, S. D., April 28, '96.

(Special Correspondence.)—D. A. McPherson, of the First National Bank, and associates have purchased of the McShane Bros. the controlling interest in the Wasp No. 2 mine on Yellow creek and have commenced work preparatory to shipping ore. This mine made the original owners wealthy and the indications are that it will do the same by the new owners.

Deadwood, S. D., April 26, '96.

(Special Correspondence.) — The owners of the Mandolin mine are putting on a night shift in their development shaft, thereby doubling the force of men they have been working. They are also preparing to start a force of men to work taking out and sacking the ore. The richness of the ore continues as greater depth is obtained.

Custer, S. D., April 28, '96.

Statistics of the production of gold and silver in South Dakota for 1895 show the value of the gold produced during the year to have been $4,267,000, and of silver, coinage value, $136,943. The output of the Black Hills during the coming year gives promise of a large increase.

### COLORADO.

The Pueblo *Adviser* says Creede is blue. The big mines are closing down and the outlook is not bright. A freeze-out game is supposed to be under way and the county of Mineral suffers temporarily.

### ARIZONA.

The Tucson *Star* thinks there is a probability of the rich copper mines of Planet being sold to the Bisbee Copper Company. The mines were worked by a San Francisco company about twenty years ago, but since that time no work has been done on them. The copper on the surface was so rich that it paid to ship via the Colorado river and the Gulf of California to San Francisco thence to Swansea, England, for reduction. A smelter was built at Aubrey, but it was a crude affair and failed to do the work intended.

Tombstone *Prospector*: George Fitzgerald, of the Duquesne Mining and Reduction Company, from Crittenden, says the machinery is in place and working at Washing Camp. There are 3000 tons of good copper ore on the dump ahead of the ore haulers, and shipments to the east-side smelter in El Paso are now being made.

Prescott *Courier*: The tunnel on the Hamilton-Poland-Bell mines, Big Bug district, is now in over 1550 feet and shows a continuous ore body averaging $65 per ton, silver and lead predominating; the average width of the pay streak is 20 inches.

Prescott *Journal-Miner*: C. E. Donaldson has resigned as superintendent of the Etta mine in Cherry Creek district, and, with Geo. Watson, has taken a bond on the Cross Cut, Nazareth, Supply, Black Chief and White Chief mines, which are extensions of the Etta. The claims are owned by Munds, Campbell and Olden, and Messrs. Donaldson and Watson propose to proceed at once to the development of them, and have in fact a force of men at work already on them. They expect to have a mill in operation soon treating the ore. Mr. Donaldson is confident in his belief that they will turn out as rich, if not richer, than the Etta.

The new find at the Harqua Hala is reported to hold out well. Some time since the theory was advanced by experts that the original discovery there of what was known as the Bonanza claim was simply in the top of a mountain which had fallen over and that the main ledge was not there at all. This theory seemed verified by the explorations made with a diamond drill, as sandstone was struck at quite a depth below where the ore was lost. The new find of the Quinn Bros. is now supposed to be on the vein from where the break occurred, and so far the deeper they have sunk on it the better is the ore produced.

The old Howard mine on the Hassayampa is coming to the front again. This mine created a sensation when discovered by the fabulously rich ore taken from it by the late J. W. Barrington and W. H. Harlan, the latter afterwards purchasing his partner's interest in it. They took out about $50,000 in sinking only a short distance when the rich ore gave out.

### LOWER CALIFORNIA.

*Lower Californian*: P. L. Griffin, the representative agent of the Pyramide Mining Company, reports the company incorporated under the laws of California; capital stock of $2,000,000; L. Hahn president, W. E. Howard vice-president. The plant to work this placer ground to which they are seeking title will be one of the most extensive of its kind in Mexico, the method used being the same as is employed at the far-famed North Bloomfield hydraulic mine in California. The field has been surveyed by a corps of competent engineers, and the company are in readiness to commence one of the most important mining developments ever proposed on this peninsula.

### MEXICO.

From the mining district of San Jose de Gracia in Sinaloa, the house of Tarribay Echavarria recently remittted two bars to the mint, valued at $11,450 52 in gold and $292.57 in silver. The Anglo-Mexican Company also shipped four bars valued at $76,050.52 in gold and $1,703.23 in silver.

## The Overland Monthly.

The editor of this paper buys the *Overland Monthly* at the news stand every month and always finds much in it to commend. It is an institution that is deemed worthy of favorable comment. The fact that it is distinctively a California production is of secondary home recognition, but apart from that it consideration. By reason of its home, it merits has a strong claim on the good will of Californians in being a magazine that every Californian can refer to with just pride. It is representative of California and of value to the State. It does not appear to ask patronage or support because of its environment but assumes to benefit its surroundings. Certainly no traveler or chance reader can fail to have a better idea and a higher opinion of the State after perusing any one of its monthly issues. We know nothing of its affairs, its circulation, or its advertising receipts, but it is spending considerable money. In the May number are thirty-six half-tone engravings, evidently made specially for that issue, twenty-one of which would do credit to any magazine in the world. In their execution and typographical production they are excellent. Besides these appear sixteen others, any one of which is superior to the ordinary "picture," or "cut." The paper on which these engravings are printed is the finest heavy plated, the most expensive that can be put in a magazine. If the circulation is extensive—runs into the thousands—the paper bill alone is a big item; the illustrations for that one number must have cost in all close on to $1000. On the cover is the old, familiar grizzly crossing the railway track, as in the '60s, the main representation being a California miner whose pick has just uncovered gold. He could well dispense with the dirk in his boot and the ill-drawn pistol in his belt, but that, like the story of "Doc Willis" on pages 510-526, is a concession to the Bret Harte period, a reminiscence that serves to give a wrong impression of California, past or present. The magazine has thirty-six pages of advertisements. Were it published on the Atlantic slope it would have been double that number, and deserves a better showing in that regard. The article on "Unexplored Regions of the High Sierras" is of unusual merit, reminding the reader how little the natural mountain grandeur of our State is even now known. "The Quicksands of Pactolus," its main serial, a California story, is excellent in many regards, with insufficient attention to local details, and needing an immediate finis. "California Artists," is superbly illustrated. There is nothing finer in any of the current magazines than the engravings on pages 506 and 507, the one on the latter page being, next to the frontispiece full page portrait of Irving M. Scott, the best among the many fine engravings in the issue under discussion. "The Deserted Homes of a Lost People," though of little literary merit, is a valuable historical contribution. "The Simple Story of a Tailor-made Overcoat," is a clever and original short story, and "Nature's Thermometer" is far above the average magazine poetry, which, ordinarily seems strung together solely for the convenience of the foreman of the composing room, just right in size and handy in making up the forms. There are three didactic articles on education, which, in their scope and treatment, justify the claim of the magazine for recognition by the educators of our California youth. "The Silver Question" is discussed by the versatile Jno. P. Irish, whose present views on this subject differ diametrically from his Des Moines utterances. A thoughtful article, "Hard Times; Causes and Remedies," an answer to inadequate criticism and a sequel to a former article, is Irving M. Scott's formulation of the present main political question. The article is a timely and valuable contribution to the manifestly correct doctrine that in bimetallism and protection lie the cure of the prevalent hard times in the nation. The "Etc." is somewhat self-laudatory, but that is allowable, for in these days of fierce competition in all lines of business no one or more dependent on the work of hand or brain for support can ignore the homely apothegm, "He that tooteth not his own horn the same shall not be tooted." As an entirety the magazine is worthy of praise. It is clean, honest, and possessed of considerable artistic, literary merit; it seems to have an ideal, and minds its own business, not sneering nor carping; not meanly personal nor vauntingly arrogant; but with a commendable determination to honorably fill a worthy place in current literature and honestly make the profit of the work exceed the expense.

# ORES! ORES!

## Gold, Silver and Lead Ores and Concentrates

PURCHASED AT REDUCED RATES FOR TREATMENT.

SELBY SMELTING & LEAD CO.

416 Montgomery St., San Francisco.

Consign shipments to Vallejo Junction, Cal

## Great Reduction in Light!

# IMPERIAL Automatic Gas Machine

Produces a Beautiful Light.

The difference between the brilliancy of light produced from gasoline gas and from coal gas is 3 to 1. The gasoline light is clear and soft, rests the eyes and brings comfort to the home.

The latest and most perfect Automatic Gas Machine now in use, particularly for illuminating private dwellings in the country, as well as residences in the suburbs of a city or town, public institutions, asylums, hotels, etc. The light is steady, soft, bright and pleasant to the eyes and can be furnished at an expense of but eighty cents per 1000 feet of gas. It is much safer than coal oil lamps, which are so dangerous to have in the house on account of an explosion.

These Gas Machines are perfectly safe, and free from any danger whatsoever. Every modern house built for gas should have one of these machines. No public institution should be without one. I have no hesitancy in saying that there is no other gas machine in the market that can compete with mine as to prices, and they surpass as to perfection in all its requirements.

For supplying gas for gas stoves for cooking or heating these gas machines have no equal. Address

JACOB SCHRIEBER,
East Berkeley, Cal.

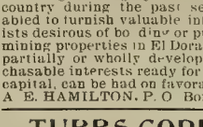
Or H. E. STEMLER, Agent, Merced, Cal.

## LINK BELT MACHINERY CO.

Engineers, Founders, Machinists.

CHICAGO, U.S.A.

Malleable Iron Buckets of approved pattern and weight.



Elevators & Conveyors.

ELECTRICAL MINING MACHINERY.

Water Elevators, Shafting, Pulleys, Gearing, Friction Clutches, Rope Sheaves, Etc.

Send for Special Mining Machinery Catalogue.

## FIELD & GOETZMANN, ENGINEERS,

712 Cooper Bldg
Denver Colo.

Detachable chain belt, sprocket wheels, malleable and steel elevator buckets, elevating and conveying appliances.

## GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of boring or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 68, Placerville, Cal.

## TUBBS CORDAGE CO.

(A CORPORATION.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc. ☞ Extra sizes and lengths made to order on short notice

611 and 613 FRONT ST., San Francisco, Ca

## Coast Industrial Notes.

—It is proposed to connect Grass Valley with Colfax by telephone.

—The steam road from the Park to the Cliff House, this city, is to be changed to an electric railway.

—The California combination of redwood lumber sellers have raised the price $1 per M. all along the line.

—A new evening newspaper, the *Daily News*, will be started by unemployed printers about the 15th inst.

—The Southern Pacific Company has decided to use petroleum for fuel on its entire system south of Fresno.

—The Northern Pacific Railroad and all its properties is to be sold at West Superior, Wis., before July 1st, '96.

—The schooner J. D. Colman, bound for Siberia, shipped a crew last Wednesday at the rate of $16 per month.

—California shipments of green and dried fruit for '95 amounted to 360,459 tons, of which 156,845 tons were shipped by southern California.

—The battleship Oregon was successfully drydocked at Hunter's Point last Sunday, came off the next day and will have her trial trip next week.

—The Southern Pacific Co. has reduced wool rates from San Francisco to the Atlantic coast, greasy wool eighty cents and scoured wool one dollar per cental.

—It is expected that the bridge across the Merced will be built in time to move a portion of this season's San Joaquin wheat crop on the Valley road to tide water.

—It is said that the white ant in Central America will destroy pine, but will not touch California redwood or fir. A good trade is being developed in these countries.

—At the request of the San Francisco subtreasury Secretary Carlisle has directed the coinage of $50,000 in pennies, nickles and dimes, for distribution in California.

—From motives of economy the narrow gauge South Pacific Coast road to Santa Cruz will, after the 1st of next month, be consolidated with the broad gauge Coast road from Third and Townsend.

—The Puget Sound and Central American Steamship Company say that by June 1st they will dispatch four ships from Seattle, Wash., to Central American points with cargoes constituted mainly of goods sold by Seattle wholesalers.

—The California manufacturers of blasting and gun powder have been trying to consolidate. Increased consumption occasions little profit owing to competition. Three San Francisco companies make nearly 15,000,000 pounds of dynamite annually.

—The Treadwell Bros. expect to have their railroad from Stockton to the Corral Hollow coal mines finished in thirty days, when they calculate on employing 1000 men and daily turning out 3000 tons of coal. They propose to carry the coal from Stockton to this city in steel barges.

—The Pacific Torpedo Co. has incorporated to build submarine projectiles invented by F. M. Close of Oakland, Cal., which are intended to carry 700 pounds of dynamite and be susceptible of being guided from shore to annihilate a vessel. Col. Geo. H. Mendell is one of the directors and says the scheme is feasible and scientifically correct.

—In a recent address delivered by W. L. Watts, of the State Mining Bureau, before the Los Angeles Chamber of Commerce, he expressed the opinion that the local oil deposit would not yield a large supply for any length of time unless extensions of the present territory were discovered, and he estimated that the Los Angeles oil field, which is bounded on the west and east by breaks in the formation, contains something less than 3,000,000 barrels of oil, of which about one-fourth has been pumped out.

—The Manufacturers' and Producers' Association is trying to get the managers of the California insane asylums to buy California coal. The following letters have been sent by the association during the week:

SAN FRANCISCO, April 29, 1896.

*To the Honorable Board of Trustees of the State Asylum for the Insane, Napa, Cal.*—GENTLEMEN: Our attention has been called to the fact that on the 25th inst. bids were opened at the Napa Asylum for its supply of coal, and we are further informed that the following bids were received:

Six hundred tons Welch coal at $6.03, $3618; 800 tons Clarke coal at $3.65; $2920; 800 tons Clarke coal being required to evaporate 13,888,400 pounds of water as against 600 tons of the Welch.

We are further informed that although there is a difference of $698 in favor of the Clarke, which is a California coal, the contract was awarded to the parties bidding on Welch coal from Great Britain.

This association, numbering among its members some of the largest taxpayers in the State, has considered it a part of its duties to call the attention of State institutions to the fact that they should, at equal price and quality, give the preference to California manufactures and products. In this connection communications have been sent to said public institutions from time to time.

An interview was had some months since with Governor Budd on the subject, at which he declared himself very warmly in favor of the patronage of home industries by said public institutions. Therefore, it was with much surprise that we heard of the action of your board in awarding this contract to the highest bidder; and supposing it was an oversight on your part, we would most respectfully request that you cancel said contract and award the same in favor of the California coal, thereby assisting home industries, as well as saving a large amount to the State.

Trusting that this matter will receive prompt attention at your hands and awaiting your favorable reply, I am, for the association, yours very truly,

S. H. TACY, Manager.

SAN FRANCISCO, April 29, 1896.

*To the Honorable Board of Trustees of the State Asylum for the Insane, Stockton, Cal.*—GENTLEMEN: We have been informed that on the 23d inst. bids were opened at Stockton for the coal supply of the asylum, and that among others the following bids have been received: 10,315,200 pounds of water evaporated with 500 tons Welch at $6.83, $3415; 10,315,200 pounds of water evaporated with 822 tons Clarke at $3.74, $3074.48, making the difference in favor of the Clarke coal (which is the California production) of $340 52.

Although I suppose it is hardly necessary, I desire to call your attention to the question of patronizing home products, and urge that the contract be given for the California (Clarke) coal. I have no doubt that the bid on Clarke coal being lower for equal quality that this course will be taken by your honorable board, and thanking you in advance, I am, for the association, yours truly,

S. H. TACY, Manager.

## Personal.

W. G. DODD is in Nevada City in the interest of the Dodd water wheel.

S. F. MOUCK, a prominent Colorado mining man, died at Marcus, Wash., last Saturday.

G. A. NIHELL is now superintendent of the Fortuna or Live Yankee mine, Nevada Co.

C. W. TOZER is examining a copper property at Grand Canyon, north of Flagstaff, Arizona.

GOV. BLAISDELL has returned from an extended trip through Amador and Calaveras counties.

MINT SUPT. DAGGETT has returned from Siskiyou Co. and makes good report of his Black Bear mine.

J. R. BURNS, the constructing engineer of the Hammond Manufacturing Co., is visiting San Francisco.

JAS. SPIERS of the Fulton Engineering and Shipbuilding Works has returned from southern California.

JAS. D. HAGUE of the North Star mine and Raphael Pumpelly are visiting the mines of Deadwood, S. D.

COL. PAT DONAN, the prince of boomers and a leader in the use of superlatives, is inspecting Mercur, Utah.

C. H HOLBROOK will have charge of the Young America mine, Sierra City, sold last week to S. M. Green.

THOS. JAMES has resigned the superintendency of the Ashland, Or., mine. He is succeeded by Foreman Kinney.

JUDGE RICHARD RISING, well known to old Nevadans, is going to open a law office in Johannesburg, South Africa.

O. B. WHITNEY has organized a new company which takes charge of the Cerbat, Arizona, mine. O. D. Clack is superintendent.

A. K. P. HARMON, a California pioneer, and a prominent figure for many years in mining and banking corporations, died at his home in Oakland, Cal., on the 30th ult., aged 75 years.

SUPT. MCNALLY, of the Virtue mine, Baker City, Or., is credited with receiving an annual salary of $6000. The mine is now yielding at the rate of $400,000 per year and is owned by G. W. Grayson, of this city.

EDWARD WHILDEN, probably the oldest miner in the State, a resident of Nevada county for over forty years, died last week at Gold Flat. He had worked forty years underground and was nearly 84 years of age.

PROF. KIMBALL, a mine reader, who claims to be "possessed of a magnetic invention for detecting the proximity of ore bodies," has arrived on the Comstock. A local paper declares that "he located many of the Cripple Creek mines."

CONSIDERABLE anxiety is felt at Sutter Creek, Cal., by the relatives and friends of James H. Tibbits, who left there last fall for Buluwayo, South Africa, under an engagement with an English mining company. When last heard from he was 75 miles from Buluwayo, in the heart of the country since raided by the Matabeles.

W. B. DIGERT, a miner, has returned from Cuba, where he spent two months in jail, the charge against him being that a Spanish soldier found an old Sharpe's rifle near the place where he was arrested. After suffering the horrors of incarceration with thirty-two others in a room 16x18 feet, he bribed a guard with $100 to report the case to the American Consul and finally succeeded in getting out.

PROF. VAN DER NAILLEN, of the school of engineering in this city, left here a few days ago on an extended trip throughout Europe. While abroad the professor will devote much of his time to the investigation of the latest developments in applied science, as well as to the securing of a complete equipment of newly developed and the new modern apparatus to facilitate experimenting in the higher branches of scientific research, as applied to electricity, mining engineering, assaying, etc. Prof. Van der Naillen has for many years been looked upon as a pioneer in the engineering profession on the Pacific coast.

JNO. HAYS HAMMOND, on trial at Pretoria, South Africa, with other prominent American miners for alleged complicity in recent political troubles there, pleaded guilty of treason last Monday and was sentenced to death. The receipt of the news created widespread remonstrance, modified twenty-four hours after by official announcement that his sentence was commuted, though in what the commutation consists has not yet been determined, the latest from Pretoria, South Africa, under date of May 1, being that it was then reported that the Executive Court had decided to impose a sentence of five years, and at the expiration of that time banishment for life.

## Recently Declared Mining Dividends.

THE Morning Star gravel mine, Iowa Hill, Placer Co., has declared another dividend, No. 65, of $4 per share.

## Recent Mining Incorporations.

Table Mountain Gold Mining Company; L. Van Laak, J. F. Fletter, F. W. Wallace, D. W. Martin, E. C. Rigney; capital stock, $1,000,000, all subscribed.

Main Office and Works: 222 to 240 North Union Street, Chicago, Ill., U.S.A.
Eastern Office: No. 284 Pearl Street, New York

This doesn't happen every day. You can't expect it more than a few times in a lifetime. No one is going to agree and guarantee positively to save you 30 per cent or else no pay unless they know what they are about You can't expect people to say, "You need not pay for this until you have proved our guarantee," unless they intend to do all that they claim. As a matter of fact, we do more than we claim. We guarantee to save 30 per cent, but actually we save a good deal more.

Have you ever heard of a Double Pipe Air Compressor? It has one disadvantage. It needs twice as much piping as is needed with the ordinary makes of Air Compressors. On the other hand, it has more real, genuine advantages than you can shake a stick at. It will do the same work as the ordinary Air Compressors, such as are in general use throughout the mines on this coast, on 30 per cent less power. We will guarantee this and prove it to your satisfaction, else you need not pay for the Compressor. It weighs less than half as much as the ordinary Air Compressor. It costs less for freights and is more easily carried up into the hills. It shows the same high efficiency at all altitudes, high or low. It takes no more fuel to do the work if located on the highest peak of the Sierras than it would take if located at the sea level. It enables you to buy a smaller boiler than you can use with any other Air Compressor to do your work. It does not overheat the air at the Compressor and freeze it at the rock drill. In short, it is the ideal Air Compressor. It has been tried in practice, and we can show you the highest recommendations and endorsements. We sell it on a strict, positive, iron-clad guarantee. If your power costs you anything, you want the Double Pipe Air Compressor, because you can buy it on a guarantee that it will run on 30 per cent less power than any other make of Compressor. If you have to take a Compressor to your mine over bad roads, you want the Double Pipe Air Compressor, because it weighs less than half as much as any other Compressor. It is cheapest to buy, cheapest to run, cheapest to transport, cheapest to carry anywheres. For pumping it beats the world. You can run it with steam or water.

Write to the Pneumatic Power Co. for further information. If you are in the city and want a compressor, call and see them. They will show you the Double Pipe Air Compressor in operation. Remember you run no risk. We claim wonders, but we have to perform wonders in Air Compression, or else you don't have to pay for the machine. We are ready. Are you?

Pneumatic Power Co., 306 Pine St., Room 10, San Francisco, Cal.

NOTICE TO ORE SHIPPERS.

By shipping your ores to us you can obtain the highest prices paid on competitive bids in the public market, together with a careful and accurate sample, as with our new mill and improved machinery we are able to give perfect satisfaction to all shippers. *Write for our Pocket Reference Book.* The highest cash price paid for gold bullion and old gold. Prompt returns.

STATE ORE SANPLING COMPANY, Denver, Colo.

RUPTURE CURED.

Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absolutely without danger. Usually but a single treatment required.

OFFICE: MCPHEE BUILDING, DENVER, COLORADO.

**MILLS BUILT WITH GUARANTEE OF SUCCESSFUL OPERATION.**

**KENDALL GOLD AND SILVER EXTRACTION CO.**

The Kendall Process is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.
*The Kendall system is covered by patents which this company will defend.*
The American Cyanide Gold and Silver Recovery Co., organized in Denver more than a year ago to introduce and operate the Kendall Process in several States, have closed contracts with some ten mines for the use of this process after exhaustive comparative tests with the ordinary plain cyanide method.
Capt. De Lamar has adopted the process at his Nevada mines, where a 250-ton plant is being completed. He writes that he is saving 95 per cent of his gold values, and regards the Kendall Process as the cheapest and best he is aware of for the treatment of gold ores.
*All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.*
Owners of mines and reduction works can obtain full information on application to

London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

## THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

**Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines,** using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

| | |
|---|---|
| Coal Gas, ten hours' run, 1000 feet | $2 00 |
| Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c. | 1 25 |
| Coal Oil, ten hours' run, 7½ gallons @ 10c. | 75 |
| Crude Petroleum, asphaltum base, 16 gallons @ 3c. | 48 |
| Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c. | 65 |

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon—21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

## THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. Price $575 f. o. b. Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury, Manufacturer, 141 to 143 First St. San Francisco. Cal.

PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1895.

# THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

## Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

# Market Reports.

## The Markets.

SAN FRANCISCO, April 30, 1896.

With clearing weather general business shows signs of improving. The buying seems to be breaking away from its hand-to-mouth character, for merchants in the mining and lumbering districts are ordering more goods. It is said that those in the mining districts not only buy more each time when ordering, but they order oftener, which indicates a large and increasing consumption. It is also said that they meet their obligations more promptly. Heavy rains in the agricultural districts have done no little in restoring confidence in this direction, but, as yet, jobbers do not seem disposed to enlarge their line of credits, owing to the fickle character of California weather. If the month of May passes favorable, then more chances will be taken and merchants in the rural districts be given more credit. In this city manufacturers report a continued good supply of orders, which admit of running on fairly full time with, in many instances, an increase of hands employed. This is particularly the case with iron workers.

In the local money market the easy tone noted last week not only continues, but the feeling grows that the change for the better is based on substantial grounds. The steady revival in gold mining on this coast is without doubt the main pillar on which rests the belief of far better times. This is supplemented with more cheering news from the lumbering camps, with higher prices ruling for lumber, and also the prospects favorable for a good wheat crop and fair prices, while the outlook for the fruit crop is far from discouraging. Eastern advices are confirmatory that the money markets are working easier and that buyers of paper are increasing, while the supply of the latter is not so large. This change is causing a lower range of interest, which will lead up to an expansion of business and more activity in speculative channels. The supply of foreign capital seems to be increasing, which is quite an important factor at the East. European advices state that there is a plethora of funds and a continued desire to put it out. This has caused quite a strong market for all good bonds and desirable securities.

**New York Silver Prices.**

NEW YORK, April 30.—Following are the closing prices for the week:

| | Silver in London. | Silver in N. Y. |
|---|---|---|
| Friday | 31 | 67¾ |
| Saturday | 31 | 67⅞ |
| Monday | 31⅛ | 68 |
| Tuesday | 31 3-16 | 68¼ |
| Wednesday | 31 1-16 | 68 |
| Thursday | 31 1-16 | 68 |

| | Copper. | Lead. | Iron. | Tin. |
|---|---|---|---|---|
| Friday | 10 75 | 3 05 | 11 00@13 35 | 13 30 |
| Saturday | 10 75 | 3 05 | 11 00@13 35 | 13 30 |
| Monday | 10 75 | 3 05 | 11 00@13 35 | 13 25 |
| Tuesday | 10 75 | 3 05 | 11 00@13 50 | 13 35 |
| Wednesday | 10 75 | 3 07½ | 11 00@13 50 | 13 40 |

The local bullion, money and exchange quotations current are as follows:

| | |
|---|---|
| Commercial Loans, % per annum | 7@8 |
| Commercial Loans, prime | 6@8 |
| Call Loans, gilt edged | 7@8 |
| Call Loans, mixed securities | 7@8 |
| Mortgages, prime, taxes paid by lender | 6@8 |
| New York Sight Draft | par |
| New York Telegraphic Transfer | par |
| London Bankers' 60 days | $4.86¼ |
| London Merchants | $4.86¼ |
| London Sight Bankers | $4.90 |
| Refined Silver, per oz., 1000 fine | 68c |
| Mexican Dollars | 54@55c |

SILVER.—The market at the East and in London moved up slightly the fore part of the week under review, and then shaded off slightly. The improvement is said to have been due to a better demand from the Orient for new tea crop moving. This only goes to show the sensitive character of the metal, and that the supply is under fair control, while the output of the mines is steadily decreasing. In our market the demand does not show any material change from that heretofore reported. The receipts are only fair, as the bulk is sent eastward.

MEXICAN DOLLARS.—The demand is said to show a slight improvement, but the supply is liberal, both on spot and offerings for shipment. The dealers report the range from 54 to 55 cents.

COPPER.—The market at the East is reported slightly easier but not quotable lower. The American consumption does not show any improvement, causing home buyers to be indifferent, but there is still an active export movement, which keeps the market from going off, notwithstanding the light output by the mines. The opinion at the East seems to be that the foreign demand is somewhat of a speculative character.

The market is quoted as follows:

| | |
|---|---|
| Bolt | ½ & 5-16, 20c; ⅜ and larger, 17c |
| Lake Superior Sheathing | 20 |
| Ingot, jobbing | 13 |
| Ingot, wholesale | 12 |
| Sheet copper | 17 |

TIN.—The market for pig shows more strength at the East and in Europe, due to a fairly good demand and stronger holding. It may also be due to a speculative influence. Tinplate is steadier. The demand is light. The East reports a firm market for plate. This probably is due to the advance in steel and iron.

The market is quoted as follows:

| | |
|---|---|
| Pig, per lb | 14½c |
| Plate, I.C coke, heavy, per box | $4 25 |
| " " " light, " " | 4 10 |

ANTIMONY.—The market is quiet at 9 cents as an outside figure. New York mail advices quote 7⅞@8c for Cookson's, 6¾ for Hallett's and 6¾c for Japanese, from store.

LEAD.—The market at the East is firming up. This strength is not due so much to an improvement in the demand as to lighter offerings. This would seem to indicate that holders believe that with improving business in this country the consumption will enlarge in all directions for paints and all lead products.

The market is quoted as follows:

| | | | |
|---|---|---|---|
| Pig | 3 75 | @ | 4 00 |
| Bar | — | @ | 4 15 |
| Sheet | — | @ | 5 50 |
| Pipe | — | @ | 4 75 |

SHOT.—There is nothing new to report.

The market is quoted as follows:

| | |
|---|---|
| Drop, sizes smaller than B, per bag of 25 lbs | $1 40 |
| Drop, B and larger sizes, " " | 1 65 |
| Buck, Balls and Chilled, do, " " | 1 65 |

QUICKSILVER.—The market is reported about the same as last week.

The market is quoted as follows:

| | |
|---|---|
| Home trade, per flask | 39 00 |
| Distant points up north | 38 00 |
| West coast of Mexico, for export | 34 00 |

POWDER.—There is continued good demand for mining purposes. The market is firmer.

The market is quoted as follows:

| | |
|---|---|
| Hercules, No. 1, per pound | 11½c |
| " No. 2, " " | 8½c |

BORAX.—The market is steady, and quoted as follows:

| | |
|---|---|
| Refined, in car lots | 6¼ |
| Refined, in sacks | 5⅞ |
| Powdered, in car lots | 6⅛ |
| Concentrated, " | 5⅝ |

LUMBER.—The redwood lumber combine has made another advance. The market for all kinds is steady to firm with a good demand reported.

The market is quoted in this city from dock or yards as follows:

| | | | |
|---|---|---|---|
| Redwood, Fluming | 17 00 | @ | — — |
| Pine | 14 00 | @ | 19 00 |
| Spruce | 26 00 | @ | 31 00 |

NAILS.—We advance quotations 15 cents per keg. Jobbers continue to report a good demand. The market is strong.

The market is quoted as follows:

| | |
|---|---|
| Wire, carloads, basis per keg | $3 22½ |
| " jobbing, " " | 3 35 |
| Cut, carloads, " " | 2 97½ |
| " jobbing, " " | 3 10 |

IRON.—The local market, while not quoted higher, is firm in sympathy with the East. At the East it looks as if the late advances will be maintained, although there is some still available at the old price. As this cleans up there will be less difficulty of sustaining the market, owing to a continued free consumption. The demand for structural purposes is quite large, while for railroad purposes it is increasing.

Our market is quoted as follows:

AMERICAN.

| | To Arrive. | Spot. |
|---|---|---|
| Sloso | $21 00 | $23 50 |
| Thomas | 22 00 | 23 50 |
| Salisbury | 30 00 | 33 00 |

ENGLISH.

| | | |
|---|---|---|
| Barrow | $21 00 | $23 50 |
| Gartsherrie | 21 50 | 23 50 |

COAL.—The general situation is essentially unchanged. There is a good demand for both steam and household, which has reduced spot stores, but the supply on the way of foreign is said to be quite liberal, while improved crop prospects will send more coal vessels to this port for wheat loading.

SPOT FROM YARD—PER TON.

| | | | |
|---|---|---|---|
| Wellington | $7 50 | @ | 8 00 |
| Greta | 6 00 | @ | 6 50 |
| Nanaimo | 6 50 | @ | 7 00 |
| Gilman | 5 50 | @ | 6 00 |
| Seattle | 5 00 | @ | 5 50 |
| Coos Bay | — | @ | 4 50 |
| Cannel | — | @ | 8 00 |
| Egg, hard | — | @ | 13 00 |
| Wallsend | — | @ | 6 50 |
| Scotch Splint | — | @ | 7 50 |
| Brymbo | — | @ | 7 50 |

TO ARRIVE—CARGO LOTS.

| | |
|---|---|
| Australian | 5 25 |
| Liverpool Steam | 6 25 |
| Scotch Splint | — — |
| Cardiff | 6 25 |

| Egg, hard | 10 00 |
| West Hartley | 6 50 |

COKE.—The market is quoted as follows:

| | | | |
|---|---|---|---|
| Gas Companies' | — — | | — — |
| English, to load | 9 00 | @ | 10 00 |
| " spot, in bulk | — — | @ | 10 00 |
| " in sacks | — — | @ | 10 50 |
| Cumberland | — — | @ | — — |

## Mining Share Market.

SAN FRANCISCO, April 30, 1896.

The market has been fairly active, but transactions as recorded indicate that there is considerable cross-ordering, although professional room-traders are quite a factor in swelling the total sales. So far as surface indications go, there is nothing to warrant that large moneyed men are in the market, but everything points to two or three small pools doing the manipulation. This can be easily done by them, owing to the low range of values, but to promote a respectable-sized deal is beyond their power, for outsiders with money can not be induced to come in and buy unless there are two or three more dividend propositions. The past week has been prolific in reports to excite the cupidity of dealers, but so far without much effect. It is not at all unlikely that these reports may be followed by still higher prices, so as to give color, if possible, to their being correct. If this movement proves a success by letting the persons manipulating the market sell out a fair profit, then the incentive for advancing prices will be gone, after which a lower market can be looked for, entailing losses to those who bought at the advance. This is the history of the mining market in the absence of large ore developments and the right kind of moneyed backing. While the general situation of the Comstock mines is encouraging, yet experience has taught that favorable prospects are oftener more deceptive than otherwise. It is to be hoped that the work which is being done now may lead up to better results than has been witnessed since 1886 in the Con. Virginia deal or in 1888 in the Confidence deal. In both of these deals prices were driven considerably higher than the ore developments warranted, and those who bought were heavy losers. The true market value of shares is only what the ore in sight and prospects justify, yet in a spirit of gambling prices may be forced to a higher range than warranted by the conditions of the mines, and, when this is done, they can not be sustained without a large moneyed backing, which seems to be lacking.

From the Comstock mines, with a few exceptions, our advices are confirmatory of more exploiting than at any time since 1892 and 1893, with the prospects in two or more of quite an encouraging character. Ten or twelve years ago the market would have responded to so favorable a condition in the mines by shares selling at a large advance on prices now ruling. At that time there was large outside buying and selling, besides which several moneyed mining men would have come in the market, but now they can not be brought in, on the same principle that a burnt child dreads the fire. In the Alta group, official letters from Alta report that a few tons of ore are still being extracted while doing exploiting work. In the Gold Hill group official letters do not afford much comfort to the shareholders, yet the work that is being done in these mines may strike sufficient ore to promote quite a move in the market, but even after such a strike has been made it is only reasonable to infer that it will take time and money to show its extent and value. Shrewd and successful operators sell on ore strikes, letting others get the ore or assessments to pay while they get the coin. Seg. Belcher is raising more ore. If the output continues to increase in the near future the mine will come very nearly paying current expenses while doing exploiting work. In Overman, preparations, according to official letters, are under way to commence more active operations on two more levels. From Belcher, there is a total absence of the work that is being done. All that is being given officially is the number of tons of ore raised each week. Official letters from Crown Point report active work on second levels, but no ore of sufficient value to extract. No work is being done, so far as reported, in Kentucky. From Yellow Jacket there is no news which cause many to think that there is a "nigger behind the fence," so suspicious is the average trader. The west cross-drift that is being run by Challenge, Confidence and Con. Imperial got another move on, but the letter says it was extended nine feet, which is one foot faster progress than has been made. In Confidence, exploiting work is being done on the upraise from the 200-level. A few tons of ore are extracted each week. From Alpha official letters report work on the 500-foot level, but private letters also state that work is also being done on one or two other levels. The long west cross-drift from the 850-foot level of Bullion is being pushed slowly ahead. It is now out over 1760 feet. In Potosi, Chollar, Hale & Norcross and Savage active work is being done in different directions and on second levels. It would seem that every promising prospect is followed up in the hopes of its leading to something good. While prosecuting the work, ore is extracted each week, which helps to pay expenses but it is not enough to keep them from drawing on funds raised by assessment. The west cross-drift in Gould & Curry is out over 2200 feet. It ought to be soon far enough out to show practical results. The work in Best & Belcher is deserving of more attention than is given to it, for unless the work in the west cross-drift is stopped, it will be extended far enough within the next few weeks to show what can be expected in that direction. Con. Virginia continues to raise and mill enough ore to pay all expenses while still pushing exploiting work on several levels. From Ophir, Mexican, Union and Sierra Nevada there is nothing new to report outside of a general favorable formation in the material encountered. The work is on the same levels heretofore given by us. In Utah the ore encountered assays from $1 to $2 per ton. This is doubtless enough to have shareholders pay assessments. In Andes work is being done on the 450-foot level.

From the Brunswick lode our advices report that in Occidental they are still in ore, while development work is still being pushed ahead. The assays reported are about as heretofore made public, but the ore seen by the writer looks as if there is some base metal in it, which, if the case, will necessitate it being worked by a process different from that on the Comstock. The work done at other points is both dead work and exploiting, with more favorable indications reported.

From the Bodie district official letters do not report any essential change in the condition of the mines, but private letters are of a more encouraging character. A fire the past week in the Standard mines did some damage, but which can be soon repaired.

The market opened strong and higher this morning, with a good demand for Chollar and Best & Belcher. The former advanced to about 25 per cent over yesterday's prices, and then shaded off. This advance caused the entire list to sell at better figures.

At the 2:30 session to-day, Chollar sold still higher. The advance is said to be due to a report that Prof. Price had gone up to examine and analyze the ore found in this company's ground on the Brunswick lode. It is also said he will test the find in Occidental. The rest of the market, except Crown Point, Confidence, Hale & Norcross and some others were slightly higher in sympathy with the new move in Chollar.

The following illustrates the changes of the week:

| MINES. | Apr. 23. | Apr. 30. |
|---|---|---|
| Alpha | ..... | ..... |
| Alta Consolidated | $ 08 | ..... |
| Andes | 26 | $ 28 |
| Belcher | 43 | 50 |
| Best & Belcher | 49 | 58 |
| Bodie | 48 | 50 |
| Bullion | 13 | 14 |
| Challenge | ..... | 38 |
| Chollar | 39 | 68 |
| Confidence | 69 | ..... |
| Consolidated California and Virginia | 1 70 | 1 75 |
| Consolidated New York | ..... | ..... |
| Crown Point | 28 | 35 |
| Exchequer | ..... | ..... |
| Gould & Curry | 22 | 44 |
| Hale & Norcross | 1 15 | 1 25 |

## Commercial Paragraphs.

FRASER & CHALMERS of Chicago have the contract for furnishing the machinery for the new concentrating mill which Supt. Elling will build at the Easton, Virginia City, Montana, a 10-stamp affair.

THE *Electrical Review* is credibly informed from several sources that the General Electric Company will close its large factories at Schenectady, N. Y., Lynn, Mass., and Harrison, N. J., and will remove its entire manufacturing business to a new and modern plant to be erected for the company near Elizabeth, N. J.

THE South American Light, Power and Traction Company of Lima, Peru, has just placed a contract with the General Electric Company of New York for the installation of a 5000-horse power electrical plant. The dynamos will be erected at the waterfalls, eleven miles from Lima, and the electric power generated will be transmitted to the city, where it will be used to operate the surface railways and electric lights and furnish to the public generally such electric power as may be required. This will be the largest installation of electricity in South America.

**Tours in the Rocky Mountains.**

The "Scenic Line of the World," the Denver & Rio Grande Railroad, offers to tourists in Colorado, Utah and New Mexico the choicest resorts, and to the transcontinental traveler the grandest scenery. The direct line to Cripple Creek, the greatest gold camp on earth. Double daily train service with through Pullman sleepers and tourists' cars between Denver and San Francisco and Los Angeles.

Write S. K. Hooper, G. P. & T. A., Denver, Colorado, for illustrated descriptive pamphlets.

## Assessment Notices.

OCCIDENTAL CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 24 day of April, 1896, an assessment (No. 22) of ten cents (10c) per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the company, room No. 63 Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of May, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before will be sold on THURSDAY, the 28th day of May, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURROW, Secretary.

Office—Room No. 63, Nevada block, No. 309 Montgomery street, San Francisco, California.

---

INYO MARBLE COMPANY OF CALIFORNIA. Location of principal place of business, San Francisco, California. Location of Works, Inyo, Inyo county, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 30th day of March, 1896, an assessment No. 28 of ten (10c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 323, Phelan Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of May, 1896, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the 4th day of June, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

M. A. CAHN, Secretary.

Office, Room 323, 5th Floor, Phelan Building, San Francisco, California.

---

TO THE STOCKHOLDERS OF THE SOUTH PALOMA GOLD MINING COMPANY, LIMITED:

Notice is hereby given that by resolution of the Board of Directors of the corporation, adopted on the 21st day of March, 1896, a meeting of the stockholders of the corporation was called for the purpose of increasing the capital stock to the amount of two hundred thousand dollars, to be divided into one hundred thousand shares of the par value of two dollars per share, and of determining the disposition to be made of the increased capital stock; and it was resolved that such meeting shall take place at the principal place of business of the corporation, being the same building where the Board of Directors usually meet, to wit: No. 222 Sansome street, room 17, in the City and County of San Francisco, on WEDNESDAY, the 10th day of June, A. D., 1896, at 11 o'clock in the forenoon of that day.

Dated San Francisco, 2nd of April, 1896.

JOHN A. WRIGHT, President.

CHAS. WEBB HOWARD, JR., Secretary.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion - Frame, Five - Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

SAN FRANCISCO, CAL.

## READ WHAT MINERS THINK OF THE BRYAN IMPROVED ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.

One set of dies will crush from 1500 to 1600 tons.
One set of tires will crush 1500 tons.
One ring plate will crush from 2200 to 2300 tons.
The mills require very little attention. At our mill an ordinary peon," earning one dollar per day, has complete charge.
In regard to silming, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a MUCH less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator, it is unequaled by any mill now in existence. Yours truly,

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec'ty.

BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. W. J. BEATIE, Sec'ty.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY.
S. BAMBERGER, President and Manager.
SALT LAKE CITY, UTAH, October 10, 1895.

B. R. TAWNDRAW, ESQ., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly.
[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO.
C. C. MCIVER, President; D. CUSHMAN, Secretary.
MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. MCIVER, President.

## Largest Hoisting Engines in the World.

The illustration on this page depicts a front view of the Modoc, as erected in the shop of the Union Iron Works. On page 377 appear two more illustrations of these massive machines, which will shortly be at work raising loaded 4-deck cages at the rate of 2400 feet per minute.

The two largest hoisting engines in the world are nearing completion at the Union Iron Works in this city. They are intended for the Anaconda Mining Company, and in a few days will be taken apart and shipped to their destination. These mammoth pieces of machinery are named the Modoc and the Aztec Each consists of one left-hand and one right-hand compound beam engine, connected with the reel shaft by disc cranks, the crank-pins being set at right angles. The cylinders are vertical and inverted. There is one high-pressure, 26-inch diameter, and one low-pressure, 46-inch diameter, for each engine. The pistons are connected with the opposite end of the beams by piston rods, cross-head and reach-rods or links. At the top, or king post, of each beam one of the main connecting rods takes hold, while the opposite end of the rod is attached to the crank-pin, which at all times will give a positive stroke of 72 inches to the pistons.

The high-pressure cylinder is located in front of the low-pressure cylinder, with a reheater between them. Both are steam-jacketed. The condensed water will be automatically carried off from the jackets by steam traps discharging into feed tanks or condensers. The cut-off valve gear mechanism on the low-pressure cylinders is adjustable by a hand lever or governor, as desired, while the cut-off valve gear mechanism of the high-pressure cylinders is controlled by a governor and by a hand lever on a working platform. The cylinders of each engine are supported by a cast iron frame, consisting of four vertical and four diagonal columns, resting on a heavy bed-plate and securely bolted to it. They are handsomely covered with teak wood lagging, with highly finished metal covers at the top end.

The main valves of each engine are of the Corliss type, and are worked by a wrist-plate, which derives its motion from an eccentric on the reel shaft and a crank on the beam-pin. The motion is a modification of the Walseheart valve gear. The reversing gear is operated by a separate engine and an hydraulic-controlling cylinder. The beam center bearings are cast in and form part of the main sole plates. The same is also true of the main bearings for the crank shaft. All are substantially fitted, and provision is made for adjustment in case of the wearing away of the moving parts. On each crank shaft there will be two reels, each of the capacity of about a mile of flat wire rope. They will be operated independently, or in balance, as may be desired. Each reel will be provided with a patent friction-band clutch, applied by an entirely separate engine, and hydraulic controlling-cylinders. The reel breaks are of the Post pattern, with beams of heavy cast iron securely braced with steel rods, bound together at top and bottom, each operated by a special engine and also controlled by hydraulic cylinders. The auxiliary engines for working the reel brakes, reel clutches, reversing gear and disc brakes are operated by hand-levers, all conveniently grouped on the operator's platform, which is located between the engines and forms part of the main engine gallery. Each reel is provided with an ingenious arrangement for indicating the position of the cages in the shafts and the speed at which they are moving. To the end of the rope on each reel will be secured a four-deck cage, which, when loaded and in full motion, will travel at a velocity of forty feet a second, or nearly half a mile a minute. A governor, fitted to each pair of engines, entirely controls them, giving a uniform speed to the cages, and regulating the valve gear tripping mechanism, so as to cut off at the most desirable portion of the stroke. By this means an economical distribution of the steam is secured in the cylinders and saving is made in the fuel consumed.

One main, central winding stairway leads to the upper gallery, or operator's platform, and there are numerous smaller platforms winding their way around those parts of the engine requiring constant attention or adjustment The platforms are provided with brass-capped iron stanchions and with brass hand-railings, neatly designed and highly polished. Only brass piping is used around the engines and brass drip-pans are placed to catch the waste oil from the journals.

To work one pair of these engines in all of their requirements, the operator has one foot and seven hand levers to handle, while in front of him are located the two indicators, which will require his constant attention while the machinery is in motion.

Each pair of hoisting engines has seven separate subordinate engines, and each pair weighs about 400 tons.

THE MODOC—ONE OF THE TWO LARGEST HOISTING ENGINES IN THE WORLD.

## Another Gold Extraction Process.

Many are the processes for gold extraction, and in no case is "the survival of the fittest" more manifest. M. de Rigaud brings to public notice a process wherein he treats gold ores with tetra-chloride of sulphur, at a cost, he claims, of $1.80 per ton. He has two methods, a "rapid" and a "slow" process. In the former the ore and chloride of sulphur are placed in a leaded cast-iron drum, supported horizontally with a shaft in its axis carrying blades that stir the mass as it revolves. When the chemical reaction is complete the cylinder is given an almost perpendicular position, and the chloride of gold run off. This, he says, occupies from four to five hours. In the "slow" process M. de Rigaud uses a set of reaction tanks, a pump and exhaust chamber. The tanks stand vertical and permit of inversion. The ore, ground to a slime, is placed therein with chloride of sulphur, then covered, and the resultant chlorine drawn by the pump through the mass, the destructive action of the chlorine on the pump being neutralized in the exhaust chamber by being drawn through a siphon tube into milk of lime in the upper part of the chamber. The chloride of gold is run into precipitating tanks, sulphate of iron added. The claim is made that the tailings are barren of gold, that complete works capable of treating 100 tons daily can be erected for from $20,000 to $60,000. The Total Gold Extraction Co., on the Tancarville Canal, Havre, France, is now completing a plant for gold extraction by this process.

M. de Rigaud furnishes figures which estimate the cost of treatment at eighty cents per ton, purchase of tailings at sixty cents per ton and "redemption of capital" forty cents, making, according to his calculations, the total cost of treatment $1.80 per ton. He says the tailings on which the company will operate will give a profit of $4.20 per ton, and claims that considerable resultant profit can be secured, alleging "the entire and absolutely complete extraction of all the gold," and that the solvent can be furnished at a price not to exceed six cents per ton treated, according to a paper read by him before the French Society of Civil Engineers, February 28th.

## A Supreme Court Decision.

The following, of some interest to California miners, is published by request. It is a recent decision by the Supreme Court of this State as to the liability of a County Recorder and his bondsmen for money paid by miners for recording notices of locations of mining claims. The case in question was on appeal from the Superior Court of San Bernardino county:

Filed April 11, 1896.

IN BANK.

*County of San Bernardino, Plaintiff and Appellant, vs. Alonzo S. Davidson et al., Defendants and Respondents.* | No. 19,419.

This is an action on the official bond of defendant Davidson as county recorder of the county of San Bernardino. A general demurrer to the complaint was sustained by the Court below, and plaintiff declining to amend, judgment was rendered for defendants. Plaintiff appeals from the judgment.

The demurrer was properly sustained and the judgment is right. By this action it is sought to hold Davidson and his bondsmen liable to the county for certain money paid to him during his term of office by miners for recording certain notices of locations of mining claims. But the statute concerning county recorders makes no provision for the recording of notices of locations of mining claims, and such record is not within the purview of his official duties *as county recorder*. In certain mining districts there is a custom which requires a notice of location to be recorded with some one selected as a mining recorder; and in some of these districts the County Recorder is so selected. The purpose of the recording is to show a compliance with the mining customs; but this purpose, and the whole scheme, is entirely distinct from the statutory system of recordation by which parties are permitted to have transfers of property and certain other written instruments recorded in the County Recorder's office so as to give constructive notice thereof, and the County Recorder is *required* to record the same when presented properly acknowledged or authenticated as provided by statute—each kind of instrument to be recorded in a book to be kept for that purpose. A notice of a mining location in a Recorder's book is "the original notice, not a record or copy of an independent original." Pralus vs. P. G. & D. M. Co.; 35 Cal. 36. A statutory County Recorder could no more be required to record a miner's notice of location than he could be required to furnish a miner with a pick or shovel. If he chooses to do so he may transcribe such notice of location in a book, or collection of sheets of paper, which he has procured for that purpose; but if he do so he does it not as a County Recorder elected by the people, but as a person selected by the miners to do an act not provided for by the recordation laws of the State, and any moneys which they may pay him for such services are not fees for which he and his bondsmen are accountable to the county. The cases of Placer county vs. Austin, 8 Cal.; 304, McKee vs. Monterey county, 51 Cal.; 275, and People vs. Bunker, 70 Cal.; 215, are not in point. In the first of those cases a tax collector undertook to retain money, which he had received as such tax collector, upon the ground that the taxes had been illegally levied: in the second case the defendant as treasurer of Monterey county had received certain moneys by the allowance of the controller and sought to retain them upon the ground that the controller had exceeded his authority in making the allowance, and in the third case it was held that a commissioner of irrigation "having assumed to act *under a statute of the State*, and having collected moneys according to the letter of that statute, cannot be heard to say that the statute, was in conflict with the Constitution of the United States," and that therefore he was not bound to pay them over. In those cases the officers received the money as agents of the State or county upon the assumption that it was money belonging to the State or county; and they were decided upon the principle that one to whom money has been paid by another for the use of a third person cannot, as against the third person, set up any illegality in the payment. But such was not the fact in the case at bar. The respondent did not receive the money upon the pretense that he was collecting it as the official agent of the county. He was not *ex-officio* mining recorder; for there is no such officer created by the statute. And it is quite clear that the demurrer fully presents the question under review. The averment of the complaint is that during Davidson's term of office "there existed a general custom and rule amongst the miners of said county, to file for record with the recorder of said county. Notices of Location of Mining Claims," and that he knew of such custom. This presents the whole question: and the averment that he received the fees "as such recorder" does not change either the fact or the law.

The judgment is affirmed,

McFARLAND, J.

TEMPLE, J.

## California's Mineral Product for 1895.

The following was received from the State Mining Bureau last Tuesday and is of considerable value. Apart from its unquestionable accuracy its timeliness is also noticeable, it being months in advance of the date at which such compilations are ordinarily available, reflecting credit on the Bureau and all connected therewith.

Bulletin No. 8 of the California State Mining Bureau, J. J. Crawford, State Mineralogist, showing by counties the mineral productions of California for the year 1895 has just been issued. It was compiled by Charles G. Yale, statistician, from direct returns by producers. The total valuation of the mineral substances produced last year was $22,844,664.29, as compared with $20,203,294.44 in 1894, an increase of $2,641,369.85 for the year. Of this increase $1,411,035.80 was in gold and $302,458.15 in silver. The precious metals, therefore, are accountable for $1,713,493.95 of the total increase named.

According to Mr. Yale's figures the value of the mineral products of the two years was divided as follows:

| | *1895.* | *1894.* |
|---|---|---|
| Precious Minerals | $15,934,107 39 | $14,220,613 44 |
| Other Metallic Substances | 1,444,200 90 | 1,202,718 00 |
| Non-Metallic Substances | 1,348,280 00 | 1,331,351 00 |
| Hydrocarbons and Gases | 1,404,321 00 | 1,492,586 00 |
| Structural Materials | 2,713,755 00 | 2,056,026 00 |
| Totals | $22,844,664 29 | $20,203,294 44 |

These figures show a growing mineral industry in California, outside of gold and silver. The details of amount and value of each substance, as shown in the Bulletin referred to, are as follows:

**Amount and Value of Mineral Products in California in 1895.**

| | |
|---|---|
| Antimony, 33 tons | $ 1,485 00 |
| Asbestos, 25 tons | 1,000 00 |
| Asphaltum, 25,525 tons | 170,500 00 |
| Bituminous Rock, 38,921 tons | 121,586 00 |
| Borax, 5,959 tons | 595,500 00 |
| Cement, 16,283 barrels | 32,556 00 |
| Chrome, 1,740 tons | 16,795 00 |
| Clays—Bricks, 131,772 M. $672,360 00; Pottery Uses, 37,660 tons 39,685 00 | 712,045 00 |
| Coal, 79,858 tons | 193,790 00 |
| Copper, 225,650 lbs | 21,900 00 |
| Gold | 15,334,317 00 |
| Granite, 288,449 cubic feet | 224,329 00 |
| Gypsum, 5,158 tons | 51,014 00 |
| Lead, 1,592,400 lbs | 49,364 00 |
| Limestone—Lime, 394,764 barrels $386,094 00; Lime Rock, 71,355 tons 71,640 00 | 457,734 00 |
| Macadam, 840,650 tons | 700,987 00 |
| Magnesite, 2200 tons | 17,000 00 |
| Manganese, 880 tons | 8,200 00 |
| Marble, 14,864 cubic feet | 56,566 00 |
| Mineral Paints—Copper, 250 tons $2,250 00; Iron, 225 tons 3,375 00; Ocher, 375 tons 2,800 00 | 8,425 00 |
| Mineral Waters, 701,397 gallons | 291,500 00 |
| Natural Gas—Carbonic Acid $ 12,000 00; Fuel Gas 100,000 00 | 112,000 00 |
| Onyx, 1,200 cubic feet | 112,000 00 |
| Paving Blocks, 2,232 M. | 12,000 00 |
| Petroleum, 1,245,339 barrels | 1,000,235 00 |
| Platinum, 15 oz. | 900 00 |
| Quicksilver, 36,104 flasks | 1,337,131 00 |
| Rubble Rock, 414,038 tons | 394,952 00 |
| Salt, 53,031 tons | 150,576 00 |
| Sandstone, 55,242 cubic feet | 35,373 00 |
| Serpentine, 4,000 super. feet | 4,000 00 |
| Silver | 599,789 70 |
| Slate, 1,350 squares | 9,450 00 |
| Soapstone, 25 tons | 375 00 |
| Soda, 19,000 tons | 47,500 00 |

The Bulletin is in the form of a large table, so arranged that the total amount and value of each substance is shown, as well as the amount and value produced in each county in the State. The lower footings show how much of each substance was mined and its value. The side footings show the value of the entire mineral product of each county, gold, silver and everything else. In this way a record is kept of the progress of the mineral industry of the respective counties, as well as that of the whole. The figures are made up from direct returns from producers, except those of gold and silver, for which the U. S. Mint figures are accepted. In no case is the identity of any mine or company revealed; so that, while no private business is made public, the table shows one entire mineral product with a degree of accuracy far beyond what could be attained by new estimates.

The total value of the mineral products of the different counties of the State during the years 1894 and 1895 are given in the bulletin as follows:

**Total Product of Counties.**

| *Counties.* | *1895. Value.* | *1894. Value.* |
|---|---|---|
| Alameda | $ 274,647 00 | $ 242,050 00 |
| Amador | 1,443,504 40 | 1,394,042 81 |
| Butte | 706,196 38 | 473,672 65 |
| Calaveras | 1,734,918 14 | 2,192,029 47 |
| Colusa | 440 00 | 7,500 00 |
| Contra Costa | 139,655 00 | 94,000 00 |
| Del Norte | 8,250 00 | 8,000 00 |
| El Dorado | 738,498 99 | 386,763 67 |
| Fresno | 52,049 00 | 12,902 00 |
| Humboldt | 356,221 20 | 247,779 86 |
| Inyo | 464,409 51 | 327,076 91 |

| Totals | $22,844,664 29 | $20,203,294 44 |

REGARDING some editorial statements in last week's issue concerning the time allowed a delinquent co-owner of an unpatented mining claim to contribute his proportion of the required amount of labor or improvements thereon, the following, which is a copy of section 6, General Circular Instructions of October 31, 1881, (Land Office Regulations), may be added, in a supplementary way: "Upon the failure of any one of several co-owners of a vein, lode or ledge, which has not been entered, to contribute his proportion of the expenditures necessary to hold the claim or claims so held in ownership in common, the co-owners, who have performed the labor, or made the improvements, as required by said Revised Statutes, may, at the expiration of the year, give such delinquent co-owners personal notice in writing, or notice by publication in the newspaper published nearest the claim, for at least once a week for ninety days; and, if upon the expiration of ninety days after such notice in writing, or upon the expiration of 180 days after the first newspaper publication of notice, the delinquent co-owner shall have failed to contribute his proportion to meet such expenditures or improvements, his interest in the claim by law passes to his co-owners, who have made the expenditures or improvements as aforesaid. Where a claimant alleges ownership of a forfeited interest under the foregoing provision, the sworn statement of the publisher as to facts of publication, giving dates and a printed copy of the notice published, should be furnished, and the claimant must swear that the delinquent co-owner failed to contribute his proper proportion within the period fixed by the statute."

## Concentrates.

"THE rush to Alaska is over." 'Twas about time.

SPOKANE, WASH., is going to form a mining brokers' exchange.

THE mill at the Brunswick mine, Nevada Co., has resumed operations.

OREGON'S bullion yield for '95 is placed at $1,852,874. 'Twill be greater in '96.

THE Witwatersrand, South Africa, gold output for March was 173,952 ounces.

PORTLAND, OR., mining men suggest the formation there of a mining exchange.

NEVADA Co. last week collected $210 more for the California Miners' Association.

THE Mammoth, Utah, mine expects to resume payment of dividends next month.

FIFTY-FIVE MINERS have gone from Pennsylvania to the Coos Bay, Or., coal mines.

THE trustees of the Montana School of Mines propose to build an $80,000 structure at Butte.

ONTARIO is offering a bounty of $1 to every one producing sufficient ore to make one ton of iron.

CRANE & LORING of Spokane, Wash., have bought the Monte Cristo claim, Trail Creek, B. C., for $25,000 cash.

THE new mill at the De Lamar, Nevada, has started up, and that property now has a daily milling capacity of 300 tons.

GENERAL MANAGER MAGNER of the Gold Dust Mining Co., Red Rock, Mont., will build a twenty-stamp mill this summer.

IT is reported from Sierra that the mill at the Alaska mine, Pike City, was totally destroyed by fire last Monday night.

A LANDSLIDE at the North Bloomfield gravel mine, at Malakoff, Cal., last Sunday killed A. Martins and wounded two others.

THE San Andreas, Calaveras Co., *Citizen*, a carefully edited and reliable paper, has begun the twenty-sixth year of publication.

HOISTING works and a 10-stamp mill are to be put on the Hedrick gravel mine, two miles southeast of San Andreas, Calaveras county.

THE superintendent of the North Pole Co., Baker City, Or., is locally credited with intention to increase the number of stamps in the mill to 80.

CRIPPLE CREEK pluckily announces that she is able to take care of the fire sufferers and that the offers of relief from outside are unnecessary.

THE Patterson mill in Gold Basin, Arizona, was destroyed by fire on April 30th. There was no insurance on the property. The mill was built last summer.

THE Calumet & Hecla, which has the deepest shaft of the kind in the world—the Red Jacket, 4900 feet—in its latest dividend aggregates a total of $45,350,000.

AT Burke, Idaho, the Poorman-Tiger people are clearing the ground for the new concentrator. Nearly $100,000 will be expended for new machinery this summer.

THE report of the Argentum Juniata mine, Aspen, Colorado, published elsewhere, shows that silver is produced there at current rates at a profit of 20½ cents per ounce.

D. E. LUTES, Juneau, Alaska, has examined a group of six claims at Berners Bay, and has sixty days' option and a $60,000 bond. The *News* says he will erect a ten-stamp mill.

THE Rossland, B. C., *Miner* patriotically predicts that inside of twelve months Rossland mining stocks will have displaced Kaffirs and Westralians in the London market.

THE Kootenai (Idaho) Water Supply Co. have their hydraulic plant in operation. It is the intention of the company to put in works to furnish electric power to the different mining camps.

THE Gold Cross Mining and Milling Co., Hedges, Cal., which has the largest number of stamps in operation under one roof in the State, reports that in April the returns were more than double the expenses.

A ROSSLAND, B. C., paper of the 2nd inst. comes squarely out with figures and states that its issue of the previous week had a "paid in advance" circulation of 301, which appears to be an honest statement.

THE Golden Reward Mining and Milling Co., Deadwood, S. D., will double their milling capacity and consolidate all their interests in one large corporation. Harris Franklin is president and general manager.

OF ALL places on earth a mining paper has been started, or rather resuscitated, in Philadelphia. It is called the *Bullion Miner*, and, considering its surroundings, is excellent. It certainly need fear no competition.

THE Treasury statement on the 1st gives all the kinds of money in circulation at $1,540,007,082, or $30,000,000 less than May 1, 1895. The per capita circulation, based on a population of 71,136,000, is stated at $21 65.

THE Pueblo, Victor and Cripple Creek Railroad Company has organized to build a belt line around Pueblo, thence to Victor, and another belt road to Cripple Creek, and via Gillett, Grassey, Altmand and Goldfield back to Victor.

THIS city will be honored this month by the American Society of Civil Engineers, which will hold its annual convention here during the week beginning May 30th. The society numbers nearly 1800, and at least one-half will attend.

LOS ANGELES PAPERS think that the new gold strikes reported from Mojave to Yuma and along the Colorado river justify the belief that "within a year from ten thousand to twenty thousand men" will be working in that region: Hardly.

THE Blue Bird Mining and Milling Co. of Spokane, Wash., owners of the Blue Bird claim, say they will put in a stamp mill soon on their property in the Blackfoot, Wash., district. They have a 40-foot shaft and the vein has widened from two to three feet.

THE *Oasis* says that, owing to the scarcity of laboring men in the State of Sonora, Supt. George Bent of the National Mexican Mining and Developing Co. has been compelled to send to Guanajuato for a gang of sixty men to work the company's mine at El Plomo.

UTAH is a land of marvels. It has furnished silver in sand, gold in coal, and now from Oasis, Utah, comes report of a ptyschaporia kingi, or prehistoric crab, covered with silver and Capt. Richards says that at the Emigration canyon lime quarries "the lime which finds a market at the smelters contains an average of $5 a ton in silver, and that this paid all costs of production and transportation, leaving the value of the lime a clear earning."

THE seventy-first meeting of the American Institute of Mining Engineers will be held in Colorado, beginning at Denver on September 21st. The sessions and excursions of this meeting will include Pueblo, Cripple Creek, Creede, Leadville, Aspen and other points.

THE British Columbia Mining Association is taking steps to test the validity of the recently passed assessment act, as far as it relates to the taxation of mines. The ground of the objection is that it discriminates against quartz gold mining and is in favor of placer gold mining.

MANAGER RIEBER, of the Golden King Mining Co., Dixie Mining district, Elmore Co., Idaho, is drawing plans for a mill of 100 tons capacity. He estimates that he has 75,000 tons of ore in sight, that will average $14. The company has thirteen claims, eight of which are patented.

DURING 1895 the imports of gold into England were the largest on record, amounting to $179,000,000, of which $57,250,000 went from the United States, $41,000,000 from South Africa, $31,250,000 from Australia and $16,500,000 from India and China. The exports amounted to $102,000,000.

SHOULD the President veto the bill containing the proposed $250,000 appropriation, it is believed that Congress will pass it over his veto by the necessary two-thirds vote. It is expected that in the event of a Presidential veto of the California Mineral Land bill the same result could be assured.

The Johannesberg, South Africa, *Standard and Diggers' News* of the 6th, claims authority for stating that the sentences imposed upon the convicted members of the reform committee will be reduced to nominal fines, that part of the sentences prescribing imprisonment and subsequent banishment being revoked.

THE long-delayed distribution of the Columbian Exposition medals and diplomas is at last begun and the MINING AND SCIENTIFIC PRESS expects to receive the medal awarded to it for its reliability and the general value of its contents—a distinction, so far as known, not accorded to any other American class journal.

THE deepest bore-hole—that at Paruschowitz, in upper Silesia—has reached a depth of 6570 feet and penetrates eighty coal seams, with a combined thickness of 293 feet. The temperature has increased one centigrade degree for every 111 feet. The rod, tools, etc., weigh fourteen tons, and have bored sixteen feet per day.

IN Union Square, in this city, last Tuesday, a cannon was fired by electric power generated and sent from Niagara Falls, N. Y., the occasion being the opening in New York City of an electrical exposition. This ordinary occurrence, accepted as a matter of course, is far ahead of the most fantastic of any Oriental tale of magic.

STORIES of the finding of "lost mines" are usually prevalent, and in some cases, whether "lost" or not, the fact is evident that diligent prospecting is resulting in valuable finds. Marked copies of papers from every corner of the west half of America contain reports of finds that in many instances will result in a valuable prospect.

AT the Bald Eagle mine, Sum Dum, Alaska, thirty-five men are at work. A tunnel 5x7 feet has been driven into the mountain a distance of 1400 feet, and it is estimated that a further drive of 900 feet will tap the ledge at a depth of 500 feet, when, it is understood, the present capacity of the mill will be increased to forty stamps.

IT is again locally asserted that Supt. Babcock of the Golden Scepter mine at Quigley, Montana, eight miles from Bonita, a station twenty-five miles east of Missoula, is going to put in a 100-stamp mill. Considerable work is being done there, a flume 6x9 feet, seven miles long, is building, and an electric road of similar length is to be constructed.

JOHN J. JENKINS of the Cwmfelin Tin Plate Company, Limited, at Swansea, Wales, has issued a circular announcing the permanent closing of the concern. He states that the depression, coupled with the action of the men in stopping work after only twenty-four hours' notice, has led him to the conclusion that the best course will be to discontinue operations.

THE Secretary of the Interior has decided that the official survey of a mining claim must be in accordance with the recorded notice of location as of record at the time of the order authorizing the survey. In the absence of an organized mining district the record of a mineral location should be made in the recorder's office of the county in which the land is situated.

THE Governor of Chihuahua, Mexico, sent a regiment of troops to Mina Vejo to compel the peons to obey and rescue the miners. He had the police gather all the unemployed men in the city streets and march them to the mine to work. Of sixty-one entombed, fifty were taken out dead. The disaster was caused by encroaching for ore on the pillars supporting the roof.

THE Mineral Land Bill passed the Senate last Tuesday with an amendment including the State of Oregon in its provisions. It now goes back to the House of Representatives, as amended. It passed that branch of Congress in its original form, and may be acceptable to a majority of the members. Should it pass as amended, it only needs the President's signature to become a law.

THE future of the copper market hinges largely on the ability of Europe to absorb the heavy shipments of American copper. Production here is more than twice as great as the home consumption, and Europe should count on having to take care of fully 100,000 tons of fine copper from this country in 1896. More than 34,000 tons have been shipped abroad since January 1st, and fresh orders are again reported from foreign buyers this week.

THE sale of the Yellow Jacket gold mine of Yellow Jacket, Lemhi county, Idaho, to a New York syndicate representing $5,000,000 has finally been consummated. The cash transfer is $1,000,000. The former owners still retain a large interest in the property. The property consists of thirty-six lode claims, six placer claims, three mill sites and in all 800 acres. A townsite is being laid out on the placer claims. Government patents covering the entire property have recently been issued.

THE De Lamar, Idaho, Miners' Union organized with 140 members on the 1st inst. On the 2d the miners went out on a strike for an increase of 50 cents a day in wages and a reduction from $36.50 to $30 a month for board and hospital dues. Manager Plummer could not accede to the demand without authority from the home office in London, and the works were shut down pending the receipt of instructions. There has been no trouble, and none seems to be anticipated. The rate that has been paid for miners is $3, and for carmen $2.50 per day.

THE B. C. provincial parliament has adjourned. Among other mining legislation the following is important in that province: "Upon any dispute as to title to any mineral claim, no irregularity happening previous to the date of the record of the last certificate of work shall affect the title thereto; and it shall be assumed that up to that date the title to such claim was perfect, except upon suit by the attorney-general based upon fraud." According to that, the prospector need now only do $100 worth of improvement on his claim and record it.

DURING the week ending the 7th inst. six new mining papers have been received at this office. Nothing more strikingly illustrates the activity in mining than the great number of new publications devoted to mining matters. The MINING AND SCIENTIFIC PRESS welcomes these new recruits, wherever published, and, without the slightest jealousy, takes cordial pleasure in noting their advent. It extends greeting to all its contemporaries, whatever their age, and wants the only rivalry to be to see which can best aid the great mining industry of this country.

WITH pleasure this paper receives a multitude of commendations for the list of California mines and miners now appearing, and numerous additions and emendations from mining managers, superintendents and others. Any information will be gladly received regarding the name, location, character, etc., of any California mine, the name and postoffice address of the owner, agent or superintendent, for it is realized that no amount of individual care or research in preparing such a list can produce a result satisfactory or correct. Several such statements have been received from different parts of the State during the week and are gratefully acknowledged.

G. LANSELL'S No. 180 mine, at Bendigo, Victoria, is believed to be the deepest sole gold mine in the world. At a depth of 2,640 feet a diamond drill bore-hole was put down 500 feet perpendicularly below that, making 3,140 feet, when a thermal spring was cut. A further 210 feet makes the present depth, 3,350 feet. Crosscuts are being run at the 3,310 and the 3,200 levels. The "180" has 180 yards north and south on the New Chum and Victoria main line of reef. At the bottom of the shaft the rock is the hardest in the district. The water is very great and supplies the New Chum and Victoria crushing works, with more to spare. The cost of working this mine averages $5,000 per month.

SOME residents of Wahkiakum Co., Wash., have discovered what they think to be gold on the patented Northern Pacific Railroad lands in that county. They have located mining claims and recorded the same in the county auditor's office, and have now asked the Commissioner of the General Land Office if such claims can be held against the railroad company. The Interior Department holds that when land has been patented it is out of the jurisdiction of the Government, and that the patents can only be set aside in the courts. However, it is a settled question that mineral lands cannot be patented to the railroad company as a part of its grant, and if it could be clearly shown that the railroad company had obtained patents to mineral lands the patent would undoubtedly be set aside by order of the court.

THE Sonora *Democrat* editorially complains at some length that in the report of the gold output by counties for '95 Tuolumne is only credited with $650,000, and claims that interviews with leading gold producers of that county since the appearance of these figures justifies the statement that Tuolumne Co. in '95 produced in gold $1,300,000, one mine alone in that county shipping over $600,000 during ten months of '95 to San Francisco that did not go through Wells, Fargo & Co. Very likely. 'Tis probable that the recent figures were below the actual yield in a good many other counties as well as in Tuolumne: it is probable that the fifteen and one-third millions should have been eighteen to approximate California's gold yield last year, but no statistician, no Government report, no publication, can secure figures or facts that mine owners decline to give, and so long as gold producers neglect to furnish statistics, so long will the aggregate be underrated.

At the Republican Convention of this State which met at Sacramento during the week, to select delegates to the National Convention and formulate a party platform the following was made, next to the protection plank, the foremost piece of timber in the platform: THE MINES OF CALIFORNIA, WITH THEIR ANNUAL OUTPUT OF MANY MILLIONS OF DOLLARS, HAVE BEEN OUR FINANCIAL BULWARK IN TIMES OF ADVERSITY; THEY MAINTAINED THE NATIONAL CREDIT DURING THE DARK DAYS OF THE REBELLION, AND THEY FORM THE BASIS UPON WHICH THIS GRANDEST OF COMMONWEALTHS, CALIFORNIA, HAS BEEN REARED. THE MINING INDUSTRY OF OUR STATE SHOULD RECEIVE SUCH AID AND PROTECTION AS WILL INSURE ITS PERMANENCE AND PROSPERITY, AND FOR THAT PURPOSE WE FAVOR SUCH AID AND PROTECTION AS WILL RELIEVE THE MINER FROM UNNECESSARY BURDENS, ENABLE HIM TO OBTAIN AND DEVELOP HIS MINING PROPERTY, AND WILL PROMOTE AND ENCOURAGE THE BUSINESS OF ALL KINDS OF MINING, INCLUDING THAT KNOWN AS "HYDRAULIC MINING," WHENEVER AND WHEREVER THE SAME CAN BE CARRIED ON WITHOUT INJURY TO THE OTHER INTERESTS IN THE STATE.

TIREY L. FORD, who has been representing the miners' cause at Washington, D. C., since Feb. 18th, will return to this city next Monday. On the eve of his departure from Washington, last Tuesday, he said to an Associated Press representative: "The miners of California certainly have much cause for rejoicing over the splendid treatment they have received at the hands of the Fifty-fourth Congress. A bill to segregate and classify mineral lands within railroad land grants in California has passed both houses, and an appropriation of a quarter of a million dollars for the construction of restraining works has been incorporated in the River and Harbor bill and has successfully passed two committees and one branch of Congress, and nothing short of injudicious conduct on the part of its friends can dislodge it from the advantageous position it occupies. Other mining measures favored by our association at home have not reached so favorable a stage, for the reason that they have not been so urgently pressed. I am highly gratified at the progress made by the two principal measures to which I have alluded. Our successes have not only been gratifying, but in some degree, have surpassed our hopes." Secretary Sonntag last Wednesday wired Mr. Ford that the legislation was satisfactory to the California Miners' Association.

## Matte Smelting.

NUMBER IV.

Written for the MINING AND SCIENTIFIC PRESS by W. L. AUSTIN, Ph. D., Denver, Colorado.

The broad subject of patents and the intricate laws regulating their issue, use, and infringement is not usually matter for discussion in metallurgical handbooks. Wise men consult the lawyer and not the metallurgist when legal points are involved. Mr. Lang has strayed from his announced purpose,—"an essay which is professedly of a practical nature" (see page 75)—when he attempts the elucidation of matters relating to patents; and as this subject is of considerable interest to many, it might be well to test the correctness of his views on patent law in the light of the Statutes and of the decisions of the courts.

On page 49 of his book will be found the following: "the only patented features of any process being solely those novel mechanical principles which distinguish the different processes."

Now Section 4886 Revised Statutes of the United States, relating to the grant of patents, reads as follows: "Any person who has invented or discovered any new and useful art, machine, manufacture or composition of matter, or any new and useful improvement thereof, not known or used by others in this country, and not patented or described in any printed publication in this or any foreign country, before his invention or discovery thereof, and not in public use or on sale for more than two years prior to his application, unless the same is proved to have been abandoned, may upon payment of the fees required by law, and other due proceedings had, obtain a patent therefor."

In treating of this subject Simonds (*) states as follows: "An art, as the word is used in the patent statutes, means a mode or method or manner of accomplishing some certain result, in distinction from such result, and also in *distinction from the instrumentalities made use of* (**) in accomplishing that result. In some cases an art is a 'process' (Dolbear v. Tel. Co., 8 Sup. Ct. Rep., 778). 'A process' has been defined by the United States Supreme Court as follows: 'A process may be patentable, *irrespective of the particular form of the instrumentalities used.*' 'A process is a mode of treatment of certain materials to produce a given result. It is an act, or a series of acts, performed upon the subject-matter to be transformed and reduced to a different state or thing. If new and useful, it is *just as patentable as a piece of machinery.* In the language of the patent law, it is an art. The *machinery* pointed out as suitable to perform the process may or *may not be new and patentable;* whilst *the process itself may be altogether new, and produce an entirely new result.* The process requires that certain things should be done with certain substances, and in a certain order; but the tools to be used in doing this may be of secondary consequence.' (Cochrane v. Deener, 94 U. S., 780). * * * The law not only makes patentable an art, a machine, a manufacture, and a composition of matter, but it also makes patentable any 'improvement thereof.' It is important that this is so, for it is very rare to find a patented thing which is a new thing in all its parts, and which is not simply an improvement on something which had prior existence. * * * That is not the way and manner in which invention commonly proceeds. It proceeds step by step; these steps follow one after the other in rapid succession and along the whole line of human activity, so that a short time suffices to advance that line over a wide interval; still the advance is step by step."

But Mr. Lang appears to differ from the authorities just quoted when he records *his* opinions that the only patentable feature of an art is "its novel mechanical principles." Quoting again from Simonds: "It is quite a common thing to hear persons speak of the 'principle' upon which a machine operates and even to speak of patenting such principle. Users of the word in this connection generally have no distinct and accurate idea of what they mean by such use, and because of the vagueness and mistiness which hang around the word, lawyers in patent practice and mechanical experts rarely use it."

To illustrate the absurdity of Mr. Lang's position relative to patentable things, the cases of a number of patented processes could be taken at random; for instance, the Harvey process for hardening the surface of nickel-steel plates, the Mond process or process for producing nickel carbonyl, or some that are perhaps better known in the West, as for instance the Russell process or the MacArthur-Forrest process. In the latter process (which is selected as an example simply because it is so widely known, and without any intention on the part of the writer to enter into any controversy which may exist between the patentees and those using the process) is instanced a valuable metallurgical advance, the introduction of cyanide of potassium for dissolving the precious metals out of their ores. Before its introduction by the patentees (at a heavy expense to themselves) the world was (to all intents and purposes) wholly ignorant of the great value of that reagent for the purposes to which the MacArthur-Forrest people have applied it. Now, the fact that cyanide of potassium would dissolve gold, etc., was nothing new, and certainly the rolls, tubs, launders, and other contrivances used in carrying out the process could not be brought under the caption, "novel mechanical principles;" but the adaptation of cyanide of potassium to the extraction of the precious metals from their ores upon a commercial scale was new and the world at large was materially benefited by the introduction of this *process* irrespective of the mechanical appliances by which the operations were carried out. By utilizing the so-called selective action of cyanide of potassium in treating auriferous material of various kinds it became possible to handle very low grade substances and the wealth and comfort of mankind were thereby increased and the object for which the patent laws were created has been attained in this instance at least. Therefore, without going into the legal merits of the case, the patentees are entitled in equity to some return for the benefit others are deriving from their work. This, however, Mr. Lang would deny them, since according to the views he has expressed—"the only patented features of any process being solely those novel mechanical principles which distinguish the different processes"—these patentees have nothing patentable.

Men who want to avail themselves of the work of others without making any return therefor, are attacking the MacArthur-Forrest patents both in this country and abroad; but it is a pleasure to note that they are not meeting with success, and that in the majority of instances those using the process prefer to consider the case as one calling for common honesty, and are paying a royalty to the patentees for the use of their invention.

Doubtless it would very convenient to Mr. Lang if he could induce others to accept his interpretation of the patent laws of this country, and doubtless also some unwise or selfishly interested persons will accept his statements, and in so doing will become liable to much unnecessary trouble; for they will find both the letter and the spirit of the law diametrically opposed to them.

Quoting again from Simonds: "The patent law does not exist for the benefit of inventors. It exists for the benefit of the public. The enlightened public selfishness which called that act into being was expressed in the organic law—in the Constitution of the United States—when Congress was therein authorized to secure 'for limited times to authors and inventors the exclusive right to their respective writings and discoveries,' in order 'to promote the progress of science and useful arts.' Thoughtful students of our national life have not rarely said that no other feature of our institutions has played so great a part in the development of the splendid material prosperity of the nation as our wise patent laws and *their kindly construction by the courts.*"

The disposition of so many men to avoid legal recognition of patents which in the end must conduce to the general welfare, is a serious impediment to metallurgical advance, because too often nowadays when a discovery or invention of importance is made, every effort is also made to keep the matter a secret, and the world at large is therefore debarred from its use. It is becoming more and more difficult to gain admission to metallurgical establishments because the managers of such works prefer to keep the results of their experience (which as a rule have been dearly purchased) as secrets, rather than trust to the protection of patents. They dislike to part with these secrets, because, no matter how good the claim to patent rights may be, some interested individual (usually with more ingenuity than principle) is pretty sure to declare it worthless both legally and practically,—and then proceed to use it without paying for it. If the metallurgical engineer on his travels is refused entrance to the works he desires to visit, or is hurriedly shown through unimportant parts of them, he is mainly indebted for his disappointment to this class who may be justly designated the sharks of the profession.

Mr. Lang's position, that only the novel mechanical principles of a process are patentable, is clearly an untenable one, and it is to be hoped that other statements in his work have a better foundation in fact. This may be further discussed by the writer in future articles; but one case will be noticed now in which his statement is more than doubtful, as witness the following quotation from page 49:—"I need hardly add that the methods of heating the blast are in no case distinctive of any process of pyritic smelting; and I may say further that the application of the hot blast to this form of smelting has not been patented to any person," etc. The evident intention of Mr. Lang is to convey the idea that the application of the hot-blast to that method of smelting sulphides in which the iron and sulphur furnish the greater part, practically all, of the heat used, is not distinctive of *any* process of *pyritic* smelting.

It is difficult to understand how he can reconcile such a statement with the claims set forth in the specifications of U. S. patent No. 453,529 (application filed February 28, 1889). Claim 1 (see page 3 of said specifications) reads as follows: "Having thus described my invention, what I claim is—1. As an improvement in the art of smelting pyrites, blende, sulphurets, or sulphides, the method of securing continued combustion and smelting without the necessity of continued use of carbonaceous fuel, which consists in first heating the lower part of the charge containing one or more of the substances or compounds up to a point where combustion can take place *and then subjecting the charge to the action of a hot air blast* and continuously drawing the molten products as formed away from the path of the blast, substantially as and for the purpose specified."

From the wording of this claim it is evident that it was the purpose of the inventor to smelt sulphide ores, etc., without the "continued use of carbonaceous fuel" in his furnace. Now, to keep up a smelting operation by the fuel qualities of sulphides in place of coke or charcoal, in other words, to produce commercial results by such a method as is described in the claim quoted, is an utter impossibility without the use of the hot-blast, and its use is the main factor of the claim. Of this fact anyone can easily satisfy himself by experiment. Therefore, as the claim referred to is a patented claim, and as the use of the hot-blast is an essential feature of the process—in fact, a *sine qua non*—its use for the purpose specified is necessarily a part of the specification. That this is the case is all the more apparent if the hot-blast feature is cut out of the claim, for then the claim becomes an absurdity and the process a metallurgical impossibility. The use of *the hot-blast is the essential feature of the process described* and its employment for the purpose indicated is clearly intended to be granted by the said letters patent to the patentee. For this process differs from all other pyritic smelting methods suggested previously; and the word "suggested" is used advisedly because until this process was introduced there never was a practical way found for utilizing the fuel qualities of pyrites for smelting purposes. All the various ideas suggested from time to time were wholly unproductive of commercial results. Therefore, the hot-blast *is* distinctive of, and inseparable from, *one* process of pyritic smelting, Mr. Lang to the contrary notwithstanding; furthermore, the application of the hot-blast to this one process of smelting is covered by U. S. patent; and, lastly, this is the only process that has produced commercial results up to the present time, and has proved itself to be not only "professedly" but *really* of a "practical nature."

It goes without saying that any person using this patented process without the consent of the owners is amenable to the laws of this country. The employment of small amounts of coke, or other carbonaceous fuel, in a furnace charge consisting essentially of raw sulphides,—either because the apparatus used is not suitable for their combustion, or for the purpose of evading the patent, does not evade the penalties of infringement. "Imperfect production of the proper result of a patented machine does not avoid infringement." (Mach. Co. v. Binney, 5 Fish. P. C., 166). "An inventor is entitled to all the legitimate results of the invention covered by his patents, including even those which were not foreseen by him." (Thomas Meter Co. v. National Meter Co., 65 Fed. Rep., 427). "A thing infringes a patent if it infringes any claim of a patent, and patents sometimes have many claims, so that each claim is to be considered by itself on this question of infringement."

Mr. Lang evidently considers that his statement regarding the patentability of things definitely disposes of the whole matter, for he not only appropriates the hot-blast to his own requirements in what he is pleased to denominate "the Gradual Reduction Methods—Hot Blast. (b) (Hypothetical)," but he invites others to share with him the benefits to be derived from its free and unrestricted employment. His invitation is issued in the following form: "Metallurgists, therefore, are not debarred from the employment of the heated blast as a means of pyritic smelting." But it would be well for Mr. Lang, before engaging in any extensive reduction of ores by that method, to produce stronger proof than any he has yet shown, that the hot-blast when applied to the smelting of raw sulphide ores, producing thereby commercial results that cannot be realized in any other manner, was not a patentable novelty previous to Feb. 28, 1889; and it would also be wise to remember that "Officers of a corporation who have participated in an infringement are per-

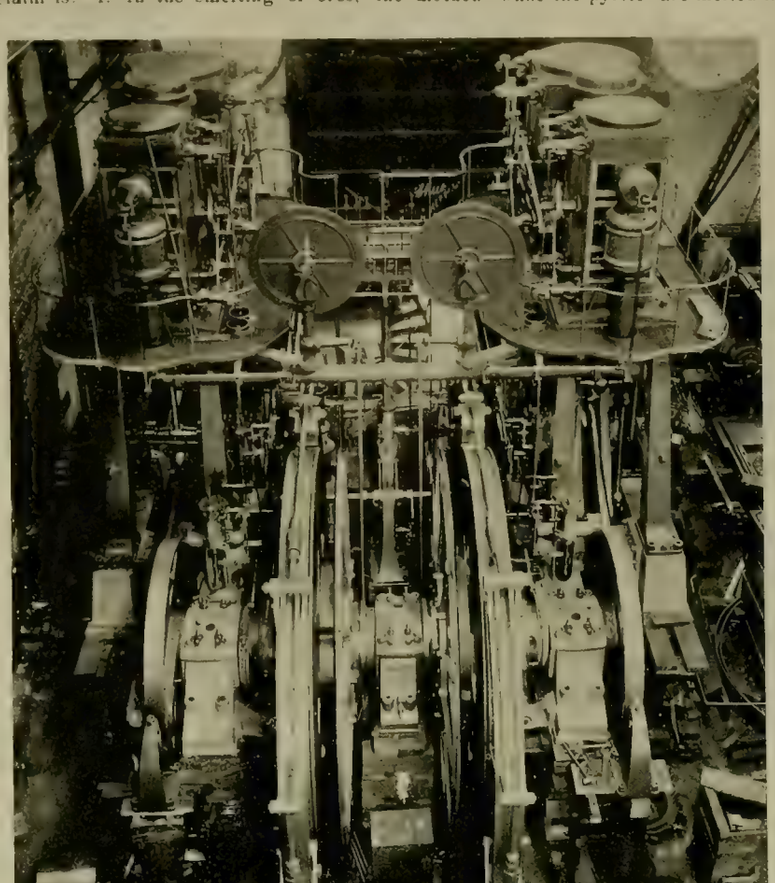
(*)A condensed treatise on the law of patents for useful inventions, by W. E. Simonds, Ex-Commissioner of Patents, author of "Digest of Patent Cases," etc.

(**)These and all other italics in this paper are the writer's.

sonally liable." (Car Brake Co., v. M'f'g. Co., 19 Fed. Rep., 514).

The Hollway process has been referred to in connection with the method of smelting set forth in U. S. patent specifications No. 453,529. These two processes are entirely distinct as will become apparent to any unprejudiced investigator upon the examination of the claims set up in each case. The following table is given in order to indicate in a convenient form the differences between the two processes:

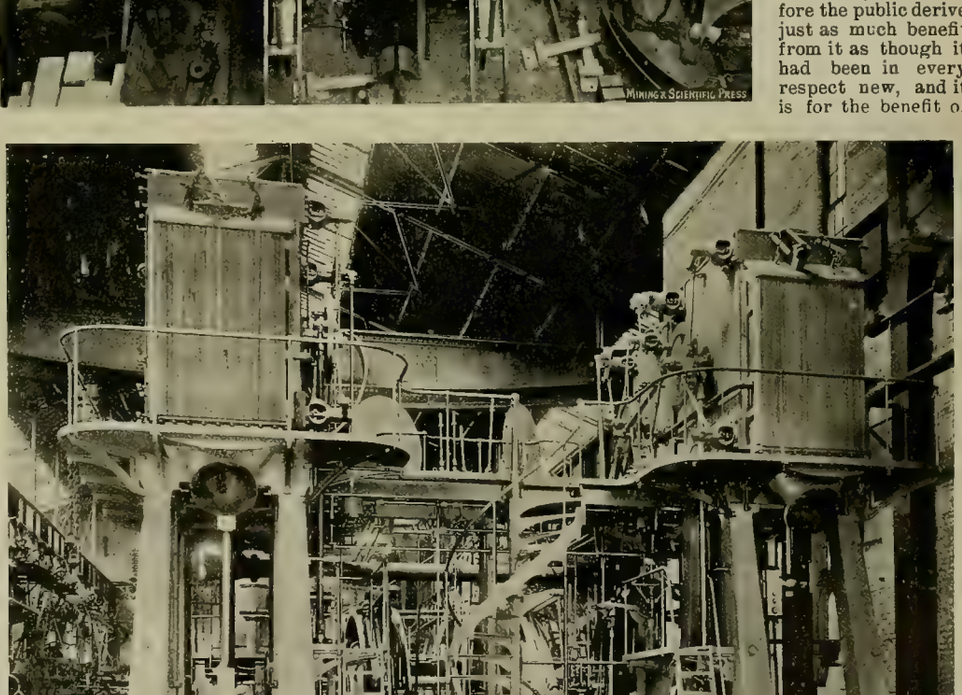
COMPARISON OF PYRITIC SMELTING PROCESSES.



| | Hollway's Process | Process Described in U. S. Pat. Spec. No. 453,529. |
|---|---|---|
| Style of apparatus in which the process must of necessity be carried out. | Converter. | Blast-furnace. |
| Use of bath of molten sulphides as a heat generator. | A necessity. | Not used for purpose specified. Can be omitted. |
| Method of heating the air-blast. | By blowing into and through a bath of molten sulphides. | By combustion of fuel in suitable apparatus outside of furnace. |
| Use of the hot-blast. | Optional—not a necessity and not set forth in the patented claims. | A necessity when no fuel is used in the furnace. |
| Results obtained. | NIL | A pronounced success—large quantities of material being treated under this patent in the United States alone. |
| Action of silica. | Of secondary importance—takes up the iron - protoxide on the edges or top of the bath. | Assists in the decomposition of the sulphide and by being distributed throughout the charge prevents the formation of ferric oxide to a great extent. |

To carry out the Hollway process a bath of molten sulphides must be provided and no combustion of the pyrites is attempted until after they have been fused and are collected in such a bath. To burn the sulphides, air is forced into and through this bath, and it becomes heated by contact with the same in its passage through the fused mass. In all of Mr. Hollway's work, and wherever he introduced the process, he used the molten bath as a heat generator and employed furnaces constructed upon the converter principle.

With all respect to Mr. Hollway, whose experimental work along the lines of pyritic smelting is worthy of the highest praise, it must be said that wherever his process was introduced the results were disappointing, and the technical periodicals of those years in which Mr. Hollway was actively engaged upon this work contain many references to these failures, and to the ultimate abandonment of the project. These failures, however, throw no discredit upon Mr. Hollway but were the unfortunate result of his adoption of furnaces with converter hearths. Had he employed the blast-furnace with proper modifications instead of the converter, and had he in addition preheated his air-blast, and, most important of all, had he operated direct upon the pyrites themselves instead of upon a bath of fused sulphides, his success would have been fully equal to his anticipations. But even as it was, the description of his experiments published in the Journal of the Society of Arts, is by far the best treatise upon the subject of pyritic smelting which has yet appeared; in fact, it is the only truly scientific essay upon this subject. It is written by a scientific man for the purpose of imparting information and is replete with useful experimental data.*



The complete failure of the process introduced by Mr. Hollway, and the success attained in the same field by the process described in U. S. patent No. 453,529 emphasizes the radical difference existing between those two methods of reduction in the most practical manner; for where one method fails and another succeeds, there must be a radical difference between them. Should anyone doubt that there *is* such a difference, it is only necessary to try the process described by Mr. Hollway and then compare the results produced with those which can be, and are obtained by following the specifications of U. S. patent No. 453,529 and he will convince himself in a thoroughly conclusive though perhaps uncomfortably expensive manner.

That Mr. Hollway considered the use of a molten bath of sulphides as essential to his operations is evident from the following clauses taken from his patent specifications: "When commencing the operation I smelt a quantity of pyrites by means of carbonaceous fuel until a bath of molten sulphides has collected or formed on the hearth. * * * I employ furnaces of sufficient depth or height, so that the free oxygen of the air blown in, neither comes into contact with the pyrites nor with the sulphur liberated." From the use of this language it is perfectly clear that Mr. Hollway purposely avoided blowing air into or upon the pyrites themselves, but regulated the depth of the bath of molten sulphides, and the pressure of his blast, so that *all* of the oxygen of the latter should be consumed in passing through the bath and therefore *none could reach the pyrites*. But if there is any doubt upon this matter reference to the claims of the patentee sets it at rest. "Having now described my invention, what I claim is: 1. In the smelting of ores, the method herein described * * *, *which method consists in forcing a blast of air or other oxidizing gas through the molten mass.* * * * * * * 4. In the extraction of copper and other metals, as also sulphur, from pyrites, the continuous process hereinbefore described, which consists *in first forming a bath of molten sulphide* of iron, as set forth, *then passing an oxidizing gaseous agent*, such as a blast of air, or air and steam, *through the liquid*, and gradually introducing the pyrites, or the pyrites and other metalliferous or slag-producing substances, into it, whereby part of the sulphur is distilled by the heat of the bath while the pyrites are melted in said bath of sulphide under the action of said blast of air, or air and steam, and part of the remaining sulphur is obtained in the form of sulphurous acid or sulphureted hydrogen, while the metals less oxidizable than iron originally contained in the pyrites and other substances employed are obtained as a regulus and the combustion is maintained by the oxidization of the pyrites introduced, and the latter is thus utilized in lieu of carbonaceous fuel, as set forth."

But assuming for the sake of argument that U.S. patent No. 453,529 is only an improvement upon the process described in Mr. Hollway's patent specifications, still (as has been already shown) an improvement in an art is patentable under the United States Revised Statutes, and an "improvement" which makes a practical method of ore reduction out of an impractical one, has all the essential virtues sought in a new invention, and therefore the public derive just as much benefit from it as though it had been in every respect new, and it is for the benefit of the public that the patent law exists. To quote the words of a celebrated metallurgist: "I hold that the true author of a process is the one who, seizing an idea, often well known, studies it, and by his labor succeeds in transforming it into a practical method, yielding good results and realizing an important economical progress." W. L. AUSTIN.

Denver, March 14, 1896.

THE MODOC AND THE AZTEC, THE LARGEST HOISTING ENGINES IN THE WORLD.

(See page 373.)

*This subject is also very competently handled, in a popular style, by Mr. Philip Argall, in the Engineering Magazine of April, 1894.

# Electrical Progress.

## On Apparatus for Cathography.

By NIKOLA TESLA.

In order to produce the most intense effects, we have first to consider that, whatever their nature, they depend necessarily on the intensity of the cathode streams. Then, again, being dependent on the magnitude of the potential, it follows that the highest attainable electrical pressure is desirable.

To obtain high potentials we may avail ourselves of an ordinary induction coil, or of a static machine, or preferably of a disruptive discharge coil. If we put two electrodes in a bulb, or use one inside and another outside electrode, we limit the potential, for the presence not only of the anode, but of any conducting object, has the effect of reducing the practicable potential on the cathode. Thus, to secure the result aimed at, one is driven to the acceptance of a single electrode bulb, the other terminal being as far remote as possible.

Having selected the induction apparatus and type of bulb, the next important consideration is the vacuum. On this subject I am able to make known a fact with which I have long been acquainted, and of which I have taken advantage in the production of vacuum jackets and incandescent bulbs, and which I subsequently found to be of the utmost importance, not to say essential, for the production of intense Roentgen shadows. I refer to a method of rarefaction by electrical means to any degree desirable, far beyond that obtainable by mechanical appliances.

Though this result can be reached by the use of a static machine, as well as of an ordinary induction coil giving a sufficiently high potential, I have found that by far the most suitable apparatus, and one which secures the quickest action, is a disruptive coil. It is best to proceed in this way: The bulb is first exhausted by means of an ordinary vacuum pump to a rather high degree, though my experiences have shown that this is not absolutely necessary, as I have also found it possible to rarefy, beginning from low pressure. After being taken down from the pump, the bulb is attached to the terminal of the disruptive coil, preferably of high frequency of vibration, and usually the following phenomena are noted: First, there is a milky light spreading through the bulb, or possibly for a moment the glass becomes phosphorescent, if the bulb has been exhausted to a high degree. At any rate, the phosphorescence generally subsides quickly and the white light settles around the electrode, whereupon a dark space forms at some distance from the latter. Shortly afterwards the light assumes a reddish color and the terminal grows very hot. This heating, however, is observed only with powerful apparatus. It is well to watch the bulb carefully and regulate the potential at this stage, as the electrode might be quickly consumed.

After some time the reddish light subsides, the streams becoming again white, whereupon they get weaker and weaker, wavering around the electrode until they finally disappear. Meanwhile, the phosphorescence of the glass grows more and more intense, and the spot where the stream strikes the wall becomes very hot, while the phosphorescence around the electrode ceases and the latter cools down to such an extent that the glass near it may be actually ice-cold to the touch. The gas in the bulb has then reached the required degree of rarefaction. The process may be hastened by repeated heating and cooling and by the employment of a small electrode.

I may state here that the experimenter need not be deterred from using a glass bulb, as I believe the opacity of glass, as well as the transparency of aluminum, are somewhat exaggerated, inasmuch as I have found that a very thin aluminum sheet throws a marked shadow, while, on the other hand, I have obtained impressions through a thick glass plate.

The above method is not only valuable as a means of obtaining the high vacua desired, but it is still more important, because the phenomena observed throw a light on the results obtained by Lenard and Roentgen.

Though the phenomenon of rarefaction under above conditions admits of different interpretations, the chief interest centers on one of them, to which I adhere—that is, on the actual expulsion of the particles through the walls of the bulb. I have lately observed that the latter commences to act properly upon the sensitive plate only from the point when the exhaustion begins to be noticeable, and the effects produced are the strongest when the process of exhaustion is most rapid, even though the phosphorescence might not appear particularly bright. Evidently, then, the two effects are closely connected, and I am getting more and more convinced that we have to deal with a stream of material particles, which strike the sensitive plate with great velocities. Taking as a basis the estimate of Lord Kelvin on the speed of projected particles in a Crookes' bulb, we arrive easily by the employment of very high potentials to speeds of as much as a hundred kilometers a second.

It may not be known that even an ordinary streamer, breaking out suddenly and under great pressure from the terminal of a disruptive coil, passes through a thick glass plate as though the latter were not present. Unquestionably, with such coils pressures are practicable which will project the particles in straight lines even under atmospheric pressure. I have obtained distinct impressions in free air, not by streamers, as some experimenters have done, using static machines or induction coils, but by actual projection, the formation of streamers being absolutely prevented by careful static screening.

A valuable evidence of the nature of the radiations and progress in the direction of obtaining strong impressions on the plate might be arrived at by perfecting plates especially sensitive to mechanical shock or impact. There are chemicals suitable for this, and the development in this direction may lead to the abandonment of the present plate. Furthermore, if we have to deal with streams of material particles, it seems not impossible to project upon the plate a suitable substance to insure the best chemical action.

By exposing the head to a powerful radiation strange effects have been noted. For instance, I find that there is a tendency to sleep and the time seems to pass away quickly. There is a general soothing effect, and I have felt a sensation of warmth in the upper part of the head. An assistant independently confirmed the tendency to sleep and a quick lapse of time. Should these remarkable effects be verified by men with keener sense of observation, I shall still more firmly believe in the existence of material streams penetrating the skull. Thus it may be possible to project a suitable chemical into any part of the body.

Since my above-mentioned discoveries I have made considerable progress, and can presently announce one more result of importance. I have lately obtained shadows by reflected rays only, thus demonstrating beyond doubt that the Roentgen rays possess this property. One of the experiments may be cited here. A thick copper tube, about a foot long, was taken and one of its ends tightly closed by the plate-holder containing a sensitive plate, protected by a fiber cover as usual. Near the open end of the copper tube was placed a thick plate glass at an angle of 45° to the axis of the tube. A single terminal bulb was then suspended above the glass plate at a distance of about eight inches, so that the bundle of rays fell upon the latter at an angle of 45°, and supposedly reflected rays passed along the axis of the copper tube. An exposure of forty-five minutes gave a clear and sharp shadow of a metallic object. This shadow was produced by the reflected rays, as the direct action was absolutely excluded, it having been demonstrated that, even under the severest tests with much stronger actions, no impression whatever could be produced upon the film through a thickness of copper equal to that of the tube. Concluding from the intensity of the action by comparison with an equivalent effect due to the direct rays, I find that approximately two per cent of the latter were reflected from the glass plate in this experiment.

---

EDISON has often been accused of a proclivity for "talking to the gallery," and much of the recent newspaper description of his work on the X rays, ostensibly based on conversations with him, would tend to encourage this idea. For all that, Edison is just now doing scientific work which no amount of newspaper perversion can belittle, and which is of value to the world. Roentgen made public his X rays, and Salvioni forthwith found in the cryptoscope a method by means of which hidden objects could be made visible, and the time and trouble of taking photographic plates saved. Edison at once set himself to work to make this scientific device of practical use. This he has done. His fluoroscope, used in conjunction with the X rays, shows bones and other hidden objects so distinctly that doctors can now see the nature and extent of fractures to be treated, and need no longer depend upon touch alone. The fluoroscope consists of a flaring box, curved at one end to fit over the forehead and eyes, like the stereoscope. The end of the box is closed by a pasteboard cover, on the inside of which is spread a layer of tungstate of calcium, which material Edison reports he has found to possess six times the fluorescing power under the influence of the X rays of the barium platino-cyanide used with the cryptoscope. Without a vivid fluorescence of the substance upon which was thrown the shadow of the object to be seen, such an instrument as this would be of little real service. The amount of experimentation which had to be done in finding a material six times as sensitive to fluorescence as barium platinocyanide, can hardly be realized by any one unacquainted with Edison's extraordinary industry and capacity for work. While this special series of experiments were going on, a visitor to the laboratory found Edison holding in his hand the box which ultimately became the framework of the first fluoroscope. In front of him were a number of slides containing rows of discs of different materials. These slides were one by one being slipped into the broad end of the box, and examined by Edison as the Roentgen rays played upon them. The degree of the fluorescence of the respective discs was noted and a record of any distinctive characteristics was made by an attendant for future reference. Five hundred different materials were being tested at that time, and before them no less than 1,800 distinct substances had been critically examined by Edison, as they were passed under the Roentgen rays. Even this incident gives but a faint idea of the laborious investigation which is often necessary before a scientific toy can be made of real service to mankind.

---

AN electric furnace for the reduction of iron ores has been devised by Herr Unbanitzky. It is made large enough for the action to be continuous and on the necessary large scale, the carbons entering from the top and being supported from a disk that can be revolved around a vertical axis. Such a furnace has important advantages for obtaining very pure iron. Only one man is necessary, and with 500-horse power about 220 pounds of pure iron can be produced in twenty-four hours.

---

IN the wire industry electricity is now used to anneal rods. Bending a wire rod while subjected to red heat causes slag scale, and oxidated particles adhering to it to drop at and near the bend. To this observation the invention owes its origin. The heat is to be applied by electric current. The rod is reeled off the coil without previous subjection to the acid bath, and on its way is brought in contact with the electric current, which, owing to the resistance offered by the rod, causes it to be heated to a degree controlled by the usual means of regulation through voltage. Passing on its way from this point the red hot rod is fed to a set of suitable rollers, by means of which every portion of it is bent, which loosens and removes the scale. The rod is then further passed through wire brushes and other appropriate cleaning apparatus, issuing from these as a pure, soft wire rod ready for drawing. After the current of electricity has given it the red heat the rod may be passed through rollers to reduce its diameter, thus further saving labor and expense. This process can, of course, be repeated whenever through the application of the drawing block the rod has become too brittle.

---

F. N. DELANCY, representing the Fort Wayne Company, says he will put in an extensive electric light plant in Alameda, Cal., to furnish electricity for cooking, heating and lighting, complete in every detail and at a low rate. The company is to be incorporated with a capital of $100,000.

# Scientific Progress.

## Man's Chemical Composition.

It is interesting to consider the human being from a purely chemical standpoint, figuring on how many ounces and pounds of the various minerals and metals there are in the make-up of the average genus homo, as well as the number of feet of gas, etc., his body contains. Pope declares that the proper study of mankind is man, and Huxley says there is no more fascinating page in the bypaths of science than that which tells of what man is composed. Huxley's table on the "Chemical composition of man of the average weight of 154 pounds" was for years the standard by which all scientists gauged the mineral and metal worth of men who were worthless otherwise. Huxley's table was formerly standard, but has recently been superseded by a new one compiled by the Paris Academy of Sciences. The table is appended:

CHEMICAL ELEMENTS IN MAN.

| *Elements.* | *Pounds.* | *Ounces.* | *Grains.* |
|---|---|---|---|
| Oxygen | 111 | 8 | 0 |
| Hydrogen | 21 | 6 | 0 |
| Carbon | 21 | 0 | 0 |
| Nitrogen | 3 | 10 | 0 |
| Phosphorus | 1 | 2 | 88 |
| Calcium | 2 | 0 | 0 |
| Sulphur | 0 | 0 | 219 |
| Chlorine | 0 | 2 | 47 |
| Sodium (salt) | 0 | 2 | 116 |
| Iron | 0 | 0 | 100 |
| Potassium | 0 | 0 | 290 |
| Magnesium | 0 | 0 | 12 |
| Silica | 0 | 0 | 2 |
| Totals | 154 | 0 | 0 |

## Carbide of Calcium — Acetylene Gas.

The *Progressive Age* presents the report of a commission which that journal recently sent to Spray, N. C., to investigate acetylene. The decision of the commissioners is thus set forth:

| | |
|---|---|
| Materials per day and per ton of gross carbide | $14.39 |
| Labor per day and per ton of gross carbide. | 11.00 |
| Water power, 1,229 5-365 | 3.37 |
| Petty stores, waste, etc., $150 per annum | .41 |
| Taxes at $100 per annum | .274 |
| Interest on investment at 5 per cent, $11,955. | 1.638 |
| Depreciation and repairs, 5 per cent on electric plant and turbine | 1.218 |
| Six per cent on countershafting, building, rolls and crusher | .446 |
| Twenty per cent on furnaces | .021 |
| Total | $32.767 |

Its estimate of the cost of producing calcium carbide at Spray—by working the furnaces 365 days a year and 24 hours a day, yielding on the average one ton of 2,000 pounds gross carbide a day—is thus $32.767 per ton. Of this amount $14.39 is for material. The freight charges on lime and coke are heavy at Spray and add materially to the cost.

---

A DELEGATION of scientific men headed by Professor Mendenhall, ex-superintendent of the Coast and Geodetic Survey, were recently given a hearing by the sub-committee of the Senate Committee on Finance, in advocacy of Senator Cannon's bill for the

adoption of the metric system by this country. They based their advocacy of the change upon the theory that the system would be far more satisfactory than the present system, and said the longer the change was postponed the more difficult it would be to make it. Senator Sherman, as chairman of the sub-committee, said it was too late to give the measure consideration at the present session.

ONE of the most persistent superstitions associated in the popular mind with electricity is that this science "is only in its infancy." This apothegm has lately been indignantly and completely confuted by Professor Crocker of the well-known Franklin Institute, Philadelphia. An observation recently published in relation to the science of electricity to the following effect—"that in a department of knowledge whose principles are yet obscure, any moment may give birth to a discovery revolutionary in its consequences"—was regarded by Professor Crocker as a libel on the profession of electrical engineering. Professor Crocker maintained that electricity as a science is one of the most exact of the known sciences, and second only to astronomy. The most important test of the exactitude of a science, Professor Crocker contended, is the power of prediction. In this, electricity is maintained to stand pre-eminent, because the economy of a dynamo or motor can to-day be calculated from the drawings before the machine is built with a precision not attainable by any other form of mechanism.—Industries and Iron.

## Mechanical Progress.

### Government Engineering Contracts in England.

One very excellent reason why Government contracts in England, at least those pertaining to naval construction, are not popular with, nor specially sought after by, some of the foremost engineering firms of that country, has been furnished by the experience that Messrs. Yarrow & Co., the well-known torpedo-boat builders, have more recently gone through with the British Admiralty, and which is about as unique as it is condemnable. Messrs. Yarrow & Co., as is pretty generally known, were the first, several years ago, to turn out vessels of the torpedo-boat destroyer type. The success attained by these was remarkable at the time, and more recently, therefore, it was determined by the Admiralty to order a large number of them, of the latest and still further improved Yarrow design, and to extend the orders for them to builders of larger vessels in the northern shipbuilding districts, who, it is admitted, did not then have much experience with craft of this kind. Instead, however, of inviting these newer firms to submit designs of their own, the Admiralty, with, no doubt, laudable intentions so far as the good of the Department and of the country was concerned, but with entirely unwarrantable freedom with some one else's property, proceeded to have Messrs. Yarrow's drawings—which had been confidentially submitted—traced and distributed among those other establishments. It is not to be wondered at that Messrs. Yarrow have most emphatically protested against this strange proceeding, which may well put other builders of original machinery on their guard when dealing with the Government. Had the latter acquired property rights in the drawings there might have been no question as to its privilege to make any use of them that it thought proper. As it is, however, the Admiralty used documents confidingly submitted to them as though they were their own. Certainly, no argument seems necessary in this case to convict them of having been guilty of a practice which every right-thinking contractor will condemn, even though he may have profited by it. What the Admiralty has done in this instance appears to be but a sample of other similar methods followed by it for years, less seriously aggravating, perhaps, but none the less unworthy of a great Government. The result is already apparent by the preference which is shown by some of the prominent English contractors for the work of other Governments, and this preference may be expected to increase largely if the universal distribution system of one contractor's drawings among his competitors is to be followed in future.—Cassier's Magazine for May.

A FRENCH physician has a plan whereby every one may become, as he will, his own life preserver in case of an accident at sea. The inventor does away with all artificial belts and other floating appliances, and proposes to inflate the cellular texture beneath the human skin on the breast, which, if filled with air, forms a natural pneumatic belt, by the aid of which one can not only float oneself, but even support another body; that a man weighing about 160 pounds needs only about 200 cubic inches of air within his body in order to float with his head above water. This amount of air is easily inserted into the hollow space beneath the skin by means of an aseptic syringe. Simpler still is the use of a hollow needle and a thin rubber hose 18 inches long, into which this needle is inserted. A little aseptic cotton placed in the open end of the rubber hose is all that is required. The skin is raised, the hollow needle introduced into it, and then the other end of the rubber tube taken into the mouth, and the man's own breath blown into it. Two deep respirations which are blown into each side of the breast would, he thinks, be sufficient to float a man however heavy.

NAVAL ENGINEERS are interested in the results of a forthcoming experiment at the Brooklyn navy yard of a machine designed to send a vessel through the water without the aid of propellers. The test is to be made by order of Secretary Herbert, and the device will, by election of the inventor, be fitted into a 28-foot boat, although the Department would prefer the use of a 104-foot boat, which is now at the yard. By burning oil, gas is generated, which enters into a cylinder. There it is ignited by means of an electric spark. The force of repeated explosions drives the piston up and down. As the result of the explosion a jet of air is blown out of a tube in the stern of the vessel and the resistance of the water causes the boat to move forward. The engineering experts say that the invention, which has been tried privately, does not give much promise of usefulness in naval warfare, but the inventor claims that it will be of great service in torpedo boats and that, with his device, they can be driven noiselessly and at a phenomenal rate of speed.

## Practical Information.

PROF. THOMPSON believes that all planets will eventually come to a standstill, that a day will arrive when the great system of worlds will cease to revolve upon their axes and to make their regular periodical revolutions around the sun. When that time comes, if it ever should, all motion will cease and the universe will be at rest. Our finite minds cannot comprehend such a state of affairs, but scientists furnish evidence that such an era is approaching. Primarily the case interests us only so far as it applies to the motion of our own little world, but we have been told that whatever affects the other spokes of the great wheel will surely affect us sooner or later. So it is with our world as respects the others. If there is a retarding medium in space that is causing a gradual slowing up of the earth's movements, as astronomers declare, that same medium is at work slowly but surely decreasing the axial and other motions of the sun and his whole vast systems of worlds. Newton's mind conceived the idea that the friction of the tides and other forces calculated to retard motion were having their effect on the earth's axial as well as its annual revolutions, but the majority of thinkers of his time and the last hundred years have argued that such motion will continue forever. Within the past decade, however, there has been a change of sentiment on that score. It now appears certain, from calculations made by Astronomers Ball and Hutchins of England and Prof. Adams of the United States Observatory, that the earth is now losing speed at the rate of one hour every 16,000 years. When the loss is so slight it appears that it can be of no particular moment to us. At best we will only live a tithe of the period which it takes to lose that hour, and the whole of the twenty-four hours must be lost before motion entirely ceases. But all should have an interest in the ultimate fate of the old world and of the universe in general; therefore it is interesting to know that there is as much as a minute lost in the course of even 100,000 years. Whatever the loss is, it eventually means a cessation of motion and a general standstill. If this period of planetary rest should ever come, what will be the result? Will the great worlds and suns hang in space—the planets freezing on one side and burning up on the other—or will they fall down, down, down, forever? But let us see: In such a case gravitation would cease to exert its influence. Then there would be no "up" or "down."

THE influence of the direction in which the human body reclines in sleep, though often discussed, is doubtless generally regarded as a very trivial question. So eminent a medical man as Sir B. W. Richardson has taken up the matter, however, and declares that the effect of the earth's rotation has not been properly investigated, and that it is probably of much importance, especially to invalids, feeble and sleepless people. The rapid motion of the earth tends to affect the circulation. The blood is inclined toward the head or away from it, according as the head is placed toward the east or the west, and Dr. Richardson finds he sleeps most comfortably, and awakens more readily, with the head in the westerly direction. Another curious fact connected with the earth's rotation is the temporary uneasiness of animals about an hour before dawn, no matter at what hour this occurs. Children turn and moan, elderly people awaken and turn over for another sleep, cocks crow, dogs become uneasy, and horses and cattle move about for a short period, when stillness returns for a time. What is the cause? Are the animals, it is asked, affected by some magnetic wave which precedes sunrise an hour or so, or is the habit one of heredity, passed down through numberless generations from an original wild state, when an alertness just before daylight was necessary for protection from enemies?

WITHIN the twenty-four hours which elapse from one sunrise to another the astronomers of the world have not less than 20,000,000 stars within the range of their powerful telescopes, which today point out in all directions towards the blue canopy which overhangs the earth. These bright, shining, silvery disks are each a burning central sun, surrouuded with its own colony of planets, each of these 20,000,000 communities of the skies having its allotted part to perform in the economy of nature. When we consider that the nearest of these is 250,000 times as far away from us as our own light and life giver, and that each of those planetary colonies is from 10,000,000 to 500,000,000 miles from some other family of swinging worlds, we begin to get some light conception of the grandeur and magnificence of the universe. Another thought in this connection: Each of these 20,000,000 suns is known to be moving somewhere through illimitable space, taking its brood of worlds with it, some of them traveling upwards of 200,000 miles an hour. It is such stupendous facts as these that have caused the writer to often remark that no brain can conceive of what is meant by "space," "universe" or "eternity,"

If you want to buy or sell a Mine, Mining Properties or Mineral Lands, it will be to your advantage to correspond with or consult.....

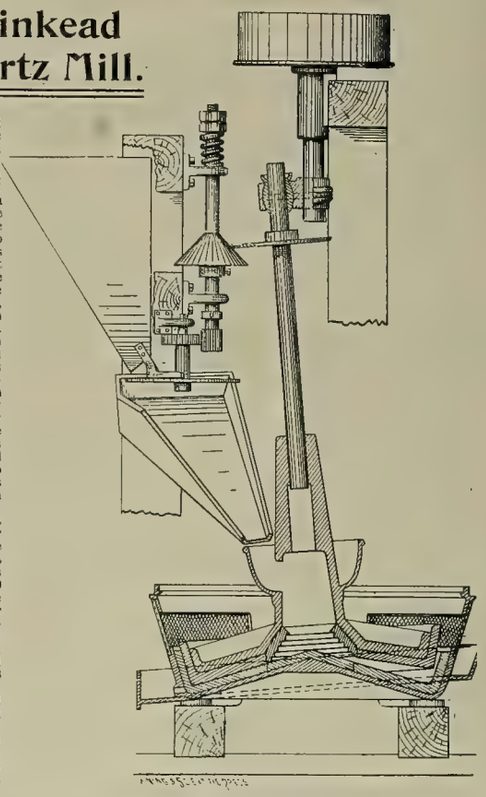
## THE DANIEL BEST CRUDE OIL ENGINE.

CAPACITY 2 to 200 HORSE POWER.



**The Cheapest Power Known—Invaluable Where Fuel Is Scarce.**

The most economical motive power ever invented, costing but 10 cents per H. P. per ten hours run, using crude oil. Cheap, safe, reliable and clean. Strong and simple to operate. Requires no engineer, and when you stop, all expenses cease, and no fire is left to endanger your building. Send for Illustrated Catalogue with full particulars, and mention the MINING AND SCIENTIFIC PRESS.

—Also Agents for—

## The Kinkead Quartz Mill.

This sectional drawing shows the main features of **The Kinkead Quartz Mill** which will do the work of five stamps with less than half the power, and can be built and put into operation for less than half the cost of stamps. The only wear is the shoe and die, which is less than that of one stamp. The cheapness in first cost and operation of this mill makes it possible to work with profit ores so low in value that they have heretofore been treated as waste. Each mill will crush 15 tons in 24 hours through a 40-mesh screen.

It requires a two-horse power Daniel Best Crude Oil Engine, at a cost of 10 cents per H. P. per 10 hours' run. There is no vibration or jar, and very little noise.

Engine and Mill can be set up and running in 48 hours.

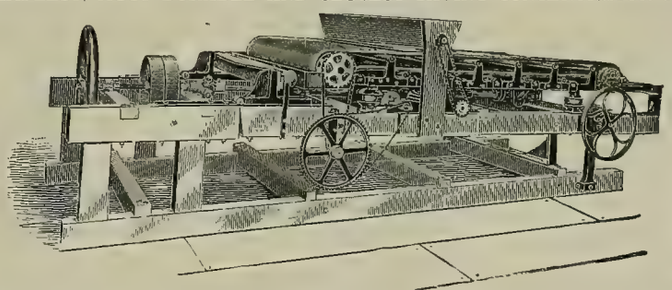
**Price of Mill $1,000, f. o. b. San Francisco.** Feeders, Apron and Plates included. Weight, 2½ tons; heaviest piece, 1,00 pounds

# The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager

Can be seen in operation at the Company's works, 132 **Main Street, San Francisco.**

**Office, 116 Davis Street.**



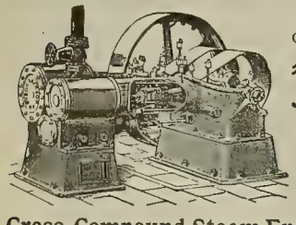
**NINETY-FOUR AND ONE-HALF PER CENT**
**—SAVED—**
**ON ORES DIFFICULT TO CONCENTRATE.**

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

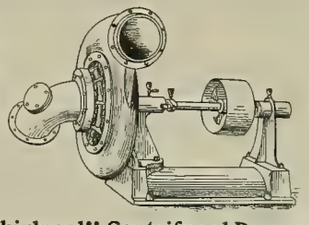
**PRICE.....$350 EACH**
Including prepared canvas belt 4 ft. 6 ins. wide.



FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.

THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.



Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

## Coast Industrial Notes.

—The *Investor* reports that for the first fifteen weeks of 1896 San Diego city has taken out $301,000 of building permits.

—Northern California hears that the State division of the S. P. road is to be incorporated with the Oregon part of the road, under the management of R. Kohler.

—The A. T. & S. F. is credited with intention to build from Magdalena, rather than pay $15,000 a mile for the Atlantic & Pacific road, to be sold under foreclosure early in July.

—The Victor, San Bernardino Co., reservoir project has received recent impetus. The company proposes to impound 185,000,000,000 gallons of water from the Mojave river for irrigation purposes.

—This year's fair at the Mechanics' Pavilion in this city is to be held jointly by the Mechanics' Institute and the Manufacturers' and Producers' Association and none but Pacific coast exhibits will be made.

—Some months ago the MINING AND SCIENTIFIC PRESS had an account of a French civil engineer who had, it was claimed, solidified crude petroleum for fuel purposes. The Riverside, Cal., *Press* states that a man in that city has been experimenting that way and succeeded in turning out some sample bricks that will double in fuel value the same bulk of coal, and that it can be produced so as to be sold at $5 a ton.

—The World's Proctor Memorial Association has announced that it will erect the largest observatory in the world on the summit of Mount San Miguel, near San Diego, Cal., as a memorial to the astronomer and author, Richard A. Proctor. The association was organized some years ago in this State, but it is proposed to make the observatory of an international character, and secure, if possible, the co-operation of the leading Governments of the world. The intention is to equip the institution with the largest telescopes constructed on the sectional lens principle invented by Prof. Gathman of Chicago. Mount San Miguel comprises about 12,000 acres and has an elevation of 3600 feet.

—The Atchison and the St. Louis and San Francisco roads are to be operated independently of each other. Under the Atchison reorganization plan part of the new securities was reserved for the acquirement of the St. Louis and San Francisco. No arrangement could be made satisfactory to both parties and now the latter road has a reorganization plan of its own. The result of the adoption of this plan will be the wiping out of the St. Louis and San Francisco stock held by the Atchison, the cancellation of the claims of the latter company for advances, and the abandonment of the joint guarantee of the Atlantic and Pacific bonds. The Atchison is about to sell its St. Louis and San Francisco consolidated bonds for 35 per cent.

—This week a circular was issued signed by the Southern Pacific and connecting lines to Pueblo, Col., reducing the rate on iron articles from Pueblo to San Francisco 25 per cent, in pursuance of an order of the Interstate Commerce Commission to the effect that rates from Pueblo must not exceed 75 per cent of the rates from the Missouri river. The order was the outcome of the case brought some time ago by the Colorado Fuel and Iron Co. against the Colorado lines and connections, including the Southern Pacific, before the Commission, and decided in favor of the shippers. Heretofore the rates from Pueblo to San Francisco have been the same as from the Missouri river, although there was a difference of about 500 miles in the haul.

—Work, it is reported, will shortly begin on a railroad from Nampa, Idaho, to the Snake river, an outlet for the gold mines in the Owyhee mountains. Its length is 17 miles and the intention is to extend it to Silver City, a distance of 63 miles. Another extension will be made north from Nampa to the heavily timbered region of Idaho. A large force is at work on the road, which is being built by A. B. Hammond from the point where the Northern Pacific crosses the Columbia river to Oregon. It is expected that the road will be in operation by July 1st, and when finished it will be one of the most important feeders of the Northern Pacific. Another road is planned from Helena, Mont., to the Castle silver mines. The capital has been secured and the work will soon begin. It will be 70 miles in length.

—L. R. Mead, secretary of the Manufacturers' and Producers' Association of California, has sent the following to the Pacific coast Congressional delegation: "It having been brought to the attention of this association that Senate bill 293, authorizing the appointment of a non-partisan commission to collate information and to consider and recommend legislation to meet the problems presented by labor, agriculture and capital, as received from Mr. Perkins from the committee on education and labor, report No. 575, recommending the passage of the bill. The board of directors of this association at their meeting yesterday afternoon discussed the matter, and it was ordered that, inasmuch as the passage of said bill is of particular interest to California and the Pacific coast, the members of Congress from the Pacific coast be requested by this association to lend their earnest support to the same."

### Tours in the Rocky Mountains.

The "Scenic Line of the World," the Denver & Rio Grande Railroad, offers to tourists in Colorado, Utah and New Mexico the choicest resorts, and to the transcontinental traveler the grandest scenery. The direct line to Cripple Creek, the greatest gold camp on earth. Double daily train service with through Pullman sleepers and tourists' cars between Denver and San Francisco and Los Angeles.

Write S. K. Hooper, G. P. & T. A., Denver, Colorado, for illustrated descriptive pamphlets.

## Personal.

J. A. EDMAN will return to Plumas county next week.

E. K. STEVENOT has moved from Sonoma county to this city.

TIREY L. FORD is expected to return from Washington, D. C., next week.

JNO. MCMURRAY of Weaverville is looking at placer property in southern Oregon.

JOHN HOWELL is prospecting the Mount Costigan and Peelwood silver mines, N. S. W.

PRINCE PONIATOWSKI has reached London, where he will work in the interest of the California Exploration Co.

ARTHUR THOMAS, lately of Grub Gulch, Madera county, goes on a year's prospecting tour through Sinaloa and Oaxaca, Mexico.

SUPT. J. C. ADAMS of the Hidden Treasure, Phillipsburg, Montana, is considering an offer of $10,000 per annum from a South African mining company.

CHAS. J. PRICE of Deadwood, S. D., has accepted an offer of the superintendency of a Johannesburg, S. A., mine, at a salary of $10,000 a year for two years.

WM. IRELAN, JR., ex-State Mineralogist, who received serious personal injury in a wreck of an S. P. train near Ione, about sixteen months ago, has compromised a suit for damages against the company by the acceptance of $11,000.

THE directors of the British South Africa Company asked for the resignations of Cecil Rhodes and A. Beit, by reason of their now evident connection with the project to overthrow the Transvaal Government, but upon their request being acceded to the company declined to accept the resignations.

E. B. PRESTON, of the State Mining Bureau, is in El Dorado Co.; W. H Storms is in the southern part of the State and W. H. Watts is examining Los Angeles oil interests. Capt. R. L. Ogden, so long in charge of the desk in the office on Fourth street, has been relieved by the appointment of Mr. Jacobson.

C. G. WARNFOR LOCK, Superintendent Wentworth Goldfields Proprietary mine, Lucknow, N. S. W., reports March 12th: Five weeks' crushing, 900 tons, gave 380 ounces of gold bullion, 18 tons concentrates carrying 1,400 ounces fine gold; and 11 tons crude ore, carrying 500 ounces fine gold, shipped to London.

GENERAL MANAGER COUCH of the Merced G. M. Co., Mariposa county, Cal., and Boston and Montana, of Butte, is said to have under advisement an offer at the usual large salary from a South African mining concern. The unsatisfactory nature of the present situation to prominent American miners may, however, serve as an encourager of hesitancy.

IT is with more than ordinary pleasure the MINING AND SCIENTIFIC PRESS learns that Land Commissioner Lamoureux will start, June 1st, on a visit to this coast. Such action betokens a willingness of mind on his part to learn something, for to the joys of a sojourn in California cannot wholly be ascribed his determination. Doubtless he realizes the possibility that some of his recent rulings have been, to put it mildly, a little one-sided. It is believed that, with the Mineral Land bill a law, the visit of Mr. Lamoureux may be of mutual advantage to himself and the California miner.

RECENTLY word was received from Capt. Thos. Mein, manager Robinson G. M. Co., Johannesburg, S. A., that he had resigned, and would leave there for Oakland, Cal., his home. It is now learned that the Pretoria Court has ordered that he be fined $10,000, imprisoned two years and then be banished from the Transvaal for three years. The Captain's offense seems to be that he hails from California. He certainly attended strictly to business, but his wealth has probably incited cupidity and his success jealousy, as in the case of some others. 'Tis reported that V. B. Clement and J. S. Curtis have been given the same harsh sentence. It is believed, however, that sober second thought on the part of the Boer authorities will result in remitting the severer portions of the sentence.

RECENTLY in this column was chronicled the demise of one of California's most prominent miners—Reuben Rickard, of Oakland, who died while in discharge of his professional duties as a mining engineer, in charge of properties in the Coolgardie District, West Australia. The report published was from his brother, Alfred Rickard, a gentleman of almost equal prominence in the mining world. And now comes the sad news of the death of that brother at Albany, on the West Australian coast, whither he had gone to meet his brother Reuben and take charge of a New Zealand mining property. The brothers came of a race of miners, were uncles of T. A. Rickard, the State Geologist of Colorado, and were held in high esteem wherever known.

**Michigan Mining School.**

A high grade State technical school. Practical work. Elective system. Summer courses. Gives degrees of S. B., E. M., and Ph. D. Laboratories, shops, mill, etc., well equipped. For catalogues, address M. E. WADSWORTH, Ph. D., Director, Houghton, Mich

**V. BLANC,** Analytical Chemist. Assayer. Graduate from Paris. 1620 California St., Denver, Colo. Gold and Silver Bullion, Old Gold, Placer Gold, Jewelers' Sweeps and Rich Ore Refined, Melted and Assayed or Purchased. Gold and Platinum Refined for Jewelers and Dentists. All work carefully done. Samples by mail will receive prompt attention.

**TUBBS CORDAGE CO.**
(A CORPORATION.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc. ☞ Extra sizes and lengths made to order on short notice
611 and 613 FRONT ST., San Francisco, Cal.

THE HARRINGTON & KING PERFORATING CO.

Eastern Office: No. 284 Pearl Street, New York

**DOUBLE PIPE AIR COMPRESSOR.**

This is a cut of the **Double Pipe Air Compressor**, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to us at 306 Pine St., San Francisco, Cal. We could save you money though in cost of foundations as our Compressors are half the size of other makes.

WORKS AT POTRERO. CORRESPONDENCE SOLICITED.

# Mining Summary.

## CALIFORNIA.

### Butte.

At Forbestown, Henry Vail has five men at work in the gravel mine he is opening at the Buckeye. The tunnel is run under the Walker plains on the line between Butte and Plumas.

The Golden Butterfly mine near Oroville has been closed down. G. H. Evans, the manager of the English company, will operate the Big Betsey and the extension Uncle Sam.

Roger Johnson has brought suit against N. D. Rideout to recover $75,000 with interest from October 23, 1894. He claims to have owned a 10 per cent interest in the Magalia mine, which was sold to the Magalia Mining Company, the consideration being 10,000 shares of stock said to be worth $100 a share, and claims that $75,000 is the value of that stock. He made a demand on defendant for that sum and was refused.

### Calaveras.

The *Prospect* hears the Herrold mine near Big Bar, which had been closed down about eight months, will soon be started up again. S. H. Lucas, the superintendent, is putting the mill in repair.

The boring process has been suspended at the Gwin and sinking is being prosecuted.

Six men are at work at the North Star mine in Happy Valley near Mokelumne Hill.

Grading is going on at the Esperanza preparatory to adding twenty stamps to the mill and erecting larger hoisting works.

At the El Encino in Chili Gulch six men are at work sinking.

Twenty stamps more are to be added to the mill on the Roanoke mine.

C. M. Burleson is surveying for a ditch from the Foote & Thompson mine near Rich Gulch, four miles to Sandy Bar near Mokelumne Hill, where the proposed electric plant is to be built.

AROUND SAN ANDREAS AND ITS MINES.—(Special Correspondence)—On the Ford mine, three-quarters of a mile east of here, two shafts have been sunk, one to a depth of 200 feet, at which level a crosscut has been run for over 60 feet.

At the Fellowcraft mine, one-half mile from San Andreas, under the new management of the incorporated company development has been made in sinking, crosscutting and drifting.

The owners of the Culbertson mine have run a tunnel about 300 feet to date. In the crosscut they struck a 14-foot ledge of low grade ore. They continue, as they have about 100 feet more to tap the Ford ledge.

The Leonard mine, owing to a lack of economy and confidence, was closed down. The milling ore is similar to that of the mother lode mines.

The Donnallan mine, two miles northwest of the town, on the Mokelumne Hill road, the only producer in the district, is supplied with a 15-stamp mill, crushing forty to seventy-five tons a day of twenty-four hours, according to the character of ore. There is plenty of pay ore to keep the mill in operation. Free water is obtained from the Calaveras river under a head of 50 feet.

The Edna mine, on the east side, like other properties, is now idle. It will be started again soon under the direction of J. S. White, one of the owners.

Across the serpentine system, which is about one-quarter of a mile wide, is the Gottschalk mine, on the west side of the mother lode, on a ridge between the north fork of the Calaveras river and Murry creek. It has been prospected through two shafts, one being 110 and the other 195 feet deep. The latter was sunk by Mr. De Golyer of Utah under a bond, but since his bond ran out it has diverted to its original owner, C. V. Gottschalk.

The Everlasting mine, about one-half mile south of the town, is on the west side and is in the serpentine formation, although some slate occurs there. Several shafts have been sunk. The owner recently bonded it for $25,000. A new shaft was commenced last November for a depth of 40 feet, but water coming in from old workings it was abandoned for a new and large double compartment shaft. As soon as depth requires machinery will be put in for hoisting and pumping.

Still south is the Holland mine, whose lead prospects well in free gold, but is still idle.

Turning west is the Chief Pioneer mine, which is on the footwall of the mother lode. Three shafts have been sunk from 100 to 300 feet, but it is still idle.

East the Kentucky House mine is on a great ridge and is considered to be a valuable property. It is owned by Beals & Sciefford. It is a fact that it differs from any mine in the district in strike and dip. It strikes northeast and dips southeast. A chute cutting the mother lode is between well-defined walls in the porphyry formation. Twenty-two assays made show an average of $60 a ton. There is considerable ore in sight.

The Coulter group of mines, two miles southeast of the town, is owned by Coulter & Co. They are on the west side of the mother lode. The Coulter mine has been prospected to a depth of 30 feet. At the bottom the vein is 6 feet wide and heavily sulphuretted below water level. No "colors" could be obtained, but gold only came from the sulphurets, which often went as high as $1000 a ton. The owners are going to sink 100 feet. Chimneys have been found by them within the limits of their claim, and rich gold float within these.

### El Dorado.

(Special Correspondence.)—S. A. Laine in the Brownsville district, 25 miles eastward, is reopening the old Stillwagon mine, famous in its day for rich ore and operated by an arrastra. Mr. Laine has started a five-stamp mill. The ore body, though not very large at present, yields $30 and over.

Bangs & Rentgraf, near Sweet Water P. O., 18 miles southwest of here, are prospecting on three ledges of ore that is free milling and runs at $14, with $40 sulphurets. The prospects for a mill to be erected are good. The claims are on the Zantgraf land.

Sacramento people are negotiating for lease and bond with W. H. Meyers for the Etzel claims in Jay Hawk district, west of town.

The erection of machinery on the Salisbury was interfered with by the heavy rains. The work is moving methodically and on a large scale. Monroe Salisbury is giving his personal attention to the management of the work.

H. E. Pickett, part owner and manager of the Grand Victory, east of town, and likewise manager and part owner in the Two Channel Mining Company, near Georgetown, is taking much interest in forwarding the advantages and resources of mining in El Dorado county.

L. Thurwachter, treasurer of the Baltic Company, operating near Sly Park P. O., reports a tunnel 240 feet in depth, with north and south drifts, on a 3½-foot ledge of $10 ore.

The Lone Star, four miles east of Placerville, owned by General Wagner of San Francisco, is driving drifts and crosscuts on both ledge and gravel. This property has a ten-stamp mill ready for operation. The claim is on the Rupely farm.

The Old Judge mine, famous at one time of shallow mining, was purchased under bond this week and a company organized to effectually work both gravel and quartz. The parties are C. C. Shepardson, of Los Angeles; F. M. Husted, H. Otersen, W. W. Boughton, of San Francisco, and F. W. Beardslee, of Alameda. This property is eight miles northeast, in the Kelsey district.

Thomas Clark, manager and principal owner of the Franklin mine, near town, has just returned from New York. The Franklin is a gravel mine of large area, has a ten-stamp mill always in operation and is a reliable bullion producer.

### Kern.

Since the last strike at Randsburg the *Eyrie* says the hills have been alive with prospectors. New buildings are constantly being erected and there must now be at least two hundred residents, prospectors and miners.

### Mariposa.

Messrs. Bigelow and Nelson have returned from California says the Boston News Bureau.

At Merced there has been only one mill run of about 1,000 tons from ore taken from the openings at the end of the Potosi tunnel, from the 200 to the 400-foot levels. This was a disappointment to Captain Couch, but it has not yet been determined if it be necessary to report results immediately to the stockholders.

On the second run taken largely from the 400-foot level (the mine seems to improve in depth) the plates are looking better and higher results are expected.

On the first mill run more than $1 per ton went off in the tailings, whereas not more than 50c per ton spould be lost.

The Potosi tunnel is about 2,000 feet long, and the first mill run was on rock taken mostly from the Dillon claim at the end of the tunnel.

The company has more than a dozen claims and 4½ miles on the lode, so that it is believed that no fair test of the property can be made under many months, but it is thought that results will gradually improve.

*Miner*: Men are at work on the road from Coulterville to the Virginia mine, four miles. Lumber will be hauled and new buildings put up. J. J. Dolan has charge, and will put men to work next week.

### Mono.

*Index:* Don't come to Bodie unless you have money in your clothes. There is no opening for the penniless man, no matter how good he may be. There is no work to be had. We have all the floating population that we can sustain. So, don't come.

### Nevada.

*Tidings*: The suit that was commenced some time ago by the Polar Star Mining Co. against the Harvey Gold Mining Co., to quiet title to what is known as the old Harvey mine, was decided yesterday by Judge Caldwell in favor of the Polar Star Co. The Harvey ground adjoins the North Star on the southwest and is a valuable property, having produced at a superficial depth $200,000. The Polar Star Co. is composed of some of the wealthiest mining men in the State, and they propose to thoroughly develop this property. W. W. Byrne will put a force of men on this week and sink the incline shaft 300 feet deeper.

*Transcript:* At the Live Yankee drift gravel mine near Graniteville the main tunnel has been run about 1000 feet altogether, but they followed the channel in a round course. Now they are running straight across and expect to reach the heavy gravel under the lava-capped mountain in about 1000 feet more. There has been a prospect all the way, but the main channel has not been struck.

### Plumas.

The Shenandoah Mining Co. has elected a new Board of Directors, C. H. Smith is president, C. K. King secretary.

### Riverside.

Day & French are pushing work in the drift of the Golden Chariot mine near Perris at a depth of 300 feet.

### San Bernardino.

The *Sun* says the Altura Mining Company will commence operations again after an idleness of some time. James Ryan of Los Angeles is superintendent and a quarter owner in the stock. He is at Victor with 12 men.

At the Eagle Cliff mine, in the Colorado desert, ore which, in a milling test of a ton turned out $125, has been struck. Originally the shaft went down on a fairly good vein of ore, a vein of talc running with the ore. At a depth of twenty-five feet the ore petered out, but the owners continued to follow the talc until a depth of eighty feet was reached. Last week the talc again opened into a vein eighteen inches wide. At the Desert Queen mine, a mile away from the Eagle Cliff, ore has been struck in the tunnel, the vein being four feet thick. Gold can be readily horned out. The tailings are being worked over and are netting $48 per ton.

### Shasta.

The old Spanish mine in Lower Springs district has closed down temporarily.

### Siskiyou.

*Journal:* The Blue Gravel mine at Greenhorn creek, is paying rich again.

The Black Lead claim on Greenhorn, above Austin & Co., worked by Elliott & Co., is also paying well.

H. B. Warren is putting up a five-stamp mill at Cherry creek.

George Kniest, now engaged in mining on Hamburg Gulch, succeeded in taking out $20 one day last week—a nugget in the form of a $20-piece. It was dated in 1857, and was, no doubt, lost by some prospector while at work in that claim.

The Blue Gravel claim at Greenhorn, just south of Yreka, has been paying rich lately. The clean-up from one riffle last Saturday yielded 7¼ ounces, and a full clean-up would have realized one-half as much more, or not less than 10 ounces. A general clean-up of the sluices will probably show an average of 10 ounces a day.

Herr & Fairchild are putting up a 2-stamp mill on Yreka Flats to prospect coment known to contain considerable gold. It is found under the gravel, and may extend deep down, with possibility of gravel underneath, the same as at the Blue Gravel mine, on Greenhorn.

The Columbia quartz mine in ridge between Oak Bar and Scott Bar is now being worked with energy in getting out quartz to keep a 5-stamp mill in steady operation.

A new strike has been made at the Empire quartz mine, on Empire creek, Klamath river, near Honolulu. It is a 6½-foot ledge of free-milling ore, a contact vein. One man's work can almost supply the 12-stamp mill for a day and night's run.

*Journal:* The five-stamp quartz mill now being put up at Cherry Creek will crush rock principally for the Nebraska mine, owned by Bohnart & Warren, but will do custom work also for others having rock to be crushed.

### Trinity.

*Journal:* At Minersville F. Gillardy, has bonded from C. Van Meter Hayward's Flat, aggregating 470 acres. The first payment on the bond is to be made on the 4th of August. The above group of mines adjoin those of the Minersville Hydraulic Gold Mining Co. on the east and comprise an ancient channel. The gravel bank is about 50 feet in depth and prospects twenty cents to the cubic yard.

### Tuolumne.

*Independent:* Machinery is on the way to the Golden Gate mine from the Demarest & Fullen foundry at Altaville.

The Old Soulsby mine had a very favorable crushing this week.

At the Mountain Bell mine at the last cleanup, the sum of $1275 was secured. The mine is situated on the Soulsby ranch, to the north of the Soulsby mine, of which vein it is a continuance. J. W. Ball and party have leased the property. The mine is run by water power.

A new corporation will take possession of the mines formerly held by the Sonora Extended Mining Co.

The old Duffield mine, in the Arrastraville district, is being opened up by the Scanavino Bros.

The North Fork mine is being vigorously worked by Soulsby & Son. A new shaft is being sunk to intersect the ore chute encountered in the old shaft.

W. W. Sharwood will shortly open up the old Grizzly mine.

The Spring Gulch mine, south of Summersville, is being opened up by Essenburgher & Co.

A three-stamp mill has been put up on the Chimney mine on Knight's creek.

The Tibbits & Green mine, above Columbia, is taking out ore which averages $100 per ton.

## NEVADA.

### LANDER COUNTY.

At Austin, the Austin Mining Company has increased its force at the Chifton tunnel, which is now being driven back nearly a mile under Lander hill. This tunnel, when completed, will drain all the mines on the hill, tapping them at a depth of 300 or 350 feet below the water level.

The Tenaba Mill & Mining Company, with a capital stock of $1,500,000 has filed articles of incorporation with the Recorder of Lander county. This new company proposes to operate the Cortez mines on an extensive scale. Work will begin at once.

Considerable machinery has arrived at Austin for the New Pass mines, which will be developed this season.

### LINCOLN COUNTY.

The DeLamar *Lode* says the construction of the April Fool mill nears completion and that its stamps will be dropping May 10th.

### LYON COUNTY.

Work has been resumed in the Silver City property of the Isis Mill and Mining Company, formerly the Independent mine. The property is now owned by Messrs. Lacrouts, Gignoux and Dazet.

### STOREY COUNTY.

An important strike is reported on the Brunswick lode, which means much to the Comstock. Supt. Kervin reports as follows:

Shaft No. 1 has been sunk 14 feet on the incline, passing through clay, porphyry and quartz, and showing some value; total depth, 425 feet.

200 level—The south drift, which was started from the end of east crosscut No. 1, has been advanced 16 feet; total lenght, 188 feet. At a point 6 feet from the face ore was encountered showing a width of 2½ feet, assaying $75 per ton. The face now shows 3 feet of ore of an average value of $63 75, gold predominating.

The north drift started from the station (H. & N.) has been extended 15 feet; total length, 167 feet; face in porphyry and a streak of quartz, which assays about $16 per ton.

Shaft No. 2—The north drift started from west crosscut No. 1, 25 feet from main south drift has been extended 20 feet, passing through porphyry, clay and quartz; total length, 29 feet.

Gould & Curry Company's Tunnel—The main north drift has been advanced 14 feet; total length, 722 feet; face in porphyry. At a point in this drift 700 feet from the mouth we ran a west crosscut for a distance of 12 feet to the footwall, cutting through a body of quartz 2½ feet wide of an assay value of $6 per ton.

### WHITE PINE COUNTY.

Ely *News:* About 4 feet of ore has been uncovered in the Emma mine which assays 61 per cent lead, 61 ounces of silver and $8 26 in gold.

## OREGON.

### JOSEPHINE COUNTY.

W. H. Taylor, of the Victory placer mines near Glendale, reports work progressing satisfactorily at the Victory with three nozzles.

The *Observer* says an $85 nugget was picked up recently at the old Baltimore mine on Williams creek. On Coyote creek the Ruble mine has produced about $12,000 during the past winter. They are still piping, using two giants.

J. S. Howard is locating the new ditch enterprise, which is to take water out of Rogue river, above Gold Hill. As laid out, it will be about 25 feet across the bottom, 29 feet across the top and 6 feet in depth. The first objective point of the ditch is said to be Galls creek, a distance of five miles from where the water is taken out of Rogue river, three miles above Gold Hill. It is estimated that the first mile of the ditch, which will include a large amount of fluming as well as rock excavation, will cost $10,000, and the rest of it will cost several thousand dollars per mile. J. W. Northup, president of the company, says that the breaking of ground on the ditch will be celebrated on May 11th at the head of the canal, three miles south of Gold Hill.

## BRITISH COLUMBIA.

Nelson *Tribune:* The lower tunnel on the Silver King mine is being advanced 6 feet a day; machine drills are used. One hundred men are now employed at the mine.

Within the next month, says the Ashcroft *Journal*, reports should be in from not less than six dredging outfits in the districts of Cariboo and Lillooet, four of them to be in operation on the Fraser and two on the Quesnelle river. On Quesnelle river the Fader dredger is now in operation. The Underwood dredger, built at a cost of $30,000, will be in operation in about two weeks, and within four weeks the Pittsburgh dredger, Mr. Young in charge, should be at work. This last named will cost between $15,000 and $20,000. The bucket dredge of Fader's has cost, plant complete, about $15,000, or in all from $60,000 to $70,000 at this point alone invested. The Dominion Gold Dredging Co., whose machinery has lain so long at Drynock, is on its way to Lillooet, where they have secured a lease to five miles of the river bed, and the two dredgers near Mormon bar, making the six complete plants, it is safe to say, nearly or quite equal $150,000.

## IDAHO.

Lewiston reports that it is filling up with prospectors and other mining men headed for Florence and interior camps. Flattering reports come from Florence, Elk and Pierce of quartz developments.

Superintendent Stanton of the Lucky Boy Mining Company's property in Custer county, says that work on the property will be resumed on May 20th, and that it will then continue steadily throughout the summer, the Miners' Union permitting. Mr. Stanton says the Lucky Boy is now productive of about $25,000 per month, and that with developments progressing steadily, it should increase to double that amount the present season. The only other mine now working in the camp is the Black, whose mill is dropping 10 stamps, with satisfactory results. The camp, since the closing down of the Luck Boy, which was employing 120 miners, says Supt. Stanton, is practically deserted.

The lessees on the Poorman-Tiger have decided not to operate the granite mill at Gem, but will sort their ore, shipping the best and holding the poorer on the dump until the new mill at Burke is ready to work it.

## UTAH.

The *Tribune* bears that at the Dalton and Lark, Bingham, a new scale of wages has gone into effect, and that the new law prohibiting the employment of miners longer than eight hours is witnessing its first test. The management of the Dalton and Lark, it is said, has notified the miners that hereafter 25 cents an hour will be paid, and with shifts limited to eight hours under the new law, this means but $2 a day with which the miner and his family must sustain themselves. Many of those who have been working at the Dalton and Lark, have signified their intention of quitting, and trouble is feared in the next few weeks.

## SOUTH DAKOTA.

The Kildonan mill runs regularly. The average amount of ore treated is 100 tons every twenty-four hours, the ore will average $20 per ton. The syndicate that owns the mill also owns the control of the stock of the Horseshoe and associate companies.

*Times*: The owners of the Sunnyside mine situated near Hill City, have purchased for $2000 the new and complete 5-stamp mill shipped in here some months ago by the Mil-

waukee parties who purchased the group of claims on Crow Peak on representations made by Expert Smith.

Prof. Jenny, formerly of the United States Geological Survey, in Denver, returned from the Black Hills, reports a remarkable gold discovery—"a blanket formation, similar to that of the Mercur district, extending over an unknown area, between lime and porphyry several feet thick, carrying values running from $15 to $500 per ton."

### MONTANA.

A group of copper properties at Copperopolis, near White Sulphur Springs, have been bonded for $50,000 to Barton Sewell, president of the United Smelting Company of Chicago.

### COLORADO.

Returns from a number of the mining counties of the State, says the Victor *News*, shows that with few exceptions a greater tonnage has been shipped to the smelters for the first three months of 1896 than for the corresponding period of 1895, and that the grade is generally higher. There is also a notable increase in the number of men employed in the various districts of the State, and an increase is reported in the number of men working for wages all along the line.

Boulder reports an increase of 1,526,395 pounds of ore shipped to the smelter, with a large number of men at work

Fifteen hundred men are employed in Pitkin against 1,300 last year, while the ore output of Aspen camp is 58,000 tons against 50,000 a year ago, with an increased value.

Cripple Creek produced $1,100,000 more gold for the first quarter of this year than last, and gives work to 1,500 more miners than was the case a year ago.

Hinsdale county comes to the front with an increase of $457,000 more in values than a year ago, and gives work to 300 more men.

Lower Clear Creek county, about Idaho Springs, shows an increase of 144.6 per cent in the shipment of smelting ores, and 75.1 per cent in mill dirt. The value is about double that of the shipments of one year ago in each case. The district gives employment to about 1400 more men than it did last year.

Gunnison has nearly doubled the number of men at work.

Ouray has shipped 15,000 tons so far this year. The big shipments from the Red Mountain mines are yet to come, the heavy producers being tied up on account of snow. The values of ores sent to smelters from this district is close to $750,000. The snow-bound properties will soon commence sending their product to market. Ouray will round out the year with at least 6,000 carloads to her credit, and as development work is in progress all over the country, it will become one of the greatest gold-producing sections of the State.

The mines about Rico have shipped less, and do not employ as many men, owing to the advance in smelter charges the first of the year, which closed a number of the silver mines of the district. There are fewer men employed at Creede than was the case a year ago.

The drills used in the Newhouse tunnel at Idaho Springs are twelve feet in length, and nine holes are drilled in the breast of the tunnel for every charge. The charge of powder required for each blast is 400 pounds of Giant. The charge is fired from a battery in a recess a quarter of a mile distant. Nearly 200 tons of rock are broken down at every discharge, and half a day is required to clear away the debris after the shots are fired. The tunnel is 12 feet square and it has not deen found necessary to do any timbering since solid formation was reached. The gases from the explosion are directed into the drainage trough and carried off in the water, so that there is the least possible delay in the work. There are thirty men employed.

The cyanide process is to be used on the low-grade ores of Leadville. It is the property of the MacArthur-Forrest Syndicate and has been leased by a Leadville company. J. C. Mitchell of Denver, secretary and treasurer. There are large bodies of this low-grade ore there that it is expected can be successfully handled. They have fitted up a plant at the Arkansas Valley Smelting Company's works and expect to begin handling about 50 tons a day. Their first operation will be on the dump of the Ibex mine.

The Cripple Creek *Times* says that the Independence mine is closed down, some men were laid off and in the development work now being performed only such ore is hoisted as has to be in continuing the work. Machinery is being put in place for operating the mine more extensively. The shaft is being sunk from the 600-foot level and will be driven to a depth of 1,000 feet. Mr. Stratton stated some time ago that he would not take out any more for shipment, but would treat the ore at his mill as soon as it is completed.

The life of a good mine is illustrated in the Seaton mine at Idaho Springs. It was located in 1860 or '61, and has been worked continuously since its location, sometimes by a few men under lease and sometimes by the owners with a high priced superintendent and a large force of miners. It had over 400 feet of tunnels twenty-five years ago. It was sold a few days ago to Denver parties for $500,000. A few years ago one of the claims was allowed to be sold for taxes, but since then a large body of mineral has been cut near the surface and the lessees have made good wages for almost one year.

### NEW MEXICO.

At Pinos Altos the Mina Grande mine has been idle for ten years and caved in. Bell & Stephens have reopened the property. They started two shafts and have struck a bonanza. The lead ore assays from $15 to $17 in gold and 40 to 120 ounces in silver per ton. The copper pyrites average $17 gold, 15 ounces silver per ton, and will run from 10 to 15 per cent in copper.

### ARIZONA.

The El Oro Gold Mining Company at Phœnix, has been organized with a capital of $1,250,000. The company owns several mines in Yavapai county.

The Kusser G. M. Co., Geronimo, Arizona, have received forty-five tons pipe, and other supplies and have started their stamp mill.

The "1896" mine at Walnut Grove, near Phœnix, has been bought by a Chicago syndicate for $75,000. The ore is said to pay $40 to the ton.

### LOWER CALIFORNIA.

The Paramide Mining Company, composed of Los Angeles and Riverside county men, has secured what the promoters believe is a rich tract of placer ground on the Lower California peninsula, fifty miles south of the line. Hydraulic machinery to a value of $5000 has been ordered, and active work is expected to begin within sixty days.

### MEXICO.

The new hoist for the Creston mine, at Prietas, has been received at Torres for the new three compartment shaft, which is to go down 2,000 feet.

A. Brixen of Salt Lake City, and Wilcox and Reddy of this city have a project to work over tailings on the Guanajuato river in Mexico and propose to erect a 500-ton mill. Mr. Brixen who has a concession to work the bar says: "Mining in that locality began in the seventeenth century, and following a chapter of rich strikes was the erection of 72 mills upon the banks of the Guanajuato river. Into the bed of the stream the tailings from this veritable avenue of mills were permitted to pour, and the result is the deposition of almost countless tons of them. Those engaged in mining during all these years in that locality made no effort to save the auriferous contents of the ore, and they were passed off into the channel, the bottom of which has risen higher and higher as the tailings flowed in, until at places they are 80 feet above the original bed."

### SOUTH AFRICA.

The following letter was received last week: it is from a prominent English mining engineer, and though not written for publication gives general views on current matters of interest.

GOLD FIELDS HOTEL,
JOHANNESBURG, S. A. R., 29th March, 1896.

I intended to have started north to-day for Buluwayo and Gevelo—660 miles from Pretoria by wagon—but the Matabeles have risen and they are murdering every one they can get at. So I am waiting over for a week to see if there is a chance to get through. We are sadly hampered by a variety of plagues:

First—Rinderpest has broken out between the Zambesi and here and the cattle dying by thousands, and no chance of getting machinery, etc., up for God knows how long. What we shall do for food I can scarcely say.

Second—A plague of locusts for hundreds of miles, and they have eaten up all the grass on the plains.

Third—A water famine. I pay a shilling for a bucket of water to bathe in, and then it's muddy.

Fourth—The Matabele rising.

Fifth—This place is like sitting on a volcano and expecting an eruption at any moment—the Boers are so troublesome. They despise Englishmen. We are insulted on all sides. The arms have all been taken from us and they are providing Germans (2000 Lee-Metford rifles with cartridges and bayonets just delivered this morning to Germans and Boers—my man saw the men take them away one by one) and others with the best English repeating rifles—the Lee-Metford—and a war may break out at any moment. The Dutch and Boers (all one race) are combining all over South Africa, and unless the Home Government puts down their foot we shall lose the whole of South Africa.

The mines are good, but really only a low grade proposition. Coal close to the mines, Kaffir labor and a fair amount of water, combined with the ores being clean—only iron oxide and pyrite—and the weak cyanide solution dissolving the gold, makes the place all right. The veins are regular in their yield, but small—2 to 3 feet, a big vein.

I have seen Jno. Hays Hammond. He's in a sad mess—a prisoner and with £40,000 bail and property interdicted—and I am afraid, unless he runs away, that something serious may happen to him.

Four other men besides Hammond are in a similar mess. Any moment we may get news from London and then we will know what we have to look forward to. If I move north I have a Matabele war; if I stay here, a revolution or a big war. My two rifles and cartridges had to be sent by another route to Buluwayo, as I could not get them through the Transvaal and I am now left with only the old revolver (which I smuggled through) and my hunting knife. Without arms in this country a man is powerless. It's almost the very worst place I have been in. My colleague is at Mafeking, about 200 miles from here, in English territory, and we have three big wagons there loaded with canned provisions, flour, etc. He is worried about the cattle trouble, and at last he has bought a lot of donkeys to pull the wagons—about eighty, I should think, for each wagon. He expects to get through about the middle of June, and in the meantime I must do the best I can for self and men.

On the mines we have not even a cabin of any sort, and we are forty miles from Gevelo, a small telegraph station. This country is made up of deserts and rocks and a railway, the only way to tackle it. This place is all right on the hills where the private residences are, but the town is full of typhoid and dysentery and fearful smells. No drainage; no water supply proper. Closets used; no ashes or soil employed, but iron buckets. Iron carts come around day and night, and empty the iron buckets, and the mules trot off with the carts, upsetting the stuff everywhere, and finally dumping it into an open pit, a mile or so from the town, and letting it dry up and blow away.

## List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

558,919.—GATE GOVERNOR—A. L. Adams, Astoria, Or.
559,051.—PHOTOGRAPHING COLORS—M. Anderson, Northport, Wash.
559,024.—SHOULDER BRACE—T. Bessing, Los Angeles, Cal.
559,119.—INVALID CHAIR—D S Carrick, Oakland, Cal.
559,073.—SOLDERING MACHINE—J B Clot, S. F.
559,074.—SOLDERING MACHINE—J. B. Clot, S. F.
559,098.—WINDOW SHADE ATTACHMENT—P. Davies, Oakland, Cal.
559,270.—EXERCISING APPARATUS—G. C. Edwards, Oakland, Cal.
559,099.—BANK CHECKS—M. Feintuch, S. F.
559,170.—ROLLER MILL—N. Fossati, Smith's Flat, Cal.
559,059.—CENTRIFUGAL MACHINE—A. Heberer, Alameda, Cal.
559,101.—UMBRELLA DRIP—F. HINDES, S. F.
559,102.—BICYCLE—L. Julig, S. F.
559,103.—CURTAIN FIXTURE—W H. Kirkman, Berkeley, Cal.
559,104.—ADVERTISING DEVICE—A. C. Morrison, S. F.
558,979.—HOT WATER IRRIGATOR—J. A. Noble, S. F.
559,341.—CARBURETER—Parr & Avery, S. F.
559,297.—STOVE—Rasmusson & Oliver, Tacoma, Wash.
558,986.—FIRE LADDER—N. Z. Room, Oakland, Cal.
559,107.—WAVE POWER—W. E. P. Rose, Angel Island, Cal.
558,999.—PRESSURE GOVERNOR—J. & P. St. Mary, Portland, Or.
559,233.—HARNESS SNAP—J. D. Tucker, Sierra Madre, Cal.
559,235.—CAR COUPLING—Van Dorn & Seaman, Spokane, Wash.
559,092.—MOP—H. A. Wolf, Sacramento, Cal.
559,093.—MOP WRINGER—H. A. Wolf, Sacramento, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

EXERCISING APPARATUS.—George C. Edwards, Oakland, Cal. No. 559,270. Dated April 28, 1896. This device belongs to that class of exercising apparatus which involves the use of a suitable head-stall adapted to fit the head and connected with a resistant device, such as a weighted cord or an elastic strap, whereby, through the movements of the head, the muscles of the neck particularly are exercised and strengthened. The particular object of the invention is to provide, by reason of the connection with the head-stall at the top of the head, for the exercising or movement of the head in every possible direction without danger or liability of disarranging the head-stall, which remains firm and in perfect position under all circumstances. The head-stall comprises an upper latitudinal band enircling the upper portion of the head, a lower latitudinal band encircling the front of the chin and back of the neck, a side longitudinal band passing under the chin and over the top of the head, a front longitudinal band passing over the head at right angles to the said longitudinal band and secured at its ends to the lower latitudinal band, the latter, together with the side longitudinal bands, having severed ends and fastening means to readily adjust and to remove the head-stall to and from the head.

INVALID CHAIR.—David S. Carrick, Oakland, Cal. No. 559,119. Dated April 28, 1896. The object of this invention is to provide a chair in which the invalid by his own efforts can adjust it to such positions that he can recline, sit up or be supported erect, and can also propel himself. The chair, generally speaking, consists of a frame or body and a seat portion, a back portion and a foot rest hinged together and supported by the frame or body of the chair, and uprights rising from said frame or body and suitable devices and connections suspended from the uprights at a point above the occupant of the chair and connected with the hinged back portion, whereby he may lift the back seat and foot rest into line to enable him to assume an erect posture. There are in connection with the chair many other devices to carry out its objects.

STREET RAILROAD CAR ADVERTISING DEVICE.—Albert C. Morrisson, San Francisco, Cal. No. 559,104. Dated April 28, 1896. This device belongs to those in which an intermittently moving drum or reel has secured to its periphery a number of advertising or display cards which by its movement it successively presents for exhibition behind or within a sight aperture. The apparatus is especially adapted, by reason of its easy connection with the bell cord, rope or strap of a car, to be used in a railroad car. It consists generally of a case having a sight aperture, a reel mounted within the case and having a series of advertising cards pivoted to its periphery, retaining spring arms projecting from each side and overlapping the path of the cards whereby each is temporarily restrained from falling, and a means for moving said reel.

CURTAIN FIXTURE.—Wm. H. Kirkham, Berkeley, Cal. No. 559,103. Dated April 28, 1896. This fixture is one of those in which the spring-actuated roller and the curtain which it carries are connected with a hanger suspended by a cord passing over a pulley at the top of the window frame or casing whereby it is adapted to be raised or lowered and the curtain itself to be rolled up from the bottom or the top in order to expose or to cover all or any portion of the window desired. The device consists of many novel details of improvement in a curtain fixture of this class, the objects of said improvements being generally to render the whole device practically efficient, durable and easily operated. The hanger consists of a cross bar and a suspending wire secured at its extremities at or near the ends of the cross bar and having the suspending cord attached to said wire at its middle.

BICYCLE.—Leopold Julig, San Francisco, Cal. No. 559,102. Dated April 28, 1896. The object of this invention is the transmission of power from the hands of the rider to assist that derived from his feet. The power transmitting mechanism consists of a pivoted lever at the head of the machine, connecting devices between said lever and the pedal crank, a handle bar mounted in the head of the machine and adapted to be turned axially, and connections normally out of engagement with said lever and adapted to be brought into contact therewith whereby the axial movement of the handle bar operates the pivoted lever.

WAVE POWER.—Wm. E. P. Rose, Angel Island, Cal. No. 559,107. Dated April 28, 1896. In this device a float is employed and suitable transmitting mechanism to convey the power of said float due to its rise and fall in the waves to operate a shaft adapted to be connected with suitable machinery. The object of the invention is to provide a simple and effective wave power, with suitable adjustments by which it may be made to operate under all conditions, especially those occasioned by waves of different and unusual heights, and also under those occasioned by the rise and fall of the tide. The device consists of a suitably restrained float, a rod extending therefrom and having teeth, a shaft having a ratchet wheel, a lever having a pawl engaging said wheel, a sleeve freely slidable upon the rod of the float and to which the lever is connected, a pawl in the upper portion of the sleeve adapted to normally engage the teeth of the rod, an arm connected with said pawl, a fixed stop above in the path of said arm whereby when the sleeve rises to its limit its pawl is disengaged, a pawl in the lower portion of the sleeve adapted to engage with the teeth of the rod, an arm connected with said pawl and a fixed stop below with which said arm comes in contact on the downward movement of the sleeve whereby the rod is freed and the float allowed to descend.

MOP.—Hermann A. Wolff, Sacramento, Cal. No. 559,092. Dated April 28, 1896. The object of this invention is to provide a mop, the frame of which is adapted to receive and to hold the mop material to the best advantage, enabling it to yield properly for the purpose of reaching corners, and similar inaccessible places, and to provide a handle for said mop adapted to be adjusted with relation thereto, and of a length sufficient to enable the operation to be carried on without stooping. The mop frame consists of standards having a toothed base, a series of toothed cross bars fitted and adapted to slide upon said standards and between which the material of the mop is wound and a means above to hold said bars to place.

MOP WRINGER.—Herrmann A. Wolff, Sacramento. No. 559,093. Dated April 26, 1896. This invention has for its object the provision of a wringing device adapted to be attached to the bucket and to receive the mop, and by the engagement therewith of the mop handle to be caused to squeeze said mop and relieve it of its excess of moisture. It consists of a perforated or foraminous vessel, composed of telescopic sections, whereby the capacity of the vessel may be increased to receive the mop and decreased to compress it and means actuated by the handle of the mop for causing one of said sections to slide within the other.

WINDOW-SHADE ATTACHMENT.—Percy Davies, Oakland, Cal, assignor of one-half to Sol Kahn, same place. No. 59,098. Dated April 28, 1896. This invention relates to an attachment for that class of window-shades which is actuated by a spring in the roller by which the shade is rolled up. It consists of a supplemental drum fixed to the end of the shade roller adapted to receive a band or cord, which winds or unwinds upon it simultaneously and in the same direction with a shade and in conjunction therewith of guides by which the band or cord may be led to a point distant from the window, so that the shade may be operated from said distant point. It is especially useful in large show windows, where the goods are displayed in such a manner that it is difficult to reach the ordinary shade.

DEVICE AND SAFETY ATTACHMENT FOR BANK CHECKS.—Morris Feintuch, San Francisco, Cal. No. 559,099. Dated April 28, 1896. This invention relates to an attachment for bank checks and drafts and similar papers, and is designed to protect those issuing such checks from loss by alteration or forgery. It consists essentially of a check or draft, having the stub at the left end, upon which the amount of the check is entered, and having at the other end a thickened or reinforce card, or extention, with a line of perforations whereby it may be readily separated from the check, said extension having imprinted upon it a corresponding amount, date and number with the check, together with the name of the bank or person upon which it is drawn, and having upon its opposite face the address to which it is sent.

Great Reduction in Light!
IMPERIAL
Automatic Gas Machine
Produces a Beautiful Light.

The difference between the brilliancy of light produced from gasoline gas and from coal gas is 3 to 1. The gasoline light is clear and soft, rests the eyes and brings comfort to the home.
The latest and most perfect Automatic Gas Machine now in use, particularly for illuminating private dwellings in the country, as well as residences in the suburbs of a city or town, public institutions, asylums, hotels, etc. The light is steady, soft, bright and pleasant to the eyes and can be furnished at an expense of but eighty cents per 1000 feet of gas. It is much safer than coal oil lamps, which are so danger us to have in the house on account of an explosion.
These Gas Machines are perfectly safe, and free from any danger whatsoever. Every modern house built for gas should have one of these machines. No public institution should be without one. I have no hesitancy in saying that there is no other gas machine in the market that can compete with mine as to prices, and they surpass as to perfection in all its requirements
For supplying gas for gas stoves for cooking or heating these gas machines have no equal. Address

TRADE MARK.

(MacARTHUR-FORREST PROCESS)

MacArthur-Forrest Process.

CAPITAL, - - - £110,000 STERLING

To MINE OWNERS and others having Refractory Gold and Silver Ores hitherto untreatable at a profit, the MACARTHUR-FORREST (Patent) Process of Gold and Silver Extraction offers a solution of the difficulty.

Advisory Board in the United States: Thomas W. Goad, Manager; Hugh Butler, Attorney; John F. Bell; P. George Gow.

California and Nevada Agency and Experimental Plant, 23 Stevenson Street, San Francisco, Cal. P. G. Gow, Sole Agent.

OFFICE: McPHEE BUILDING, DENVER, COLORADO.

## MILLS BUILT WITH GUARANTEE OF SUCCESSFUL OPERATION.

## KENDALL GOLD AND SILVER EXTRACTION CO.

The Kendall Process is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

*The Kendall system is covered by patents which this company will defend.*

The American Cyanide Gold and Silver Recovery Co., organized in Denver more than a year ago to introduce and operate the Kendall Process in several States, have closed contracts with some ten mines for the use of this process after exhaustive comparative tests with the ordinary plain cyanide method.

Capt. De Lamar has adopted the process at his Nevada mines, where a 250-ton plant is being completed. He writes that he is saving 95 per cent of his gold values, and regards the Kendall Process as the cheapest and best he is aware of for the treatment of gold ores.

*All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.*

Owners of mines and reduction works can obtain full information on application to

Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

**HORACE F. BROWN,** CONSULTING ENGINEER.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

**The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill**

**FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.**

**SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.**

**THIRD: The Large Amount of Space Saved.**

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

—MANUFACTURERS OF—

## Dow's Improved Steam Pumps,

SINGLE OR DUPLEX, FOR EVERY POSSIBLE DUTY.

**MINING PUMPS,**

**Irrigation Pumps,**

Artesian Well Engines,

Independent Air Pump and Condenser,

For Stationary Engines or Steam Pumps.

**Power Pumping Machinery,**

**Speed Governors,**

BALANCE VALVES AND PRESSURE REGULATORS FOR STEAM PUMPS,

Etc., Etc.

Correspondence Solicited. Send for Catalogue.

# The Pelton System of Power

Represents the highest development yet attained in water wheel practice and affords the most simple, efficient and economical means of utilizing water for power purposes.

## Six Thousand Wheels Now Running,

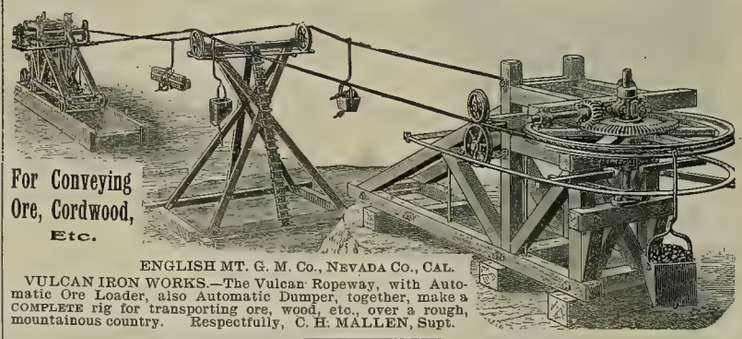
Aggregating over 400,000 horse power. Adaptation made to all conditions and every variety of service.

## Electric Power Transmission.

PELTON WHEELS are the recognized standard for electrical work and are running a majority of the stations of this character in all parts of the world.

Catalogues furnished upon application. Address

**THE PELTON WATER WHEEL CO.,**



121 MAIN STREET, SAN FRANCISCO, CAL.

# DEWEY & CO., 220 Market St., SAN FRANCISCO,

# PATENT SOLICITORS.

ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

# Market Reports.

## The Markets.

SAN FRANCISCO, May 7, 1896.

While there are still a few pessimistic merchants, yet the large majority speak quite hopeful of the general situation. The latter even go so far as to affirm that the coming Presidential election will not have that unfavorable effect as in years gone by. For fully three years we have been passing through a severe depression, during which time weak firms have been forced to the wall, leaving the remainder in better position. The improved crop prospects are a decided factor in creating a better feeling, although fears are entertained that unfavorable weather may set in before harvest. The outlook for about every kind of farm product favors the assertion that better average prices will rule this year than in 1895. The manufacturing interest, particularly with iron workers, seems to have entered on an era of much better times. The growth in gold mining has been phenomenal. This finds confirmation in the sales of dynamite powders for mining purposes. Manufacturers say that their sales in 1895 footed up the largest in their history, while so far this year they show an increase of over 25 per cent over that during the corresponding time last year.

In the local money market there is an increasing disposition to buy commercial and other good paper, with, in some instances, a slight shading in the rate of interest or discount. There can be no question that more outside money is coming in, while there seems to be a falling off in the call for accommodation. With merchants, as is usual at this season of the year, collections are poor in agricultural districts, but from the mining sections more general ease is reported. Our advices from New York are confirmatory of lower rates of interest, with money accumulating available for placing. This ease is making itself felt in business and manufacturing circles, which, if not checked by some unforeseen unfavorable event, will lead up to a large expansion of business throughout the country, particularly with labor troubles settled. It will also cause better prices. This is already being favorably felt with the iron and coal industries, which is spreading to other industries in close connection with them.

**New York Silver Prices.**

NEW YORK, May 7.—Following are the closing prices for the week:

| | London. | N. Y. |
|---|---|---|
| Friday | 31 1-16 | 68 |
| Saturday | 31 1-16 | 68 |
| Monday | 31 1-16 | 68 |
| Tuesday | 31⅛ | 68⅛ |
| Wednesday | 31⅛ | 68⅛ |
| Thursday | 31 | 67⅞ |

| | Copper. | Lead. | Iron. | Tin. |
|---|---|---|---|---|
| Friday | 10 75 | 3 05 | ..... | 13 30 |
| Saturday | 10 75 | 3 05 | ..... | 13 30 |
| Monday | 10 75 | 3 05 | 11 50@12 50 | 13 30 |
| Tuesday | 10 75 | 3 02½ | 11 50@12 50 | 13 35 |
| Wednesday | 10 75 | 3 05 | 11 50@12 50 | 13 35 |

The local bullion, money and exchange quotations current are as follows:

| | |
|---|---|
| Commercial Loans, % per annum | 7@8 |
| Commercial Loans, prime | 6@8 |
| Call Loans, gilt edged | 6@7 |
| Call Loans, mixed securities | 7@8 |
| Mortgages, prime, taxes paid by lender | 6@8 |
| New York Sight Draft | par |
| New York Telegraphic Transfer | par |
| London Bankers' 60 days | $4.88¼ |
| London Merchants | $4.86¼ |
| London Sight Bankers | $4.90 |
| Refined Silver, per oz., 1000 fine | 68c |
| Mexican Dollars | 53¾@54½c |

SILVER.—The last steamer for the Orient did not take out any silver, which is something unusual, and shows the exceptional small demand from Japan and China. Bankers having close connection with those countries profess ignorance as to the absence of shipments, further than stating that their orders cannot be filled at quoted rates for the white metal. Eastern mail advices are to the effect that there has been, so far this year, only a moderate export movement, with the immediate future somewhat unsettled. It looks as if lower prices were trying to be secured.

MEXICAN DOLLARS.—The last steamer for China took out only 11,010 dollars, which is the lightest shipment on record. Another singular feature is that no banker shipped any; it was all done by Chinese. The market is quotable weak at 53¾@54½ cents

COPPER.—The market is reported unchanged, but the feeling appears to be stiffish. The East continues to report conservative buying by Americans, but the export movement continues remarkably free, considering the large exports for weeks past. James Lewis & Son of Liverpool writes that the statistics for the first quarter of this year show an increase in English home consumption of 6,654 tons, or at the rate of 26,616 tons per annum, while the exports have increased 3,538 tons. or at the rate of 14,152 tons per annum. Official figures issued in Germany show the consumption there during January and February of this year to have exceeded that of the same months of 1895 by 3,075 tons, or at the rate of 18,450 tons per annum. Large as the American production has been for the first three months of this year, being at the rate for the whole year of 34,937 tons over that for 1895, should the consumption in England and Germany alone continue on the scale of the last three months, a further increase of 10,000 tons per annum in the production of the world would be required to prevent further decrease of stocks, assuming that there is no increase of consumption in other countries. Production generally, with the exception of the United States, shows no signs of increase. The London *Times'* report of last week of trade in Scotland states that it continues very active, that shipbuilders are busy and booking large orders, that copper smelters are busier than they have been for years and that the same applies to boilermakers, marine and locomotive engineers and brassfounders. We hear the same of the Tyne, where the leading shipbuilders have orders for warships booked extending over several years and are extending their yards.

The market is quoted as follows:

| | |
|---|---|
| Bolt | ¼ & 5-16, 20c; ⅜ and larger, 17c |
| Lake Superior Sheathing | 20 |
| Ingot, jobbing | 13 |
| Ingot, wholesale | 12 |
| Sheet copper | 17 |

TIN.—The market for pig has held fairly strong here and at the East. Tinplates have strengthened at the East in sympathy with the advance in iron and steel plate. With us no change in quotations has been reported.

The market is quoted as follows:

| | |
|---|---|
| Pig, per lb | 14½c |
| Plate, I C coke, heavy, per box | $4 25 |
| " " " light, " | 4 10 |

ANTIMONY.—The market is quiet and weak at 8½@9c cents in a jobbing way. New York mail advices quote 7½@7¾c for Cookson's, 6¾@6¾c for Hallett's and 6½@6¾c for Japanese, from store.

LEAD.—The market has ruled fairly firm at unchanged quotations. The East reports quiet markets, with business flat.

The market is quoted as follows:

| | | | |
|---|---|---|---|
| Pig | 3 75 | @ | 4 00 |
| Bar | — | @ | 4 15 |
| Sheet | — | @ | 5 50 |
| Pipe | — | @ | 4 75 |

SHOT.—The market is quoted as follows:

| | |
|---|---|
| Drop, sizes smaller than B, per bag of 25 lbs | $1 40 |
| Drop, B and larger sizes, " " | 1 65 |
| Buck, Balls and Chilled, do, " " | 1 65 |

QUICKSILVER.—There is a fair export demand for the west coast of Mexico and Central America. The home demand is light.

The market is quoted as follows:

| | |
|---|---|
| Home trade, per flask | 39 00 |
| Distant points up north | 38 00 |
| West coast of Mexico, for export | 34 00 |

POWDER.—The demand continues exceptionally large. The prices at which sales are being made do not leave any profit to manufacturers, but, notwithstanding this, we are authorized by the California Powder Works to state that the published statement that a combination is being formed is without foundation.

The market is quoted as follows:

| | | | |
|---|---|---|---|
| Hercules, No. 1, per pound | 11½c | | |
| " No. 2, " " | 8½c | | |
| Refined, in car lots | 6⅛ | | |
| Refined, in sacks | 5⅞ | | |
| Powdered, in car lots | 6⅛ | | |
| Concentrated, " | 5⅝ | | |

BORAX.—The market is quoted as follows:

LUMBER.—The market is fairly active at firm prices.

The market is quoted in this city from dock or yards as follows:

| | | | |
|---|---|---|---|
| Redwood, Fluming | 17 00 | @ | — — |
| Pine | 14 00 | @ | 19 00 |
| Spruce | 26 00 | @ | 31 00 |

NAILS.—Dealers report a good demand at last week's advance. The East reports a strong, higher and active markets.

The market is quoted as follows:

| | |
|---|---|
| Wire, carloads, basis per keg | $3 22½ |
| " jobbing, " " | 3 35 |
| Cut, carloads, " " | 2 97½ |
| " jobbing, " " | 3 10 |

IRON.—The consumption in this city of pig continues on liberal scale. The market, while quoted unchanged, is said to be firm. The East reports a steady increasing and expanding demand with railroads free buyers.

Our market is quoted as follows:

AMERICAN.

| | To Arrive. | Spot. |
|---|---|---|
| Sloss | $21 00 | $23 50 |
| Thomas | 22 00 | 23 50 |
| Salisbury | 30 00 | 33 00 |

ENGLISH.

| | | |
|---|---|---|
| Barrow | $21 00 | $23 50 |
| Gartsherrie | 21 50 | 23 50 |

COAL.—There is nothing new to report in our market. Good crop prospects are against import sellers as is the increased coast output.

SPOT FROM YARD—PER TON.

| | | | |
|---|---|---|---|
| Wellington | $7 50 | @ | 8 00 |
| Greta | 6 00 | @ | 6 50 |
| Nanaimo | 6 50 | @ | 7 00 |
| Gilman | 5 50 | @ | 6 00 |
| Seattle | 5 00 | @ | 5 50 |
| Coos Bay | — | —@ | 4 50 |

| Gas Companies' | — — | | — — |
| English, to load | 9 00 | @ | 10 00 |
| " spot, in bulk | — — | @ | 10 00 |
| " in sacks | — — | @ | 10 50 |
| Cumberland | — — | @ | — — |

## Mining Share Market.

SAN FRANCISCO, May 7, 1896.

The market for mining shares was featureless the forepart of the week under review. While there was no radical weakening in prices, yet the market had the appearance of going all to pieces, which discouraged outsiders on the long side and encouraged short sellers. Under such a condition it was only natural that large numbers sold. The shares thrown out were taken in by a combination of two or more small pools that seem to be doing the manipulation. Yesterday Chollar developed considerable strength, moving up under large transactions from around 95 cents a share in the morning to $1.55 at the close of the day's business. In the advance the whole line sympathized, with shares in Best & Belcher and Gould & Curry selling at a considerably higher percentage than did those in the other mines. It is the current belief with the better informed that much of the advance was due to some of the shorts filling on reports of a further improvement in the Chollar workings on the Brunswick lode. The advance in the market confirms the position taken in this department that two or more of the small pools could combine and promote an upward move at almost any time, but we still believe that, unless support should be given the market by large moneyed men, higher prices will be short-lived and result in quite a break; for as far as the writer is advised, present developments on the Brunswick lode do not warrant a large advance in the market. What may be found hereafter is a debatable proposition, but it is the uncertainty that makes the gamble. The advance in the market for shares in the mines on the Brunswick and Comstock lodes was felt by the Bodies, which also sold at higher figures. At this writing it looks as if, after the shorts have been forced to fill and chronic bulls come in as buyers, the market will decline and the leading shares sell at figures considerably lower than those at which they sold around top prices.

Assessments were levied the past week by the following companies: Savage, 20 cents a share; Overman, 10 cents; and Alta, 10 cents.

The news from the Comstock mines continues to report more or less work from one end of the lode to the other, except in Kentuck and Exchequer. Some of the work is of quite an encouraging character yet it points to time before results of a positive character can be determined, but while prosecuting it stringers are liable to be run into any day which may have a temporary favorable effect on the market. In the Alta group the only work officially reported is in Alta but it is essentially unchanged from that heretofore given out the past few weeks. While prosecuting the work a few tons of ore are extracted each week. In the Gold Hill group a few tons of ore raised each week by Overman, Confidence, Belcher and Seg. Belcher, with the two latter reporting the largest quantities. In none of these mines will the ore when milled pay current expenses. In Crown Point the most active exploiting work is being done which calls for the largest expenditure of money. On the 800-foot level of this mine they have started on the 2½ foot ore found in running the east cross-drift. On another level they were, at last advice, in ore assaying from $1 to $3 a ton and on still another level $3 to $7 ore has been found. It is useless to say this does not pay for extracting. We are not informed if work is being done in the Yellow Jacket mine. Prospecting work is still being done in Confidence on the level heretofore reported. Work has been stopped in the joint Confidence, Challenge and Con. Imperial west cross-drift pending some needed repairs. In Alpha the usual work on the 500-foot level is reported with no material change given out. Official letters from Bullion continue to report work on the long west cross-drift from the 850-foot station level. In Potosi, Chollar, Hale & Norcross, Savage and Best & Belcher the work is on the same levels as heretofore reported with no essential change either for the worse or the better. Ore is raised by the first four as the work progresses but it does not cover current expenses. In Gould & Curry the long west cross-drift is being pushed slowly ahead. Official letters from Con. Virginia report active exploiting work on several levels. While prosecuting the work enough ore is extracted, raised and milled to pay all expenses, which is largely in its favor. Interest continues to be centered on the work that is being done on the 1000-foot level of this mine. In Ophir and also in Mexican work is being pushed ahead on the 1000-foot level with no material change reported in the material encountered. On the central tunnel level of Ophir a few tons of hihg grade ore is being extracted as exploiting work is pushed ahead. From Union and Sierra Nevada our advices do not report any change in the character of the work or formation of the ground run through. The same advices come from Utah and Andes.

Interest seems to be largely centered by operators on the work under way on the Brunswick lode. In Occidental they are running lateral drifts south and north, so as to find the extent and value of the recent find on the upper level, while on the 750-foot level they are crosscutting the recent find. It is asserted that the ore found is base. Work under way at another point on the lode is attracting considerable attention, particularly that being done in the Chollar ground. Official letters report crosscutting on the 200-foot level, while the shaft is still being sunk. When a sufficient depth has been secured, a crossdrift will be started, so as to run for the downward continuation of the ore found above. Private letters received last Tuesday report quite an improvement on the 200-foot level. Several persons that have seen the ore are reported as saying that it is base.

From the Bodie district official letters do not report any change in the work or essential change in the material encountered, but private letters state that some stringers have been encountered of quite an encouraging character.

The market to-day partook largely of old times, with the exception that prices are not so high. Transactions were larger to day than at any time since the up-move commenced, with a most decided advance in the shares of the mines having ground on the Brunswick lode. This seems to indicate that the strikes on this load are making themselves felt. In the upheaval to-day the Gold Hills did not advance much, neither did Occidental and Hale & Norcross. The market opened strong and active this morning, but after call it shaded off slightly, only to close the informal session at noon at an advance on the 9:30 Call. The leader in the move was Chollar, with Best & Belcher, Gould & Curry, Savage and Potosi good seconds. Con. Virginia, Andes, Ophir, Union and Sierra Nevada also higher. At the 2:30 session this afternoon there was further advance under a large business, Con. Virginia leading in the north ends, Chollar in the middles and Confidence in the Gold Hills. With a very few exceptions shares sold higher to-day than for several months. The reported strike in Ophir is said to be in disputed ground; it is said to be claimed by both Andes and West Con. Virginia.

The following illustrates the changes of the week:

| MINES. | Apr. 30. | May 7. |
|---|---|---|
| Alpha | ..... | $ 18 |
| Alta Consolidated | ..... | 09 |
| Andes | $ 28 | 35 |
| Belcher | 50 | 59 |
| Best & Belcher | 58 | 1 00 |
| Bodie | 50 | ..... |
| Bullion | 14 | 26 |
| Challenge | 38 | 50 |

| E. C. Godfrey | 154 | 4,000 | 200 00 |

And in accordance with law, and an order from the Board of Directors, made on the 10th day of February, 1896, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Nos. 37 and 38 Crocker Building, San Francisco, California, on FRIDAY, the 10th day of April, 1896, at the hour of 2 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

E. C. GODFREY, Secretary.

Office, 37 and 38 Crocker Building, San Francisco, California.

### POSTPONEMENT NOTICE.

By resolution of the Board of Directors of the Gold Bar Consolidated Mining Co., the day of sale for the above delinquent stock was postponed until SATURDAY, May 9, 1896, at the hour of 2 P. M., at the office of the Company, Room 38 Crocker Building, San Francisco, Cal.

E. C. GODFREY, Secretary.

### POSTPONEMENT NOTICE.

By resolution of the Board of Directors of the Gold Bar Consolidated Mining Co., the day of sale for the above delinquent stock was postponed until MONDAY, June 8, 1896, at the same hour and place. E. C. GODFREY, Secretary.

Office, No. 38 Crocker Building, San Francisco.

TO THE STOCKHOLDERS OF THE SOUTH PALOMA GOLD MINING COMPANY, LIMITED:

Notice is hereby given that by resolution of the Board of Directors of the corporation, adopted on the 21st day of March, 1896, a meeting of the stockholders of the corporation was called for the purpose of increasing the capital stock to the amount of two hundred thousand dollars, to be divided into one hundred thousand shares of the par value of two dollars per share, and of determining the disposition to be made of the increased capital stock; and it was resolved that such meeting shall take place at the principal place of business of the corporation being the same building where the Board of Directors usually meet, to wit: No. 212 Sansome street, room 17, in the City and County of San Francisco, on WEDNESDAY, the 10th day of June, A. D., 1896, at 11 o'clock in the forenoon of that day.

Dated San Francisco, 2nd of April, 1896.

JOHN A. WRIGHT, President.

CHAS. WEBB HOWARD, JR., Secretary.

**KROGH MANUFACTURING COMPANY,**
Successors to The San Francisco Tool Co.'s Mfg Dept., builders of **Engines and Centrifugal Pumps** for Irrigation and for Mining and Water Works. These pumps can be operated by horse power, water power, steam, gasoline or electric motors.

Horse Power Mine Hoist.

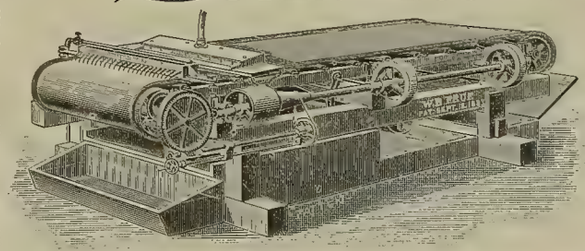
**Horse Powers!**
Triple-Acting Pumps, Deep Well Pumps, Cornish and Jack Head Pumps for Deep Mining, Horse Power Mining Hoists, Water Gate Valves up to 40 inches diameter, and Link Chain Elevators. Pipe and Pipe Fittings at lowest prices. Hydraulic Presses. We also manufacture Cyanide Tanks and Centrifugal Sand Pumps for filling and discharging them. These Pumps work the tailings to perfection and are made to handle small or large quantities.

Office and Works: 51 BEALE STREET and 9 to 17 STEVENSON STREET, SAN FRANCISCO, CAL.

**The Midas Gold Saving Machinery Co.**
—MANUFACTURERS OF—
For MILL —OR— PLACER USE.

**THE GOLD KING AMALGAMATOR.**
The only successful device for saving fine free gold from clay, talc or slimy ores. Has been proven far superior to horizontal plates in every instance. Endorsed by leading millmen. Send for catalogue and price list. Highest award at 28th Industrial Exposition.
MIDAS GOLD SAVING MACHINERY CO., 114 First St., San Francisco, C. A. RUMBLE, Gen'l M'g'r.

THE OLD RELIABLE
**COMMON SENSE STEEL WHIM**
STILL STAYS TO THE FRONT.
Over 2800 now in use, which is more than all others combined. We make them for all purposes, all sizes and prices. **Steel Ore Buckets**, all sizes from a windlass to a ton. We press "'em out" 'cause hammer dents make holes, "savy?" **Common Sense Easy Dump Ore Cars.** Center of car body over center of truck, equal weight on each axle, makes equal wear on all the wheels. Incline turn table makes the car dump itself when you press the latch. Send for Catalogue showing dozens of styles of cars for all purposes.
THE WHIM CO.,
1220-1222 Curtis Street.....Denver, Colo.



**RUPTURE CURED.**
Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absoutely without danger. Usually but a single treatment required.

# FRUE ORE CONCENTRATOR.

## OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.
" " " Improved Belt Frue Vanner..... 600, f. o. b.

DODGE AND [illegible] ROCK BREAKERS.

IMPROVED MILLS
That successfully take the place of stamps.

AMALGAMATORS,
Doing away with plates on all kinds of mills for saving gold.

DISTRIBUTORS
That save a vast amount of care and labor, divide the pulp and water evenly to two or more lines of concentrators.

SEPARATORS,
Sizes the ore from the mill, separates the sands for the jig, and slimes for the slime concentrator.

JIG CONCENTRATOR
For working the sands from the separating box.

SLIME CONCENTRATOR,
Works the slimes from the separator.

DRY JIG,
Concentrates ores where there is a lack of water.

MILLS,
To crush to any degree of fineness desired.

GRAVEL MILL,
Works cement gravel, without crushing the gravel.

CONTINUOUS AND CHARGE ROASTING FURNACES.

THE ABOVE MACHINERY IS BEING SET UP AND CAN BE SEEN AT OUR STORE.

## An Improved Geological Survey.

Director Walcott is keenly alive to the unavoidable deficiencies of the U. S. Survey and contemplates several improvements that will bring this important part of the public service more in line with the present need of miners and mining engineers. A bill now in Congress, and favored by those who are cognizant of the requirements of the case, appropriates money to erect monuments and bench marks fixing triangulation points and elevations. It provides not only that elevations above sea level, or some fixed point, shall be marked on the ground, by iron or stone posts or bench marks, in the region west of the 97th meridian, but also that one such mark at least shall be erected in each area equal to a township, six miles square, in the region east of the 97th meridian. If this provision is adopted it will enable the Survey to erect monuments not only at triangulation points, but also to establish monuments and bench marks wherever they will be of service to the civil engineer, the mining engineer, the geologist or any one who may desire to ascertain the true position and elevation of points of reference within any particular area. It is the director's desire that the proposed amendment shall be enacted into law, with a view to raising the topographic surveys to a higher standard of excellence and make them of greater usefulness.

In areal geology the geologist endeavors to delineate upon his map as accurate a picture as possible of the outlines or boundaries of different rock formations as they occur on the tract of ground which the map represents, in order that from this areal map he may draw deductions as to underground structure of that and adjoining regions, and construct profiles showing the courses and positions at various depths of these different rock formations and of their contained useful minerals. Topographic maps, even when the result of the most improved methods and greatest skill, are necessarily more or less imperfect representations of the earth's surface, and the geologist often finds it difficult to determine the exact location upon his map of an important geological feature.

Often triangulation monuments built of loose stones are scattered about, and others are built so that they cannot be distinguished by surveyors from those built by the topographers of the survey. It thus becomes apparent that it will be of great use to the geologist in mountain regions to have permanent and accurately located monuments within short distances of each other, to which he can refer in locating important geologic features and in checking on the ground the accuracy of his geological work.

In mining geology the same advantages will accrue as in areal geology, but to a greater degree. A large part of the observations of the mining geologist are made under ground, and their location is referred to a single point on the surface. This necessitates a still higher degree of accuracy for the location of such points as mouths of shafts or tunnels, because any considerable error may entirely vitiate the deductions drawn as to the probable location underground of ore bodies. Such points are located by mining surveyors with reference to corners of claims, and these in their turn with reference to some township corner. If the township corners are accurately indicated on the ground and on the map with reference to other topographical features, the other locations can be made in the office from the given starting points. In present practice, inasmuch as it is known that township corners may have a considerable though unknown error (in some cases of several hundred feet and in one known case of nearly a quarter of a mile), it is found to be necessary to make a new survey to determine the location of such mine openings as serve to connect underground workings with the surface. Owing to this, it is often the practice at present among local mining surveyors to connect their surveys with the triangulation points of the Government geological surveys, because they are more accurately and permanently located than land-survey marks. At the present time, however, these monuments are built of piles of stone, and often, when stones are scarce, of a single stone with a bottle buried beneath it, containing a record of the position of the monument; and again, the points are more or less widely separated, as they are made with reference only to the triangulation.

The original object of the topographic maps was to serve as a basis for the geologic map of the United States, but with the progress of the survey from year to year the public has become more and more acquainted with the maps, and a strong demand has grown up for the topographic maps as such, and it is time the topographic surveys should be connected directly with the land surveys in the manner proposed, and that permanent monuments should be left in all portions of the country where the surveys are made. As matters now stand it is necessary for an engineer to re-run many of the lines if he would know the exact elevation of any point. Many thousands of dollars expended in such work could be saved by the simple provision of placing a few permanent marks at the time the topographic surveys and the precise level lines are being run. It is estimated by Director Walcott that the cost of the extra work and the monuments will average from $1 to $1.50 per square mile. This will decrease the output of work about one-fifth as compared with the present cost. The greater utility and accuracy of the maps will more than compensate for the additional cost.

JARDINE'S ROAD MAKING MACHINE.

## Road Making Machine.

The attention of our readers who are interested in good roads is directed to an invention that is purely local, and has been the means of making many of the fine drives that are to be found through Alameda and Oakland, as well as this city.

The machine was first invented and built for the paving company that had the contract for paving Golden Gate avenue in this city with bitumen, and it proved itself such a success that all the other paving companies had to get them, and the builder and inventor was kept busy building them. His latest machine is a model of ingenuity and efficiency, being largely the result of the combined experience of road builders and paving men that have used them. This newest machine is herewith illustrated for the first time. It is a fifteen-ton machine, and has a boiler suitable for carrying 150 pounds of steam. It has the large or rear roller so constructed that it can be heated by steam, so as to have a hot roller for rolling bitumen or asphalt pavements. When the roller is being used for macadam the large roller can be filled with water and the water can be sprinkled on the ground as the work progresses. It has another valuable feature, viz., the hydraulic steering apparatus, which does the turning and twisting and running back and forth by hydraulic power, thereby saving the strength of the engineer, as a ten-year-old child has power enough to run the huge machine anywhere necessary.

This is believed by the inventor and maker to be the most complete machine in America of its kind, and every county in the State could with profit have such a machine that will break the rock, spread it on the road, and then roll it down. These machines are built by the Jardine Iron Works, 307 Folsom street, this city, under J. B. Jardine's patent.

Notices of Recent Patents, 404.

LAST THURSDAY'S official trip of the battleship Oregon in Santa Barbara channel was one of great industrial importance to the coast, which, with the vessel's builders, the Union Iron Works, is to be congratulated on the result. To successfully compete with the Atlantic coast shipbuilders is no small triumph, and the product of a Pacific Coast shipyard now takes her place at the head of the great battleships of the American Navy. The $175,000 extra bonus earned by the builders is a trifle in comparison to the credit that will accrue to them, to California and the entire Coast as the result of last Thursday's performance.

THE depression in silver mining caused Congress in '93 and '94 to suspend for those two years that part of the Federal mining law requiring an annual expenditure of $100 in work or improvement on an unpatented mining claim. That concession ceased in '94. While, individually, the enforcement of the law may work hardship, yet in general that requirement is a good one. If a man cannot hold a claim he had best relinquish it. A miner or prospector is not confined to the ownership of one claim: he can take up and hold twenty if he complies with the law. Many do take up more than they can manage, and that tends to keep back the development of the district. General justice requires that a man should either work a claim at least to the little extent required by the letter of the law, or else give it up.

THERE has been some advance in mining legislation in Congress from that reported in our last issue. The Mineral Land bill which passed the House, and, amended to include Oregon, passed the Senate, has had action delayed upon it before the House Committee where it went for agreement, by reason of Congressman Bowers' illness. It was expected that it would be made a special order for the 15th, when if the House concurs in the Senate amendment the bill will go to the President for his signature. The River and Harbor bill passed last Wednesday with a clause wherein a Board of Engineers is provided to take charge of the Sacramento and Feather rivers, make surveys and superintend the expenditure of all appropriations made for these waterways. For the construction of restraining barriers on the Sacramento and Feather rivers $250,000 is appropriated, to be expended in connection with the conditional $250,000 appropriation made for the purpose by this State. The President may veto the bill, but if he does the necessary two-thirds majority will pass it over his head. The contemplated adjournment of Congress and the approach of the Presidential campaign makes it unlikely that there will be any further mining legislation acted on during this session than that mentioned herein.

## The Hale & Norcross Suit.

Last Tuesday, in the Superior Court of this city, Judge Hebbard announced another decision in the Hale & Norcross case, in which, after quoting from the decision of the Supreme Court reversing his former judgment, he gave judgment for the plaintiff, M. W. Fox, in the further sum of $417,683, in addition to the former judgment of $210,197.50. He took for a basis the value of the car sample assays. After discussing the evidence as to battery assays, he says:

The following facts and figures are admitted to be correctly shown by the record in the case: Number of tons of ore from Hale & Norcross mine milled at the Nevada and Mexican mills from January 1, 1887, to July 1, 1890, 84,068.1700; value of same as shown by car sample assay, $3,224,286.53; average value of same per ton, car sample assay, $38 35. Value of same as shown by battery sample assay, $2,225,256.54; value of bullion returned by mills to mining company, $1,678,921.16, of which $718,345 was gold and $960,576.17 silver; percentage of gold in bullion, .4268; percentage of silver in bullion, .5722; average discount on silver during period, with standard at 1.2929, running from 92 to 1.06, .26112. * * * The value of these ores delivered to these mills during the period mentioned is $2,551,742, of which $1,460,107 is silver and $1,091,635 gold. This value is ascertained by deducting $8 per ton from the car sample assay value. Example: Car sample value, $3,224,286; 84,068 tons at $8, $672,544; balance, $2,551,742. * * * The deduction of $8 per ton is a most liberal allowance. Plaintiff contends that a deduction of $5 would be ample, and the evidence above referred to would perhaps warrant an average deduction of but $5. The amount of the value of the ore delivered to the mills, which was necessarily lost in working or would not under fair milling be separated from the baser matter, and therefore which is the amount to be deducted for loss, is $381,769. The loss is made up as follows: Slimes, $98,358; moisture, $32,214; tailings, $251,197; total, $381,769. * * * The average of these settler sample assays, as claimed by plaintiff, is $3.08 per ton, and as claimed by defendants $3.38 per ton; the latter is adopted for the calculation. As all the slimes and moisture are above accounted for, neither form a part of the tailings for the purpose of the calculations. The total amount of the slimes and moisture must be deducted from the amount of ore in order to ascertain the amount of tailings. Example: Slimes, 7566 tons; moisture, 840 tons; total, 8406 tons. Deduct 8406 tons of slimes and moisture from 84,068 tons of ore equals 75,662 tons of tailings, without deducting the weight of the bullion; 75,662 tons multiplied by $3.32 equals $251,197, total loss occasioned by tailings, and making the total loss occasioned by slimes, moisture and tailings, as aforesaid, the amount of $381,769. From the value of the ore delivered to the mills—$2,551,742—deduct the total loss occasioned by slimes, moisture and tailings, $381,769, and the balance, $2,169,973, is the amount of bullion, with silver at 1.2929, which ought to have been returned to the Hale & Norcross Company. From this amount, $2,169,973, deduct $1,678,921, the amount of bullion, with silver at 1.2929, which was returned, and the balance, $491,053, is the apparent deficit; .5722 of this amount, or $280,980, is silver. Taking out of $280,980 the average discount on silver, or .26112 thereof, which is $73,369, and deducting this total discount for silver, $73,369, from $491,052 leaves a balance of $417,683, which is the net deficit and the amount in money which ought to have been returned over and above the $1,678,921 which was returned in bullion, and this is the amount, $417,683, which the court finds to be the amount of damages sustained by the Hale & Norcross Company. * * * John W. Mackay, D. B. Lyman and other witnesses testified that in the old days of the Comstock the mining companies required a return from the mills of 65 per cent of the wagon sample assays in bullion; sometimes they received a little more and sometimes a little less, but if less than 65 per cent was returned the mills were called upon to make and did make up the deficiency. In view of this evidence it may be interesting to know that the amount of bullion which ought to have been returned to the Hale & Norcross Company, as above found to be $2,169,973, is about 67 per cent of the ore, $3,224,286, as valued by the car sample assay, and it is more than $12.50 per ton less than the average car sample assay per ton of $38.35.

On Wednesday, after hearing argument on the point, the judge concluded that he had power to allow interest on the $412,683 at 7 per cent from June 7, '92, and made an order in accordance therewith.

The case will undoubtedly be appealed to the Supreme Court, where it is likely a rehearing will be ordered, virtually a retrial of the whole case.

J. B. FARISH, a mining engineer working for London and Boston capitalists, who recently returned from Mexico, says: "When in Mexico ten years ago I could not buy a single piece of mining machinery made in that country, nor could I find anything manufactured there except serapas and plain cotton cloth. But with the fall in silver bullion Mexico could not afford to pay $2 for $1 and import foreign manufactures, so home manufactories started up everywhere. Labor wages and local prices are unchanged in Mexico, but you can now buy for a silver dollar or less that which formerly cost a gold dollar and more when imported. You can now buy anything there in the way of mining machinery of local manufacture. Canning establishments have been erected, and where formerly you could not get anything in that line at less than $1 a can, all being imported, you can now buy all you want of local manufacture at 25 cents in silver per can. Ginghams can no longer be imported from the United States. The best are now made there in factories stimulated into existence by the high cost of gold. A young Mexican manufacturer told me that the development of Mexico in the manufacturing line was now going on at such a pace that in a few years it would be a considerable exporter of manufactured goods into the United States. When I first conducted mining operations in Mexico," continued Mr. Farish, "there were no candles to be had in that country except the Goodwin and Snyder candles, which were imported from the United States. The only candles of local manufacture were the ordinary tallow dips of revolutionary days. Now first class mining candles manufactured in Mexico can be obtained at a reasonable cost, and at such figures as prohibit the importation of the United States product. The same thing can be said of soap and many other articles of manufacture. Besides all this, Mexico has already begun a small export trade into the adjacent silver basis countries on the south, which will in time grow to such proportions as to practically exclude imports to those countries from manufacturers in gold basis countries." This makes a good argument for free silver and protection.

## South African Trade.

The trade of this coast and the country in general with South Africa is an increasing one. For the year ending June 30, '92, the United States sent to South Africa goods valued at $3,400,000; for the next year, $3,500,000; for the year ending June 30, '94, $4,122,912; June 30, '95, $5,000,000, and it is estimated that the aggregate for the twelve months ending the 30th prox. will be nearly $10,000,000. Mining machinery is a large item and should be larger. There is an immense trade there, and, under regular conditions, this coast and country should find one of its best customers in South Africa. In '93, while we sent $3,500,000 worth of goods, England's trade there aggregated $46,000,000. California helps feed the South Africans. Oregon and Washington send lumber; but in manufactures, more especially in improved mining machinery, quality and price should overcome the natural tendency of South Africa to trade with England. A New York paper publishes a manifest of a cargo clearing on an American vessel for Delagoa bay, the port of Johannesburg. Among the items are "lard oil, leather, hardware, lamps, codfish, corn, flour, canned meats, axle grease, turpentine, varnish, manufactured wood, barbed wire, doors, handles, plows, axes, cigarettes, canned fruit, baking powder, brooms, carriages, nails, apples, apricots, canned oysters, kerosene, wheat, clocks, medicines, evaporators, hams, stoves, wheelbarrows, dried fruit, sugar, cotton goods, spokes and hubs, oil, crucibles, ropes, seeds, iron pipes, steam pumps, starch, glassware, gloves, curtains, rubber goods, shovels, mining machinery, furniture, organs, whips, hay, clothing, soap, cartridges, wire mats, oats, lumber, nectarines, candy, can openers, tongues, hay cutters, iron bolts, petroleum, books, candles, paraffine wax, suspenders, playing cards, glucose, mail coaches, knives, electrical machinery and supplies, hammocks, paper bags, trunks, exterminators, tomatoes, syrup, white duck, perfumery, windmills, benzine, oil stoves, razor strops, coffee mills, essences, copy presses, iron sieves, picture frames, bird cages, plated ware, watches, dental chairs, dress goods, lawn mowers, scales, drugs, typewriters, paper, charts, rye, bicycles, lead pipe, roofing, carts, trucks, canned salmon, feed cutters, and electrotypes." How much of such a cargo San Francisco could send is easily determined. New York has the bulk of the trade. We are at the front door of the Continent, if we look at it that way.

Terms of sale are yet according to English custom and precedent. English houses give their Transvaal customers six months' credit. American dealers draw at sight for nearly all shipments.

A GOOD MANY THINGS are "going to be done after the election." One thing that should be done is to have a Secretary of Mines and Mining in the Cabinet. The mining industries of this country are of sufficient importance to justify such a department and the miners are numerous and influential enough to secure it. Concentration of effort and unity of purpose will bring it, and it is a good time to begin the agitation of the question.

THE mining industry of this State and the manufacturing and producing interests in direct connection with it are the only California industries that are not dependent upon the result of the fall election or waiting to see what will happen.

## Concentrates.

THE Yreka *Union*, a clean, consistent paper, has begun its 44th year.

THE Trail, B. C., Tramway Co., expect to have their track laid to Rossland, B. C., by June 1.

THE largest stamp mill now in operation in South Dakota is the 200 stamps of the Homestake mine at Lead.

A RECEIVER has been appointed for the New York Mining Exchange, which will probably wind up that concern.

MESSRS. MARSHALL, KNOWLES AND MITCHELL have organized the Pacific Northwest Bureau of Mines at Portland, Or.

H. A. COHEN, manager of the De Lamar, Nev., property, says the new mill is a success, handling daily 200 tons of ore.

THE Western Federation of Miners is in session at Denver, Colo. The first two days were devoted to committee reports.

IT is locally reported that the Pearce family have sold their mine at Pearce, Arizona, for $275,000, of which $30,000 was paid them in this city last week.

THE French company which recently bought the Crown Point mine, Nevada Co., made the final $45,000 payment to A. Gauthier in this city last Monday.

GIANTS used in hydraulic mining in this State are of varying dimensions at the nozzle, according to individual requirements, eleven inches being the limit.

THE Northern Pacific announces in Montana that it will sell any land for which it acquires title for $5 per acre, "whether it be mineral land or not."

THE Treadwell and Mexican mines on Douglas island, Alaska, are credited with intention to increase their milling capacity from 240 to 300 and 40 to 200 stamps respectively.

THE net proceeds of Utah mines will be taxed as other personal property. The assessors will list this year on the basis of the net proceeds of mines for the year ending June 1, 1896.

THE Shasta *Courier* says: Recent storms have added five feet of new snow on the mountains between Etna and Sawyers Bar. The snow is also deeper on Mt. Shasta than usual at this season.

ABOUT three miles from Bodie, Cal., the Standard Co. is building a second cyanide plant of 120 tons daily capacity, the same as the first one. It will be ready to start up about the 10th prox.

SENATOR STEWART of Nevada and some of the officials of the General Land office express their chagrin at the passage of the Mineral Land bill and hope to yet block it by inducing a presidential veto.

FOR April the Alaska Treadwell Gold Mining Company reports bullion shipment, $46,867; ore milled, 22,114 tons; sulphurets treated, 347 tons; of bullion there came from sulphurets $14,759; gross expenses, $27,469.

THE Trail Creek, B. C. *News* wishes the widest publicity given to the statement that there are over 1000 unemployed men in Rossland and Trail and that any one going there seeking work should invariably buy a return ticket.

SYLVANITE, of rare occurrence and scanty yield, is usually composed of tellurium, 55.8 per cent; gold, 28.5 per cent; silver, 15.7 per cent. Sometimes antimony practically replaces the tellurium and a varying percentage of lead occurs.

THE Mountain Mines Co. of Shasta, Cal., appear to have some delay in their workings. However, they are evidently sanguine of success, as they advertise for 10,000 pounds of fresh meat per month for six months beginning June 1st, '96.

THE Victor, Colorado, mine, which originally cost $15,000 is reported sold by D. H. Moffatt and Eben Smith, to a French company for $1,250,000. The company is composed of farmers, gardeners, etc., operating through a Paris representative.

COAL MINING is paying one party of miners in the Yukon better than gold mining paid them. A find of excellent coal was made recently in the Forty-mile Creek district, and with wood at $12 to $14 a cord, the coal vein is an excellent paystreak.

ASBESTOS has again been discovered in Arizona, "for the first time west of the Rocky mountains." There are several deposits in this State and Oregon and two or three asbestos manufacturing establishments in this city where it brings about $30 per ton.

THERE was an unsuccessful incendiary attempt to burn the Bunker Hill concentrator at Wardner junction, Idaho, last Monday. The time selected was when most of the mill hands were at supper. One remaining, saw the fire as soon as it started and promptly put it out.

THIS week the Federal Grand Jury returned indictments against seven Chinese miners, charging them with violating the Caminetti act by employing hydraulic power on the Green Valley mine, in Placer county, without first securing a permit from the Debris Commission.

IN the Superior Court of Riverside county the assignee of the Santa Rosa mine at Perris has been granted an order to sell the property for sufficient to pay all the debts—$10,000—to be paid in cash and the balance in six and fifteen months, secured by a mortgage on the property.

COLORADO'S gold output for 1895, as given out by the Director of the Mint, aggregates $15,013,434. The value of the silver produced is stated to be $31,075,296, calculated on a basis of $1.29 an ounce. The value of the lead produced is computed at $3,047,590, copper $1,065,900.

NO ONE connected with the California Miners' Association in any way has received directly or indirectly any compensation for his services, in some cases those serving even paying their own expenses. The association has secured specific service that, measured by the ordinary standards of value for such skill, would have cost many thousands of dollars.

AT Soulsbyville, Tuolumne Co., last Wednesday four men—J. Mitchell, J. D. Sullivan, A. Slutten and C. Fane—working in the 130-foot level of the Soulsby mine, going in after a heavy blast had been fired, were overcome by the fumes. They were got out alive, but Mitchell died that evening and Sullivan and Slutten were not out of danger at last accounts.

WHEN some Comstock stocks went soaring last week, three brokers had to close their doors. "Servant girls," etc., who had trusted their money were the chief losers. Ordinarily the "servant girl method" of investing in mining stocks, consists of going it blind with the brain empty of knowledge and the breast full of hope, but it is sometimes a matter of misplaced confidence—in the broker.

THE Alabama mine, about 1000 feet south of the Rawhide, Tuolumne Co., has been bonded and men put to work under the superintendency of W. E. Nevills. A 20-stamp mill to work it on the proposition that it was a silver producer was put up many years ago, but was a failure. It is now being developed on the assumption that it can be made a paying gold producer.

IN the Witwatersrand district, South Africa, Crown Reef, from 209,993 tons, gave 130,031 ounces, of the value of £430,364, and Robinson, from 140,655 tons, gave 157,208 ounces, of the value of £566,606. The yield of Crown Reef and Robinson, as given in the Crown Deep report, has been: Crown Reef, 778,952 tons, yielding 512,421 ounces, or 13 dwts. per ton; Robinson, 584,283 tons, yielding 848,454 ounces, or 29 dwts. per ton.

IN Australia, with its low-grade ore, capital and energy propose lifting water 2500 feet and carrying it 225 miles across a desert; in Johannesburg, amid all the natural and political discomforts, capital and energy overcome untoward conditions. In California, under the most favorable conditions, with an auriferous area unsurpassed anywhere in extent and richness, capital and energy occasionally hesitate in taking hold.

SUPT. KEATING of the Savage mine, Virginia, Nev., says on the 850-foot level they have stoped up to the third floor in the ore encountered in the east crosscut which is of good quality and is 9 feet wide. In east crosscut No. 4 they have stoped up to the third floor, and that the ore is increasing in width and is of good quality and states that sixty carloads of ore, assaying by car sample $66.37 per ton, were extracted during the past week.

AN unconfirmed cablegram from Pretoria, South Africa, states that the sentences of Francis Rhodes, John Hays Hammond, Lionel Phillips and George Farrar, who were condemned to death by the High Court at Pretoria upon charges of treason, in being active members of the Johannesburg Reform Committee, which was held to have instigated Dr. Jameson's raid into the Transvaal, has been commuted to imprisonment for a term of five years.

A BULLETIN of the Geological Survey, issued this week, shows complete returns from all smelters and refiners in the United States, giving lead contents of the ores smelted by them, distributed according to States and Territories. Colorado leads in 1895, with 46,984 tons in the former year, as compared with 50,013 in 1894. Idaho follows with 31,638 tons in 1895, as against 33,308 in 1894, and Utah comes next with 31,305 tons in 1895, as compared with 23,190 tons in 1894.

CONGRESSMAN JOHNSON has introduced a bill to amend section 2324 of the Revised Statutes of the United States so that where a person or company has sunk or may sink any shaft of any size by boring for the purpose of developing the depth of a channel in gravel mines or otherwise, the work so done and the money so expended in said sinking or boring shall be taken and considered as assessment work done and performed upon the claim to the amount of the work or money so expended.

KEYSTONE, SOUTH DAKOTA, is favored by the presence of A. W. S. Rothermel of Brooklyn, N. Y., who, it is stated, is able to draw an accurate map of the underground workings of a mine he never saw. Further information is vouchsafed to the effect that he can locate ore bodies and if given a piece of ore can tell what part of the mine it came from. "He always goes alone," which melancholy statement precludes possibility of partnership with Prof. Kimball, who is said to be equally gifted.

LEMUEL EASTMAN of Chicago is the latest man who proposes to "revolutionize the mining industry of the world." He is the inventor of a machine for reducing ores by electricity which, he says, has solved the problem that has so long puzzled Edison and other eminent electricians of the country. The machine, it is claimed, will enable mine operators to secure 98 per cent of the metal in the refuse dumps. It is designed "to work over the dumps and separate the metals from the most rebellious ore at a cost of not more than 1 per cent of the values recovered." Mr. Eastman is so fearful of the possibility of the discovery of his secret that he has hidden the several parts, though an application for a patent has been filed.

SEVENTY-THREE firms are now engaged or ready to engage in the manufacture of tinplates in this country. Thirty-four of these concerns are dipping plants, which merely coat black steel sheets bought in the market and finish them into tinplates. The remaining thirty-nine are tinplate works proper; plants which roll and coat their own steel sheets. These thirty-nine works possess an aggregate of 172 hot mills, used for manufacturing the black steel plates, which when coated constitute tinplates. In the first three months of '96 seventeen such mills were added to the works, increasing their annual capacity by over 500,000 boxes, and bringing the present capacity of the American tinplate mills up to over 5,000,000 boxes a year.

UNDER date of April 25th a prominent mining man of this city is in receipt of a letter from London, England, which says: "The dense ignorance that prevails in London regarding the merits of California gold quartz mines is astonishing. I have been hunting all over London for a copy of the San Francisco MINING AND SCIENTIFIC PRESS, containing information about the mining interests; there is none to be found. To purchase fifty copies of the MINING AND SCIENTIFIC PRESS, each edition distributed in London, Manchester and Liverpool, would be an eye-opener to investors." London is a large place; nearly one hundred copies of this paper go there every week, but one might look unsuccessfully for a copy unless he knew just where to go.

ANOTHER attempt is to be made to raise the copper-laden steamer Pewabic, which sunk in Thunder bay, Lake Huron, thirty years ago, in 180 feet of water, by the American Salvage and Wrecking Company. The company reports a successful test in 220 feet of water in Milwaukee bay. It is said that there will be no trouble in working in water at a depth of from 200 to 300 feet. The Pewabic was sunk in a collision with the Meteor. The copper cargo is valued at about $60,000. It has been found impossible for divers to work at so great a depth of water as the Pewabic is in, and some years ago a diver named Pelig was killed in an attempt to raise the steamer. The bell to be used is built of steel, 1 inch in thickness, and is 6 feet in diameter and 8 feet in height. It weighs 13,000 pounds.

THE old Montana mining law allowed no period after discovery for tracing the course of the vein before marking the boundaries, and while the courts generally have held that the discoverer might have a reasonable time for such development work, yet locators were usually in haste to mark the boundaries, with the result that claims were often not located properly along the course of the lode. It is the policy of the new State law there to give a period of ninety days for exploration in order that the exact course of the lode may be ascertained, and the corner monuments established where they should be. A similar law has been in force in Colorado for several years, and the allowance of such a period for exploration has been approved by the U. S. Supreme Court. Since the law does not require the locator to define his boundaries by monuments at the time of posting his notice, and since nothing is to be gained by establishing the corners at such a time and much may be lost, it is deemed better for the locator to take as much of the ninety days as he needs, to trace with accuracy the course of the lode before marking his boundaries.

IT is one of the laws of the Butte Miner's union that no member shall enter into any contract to do underground work unless he receives a guarantee that his wages will be not less than $3.50 per day while engaged in such work. The union is opposed to the contract system except in certain cases, believing that the miner who toils underground is entitled to the standard wages of the camp and that the mine manager can dispense with the miner's services when he finds that the miner is not competent to do his work. Recently, says the *Miner*, the union has been called upon to adjudicate certain matters of this nature in some of the Butte properties where contracts have been let. It was claimed that in one case the men were not averaging more than $1.50 per day.

IN the case of Trevaskis vs. Peard (Supreme Court, California), 44 Pacific Reporter, 246, it is held that the owner of a placer mineral claim does not forfeit his right to same, so as to render it subject to relocation, by a failure to perform the required annual assessment work during a time when adverse possession is held by another, when he commences an action for its recovery within the statutory time. Where the owner of such a claim, which was erroneously included in a sale under a decree of court, moved his effects from the claim, and absented himself for two years, allowing the purchasers to work it without objection, while he knew that their title was invalid, and intending to claim it only in case their development rendered it profitable to do so, his acts will constitute an abandonment.

OLM & LOFSTRAND have patented in Sweden a process for extracting gold or bismuth from ores by means of melted lead. The process can be applied to mineral mixtures containing, for instance, iron ores, limestone, bismuth, native gold, quartz, or silicates, and even when the mixtures are so poor in gold and bismuth that it would otherwise not pay to work them. The process consists in placing the ores in a bath of melted lead, keeping it as free as possible from contact with the air. To gold ores which contain little or no bismuth, enough bismuth is added to reduce the melting point of the alloy as far as possible, and thus prevent oxidation of the alloy and loss of metal. The bath is filtered through a cylinder, the bottom of which consists of a perforated sheet of metal covered with a layer of asbestos, pieces of iron wire and coal dust.

THE battleship Oregon made a successful official trip in the Santa Barbara channel last Thursday morning. She made an average of 16.79, the world's record, going as high as 17.08. This is a big plume in the cap of the coast builders. Up to the present time the Indiana and Massachusetts held the record for battleships of their class. Now the Oregon, built in San Francisco, shows superior speed. The Union Iron Works will get a premium of about $175,000 over the price of the vessel and a world-wide advertisement. The required speed was fifteen knots. The Indiana had her official trip October 18th, 1895, averaging 15.61; the Massachusetts, April 25th, 1896, average 16.15. The Oregon, last Thursday, with her average of 16.79, and stands at the head of 11,000-ton battleships. The Pacific coast has shown what can be done in shipbuilding; the Union Iron Works have beaten the Cramps, their Atlantic rivals.

APPROPRIATIONS for California are contained in the River and Harbor bill as follows: For improving San Pedro, $50,000; continuing the improvement of Oakland harbor, $75,000; San Diego harbor, $50,000; San Luis Obispo harbor, $40,000; for improving the Sacramento and Feather rivers and tributaries, the Secretary of War is authorized to appoint a board of three army engineers for the purpose of making surveys and examinations of the rivers and submit the most feasible plan for the improvement of the rivers and maintenance of navigation thereon, and to have charge of the work by them recommended as appropriations are made therefor. The board may, under direction of the Secretary of War, expend any balance now remaining to the credit of the rivers in the improvement of the same, after deducting the expense of the surveys and examinations. For the construction of restraining barriers for the protection of the Sacramento and Feather rivers $250,000. For improving the San Joaquin river and completing cuts at Twenty-one mile Slough $20,000. For improving Napa river $4000.

ONE of the great mining communities in France is that at Anzin, where over 11,000 persons are employed. The management at this place has attracted much attention in various places. The pension fund system there, for instance, affords an example which other mining companies are now compelled by law to follow. After an employee has been connected with the Anzin mines for three years and is 18 years of age, he begins depositing at the rate of 3 cents in every two dollars of all his earnings, and the company deposits a like amount until he reaches the age of 50. He can then retire on a pension of about $40 a year, if he likes. The company ceases to make any deposit after that time, but the man may continue to add to his pension account if he likes, and if he keeps on working, as a few miners do. Of the 11,000 employees at Anzin 547 are over 50 years of age. At least half of the whole number are between the ages of 13 and 27; the others vary from 27 to 62. The company provides three ways of housing its miners. A man can rent one of the company's houses, or can buy one, or can get an advance of money to help him build for himself. Medical attendance is provided by the employer without charge. There are some mutual aid organizations among the Anzin miners themselves, but of course the company deserves no special credit for the good done thereby. The average yearly pay is about $290; but this average represents not only adult miners, but a lot of boys between 13 and 16 years of age. The youth of many of the French miners is a painful thing to consider.

## Waste Products of Placer Mining in California.

The loss occurring in gold placer mining has been noted for years; but so far no special effort has been made to ascertain its extent or to remove the causes that occasion it. As yet, in placer mining, all efforts appear to have centered upon perfecting mechanical appliances and using natural forces in the rapid handling of large quantities of material, without special inquiry into the percentage of loss, even in the most gigantic operations and without any scientific study of the composition of the material treated. Pursuing a different course, and investigating the physical properties of the gold and enclosing mineral matter, both in original gravel beds and in the accumulated deposits of waste products so frequent in California, the writer has discovered many of the causes of loss in mining operations, and, based on this experience, has devised methods for its prevention, which are here briefly presented in their most salient features.

A loss of gold occurs in all placer mining operations, chiefly in microscopic gold and through gold encrusted by foreign matter. This loss is variable, and is the greatest, relatively, in hydraulic mining, which, although economic in many respects, yet is the most wasteful of all known methods of gold mining. The average loss of gold in hydraulic mining, when much of the gold is fine, is fully 40 per cent, and may be as high as 60 per cent. This loss is now locked up in the tailings found all through the gravel mines of central and northern California. Much of these tailings have during late years been reduced in volume and concentrated by the action of running water, and in all such instances their gold contents are high enough to be valuable and often far exceed the gold value saved in the original hydraulic operations as quoted in the yield of gold per cubic yard. This gold can be practically recovered from the tailings chiefly in connection with the black sands.

The gold contents of such naturally concentrated tailings vary from 10 cents per cubic yard up to and above $1 to the cubic yard, averaging over 50 cents. The cost of working by my system, including concentration of tailings and extraction of gold from black sand, will, under ordinary conditions, not exceed $15 per ton of black sand, equivalent to 15 cents per cubic yard of moderately concentrated tailings. Tailings in quantity have been found by me going as high as $3 per cubic yard. In many gravels and tailings platinum exists in paying quantities and can be collected. Tin ore (cassiterite) is occasionally found of value enough to pay expenses of extraction. Iron ores present with the black sand can in some instances yield a useful by-product.

By a modification of the present system of hydraulic mining, particularly adapted to the conditions now existing in California, all the valuable portions of the gravels, not saved by present methods, can be separated, concentrated and worked economically by the new system, so that 90 per cent of the gold can be recovered, and the final yield from a given bulk of gravel be double that at present obtained under average conditions. The final waste products can also be stored in dams more safely than at present. The methods proposed can also be applied to beach mining, and generally, from the nature of the material, at less expense than in the treatment of tailings. Under such system the beaches at Gold Bluff and as far south as Humboldt bay would give good returns on the investment. The Oregon beaches about Rogue river also afford a good field.*

*Working Methods for Tailing (Outline).*—When practicable, the material to be handled by steam shovel, and nearly all mechanical treatment to be automatic. (*a*) Separation of coarse material, by riddles and screens, down to a certain size of sand. (*b*) Concentration of sands to a certain specific gravity, and extraction of the coarser gold particles. (*c*) Extraction of gold by mechanical means. (*d*) Final extraction of gold by chemical process.

*Method Applied to Hydraulic Mining.*—(*a*) Gravel to be run out in a flume as usual, but without use of quicksilver. Only one undercurrent to be used. (*b*) Separation of large rock, by grizzlies, down to one inch diameter; grizzlies to be of novel construction. (*c*) Separation of fine material, by screens, to a certain size. (*d*) Subsequent treatment as for tailings.

*Method for Beach Sand.*—(*a*) Screening to remove rocks and impurities. (*b*) Separation of coarse from fine sands, by screens. (*c*) Concentration to a determined specific gravity. (*d*) Mechanical extraction of heaviest gold particles. (*e*) Chemical extraction of finest gold. The final treatment of beach sands will differ somewhat from tailings, the gold-bearing material in each being widely different. Difference in location, climate, grade and water supply, as well as quantity, size and character of gravel and tailings, will demand modifications in the above schemes.

*Treatment of Black Sand.*—This is always based upon the physical character of the gold and gold-bearing minerals, as ascertained for each separate deposit by mechanical and fire assays, analysis and microscopic inspection. No occult or improbable methods are proposed, and the system is based upon a judicious combination of already well-known metallurgical and mechanical processes, applied to the hitherto almost unknown condition of the gold and gold minerals. These have all been tested experimentally, but not always on a large scale. Various mechanical devices used are novel and will be patented, and some already patented machinery can, with advantage, be used in the system.

A fair estimate of the gold buried in tailings of California may be fixed at 70 per cent of the total gold product of the hydraulic mines, and of this 75 per cent may be set down as recoverable, equal to 52 per cent of the original gold contents.

*Illustration of a Tailing Deposit.*—An instance of the condition of a tailing deposit, with which the writer is thoroughly familiar, and which strikingly illustrates their origin, and furnishes a clue to the mineralogical character of such deposits, occurs at Edmanton, in Plumas county, California. On the Mumford's Hill placer mine is found an old channel of limited extent, covering about ten acres and averaging 50 feet in depth. Six hundred feet of this channel rested upon and had been eroded in the Diadem lode, a large body of decomposed quartz, first noted as such in 1865. Previous to this the deposit was worked as a drift mine, and later by the writer as a hydraulic mine. The pay was chiefly in very coarse gold, and generally on or near bedrock; the fine gold obtained formed but a small portion of the total value, and less than 10 per cent. The upper strata consisted of small gravel and pipe clay in nearly equal proportions, and were generally considered barren. The material removed from this deposit by mining operations amounted to 500,000 cubic yards, of which the heaviest matter lodged in a steep ravine below the dump, for a space of 600 feet, and the lighter passed into Big creek, forming there a great deposit of tailings for nearly a mile, varying in depth from 2 to 15 feet. Below that point the light material was generally carried onward through a canyon. Hydraulic mining ceased here in 1876, and during the period following, and up to the present day, the waters of Big creek have removed much of the tailings mentioned, and in most places have cleared the creek almost down to its old bed. The bed of the creek had to a great extent been worked before these tailings flowed into it.

It was found that the debris and loose gravel now remaining in the creek carried much heavy black sand, although giving but small prospects in free gold. The heavy sand concentrated in the creek bed was found comparatively rich in microscopic gold and in gold combined with and enclosed in the grains of sand, the average gold contents per ton being $90. A careful estimate of the black sands remaining in the creek bed and originating from the tailing deposit gives 1800 tons as available, and the average gold contents from sampling the black sand through the whole deposit was computed at $76 per ton. As the sampling shows that the debris now remaining in the creek carries on an average three-fourths of one per cent of black sand, it follows that its gold contents would be one dollar and twelve cents per cubic yard, estimating the cubic yard, equals to two tons. A sampling of the remnants of the original gravel deposit, all situated on high bed rock and on the rims of the channel and taken from the upper and lower strata as well as from the pipe clay, gave one-fourth of one per cent as the average of heavy sands, which applied to the mass of gravel removed would give 2500 tons as the total of the black sands originally contained therein. Estimating the gold contents per ton of this black sand as equal to that found in the tailings would place the total value in the waste matter at $187,500. As all available information places the gold product derived from the original gravel at $200,000, or an average of 40 cents per cubic yard, it follows that the waste carried a value of 37½ cents a cubic yard.

Assuming as correct the estimate of 1800 tons of black sands, as recoverable from the creek bed, and of an average value of $75 per ton, they would contain $135,000. Estimating the cost of collection, concentration and reduction at $15 per ton, a net profit would be probable of $108,000. The heaviest tailings at the dump and in the ravine could not be thoroughly sampled, as they are largely mixed with waste rock from recent quartz mining operations, but are estimated to contain at least 260 tons of black sand with gold contents of $19,500. Samples of the black sands above mentioned have gone as high as $162 per ton, with scarcely any gold visible to the naked eye, which is explained by the fact that this sand contains gold enclosed in the grains of titaniferous iron, an occurrence so far seldom noted and not definitely proven except at this locality.

From the above instance, fully confirmed by the conditions of all tailing deposits examined by the writer, an inference may be drawn of the loss occurring in deep gravel beds, carrying fine and scaly gold and especially when the gravel is cemented, and this belief is supported by the high gold contents of the black sands, from such gravels, which frequently reach $400 per ton. Applying the above cited facts and deductions to the enormous tailing deposits in the Yuba, Bear and American rivers, and the vast amounts of "deep gravels" yet remaining unworked in California, and recognizing also their applicability in all countries where beach or placer mines of gold exist, it will readily be perceived what an immense field is opened by this new branch of mining enterprise and the enormous profits awaiting those who first enter the field with experience, skill, energy and capital.

JOHN A. EDMAN, M. E.

Meadow Valley, Cal., March 30, 1896.

*For detailed information on the black sands of California, the writer refers to his "Notes on the Gold-bearing Black Sands of California," published in the MINING AND SCIENTIFIC PRESS, Volume 69, Nos. 19, 23 and 24.

## The Effect of Washing with Water Upon the Silver Chloride in Roasted Ore.

Continued Discussion of the Paper of MR. MORSE at the Atlanta Meeting of the American Institute of Mining Engineers, October, 1895.

Prof. H. O. Hofman, Boston, Mass. (communication to the Secretary): Mr. Morse's paper and Mr. Godshall's discussion of it recall to my mind three articles by Mr. Dubois, Mr. Gmehling and the late Mr. Aaron on the effect of sulphides on silver held in solution by sodium hyposulphite. Mr. A. H. Dubois,* in making a solubility test with sodium hyposulphite on raw ore, assaying 320 ounces of silver per ton, found that if he filtered fifteen minutes after starting he extracted from 65 to 70 per cent of the silver, while if he left ore and solvent in contact for sixteen hours before filtering he obtained only 12 per cent. Working synthetically, he dissolved 800 milligrammes of silver in the form of silver chloride in 250 c.c. of sodium hyposulphite, added four grammes of sulphurets (galena, blende and pyrites), containing three milligrammes of silver, and left them in contact for sixteen hours, shaking repeatedly. The sulphurets, after filtering and washing with sodium hyposulphite and water, were assayed, and gave 282 milligrammes of silver.

Mr. C. H. Aaron† found that the solubility assay of a roasted silver ore gave much lower results if solvent and ore had remained in contact over night than if only a short time. He found by experiment that copper and silver are quickly precipitated by zinc sulphide from hyposulphite solutions; also that from a dilute solution of potassium of cyanide silver was precipitated by zinc sulphide, and that in a concentrated solution the silver sulphide soon redissolved.

In experimenting at Huanchaca, Bolivia, with a siliceous silver ore, which contained much blende in addition to other metallic sulphides, Mr. Gmehling‡ found that if he leached the chloridized ore as it came from the furnace, i. e., as coarse 10-mesh stuff, he obtained a higher extraction than if he first passed it through a 40-mesh sieve. The explanation for this is that in quick filtering undecomposed metallic sulphide (probably blende), or sulphate (probably lead sulphate), in the ore remains a shorter time in contact with the silver solution, and has, therefore, a less harmful effect.

## Correction of a Statement in an Advertisement.

TO THE EDITOR:—You will oblige me by correcting a misstatement occurring in your issue of April 18, 1896, in an article on the "Brown System of Mechanical Roasting Furnaces," in which the following sentence appears: "Several furnaces have been devised, embodying the principle of the Brown slotted-wall construction, among the latest of which is the 'Ropp' furnace, now in use at the Selby smelters."

This is a mistake, as there is no "slotted wall" to be found in the "Ropp" furnace, but the hearth or floor of the "Ropp" furnace is cut in two, parallel to the long axis of the furnace. Through this aperture the rabble arm, holding the rabbles, is allowed to enter the roasting hearth proper. If I should be called upon to describe a reverberatory roasting furnace, I would have to say that the furnace proper consists of the following parts, that enclose the room in which the roasting takes place: (1) The roof or arch; (2) The sides or walls; (3) The hearth or floor.

In no language are the roof and hearth called walls, hence I have not made use of "the Brown slotted-wall construction," nor did I intend to do so, as I consider my way of entering the furnace far superior to Brown's method, and have obtained letters of patent on my device without any trouble whatever. Yours truly,

ALFRED ROPP,
Superintendent Selby Smelting and Lead Co.

Selby, Cal., April 27, 1896.

[In justice to Mr. Ropp the above communication is given place. It is in reference to an advertisement which was so marked.—ED.]

THE amount of gold coin in use in the countries of the world is said to amount to $3,600,000,000. About one-third of the gold mined is used for coinage purposes. The value of gold coin in the United States is $600,000,000, against $800,000,000 in France, $600,000,000 in Germany and $550,000,000 in England.

# Electrical Progress.

## Roentgen Rays.

Written for the MINING AND SCIENTIFIC PRESS by PHILIP MILLS JONES, M. D.

In considering the Roentgen rays two questions are of paramount interest: (1) the source and nature of this newly observed radiation, and (2) its possible usefulness.

*The Source of the X Rays.*—Since January 4th, when Roentgen made his first announcement, a vast amount of material has piled up into a heterogeneous mass of observed or supposed phenomena, that may well be termed chaotic. The results of each particular form of apparatus have been treated as though they necessarily held good for every other variety, and, consequently, much error and contradiction has gone on record.

I have carefully followed the work being done, as reported in the technical journals, and have made quite a large number of experiments myself. Thus far I have tested and experimented with something over sixty different tubes, most of them made by Mr. G. E. Lamont, Thurlow Block, San Francisco. Other tubes have come into my hands, for observation, from the East and from abroad, but none have been so satisfactory as a tube made for me by Mr. Lamont, and of a design of which I shall speak later.

It is obvious that the rays designated "X" rays by Roentgen must emanate (*a*) from the anode, or (*b*) from the cathode, or (*c*) some solid upon which either anode or cathode streams, or both, impinge, or (*d*) from the gaseous contents of the tube, in a highly agitated condition. (*a*) The anode. Several observers have found that in the particular tubes with which they were experimenting the source of the X rays was the anode; but in all these experiments reported, so far as I am aware, the cathode stream impinged upon the anode. In a previous paper ("Journal of Electricity," March, 1896,) I gave the results of experiments, which seem to clearly show that *some* rays emanate from the anode when a platinum plate 1 mm. thick intervenes, cutting off the cathode rays from the anode, and that, consequently, some X rays emanate from the anode, *per se*. (*b*) The cathode. The only point upon which all observers seem to agree is that the X rays do not emanate from the cathode. In the article referred to I mentioned three cases in which the rays either emanated from the cathode, or were reflected therefrom. (*c*) Some solid upon which either anode or cathode streams, or both, impinge. In his original paper Roentgen assigned the glass, at the point where the cathode rays strike, as the source of the X rays. Several others have since found in certain tubes X rays emanating from the glass where it receives the cathode stream. Prof. Macfarlane, C. E. Scribner, F. R. McBerty, Prof. Corey and others have noted this. At first I was unable to obtain this phenomenon. I have found subsequently that in this case the X rays do not always proceed from the entire patch excited to flourescence by the cathode rays, but only from a part of the light area. That X rays emanate from a solid within the tube, insulated or uninsulated, upon which the cathode rays impinge, I found to be the case. Subsequently Dr. Morton and Elihu Thomson made the same observation. No one has, so far as I am aware, reported any X rays proceeding from the glass, or other solid, upon which the anode rays alone impinge. (*d*) I have noted a newspaper statement to the effect that Dr. Morton of New York had obtained X rays from a vacuum tube, which was merely encircled by a coiled wire, carrying a high-tension current. This fact I have not seen verified in any technical journal, and is the only experiment (if true) which would seem to point toward the agitation of gaseous molecules being a source of X rays.

From all the data noted, it seems evident that we have rays emanating from (1) the anode, *per se*, (2) the glass upon which the cathode rays impinge, (3) a solid, metal or non-metal, insulated or uninsulated, upon which the cathode rays impinge, and that the greatest X ray intensity is obtained when the cathode stream is focused, by means of a cup-shaped disc, upon the anode. The last conclusion I deduced from my previous work, and have since noticed that one of the professors at King's College, London, had previously reached the same conclusion. Mr. Lamont succeeded in making for me a tube of a design I suggested to him—that is, one having the cathode terminal of cup-shaped aluminum, with its focus at the anode, a platimum disc, set at an angle of about 45°. This I have found to be the most satisfactory of all the tubes I have used. With it the X rays are very intense, and as they emanate from a point, the shadows produced are clear and sharp, which is not generally the case when the rays are produced at and emanate from a larger area. In testing this tube, after sealing off from the pump, Mr. Lamont noticed and called to my attention a fact of great interest. He found that if he put his hand upon the tube, the X ray effect (as observed with a flourescent screen) was materially increased. I went over the entire surface of the tube and found two spots which, if connected to earth, made the X ray emanations many times more intense than when not so connected. These spots I covered with tin-foil and, by fine wires, grounded. One patch is just below the cathode and at the back of the tube; the other is just below the lower edge of the anode and in front. With this tube so arranged it is quite possible to clearly see the bones of the hand at a distance of five feet from the tube, and at fifteen feet the screen is still faintly luminous. The tube is excited by the secondary of an induction coil, capable of giving a four-inch spark in air. In an article in the "Electrical Engineer" of April 15th, Edw. P. Thompson says: "I receded from the Crooke's tube while looking into the skiascope, until the luminosity disappeared, and then measured the distance between the screen and the Crooke's tube. It was about six feet. This represents about the usual power of X rays, except in Tesla's experiments." This is about my experience with all tubes, except the last one noted above made by Mr. Lamont, and with this tube, I may add, I have been able to obtain an excellent negative of the bones of the hand in ten minutes and of the metal embedded in the handle of a screwdriver in five seconds, and at fifteen feet from the tube the screen is quite luminous.

*The Nature of the Rays.*—While theories are increasing in number almost daily, only a few demand serious consideration. They are, mainly, (1) that the rays are longitudinal ether waves; (2) that they are projected particles of matter; (3) that they are ultra-violet light; (4) that they are longitudinal waves in air or matter—in other words, sound waves—of mixed wave length.

And here, as in the case of the source, any of these theories may be substantiated by selected data, though all the facts observed can hardly be explained by any one. Roentgen and numerous subsequent observers are favorably inclined toward the theory of longitudinal ether waves; Tesla, Salvioni, and some others think they have to deal with projected material particles. Only a few remain of the opinion that the X rays may be ultra-violet light rays. Edison has recently voiced the theory that the X rays may be of the nature of sound waves, which theory seems very much like a rehabilitated Teslaen theory. Lord Kelvin has advanced the suggestion that they may be condensational ether waves.

If the effects observed by Roentgen are produced by projected particles, why is it that these particles emanate from the point of impact of the cathode stream (in most cases) rather than from the cathode itself? No effects have yet been observed directly from the cathode terminal, except in the instances noted by myself and above referred to. It would seem most probable for a projected particle to proceed from the point where the projecting force was greatest, rather than from the point where the original stream of projected particles is apparently stopped. If, however, the X rays are ether waves, we would expect to find them emanating from the place where the electrical oscillations are greatest. Now, consider the facts—X rays emanate, weakly, from the glass upon which impinges the cathode stream, which is negatively charged and would induce a positive charge on the other side of the glass and produce electrical oscillation. X rays emanate more strongly from a solid, when both cathode and anode streams are beating upon it—in other words, when the cathode-anode strain is greater than in the previous case, and the number and rapidity of the oscillations is increased. When the cathode rays impinge upon the anode terminal the greatest cathode-anode strain will occur, and in that case we find the maximum X rays emanate from the anode and radiate principally toward the cathode, or at least from that surface which is nearest to the cathode—where is the greatest strain.

Now if, on the surface of a tube constructed like the one referred to, made for me by Mr. Lamont, we place a bit of tin foil, the condenser effect of the tube is increased and an increase in the intensity of the X rays is noted. If the tin foil be grounded the discharge is facilitated, the oscillations are still further increased, and a corresponding increase of X rays is observed. A less amount of energy would be required to charge the tin foil than to induce a charge on the outer surface of the glass, consequently the strain is not distributed over the entire surface of the tube, but is confined almost entirely to the terminals and the tin foil patches. The waves in a condenser field are believed to be longitudinal vibrations. An excited vacuum tube is to a certain extent a condenser. This may be the reason why Edison found that covering the outer surface of his tubes, in the neighborhood of the terminals, with tin foil increased the X ray efficiency—they became better condensers, the electrical oscillations were largely increased.

Prof. Sanford has already called attention to the similarity of the conditions in a condenser field and an excited Crooke's tube, and between the results obtained by the Roentgen rays and those obtained by him in a condenser field.

If, however, the Roentgen rays are merely streams of projected particles, why should grounding one or more spots on the surface of the tube increase their intensity? It certainly does not add to the E. M. F., which, presumably, is to be regarded as the projecting force. Nor does it deflect the cathode stream, perceptibly. It merely increases the condenser capacity of the tube, and hence increases the electrical oscillations. Another fact noted in my work with the tube just mentioned is that after considerable use, when the vacuum had materially increased, the grounded tin foil became unnecessary—the oscillations on the terminals being presumably sufficiently rapid to produce the maximum X rays. One would expect, if the foregoing hypothesis were true, that the X rays would be found to emanate from the glass of the tube, or from the patches of tin foil, which are parts of the condenser. The oscillations on the terminals in the tube would be at all times more rapid and intense than elsewhere, if the cathode stream beat upon the anode. Tin foil on the outer surface of the tube would tend to increase the rapidity of the oscillations at the terminals, if the vacuum of the tube were low enough to offer comparatively slight resistance to the current, but when the relations between E. M. F. and R. became so balanced that the oscillations at the terminals reached their maximum intensity and rapidity, the condenser effect of the tube would have its minimum influence on the electrical condition of the terminals. In tubes so constructed that the cathode rays can not, to any extent, impinge upon the anode, the X rays *are* found to emanate from the glass where the cathode stream impinges. The glass at this point would certainly be in a condition of oscillatory electrification, and hence would be of the nature of a condenser and produce longitudinal ether waves. The strain at this point could never be so great as the strain at the anode, with the cathode strain beating upon it, and hence the X rays would be less intense in the former than in the latter style of tube. This, I think, is the general experience. It certainly has been mine, and has been that of all observers whose reports have come within my notice. In the one-terminal tubes, used by Tesla, the single terminal would be in a state of oscillatory electrification, in its maximum, and hence we would expect the terminal to be the source of X rays, rather than the glass opposite to it. This, I believe, Tesla has found to be the case.

There seems also to be some direct relation between vacuum, E. M. F. and X ray output. An increase in degree of vacuum requires an added difference of potential to balance it and produce X rays. To my mind, this seems to point to a wave of more or less definite length, as the X ray.

*The uses of the X ray* have probably been not more than barely guessed at thus far. Some of them I have demonstrated. In surgery it serves to show the position and condition of the bones of the extremities, and to locate any contained foreign body. I have obtained negatives of all parts of the limbs, as far as the junction with the trunk, and have demonstrated fractures, dislocations and necrosis of the bones, and have located bullets and needles. Thus far I have obtained only negative results in experiments to determine the relative density of the organs in man, but from similar work on small animals I am led to hope that this end may be achieved in the not distant future. It is a prompt and absolutely reliable test of precious and semi-precious stones, and also shows at once whether a given specimen of rock does or does not contain metal (See Journal of Electricity, March, 1896).

From some work I was doing about two months ago, I concluded that the density of substances did not determine their absorption of X rays, and I then made some rough experiments with liquids of the same and different specific gravities. I spoke to Prof. Sanford of my results, and we determined to make further researches on the same line. He kindly furnished me with a number of chemical solutions made up of known densities, and I made negatives of them with the Roentgen ray. We were about to continue this line of work, when an article appeared in the *Zeitschrift fur Physikalische Chemie*, by Novak and Sulc. They found an increase of absorbtive power, with the metals, with increasing atomic weight. "For the salts of the same metals, they are arranged with reference to their absorbtive power in an increasing series, as follows: Carbonate, nitrate, sulphate, chloride, bromide, iodide, etc. Our results seem to agree with theirs, so far as we have gone." The quotation is from Prof. Sanford's letter to me on the subject.

PHILIP MILLS JONES, M. D.
Crocker Building, San Francisco.

---

IT has been noticed that lightning often passes harmlessly through the ore and molten iron of blast furnaces to the earth, instead of being attracted to the lightning conductors. The suggested explanation is that the aqueous vapor and carbon in the smoke column offer a better conductor to and through the furnace charge than is offered by the rod outside.

THE Canyon Creek Electric Light and Power Company is putting lights into Gem, Idaho. Burke is already lighted by the same company.

# Mechanical Progress.

### Matte Smelting.

[The following remarks relative to one of the Orford furnaces referred to by Dr. Austin in our issue of May 2nd have been kindly communicated by Mr. A. H. Wethey, who is in charge of Mr. W. A. Clark's extensive smelting interests at Butte, Montana. Mr. Wethey is the inventor of the Wethey automatic roasting furnace, one of which is in operation at Mr. Clark's smelter in Butte, and about which we may have more to say upon another occasion. Mr. Wethey's statement regarding brick blast furnaces is in line with Dr. Austin's adverse criticism upon that type of smelting furnace. It is interesting to note that at Butte there were two changes made in the style of blowers used with this furnace, in each case tending towards an increase of the pressure of the blast.]

A Raschette blast furnace of the Orford type was erected at the Butte Reduction Works, Butte, Montana, in the spring of 1886, and was operated with more or less regularity for several years. The inside measurements of this furnace were as follows:

| | |
|---|---|
| Width at bottom | 40 inches |
| Width at tuyeres | 42 inches |
| Width at charging floor level | 54 inches |
| Length at bottom | 84 inches |
| Length at tuyeres | 87 inches |
| Length at charging floor level | 120 inches |
| Height from bottom to charging floor level | 78 inches |
| Height from tuyeres to charging floor level | 66 inches |
| Size of tuyeres | 6 inches in diameter |
| Number of tuyeres | 8 |

There was a wind-box under the floor of the furnace, with which the tuyeres were connected. The floor of the furnace was made of thick plates of iron, on which fire brick was laid to a depth of six inches. No trouble ever occurred by the cutting through of the metal into the wind-box or open space below the floor.

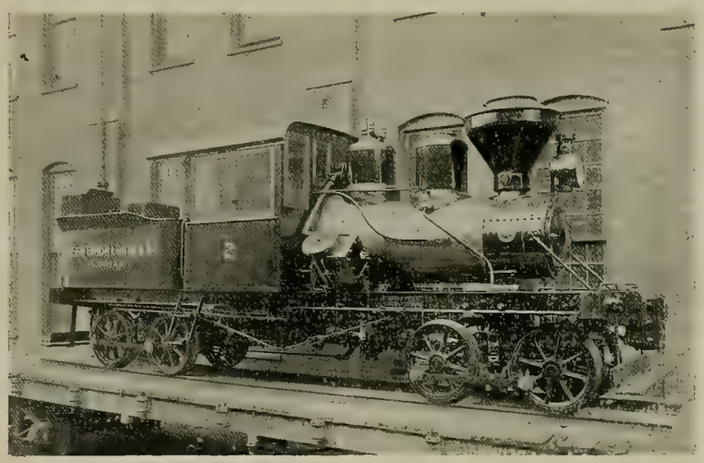
The interior side walls of the furnace were protected to some extent by having four-inch pipes placed in them a little above the tuyeres, through which water constantly flowed.

In actual practice it was found that the brick were frequently attacked, and care had to be exercised in feeding the charge so as to preserve the life of the furnace, otherwise the slag would eat its way through the brick work within a short time of the starting of the furnace.

If the furnace were run for many weeks consecutively the brick work would be eaten away, first in one direction and then in another, until the width of the furnace became much greater than it was originally. The pipes from the tuyeres, leading through the brick work, were also cut away, and the shorter these pipes became the wider the furnace grew, and a more powerful blast of air was required to enable the wind to reach to the center of the furnace, and to enable it to smelt the amount of material it was expected to handle.

When the furnace was first erected it was operated with a large Sturtevant fan; this soon proved too small and gave place to a large Baker blower; this in turn gave place to a Root blower of still greater capacity. It was found that the greater the blast the greater the capacity of the furnace.

It was not an altogether unusual thing for the furnace man, in barring out the slag that sometimes ran into the tuyeres, to strike one of the water pipes, or perhaps the water pipes would burn through; in either case the water had to be shut off from the pipe which leaked, and the furnace would be run without the advantage of using that pipe, or else the furnace would have to be shut down and cleaned out in order to replace it.



To get the best work out of brick furnaces there should always be one in good repair, so that as soon as the one in operation becomes cut out to any appreciable extent it can be shut down and the idle furnace started, while the other is being repaired.

One great advantage in water-jacket furnaces is that the distance from the inside of the tuyere to the center of the furnace is always the same, and is not liable to the sudden changes occurring in a brick furnace where the center of the furnace may vary several inches in either direction.

The pressure of air in the water-jacket furnace can be constant, while in the brick furnace it must necessarily vary.

### The Heisler Locomotive.

On this page is illustrated the Heisler locomotive, made by the Stearns Manufacturing Co., of which John D. Eby, 17 and 19 Main St., San Francisco, is Pacific coast agent. It is a geared locomotive, which, in construction and efficiency, is considered by its makers to be entitled to the same favor in economic value as that accorded the direct-connected engine. Everything in it is the result of practical experience worked out. A high-class geared locomotive, to successfully and economically haul heavy loads on steep grades and sharp curves, has many important requirements. The makers of the Heisler locomotive claim, among other points, such a locomotive should combine simplicity, the best material and first-class workmanship; great flexibility, to avoid a tendency to leave the rails on sharp curves; a heavily-proportioned truck, constructed entirely of iron, steel and bronze; all bearings of phosphor-bronze, extra large, accurately machined and readily replaced; an independent steel gear-frame, rigidly maintaining in accurate alignment

THE HEISLER LOCOMOTIVE.

the enclosed, oil-submerged and noiseless steel bevel gears; the least possible number of gears; the axle gears removably clamped, so they can be readily replaced on the road by any intelligent engineer without the use of special appliances; the gears should have extra large wearing surface and be exceedingly heavy, so that when much worn they will easily withstand the most severe shocks without breakage; a very large boiler capacity for a given weight of locomotive, so that the boiler need not be destructively forced in order to furnish the large amount of steam necessary to accomplish the severe duty required of such locomotives; a liberal cylinder volume, so the engine can easily start its heaviest loads; those parts subject to most wear so arranged that they may be replaced by inexpensive duplicates; all bearings of phosphor-bronze and adjustable for wear, provided with sufficient oiling devices; all parts to be readily accessible for inspection and repairs; the universal couplings should be self-oiling and so arranged that they can be easily replaced on the road, being preferably secured to the shafts by clamping, not unlike a split pulley; the driving wheels should be of ample diameter and the gear ratio such that when running over the road at a normal speed the motor engines will not rotate so rapidly as to cause excessive wear and danger of destruction; the motor-engines to be provided with balanced slide valves and of the simplest possible construction.

---

In an investigation of copper-zinc alloys M. G. Charpy has tested eighteen different mixtures in various ways. After annealing, it was found that the physical properties varied quite regularly with the proportion of zinc, the rigidity of the alloy increasing with increase of this metal to 45 per cent, and the maximum toughness being reached with zinc at 35 per cent.

---

In a recent sermon by Dr. Talmage he said that he experienced a pang of regret every time he heard of a new invention that would do the work of fifty men. The *Scientific Machinist*, in reply to the observation of the learned minister, says: "Probably the doctor fears that these fifty men are to be thrown out of employment to become tramps, paupers, perhaps criminals. Did he stop to think of the thousands of men to whom such an invention gives employment, perhaps saving them from starvation? Did he stop to think that that invention might lessen the cost of some article—perchance an article absolutely necessary to the civilized state of living—to millions and either add so much comfort to a vast number of lives or save money for many pockets? The cruel malignity of machinery has come to be believed in as much as the most important article of faith of the Christian religion. Its compensations should also be taken into account."

---

Sawdust is turned into transportable fuel in Germany by a very simple process. It is heated under high steam pressure until the resinous ingredients become sticky, when it is pressed into bricks. One man with a two-horse power machine can turn out nine thousand bricks a day.

# Scientific Progress.

The standard Crookes tube proposed by Prof. Elihu Thomson consists of a glass bulb containing two concave aluminum discs mounted at opposite sides on wires sealed in the glass, with a V-shaped piece of platinum supported in the center of the bulb by a third terminal that can, if desired, be used with any of the various sources of electric currents employed for generating Roentgen rays. It is maintained by Dr. Pupin that all substances under the influence of Roentgen rays become in turn secondary radiators of these rays, and this, it is pointed out, may explain the apparent reflection some experimenters have observed. In pictures obtained with magnetic rays by Prof. J. S. McKay the subject was simply laid on the film of a sensitive plate between the magnet and its armature. Both permanent magnets and electro-magnets, capable of lifting one to one hundred pounds, were successfully tried, and silhouettes were obtained with exposures as short as five minutes, substances that are conductors of electricity proving the most opaque to the magnetic radiations.

---

In the manufacture of zinc white it has frequently been observed that the product, in spite of no changes in the process of manufacturing, sometimes shows a decided yellow tinge, and this makes the article less valuable. This has often been ascribed to the presence of iron, but Fuchs and Schiff have recently found that zinc white of a yellow cast has not contained a trace of iron, but they have detected as much as 0.003 per cent of cadmium sulfide. Zinc usually contains a slight amount of cadmium, which accounts for the presence of this element in the zinc white. Experiments showed that no oxide of cadmium or iron produced any appreciable change of color in the zinc white. In order to produce the pure white color of the zinc oxide the cadmium sulfide must be converted into cadmium oxide. This may be accomplished by roasting for several hours under exposure to the air. To avoid the yellow shade, however, it is preferable to make the zinc white from as pure a zinc as possible, and to this end the zinc used should always be carefully tested for cadmium.

---

M. Deplay says green wood, when cut down, contains about 45% of its weight in moisture. In the forests of central Europe wood cut down in winter holds at the end of the following summer more than 40% of water. Wood kept for several years in a dry place retains from 15 to 20% of water. Wood which has been thoroughly desiccated will, when exposed to air under ordinary circumstances, absorb 5% of water in the first three days, and will continue to absorb it until it reaches from 14 to 16% as a normal standard. The amount fluctuates above and below this standard according to the state of the atmosphere. M. Violette found that, by exposing green wood to a temperature of 212° F., it lost 45% of its weight, which accords with observations of M. Deplay. He further found that, by exposing small prisms of wood one-half inch square and eight inches long, cut out of billets that had been stored for two years, to the action of superheated steam for two hours, they lost from 15 to 45% of their weight, according to the temperature of the steam, which varied from 257° F. to 437° F. (125° C. to 225° C.)

---

A foreign journal describes a watch made in Switzerland that calls out the hours in a voice like that of a human being. This mechanical curiosity is the invention of one Casimir Livan, who based its principles upon his knowledge of the workings of the phonograph. The case, instead of containing a striking apparatus, as some of the late costly watches do, is provided with a phonographic cylinder, which is fitted with a sensitive photographic plate, which has received the impression of a human voice before being inserted in the watch.

---

On the California Railway from Oakland to Laundry Farm, six miles, will soon run the first electric locomotive in this State, now building by Ingler & Atkinson, Oakland. It is an exact miniature duplicate of the one that hauls the B. & O. trains through the Baltimore tunnel, and which was illustrated and described at length in a recent issue of this paper. Loaded, complete, it will weigh about thirty tons.

---

For an outside stucco, hydraulic cement and clean, sharp sand, mixed with fresh water to the consistency of plasterer's mortar, is used. A coat is applied, and a second coat over this before the first has dried. The gravel must be washed so clean that it will not discolor clean water.

---

A French chemist has made a blue soap which will render unnecessary the bluing in laundry work. In ordinary soap he incorporates a solution of aniline green in strong acetic acid. The alkali of the soap converts the green into blue, uniformly coloring the mass.

---

An odd kind of headgear has been adopted for the use of the Italian garrison artillery—a "telephonic bonnet"—worn by the gun detachment commanders, so that they may be in constant communication with the officer commanding the battery or fort.

# Practical Information.

## Leaky Gas Engine Valves.

When a gas engine refuses to work, and the trouble is caused by a leaky valve, one of three specific reasons may be assigned, viz: The valve is "hung up," the spring of the exhaust valve is too weak or the slide valve seat is damaged. The hanging up of a valve is usually caused by corrosion of the metal by the gases, from standing idle, which makes them stick. Either this or a loose exhaust valve permits a portion of the gas not burned by the explosion to escape during compression into the silencing pot and exhaust pipe. The moisture which thus escapes is burned by subsequent ignitions, which causes an explosion. An oil groove should be made for the exhaust valve spindle and every morning a little kerosene oil squirted in. If the valve spring is so weak as to permit the valve to be lifted during suction by inflowing air, a back draft comes together with the gas mixture drawn through the mixing apparatus which renders the charge inexplosive. The mixture will not pass into the exhaust, but accumulate until, should the fly wheel have momentum enough to keep it going, a powerful explosion would occur. It is, however, sure to stop. Thumping in the exhaust pipe from a damaged surface of the valve may be remedied by taking out the valve, cleaning it thoroughly by rubbing with kerosene oil and replacing.

NEAR the Santa Fe roundhouse, Los Angeles, Cal., is a unique factory where are made splints for the use of surgeons in bandaging broken limbs from a fibrous material that possesses especial adaptability for the purpose—the wood of the yucca palm, which grows plentifully on the Mojave desert, trimmed into logs ten feet long and from ten inches upward in diameter. They are shipped to the factory, where they are stripped of bark and carefully inspected. About half or more of the logs contain what might be called flaws, or kidney-colored masses, so hard that the machinery used cannot cut them. Nobody seems able to explain how these formations are caused, but they make the men at the factory a great deal of trouble and spoil much timber. The logs are sawed up into suitable lengths, a length put into a lathe, and a long knife is pressed against it, taking off a shaving about one-eighth of an inch thick, more or less, according to the use to be made of it. This long shaving or board is then cut into smaller pieces and put away in racks to dry, for the trees are cut up when green, it being impossible to soften them after they are dried. Although they grow in the desert and look parched to the eye, they are full of water and weigh so much when green that they sink in water. The poorer quality of the yucca is cut up into narrow strips which are fastened around young fruit trees to protect them from sunburn and the attack of rabbits, for which purpose they are found to answer admirably, and a great many of them are used. But the use of this material upon which the greatest hope of ultimate profit is based is for splints, for which it is much better adapted than any other material used, as well as being cheaper.

## The Largest Systems.

The *Railway Age* prints the following list in order of the sixteen leading systems of this country, with the mileage, as follows:

| | |
|---|---|
| 1. Pennsylvania system | 8,882 |
| 2. Chicago & Northwestern | 7,931 |
| 3. Atchison | 7,555 |
| 4. Burlington | 7,304 |
| 5. Canadian Pacific | 7,103 |
| 6. Southern Pacific | 6,717 |
| 7. St. Paul | 6,169 |
| 8. Missouri Pacific | 5,326 |
| 9. Southern Railway | 4,644 |
| 10. Union Pacific | 4,459 |
| 11. Northern Pacific | 4,362 |
| 12. Illinois Central | 4,332 |
| 13. Great Northern | 4,256 |
| 14. Rock Island | 3,573 |
| 15. Grand Trunk | 3,512 |
| 16. Louisville & Nashville | 3,163 |

AN evidence of the striking uniformity of size among the Japanese is found in the fact that recent measurements taken of an infantry regiment showed no variations exceeding two inches in height or twenty pounds in weight.

ACCORDING to the census of 1890, there were in this country 249,273 Indians. Hoke Smith, Secretary of the Interior, is authority for the statement that they now number about 300,000, and are increasing.

## Books Received.

*"A Practical Handbook on the Care and Management of Gas Engines,"* by G. Lieckfeld, C. E., with instructions for running oil engines, 103 pp., Spon & Chamberlain, 12 Cortlandt St., N. Y., $1; brief and practical, with plain instructions to users of gas and gasoline engines, with some incidental advertising of two prominent makes.

*"Glossary of Mining Terms; a Compilation of Terms in Most Common Use in the Metal Mines of the United States,"* by L. W. Tatum, 511 Mining Exchange Building, Denver, Colo.; an excellent compendium, of practical value to many unacquainted with the meaning of words in ordinary use descriptive of matters connected with mining. Brevity is one of its merits, and any one who wants in convenient form a definition of nearly all the words in ordinary mining use would do well to send for a copy. Price, 10 cents.

*"The Mining Bulletin,"* published by the Pennsylvania State College, containing "An Estimate of Geologic Time," by Prof. W. A. Brickhout, and "Official Geology," by H. H. Stoek.

*"List of the Publications of the U. S. Geological Survey,"* compiled by H. W. Turner.

*"Journal of the Franklin Institute for May,"* containing "The Filtration of City Water Supplies," "Pending Problems for Wage Earners," by A. E. Outerbridge; "The Electro-Metallurgy of Aluminum," by J. W. Richards; "Stereoscopic Roentgen Shadow Pictures," by Elihu Thomson; the usual notes and comments.

*"Press-Working of Metals.—A Treatise Upon the Principles and Practice of Shaping Metals in Dies by the Action of Presses, Together with a Description of the Construction of such Implements in their Various Forms, and of the Materials Worked in them."* By Oberlin Smith, Member American Society of Mechanical Engineers; Member American Society of Civil Engineers; Member American Institute of Mining Engineers; Associate Member American Institute of Electrical Engineers. Illustrated with 433 engravings; 276 pages; 8vo. Cloth, $3.00. New York: John Willey & Sons. London, Chapman & Hall, Limited. This is a valuable book on an important subject. Whether viewed from a technical, scientific or commercial standpoint, the practical man interested in any way in the press-working of metals will find much of use and information. While the proposed new wire gauge, discussed on pages 98–119, may not meet with universal acceptance yet the author has advanced reasons for its adoption that justify favorable consideration. The book is admirably devoid of mere theory as such, and is a valuable addition to metal-working literature.

## Recent Mining Incorporations.

The Barossa Mining and Milling Company, Los Angeles; capital stock, $400,000; M. P. and J. E. Freebey, E. B. Aspinwall, R. S. Dias, E. Bassett, Los Angeles.

The Gold Reward Mining Company, San Francisco; capital stock, $100,000, $100 subscribed; W. T. Farrar, T. A. Keogh, N. B. Frisbie, B. C. Carroll, C. H. Maass.

Old Judge Mining Company, San Francisco; capital stock, $1,000,000; subscribed, $250; F. W. Beardslee, F. M. Husted, Berkeley; C. C. Shepardson, Kelsey; H. Oterson and W. W. Boughton, San Francisco.

Hathaway Gold Mining Company, San Francisco; capital stock, $250,000, all subscribed; M. Jones, F. E. Luty, T. E. Jewell, W. B. Murdock and S. Gardner, San Francisco.

Rival Mining Company, Oakland; capital stock, $200,000; subscribed, $500; F. Euch, M. Page, G. E. DeGolia and G. Chase, all of Oakland.

A. G. G. Mining Company, San Diego; capital stock, $20,000, all subscribed; A. W. Lane, G. M. Hawley, F. Stephens, H. G. Meyers and L. A. Wright, all of San Diego.

Eagle Mountain Gold Mining Company, Los Angeles; capital stock, $100,000; subscribed, $51,000; H. Coon, D. L. Wilbur, W. J. McIntyre, L. Wilbur and M. McIntyre, all of Riverside.

The Shasta Dredging Company, San Francisco; capital stock, $50,000; $25 subscribed; A. Becker, P. Becker, J. A. Chestnut, J. G. Barker, L. A. Gibbons.

## Recently Declared Mining Dividends.

THE Mercur, Utah, Mining Company on the 11th inst. declared its eighteenth dividend, $25,000, a total of $450,000 to date.

THE Cariboo Mining, Milling and Smelting Company pay a dividend of 2 cents per share ($16,000) on the 16th at their office in Spokane, Wash.

ON the 9th inst. the directors of the Portland Company, Cripple Creek, Colorado, declared a dividend of 1 cent per share, payable May 15th, amounting to $30,000.

# CALIFORNIA MINES AND MINERS.*

## Name, Character and Location of Mines in This State—Name and Postoffice Address of Owner, Superintendent or Agent.

(To Be Continued.)

—* Begun in issue of April 25, '96.

Standard Silver-Lead Water Jacket Smelting Furnace.

Equipped with Arch-Bar System of Mantles, insuring rigid and strong walls. No cracks.

# THE COLORADO IRON WORKS CO.,

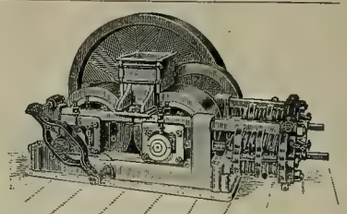
Established 1860.
1876—Incorporated—1896.

**Denver, Colorado.**

MANUFACTURERS OF AND CONTRACTING ENGINEERS FOR

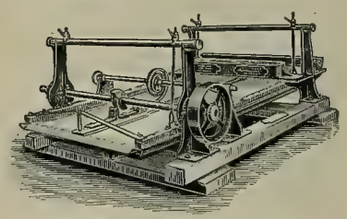
## Gold and Silver Mills & Smelting Plants

FOR THE REDUCTION OF GOLD, SILVER, LEAD AND COPPER ORES.



.....We can furnish on Short Notice MACHINERY and GENERAL EQUIPMENTS for..... ...

**Cyanide, Chlorination, Bromine, Concentration and Amalgamation Plants,**



COMPLETE, OR IN PART.

*Catalogues on application.....*

NOTE.—We have a Testing Plant (Mill) on our premises and test ore by Concentration and Amalgamation in ten-ton lots or more, to arrive at best possible method to save values, machinery to be selected accordingly.

CAZIN'S IMPROVED CRUSHING ROLLS.
"Superior to all others."
LARGE CAPACITY. FINE CRUSHING.

PERFECTION CONCENTRATOR.
Capacity 5 to 15 tons in 24 hours. A machine that will do the work.

NOTICE TO GOLD MINERS!

## SILVER-PLATED AMALGAMATED PLATES

**For Saving Gold**

IN QUARTZ, GRAVEL OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER.

AT REDUCED PRICES.

Our plates are guaranteed, and by actual experience are proved, the best in weight of Silver and durability. Old Mining Plates replated, bought, or gold separated. THOUSANDS OF ORDERS FILLED.

## San Francisco Novelty and Plating Works

Incorporated.

SEND FOR CIRCULARS.

68, 70 and 72 First Street, San Francisco, Cal.

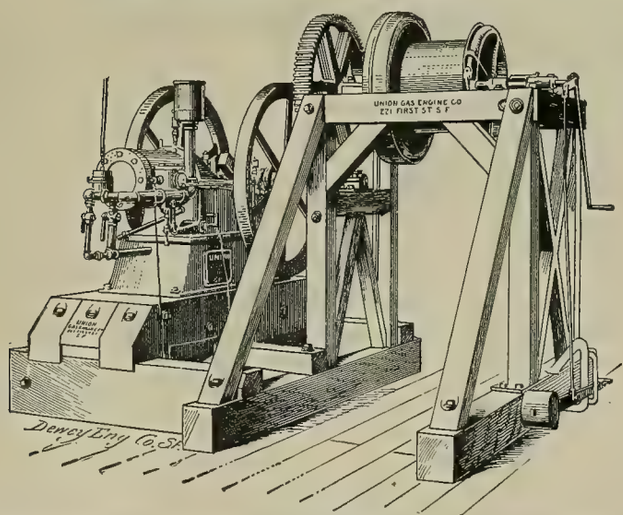
## Justinian Caire, Agent

521 and 523 Market Street, San Francisco,

—DEALER IN—

**Assayers' and Mining Material.**

—MANUFACTURER OF—



BATTERY SCREENS AND WIRE CLOTH.

—AGENT FOR—

Hoskins' Hydro-Carbon Assay Furnaces.

# UNION GAS ENGINE COMPANY,

309-311 Howard Street, San Francisco, Cal.,

Have Built the LARGEST GASOLINE ENGINES that have been Built in America.

— MANUFACTURERS OF —

ENGINES FOR ALL PURPOSES.

Engines for Stamp Mills, Hoisting and Pumping for Mines a Specialty.

SEND FOR CATALOGUE.

# DEWEY & CO.

AMERICAN AND FOREIGN PATENT SOLICITORS

ESTABLISHED 1860.

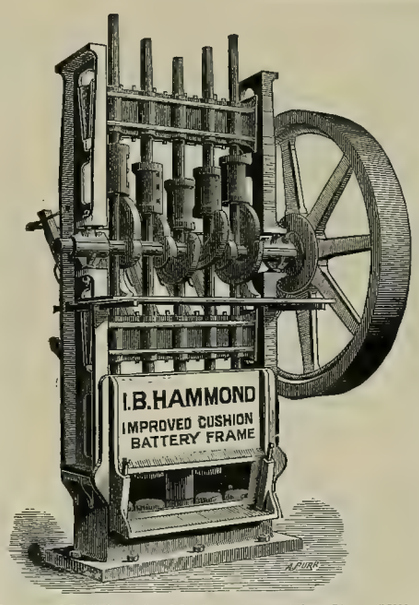
BRANCHES AT Washington, London, Paris, Berlin, Vienna, Melbourne, Etc.

No. 220 Market St.

TAKE ELEVATOR No. 12 FRONT ST.

SAN FRANCISCO, CAL.

# HAMMOND M'F'G. CO.



## 69 First Street, PORTLAND, OR.

MANUFACTURERS OF

## Stamp Mills, Ore Feeders

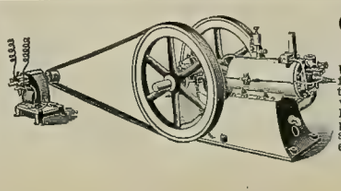
DETACHABLE BUCKET WIRE-ROPE TRAMWAYS,

Roller Grinding Pans, Desulphurizing Furnaces, Etc.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

**The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Setf-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill**

**FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.**



**SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.**

**THIRD: The Large Amount of Space Saved.**

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

Send for Catalogue and Price List.

CORRESPONDENCE SOLICITED.

## CHICAGO GAS & GASOLINE ENGINE

Used for making Electric Light or furnishing power for any purpose required. Specially adapted for electric light in private enterprises. The latest great invention of this progressive age. Built in from 2 to 50 horse power. Stationary or portable. Is the simplest power on the market. A dwarf in size, a Samson in strength. Costs but little to run it. Has no equal for even speed and durability. Send for catalogue.

J. J. NORMAN CO., Mfrs., 53 S. Clinton St., Chicago.

## Coast Industrial Notes.

—An experimental petroleum well is being sunk near Redlands, Cal.

—An oil well recently struck at Coalinga is reported to have flowed eighty barrels in four hours.

The semi centennial occupation of California by Americans will be celebrated at Monterey July 4-7.

The Alaska Packing Association paid its twenty-ninth dividend of 75 cents per share on the 12th inst.

The Atchison, Topeka & Santa Fe Co. is projecting a new air-line railroad from Victor, San Bernardino Co., to Silver City, N. M.

A. Rosenholz of San Francisco has invented an underground trolley system, that he expects will supersede the overhead electric wire.

—California has a monopoly in this country in the growing of olives. The crop of '95 brought $250,000 to the growers, and this year it is estimated at $3,000,000.

—The San Francisco and San Joaquin Railroad directors have let a contract for seven new locomotives - four freight and three passenger. They will be ready for use in ninety days, when the road will be finished to Fresno.

—The representative of the American Trading Company in Japan, Mr. Morse, has obtained from the Korean Government a concession for the first railroad in Korea, between Seoul and Chemulpo. The distance by road is 26 miles, but by rail it will be 30.

—A Federal appropriation was made for the purchase of a San Francisco postoffice site nine years ago and a site secured at a price which appeared reasonably dear. It is now suggested that before the close of the century work should begin on the proposed edifice.

—The basis of this year's Home Product Exhibition at the Mechanics' Pavilion in this city is that two committees of equal number from the Mechanics' Institute and the Manufacturers' and Producers' Association will have joint charge of the exposition, that all net profits over $10,000 shall be divided equally between the two organizations, and in case of a deficit the M. and P. Association would not be responsible.

—A disastrous fire last Sunday morning burned the Vulcan Iron Works, Fremont St., this city, and did considerable damage to the Reliance Foundry adjoining. The loss aggregates a very large amount; the Vulcan Iron Works insurance is about $45,000. Manager Graham has a temporary office N. E. Cor. 1st and Mission Sts. He says the firm is taking orders as usual, and will go ahead, it being as yet undecided whether the old site will be used or a new one secured.

—The Los Angeles *Times* reports that the Producer's Oil Company has completed a 40,000-barrel iron tank alongside the Pacific Oil Refining and Supply Company's tank of equal capacity. A few hundred feet distant is the iron tank of the Union Oil Company, having a capacity of about 30,000 barrels. In another quarter of the city are the iron tanks of the Standard Oil Company, aggregating 55,000 barrels. These tanks combined give Los Angeles an iron tankage of over 175,000 barrels. It has been but a few months since there was not an iron oil tank it the city. The Oil Exchange sold 100 barrels of oil Monday at $1 per barrel. Reports from the oil district are encouraging, and indications point to remarkable activity in drilling operations.

—H. A. Butters has returned to Oakland from the City of Mexico, where he recently bought the street railway lines of that city, which will be converted into electric lines. He says: "I succeeded in buying up the entire street railway system of the City of Mexico, or, rather, I bought all the lines in that city, for there was no system. Some were mule lines, some used goats, and others steam locomotives. There were in all 150 miles of road. The purchase was made in the interest of a syndicate of London and South African capitalists. When in South Africa I was instrumental in buying a large number of roads in the Transvaal and turning them into electric lines. I saw at a glance, when I visited Mexico last fall, that the same thing could be done there. Coal is $20 a ton in Mexico. All the coal is imported. Recently the city began the construction of a tunnel to drain the city. Mexico has never been a very healthy place on account of the bad drainage. This tunnel will be completed at a cost of $13,000,000. I bought the right to use the water after it had been drained from the valley. The city is very high, but is surrounded by mountains. The fall of water will give enough power to make a 10,000 H. P. electric current—more than enough to run the entire street car system and enable us to sell power to others for general use."

—The Supreme Court of California is called upon to adjudicate a case involving over a hundred thousand dollars. The result turns upon the precise meaning of the word "their" as it appears in a contract. The sentence is as follows:

And at *their* option the Adams Company is to have the use of all the machinery and coal-hoisting appliances now in use by the Southern Companies.

It is very plain that the word is a pronoun standing for an antecedent noun in the sentence, but there are two such nouns, and the question is to which one does it refer. It is said that the Southern Pacific Company's lawyer did not see the possibilities of the queer bit of grammar until long after the litigation had begun. It was admitted in the first answer to the suit, that the Adams Company had the option of using the Southern Pacific Company's machinery. But the latter company now rests the entire case on the contention that the word "their" meant the Southern Companies and not the Adams Company. In the sentence under dispute appears the words "Adams Company is," and the southern Companies claim that the word "company" is therefore written in the singular sense and the word "their" cannot apply to it. If the writer had meant it to apply to the Adams Company he would have used the word "its" instead of "their." The other side claims that the word "their" must refer to the Adams Company because the latter is the nearest noun to the disputed pronoun.

—It is estimated that San Francisco will receive this year 150,000,000 feet of redwood and 250,000,000 feet of pine. The total cut of the State will be in the neighborhood of 500,000,000 feet, of which there will be 230,000,000 feet of redwood from Humboldt, Del Norte, Mendocino and Sonoma counties, and 30,000,000 feet south of the bay of San Francisco. The rest of the cut will be out in the interior from the headwaters of the Sacramento to to those of the San Joaquin, along the great mountain slopes, where fine timber grows. Yellow and sugar pine of various descriptions will make up the balance of the cut. Besides this, there will be shipped to southern California from the Puget sound country and the Columbia river about 75,000,000 feet of pine, which will make, consumed in the State and shipped from its borders, between 800,000,000 and 900,000,000 feet of lumber.

## Personal.

W. H. STORMS of the State Mining Bureau is traveling through San Diego county.

GEO. QUINN succeeds F. Cook as superintendent of the App mine, Tuolumne Co.

T. J. NOLTON of Siskiyou has gone to look at some mining property in Sonora, Mexico.

BENJ. JOHNSON has been appointed superintendent of the Ford mine, near San Andreas, Cal.

G. B. WARREN has been appointed superintendent of the Golden Winnie and King gold mines, Murray, Idaho.

MANAGER STANTON relinquishes the Baldwin Hotel business and will turn his attention to his Kern Co. properties, on which he will erect a mill.

GEN'L MGR. GURNEY of the Gurney M. & M. Co. is in the city on his way to England. His company is operating extensive mines at Topia, Durango, Mexico.

HERMAN BELLINGER, formerly of Austin and Eureka, Nevada, is in charge of the British Columbia smelting plant at Trail, B. C. A local paper says he has a salary of $10,000 a year.

J. B. TONKIN has resigned the superintendency of the Iron Mountain mine, Shasta Co., and will take charge of the Iunker mine, Honolulu, on the Klamath. He has also charge of the new railroad now building from Sisson to Squaw Valley.

H. S. DURDEN, Secretary State Mining Bureau, will deliver a free lecture on "The Mother Lode" at the Good Samaritan Mission, Second and Folsom streets, this city, on the evening of the 21st inst. The lecture will be illustrated by maps and charts.

J. H. TIBBITS, at Buluwayo, Matabeleland, South Africa, under date of March 18th, states he has been appointed assistant manager of Clark's Consolidated, Limited—a company organized by and named for Captain C. Jefferson Clark, deceased. He is stationed at Guanda, a little town forty-five miles from Buluwayo.

**NOTICE TO ORE SHIPPERS.**

By shipping your ores to us you can obtain the highest prices paid on competitive bids in the public market, together with a careful and accurate sample, as with our new mill and improved machinery we are able to give perfect satisfaction to all shippers. *Write for our Pocket Reference Book.* The highest cash price paid for gold bullion and old gold. Prompt returns.
**STATE ORE SAMPLING COMPANY, Denver, Colo.**

**RUPTURE CURED.**

Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absoutely without danger. Usually but a single treatment required.

# Mining Summary.

## CALIFORNIA.

### Amador.

At the Wheeler gravel mine at Pine Grove, recently sold to Chicago men, three monitors are at work.

The shaft at the Oneida is down 200 feet.

The Bellwether, recently incorporated in Illinois at $1,000,000, will shortly begin work.

It is understood that at the Argonaut sinking will be continued till a depth of 2000 feet is attained.

The *Record* learns that at the Anita good milling ore has been found on the 200-foot level.

The *Record* also reports that at the Wildman-Mahoney, Supt. Ross has the 70 stamps crushing 7000 tons monthly.

At the Wieland, or Union Con., mine the upper Paugh tunnel is in 800 feet and the lower tunnel 780 feet. About 160 feet more will connect with the main shaft. There are 35 men on the payroll. B. Bibo is manager.

### Butte.

The bonders of the Big Betsy, near Forbestown, are doing considerable work and have put in machinery to operate the property. The Magalia and Princess, near Magalia, are also being vigorously worked. A depth of 1000 feet has been reached in the Barrow quartz mine near Oroville.

At the Banner the shaft is down 1000 feet. A tunnel will be run from the bottom of the shaft to tap the ledge when it is expected the mill will commence crushing ore from the 1000 foot level.

### Calaveras.

The owners of the Keystone mine, near Altaville, will soon incorporate the property.

In the Soap Root mine, West Point, recently bonded for $6,000, at the bottom of the 100-foot shaft, a four-foot vein assays well.

C. F. Horswell is running a tunnel to tap the gravel bed at the California mine, below North Branch, 6x7 feet in the clear. It will have to run 1500 feet.

At the Infernal gravel mine an old drift filled with a soft slum was tapped, and as the men could not hold it in place, they hoisted it to the surface and put it through the sluices. There were about fifty carloads of the stuff and it yielded a little over eight ounces of gold.

At the Machu mine, West Point, sinking the shaft is being steadily prosecuted and Whitlock, Wells and Snyder will sink a double-compartment shaft on the San Andreas quartz mine, about 100 feet south of the old shaft. The owners claim that the ore will pay $40 to the ton in free gold. It also contains a large percentage of sulphurets.

A $10,000 hoist is building at the Esperanza mine near Mokelumne Hill, preparatory to sinking 3000 feet.

AROUND SAN ANDREAS.—*Citizen:* John McSorley has resumed operations in the Green Mountain mine. Rich gravel has been struck in the Banner gravel mine. The Victoria mine in Chili Camp district is being worked by the King amalgamator process. The King Solomon mine, near Burson, is being worked by Dr. Huntington. The tunnel at the Specimen mine will be run 200 feet, when it is calculated it will intersect the lead. Pumping out the Keystone mine, near Altaville, is about completed.

### El Dorado.

(Special Correspondence).—John Kohlert has granted bond to J. Morgan Taylor and others for 100 acres gravel property. Permission to hydraulic has been applied for. This is near Indian Diggings, 75 miles southeast of Placerville.

Edward Bind has negotiated a bond for two years, to be granted A. E. Head and Jos. Clark of San Francisco, by the Cosumnes Copper Mining Co., of a claim long abandoned. The property is 20 miles east of here. Work has already begun preparatory to operate the claim. The result of assays shows the ore to be 50 per cent gold, 30 per cent copper and 20 per cent silver.

Hayward & Lane begin operations on a gravel claim near Indian Diggings. They are erecting buildings and machinery quite extensively.

A collection of ore specimens from the various mining properties in this county, for a cabinet exhibited in the Ohio House, begun eight weeks ago, resulted in gathering 165 pieces—no duplicates in the collection. Mr. T. Schamb manifests perseverance and taste in this work.

D. W. C. Morgan, a veteran California miner, is rehabilitating the old Pocahontas and also the Tullis mines.

Supt. Beardslee of the Lady Emma is in Berkeley.

Machinery for a steam hoist, to be placed on the Larkin, is being transported from the railway at Diamond station to the mine. The sinking on this property is progressing satisfactorily. At a depth of 172 feet the shaft has come into promising ore, showing free gold.

### Inyo.

In vast southeastern Inyo there are mines and mining operations which few residents know anything about. And in that region of mountains and deserts it is difficult to describe locations, no existing map showing anything about them. It is also hard to describe some of the mismanagement in their attempts to get money out of the mines. At the Mineral Ranch (the Anthony mines at Pleasant Canyon, in the Telescope or Panamint mountains), a Los Angeles company, the Golden West, erected a five-stamp steam mill and concentrator under the mines, which are on an almost overhanging cliff 1400 feet in height. In the comparatively smooth canyon below they placed the mill part of the plant, 600 or 700 feet above a stream of water flowing four to six inches. Then they sunk a shaft above the mill and drifted around the bed of the canyon to get water, failing in which they laid pipes below and put in a small boiler and pump with which to raise it. That failed, and they placed a larger boiler and pump, which also failed. It has been shown by tests that the ore carries $45 and upward, gold, to the ton, but it is not free milling, and it is understood that what ore they did "work" produced about $5 per ton. However, an assay office forms no part of the outfit.

About one-fourth of a mile below is a natural mill site, under the flowing water, and in line of a practicable tramway from the mines. The company has expended $14,000, at least $10,000 of which has been wasted.

Half a dozen miles to the southward of the Golden West Co.'s operations, the Redlands M. & M. Co. located and bought prospects galore; erected a quartz mill and proceeded to pound out all the rock they had extracted, amounting to about one day's run. This was a case of putting up a mill before they had a mine, with the usual result. This company, however, like its neighbor, have honorably paid up all their obligations.

D. C. Lane's mine at Darwin is working satisfactorily. He shipped three carloads to Selby & Co. the past week.

Curving to Death Valley diagonally to the southeast, 40 miles from the Mineral Ranch, on the Funeral range, says the *Register*, is situated the Confidence Mining Co.'s plant. It is a Salt Lake corporation, represented by Cannon, Langford, Montgomery et al. It is a strong three to four-foot ledge, 1000 feet in length, of rich rebellious gold ore. April 4th, two shafts of 150 feet were about being connected by drift on the bottom. The mine is near the summit, five miles from the nearest fresh water, a spring on the east side of the the mountains. On the west side, on the edge of Death Valley, these operators dug an 80-foot well, from which a China pump raises about the saltiest water on earth. From an immense tank it passes to a condenser, and thence to the milling plant. This consists of a rock-breaker, a Bryan roller mill, having a capacity of 20 tons per day, and a few feet of silvered copper plates. The power is supplied by a 20-horse power gas engine. Costly as all these things are at that point, there is absolutely no provision for any chemical treatment of the rich but rebellious ore, except the simplest free process. The mill was idle, but a very large accumulation of tailings showed what had been done. Men who prospected there assert that a miner could make $5 per day panning them out. No assayer cuts any figure here, either, and one wonders how they can have any idea of "where they are at" in the mining and milling business. The same company own the Johnny and Chispa mines at Montgomery, Nye county, Nevada, distant by trail about 55 miles, and teams were hauling supplies away around by Saratoga Springs, and the whole length of the Amargosa wash, from one place to the other. No superintendent or paymaster had been seen since last January. Some 20 of the men employed quit on April 4th. The company must have expended $40,000 to $50,000 in a mill that will have to be extensively added to or removed entirely before they can ever get a dollar out of it.

### Kern.

From what is usually considered a reliable source it is learned that in the Rand district G. Kenyon and sons have discovered a mine whose ore runs remarkably rich. The find recently made was a blind ledge which has all the appearance of being continuous. It is about eight feet in width, of a uniform quality and dimension. The rich streak is a strip extending through the ledge which is about four inches in width. The owners of the bonanza are not attempting to work any of the ore, but are sacking it and will buy a mill and reduce it themselves. There are several mines in the locality which are reported rich.

The Blackhawk mine, owned by Kuffel & Swarthout, is one of the best developed in the district, and is now handling ore which is said to mill $80 per ton. It is two miles south of the Burchman mine.

The Los Angeles *Express* says thousands of prospectors have hunted for the quartz ledge which has always been believed to have fed the gold fields of Goler, but the finding was reserved for F. H. Heald of Elsinore, who has just located; the ledge fifteen feet wide, solid quartz, is the first quartz ever found at Goler bearing gold. The mines at Randsberg are ten or twelve miles south of Goler in another range of mountains with a dry lake between. Mr. Heald and his friends have located eight claims and he has located a mill site with plenty of water and 640 acres of coal adjoining the mines. A new district has been organized and named after the discoverer.

### Lassen.

AT DIAMOND MOUNTAIN.—L. D. McDow is crushing ore from the Belt mine in the Branham & McDow mill.

Shinn Bros.' tunnel is in 200 feet. The rock is hard blasting and progress slow.

G. Spellier has completed 65 feet of a 100-foot tunnel to tap the old Union ledge.

The placer mines, owing to a greater supply of water than usual, are being worked for all there is in them by their respective owners.

The stamps of the Lone Pine began dropping last Tuesday.

### Madera.

The old Wilson and Berry mines, near O'Neals, were purchased about two months ago by Hart, Hedinger, McKenzie, J. Hoxie of Fresno, and will be worked.

W. Phips of San Jose is building a 5-stamp mill on his claim beyond the Zebra mine. The Krohn mine is sold to an English syndicate for $25,000, and will be operated on a large scale.

### Nevada.

*Transcript:* Work has been resumed at the upper shaft of the Reward mine, at the old rifle grounds. Operations are being carried on through both shafts.

Miners down from the English Mountain mine report it has been closed down, and it is not known when work will be resumed. The weather has been severe, and the snow is between 12 and 15 feet deep at English Mountain.

*Transcript:* At the Harmony drift mine the channel is encountered by the new drift, and gravel that pays $10 per carload is being taken out.

The *Union* says the ledge has been struck on the 800-foot level at the Federal Loan mine, and it is large in size and rich in quality.

### Mono.

In the Bodie Consolidated prospecting work continues on the 200 and 300 foot levels.

In the Mono mine the east crosscut on the 400-foot level was extended 10 feet during the past week. The face is in soft porphyry.

A little good ore is being taken from the Bulwer Consolidated.

### Placer.

*Sentinel:* The Mayflower mill is running steadily, with a good prospect of increasing the working force during the coming season.

At Red Point Supt. Hoffman reports 58 men on the payroll. The recent cave in the main tunnel has been repaired and the returns from the gravel they are taking out at present are very encouraging.

At the Eureka mine the main tunnel is now in 850 feet. The tunnel is 6½x7 feet. Supt. Felix Chappellet Jr. says that he expects to reach the 1000-foot mark during the month of May.

### Riverside.

A $75,000 mortgage on the Good Hope mine of Perris was placed on record last week to secure the payment of the above sum by H. B. Johnson of New York, who is expected to resume work on the mine, to the Good Hope Mining Co. On August 1st $10,000 is payable, on November 1st $5000, and on August 1st, 1897, the balance is to be paid. The mortgage is taken as indication that the mine will be under the personal control of Mr. Johnson, and active operations again begun.

### San Bernardino.

E. R. Sweet reports a gold strike in the Pinon mining district, near the Lost Horse mill, about eight miles from the Desert Queen and Eagle Cliff claims. It is a half mile up the mountain side, and is in such a position that by wires and buckets the ore can be carried directly from the mine to the mill.

Oregon men have bought the Sidewinder mine, near Victor, for a large sum. It furnishes low grade milling ore. The size of the ledge and the ease with which the ore is reduced making it considered a paying proposition.

McMillan and McAfee have located a four-foot ledge of boracite, carrying 50 per cent borax, near Daggett.

### San Diego.

The *Bee* says the fire in the Queen mine at Hedges is still smouldering, and it will not be in shape for work for some time to come. They have bulkheaded all places where air could get to the fire and expect it will smother by the confined gas. The fire was caused by the failure of a stick of giant powder to explode, it burning instead. Under the old cave above the 200-foot level there was a large quantity of mashed timbers which prevented the dirt from above settling down through the timbers below, and in order to accomplish that result the blasting was done, with the above result. The main loss is in time, as they will have to shut down part of their stamps.

Rice district reports a strike in the N. G. mine, which C. L. Fair lately bonded for $10,000.

A. C. Morgan of Mesa Grande has developed a ledge three-quarters of a mile east of the Shenandoah mine, which gives indication of permanence and richness.

Dr. Frizell of Escondido reports to the *Union* regarding the strike in the N. G. that it is of considerable value. It was made at the 30-foot level, and is a 4-foot vein.

Rice district is southeast of Warner's ranch, on the edge of the desert, and has been considered a promising camp since its discovery, though nothing of a bonanza nature has been uncovered before.

### Shasta.

Ashe & Poole are reported to have bought the Alta group of mines near Iron Mountain for $12,000.

*Free Press:* The Original Quartz Hill Gold Mining Company, Dr. Midowiz superintendent, suspended operations Tuesday morning and paid its employes in full. The cause of the suspension is said to be a disagreement of the stockholders. The company has been operating the old Harrison mill at Quartz Hill and has been running the old Calumet mill under a lease.

Ludlum and Jones of the Eureka Tellurium gold mine, near Middle creek, have put in two new concentrators and will run a custom mill.

The *Free Press* reports G. C. Richards, manager of the American mine, has bought six claims, the Ellis Brothers' mines, a half mile north of Gladstone, for $10,000 cash.

H. McDonnell, who in company with J. Salee is developing the property at Copper City, tells the *Free Press* that a rich streak of copper has been encountered, but that the main copper body has not yet been reached.

### Siskiyou.

*Journal:* The keels of the new dredging boats on the Klamath river, for mining that stream, have been laid at Oak Bar. They will be sixty feet in length. Two boats will be anchored in the stream together, facing up river, about six feet apart, while the third will be anchored just behind them, below the opening between the other two. Mr. Distlehorst feels confident that his dredging boats will prove successful in mining the bottom of the river, and claims that he can handle the largest boulders besides digging down into the bed-rock toward securing all the gold hidden in crevices. Several liberal offers of mining ground have been made by the owners for testing this new process, and it is probable that a great amount of gold will be realized, especially where the river is deep and difficult to work by means of wings and head dams, pumps, derricks, etc.

The McConnell claim, a little below the mouth of Humbug creek, in Klamath river, will be in readiness for hoisting pay gravel within a couple of weeks. This claim has paid well during former seasons, and will no doubt turn out well during the coming summer and fall.

The Ben Shinar mine, near Nolton, on Thompson creek, has been sold by H. H. Hunter to some Colorado people, who will develop it on a extensive scale. They will commence the construction of a ditch soon, to cover the ground. This is said to be one of the richest mines on the Klamath river.

Hydraulic as well as other mining is flourishing on the Klamath river. The river claims are all in operation, and some excellent reports are expected in this section during the coming summer.

The recent cold weather has held the water back, so that the hydraulic mines in the vicinity of Oro Fino have had scarcely enough water to keep them in operation. Quite a large amount of new snow has fallen in the high mountains, from which these mines secure their supply of water, and will enable them to keep at work fully as late this season as usual.

### Sierra.

The *Enterprise* reports about four feet of snow at Gold Valley and about thirty men working in the mine and mill.

Lane & Barnes of Chicago are having five tons of rock brought down from Purdy's mine on the East Fork to the Gold Bluff mill, to test the rock before purchasing the property.

W. Johns, superintendent of the Sierra Buttes mine, will employ about a dozen men during the early part of the coming season.

The fire which destroyed the two mills at the Alaska mine, Pike City, last week, caused a loss of $30,000. The mills contained twenty stamps each. B. S. Taylor, one of the leading owners in the mine, went from this city to the scene of the disaster. It is understood that he will arrange to pay off the company's indebtedness and build a new mill.

### Tuolumne.

AROUND SONORA.—At the Shawmut Supt. Halsey has started the new air compressor. Forty men are employed doing development work.

Supt. George Smith, at the Grant mine, on Moccasin creek, has a double shift at work sinking the shaft.

At the Rawhide sinking the shaft continues and drifts on the 900 and 950 are being driven. Thirty-five stamps are at work. The chlorination works are treating over a ton of sulphurets daily.

At the Golden Gate about 60 men are employed about the mine and chlorination works.

At the Dutch mine Supt. Trittenbach is increasing the number of men.

The Tuolumne County Mining and Development Company is working the Mt. Zion lode and 3000 feet of an extension of the Mt. Jefferson mine, near Groveland.

At the Star, Wilman Bros. are putting in an air-compressor plant capable of running four power drills and a new hoisting plant.

### Yuba.

The Brown's Valley correspondent of the Marysville *Appeal* says that the Barton Bros. have disposed of their claim to the owners of the Dannebroge and Pennsylvania mines for $3000. Messrs. Walrath and Snell are also reported to have formed a company to develop the Faust mine, formerly known as the Hibbert & Burris.

## NEVADA.

### ESMERALDA COUNTY.

Twenty-five men are working on the Candelaria pipe line.

### HUMBOLDT COUNTY.

The *Silver State* says the Gold Eagle and other mines in Central district are sold to Dr. G. B. Pfoutz and C. L. Wilbur, of Salt Lake City, for $10,000.

### LINCOLN COUNTY.

The Pioche *Record* says: The trouble between the miners and owners at DeLamar has been satisfactorily adjusted.

## OREGON.

On the 16th ult. the new 20-stamp mill on the Bonanza mine at Robinsonville, near Baker City, started up. On the 25th it was closed down for a clean-up. The result was $10,000.

### BAKER COUNTY.

At the Bonanza mine, after running from April 16th to the 25th with the new 20-stamp mill, the cleanup yielded $10,000 in bullion.

A Baker City dispatch says: "The Virtue mine Saturday evening sent in 113 pounds of gold, avoirdupois, worth $35,000, the product of twenty-two days' run with stamps. A depth of 600 feet has been reached in the mine."

### JACKSON COUNTY.

H. Mattern is developing a quartz ledge near Ashland and getting out some ore which is shipped to the Selby Co. The second-grade ore is crushed at the Hicks mill.

### LANE COUNTY.

Several hundred prospectors will work over the territory from the Bohemia mines to the Willamette river, about fifteen miles. Cottage Grove people are raising subscriptions and expect to build a road to the mines so that machinery can be carried. At present everything has to be taken in by pack animals. In the Blue River district development will be pushed, and several prospectors have already gone in.

## WASHINGTON.

Mr. Ellis, a Seattle lumberman, is reported to have bought the Toulee group of mines in the Kettle River country, on the Colville reservation, near the Mission, from A. Miller for $14,000.

A. Carpenter has brought down some ore

from the Lone Star and Washington mines, on the reservation, says the Spokane *Chronicle*, that assays $8 in gold, silver and copper. The tunnel in this mine, which is owned by the Reservation Mining & Milling Co., is down 40 feet. This mine is located in White's camp.

### BRITISH COLUMBIA.

Following are the names and addresses of 100 of the leading mining companies of British Columbia: Pacific Bullion Mining Co., Warm Springs, Kootenay; Kootenay No. 1 Mining Co., Ainsworth, Kootenay district; Kootenay Smelting and Trading Syndicate, Ld., Revelstoke; Revelstoke Mining Co., Ld., Revelstoke; Fraser River Gold Gravels Syndicate, Ld., Vancouver; Northwestern Gold and Silver Mining Co., Victoria; Middle Creek Gold Mining Co., Victoria; Columbia Mining Co., Ld., Ainsworth; Empire Consolidated Mining Co., Ainsworth; West Kootenay Mining Co., Ainsworth, Le Roi Mining and Smelting Co., Trail; Jeanette Mining Co., Ainsworth; Neosho Mining Co., Ainsworth; Western Consolidated Mining Co., Ainsworth; Columbia-American Mining Co., Ainsworth; Kootenay Mining and Smelting Co., Pilot Bay; Kootenay Lake Reduction Co., Pilot Bay; Gold Queen Mining Co., Yale; Shafer Gold and Silver Mining Co., Ainsworth; Spokane and Great Northern Mining Co., Victoria; Duluth and St. Paul Mining Co., Ainsworth; London Mercantile Association, Ld., Nelson; Freddie Lee Mining Co., Kaslo; Byron N. White Co., Nelson; Slough Creek Mining Co., Victoria; Josephine Mining Co., Nelson; Northern Belle Mining Co., Kaslo; East Kootenay Exploration Syndicate, Ld., Wild Horse Creek; Canadian Northwest Mining Co., Kaslo; Kootenay & Columbia Prospecting and Mining Co., Ld., Kaslo; Canadian Pacific Mining and Milling Co., Ainsworth; Kootenay Mining and Smelting Co., Pilot Bay; Horsefly Gold Mining Co., Victoria; Vancouver Mining Co., Ld., Vancouver; Gordon Hydraulic Mining Co., Ld., Victoria; Thunder Hill Mining Co., Ld., Victoria; Port McNeil Coal and Land Co., Ld., Nanaimo; Cataract Hydraulic Co., Ld., Victoria; Scott Mining Co., Yale; Columbia Mining Co., Yale; American Development Co., New Denver; Slocan Surprise Co., Kaslo; Bellingham Bay Hydraulic Mining Co., French Creek; War Eagle Gold Mining Co., Rossland; Trail Mining Co., Rossland; Cariboo Gold Fields, Ld., Barkerville; Finch Mining Co., Vancouver; Kootenay Hydraulic Mining Co., Waneta; Good Hope Mining and Milling Co., Rossland; Paris Belle Gold Mining Co., Rossland; Boundary Creek Mining Co., Boundary Falls; Eureka Consolidated Mining Co., Rossland; Robert E. Lee Mining Co., Rossland; West Le Roi and Josie Consolidated Mining Co., Rossland, Idaho Gold Mining and Smelting Co., Centre Star mine, Rossland; Centre Star Mining and Smelting Co., Centre Star mine, Rossland; Columbia Hydraulic Co., Revelstoke; British American Mining Co., Rossland; Lookout Mining and Milling Co., Rossland; Crown Point Mining and Milling Co., Rossland, Kootenai Mining and Milling Co., Rossland; Iron Horse Mining and Milling Co., Rossland; Spokane Ore Co., Rossland; St. Elmo Gold Mining Co., St. Elmo mine, Red Mt., Trail Creek; High Ore Gold Mining and Smelting Co., Rossland; Phœnix Gold Mining Co., Deer Park Mt., Trail Creek; Evening Star Mining Co., Rossland; Gold Hill Mining Co., Rossland; Virginia Gold Mining Co., Rossland; Silverine Gold Mining Co., Rossland; Poorman Gold Mining Co., Rossland; Caledonia Consolidated Mining Co., Rossland; Dixie Mining and Milling Co., Rossland; O. K. Gold Mining Co., Rossland; Great Western Mining Co., Rossland; Old Ironsides Mining Co., Midway; Josie Gold Mining Co., Josie mine, Trail Creek; French Creek Gold Mining Co., Revelstoke; Iron Mask Gold Mining Co., Rossland; Main Quesnelle Gold Dredging and Mining Co., Ashcroft; Black Jack Quartz Mining Co., Ld., Barkerville; Anglo-American Mining Co., Ld., Yale; Crow's Bar Mining Co., Ld., Vancouver; Stevenson Gold and Platinum Hydraulic Mining Co., Ld., Vancouver; Bear Lake Consolidated Mining Co., Ld., Victoria; Maud Hydraulic Mining Co., Ld., Vancouver; Montreal and British Columbia Prospecting and Promoting Co., Ld., Vancouver; British Columbia Gold Fields Exploration and Concessions Co., Ld., Vancouver; Vancouver Gold and Silver Exploration and Concessions Co., Ld., Vancouver; Islander Gold Quartz Mining and Milling Co., Ld., Victoria; Peters Creek Gold Mining Co., Ld., Vancouver; Nip and Tuck Gold Hydraulic Mining Co., Ld., Vancouver; Golden Gate Mining Co., Ld., Vancouver; Nest-egg Mining Co., Ld., Victoria; Crow's Nest Coal and Mineral Co., Ld., Victoria; Vancouver Island Mining Co., Ld., Wellington; Omineca Prospecting and Development Co., Ld., Victoria; Willow River Gold Mining Co., Ld., Victoria; Salt Spring Island Mining Co., Ld.; Donald Gold Mining Co., Ld., Donald; Alpha Mining and Milling Co., Ld., Victoria; Laura Hydraulic Mining Co., Ld., Victoria; Cariboo Creek Mining Co., Ld., Donald; Lillooet Hydraulic Mining Co., Ld., New Westminster City; Cariboo Reefs Development Co., Ld., Victoria; Invicta Gold Mines, Ld., Wild Horse Creek, East Kootenay.

The law regarding the free admission of mining and smelting machinery not manufactured in the Province has been renewed. Under this concession machinery of the value of $169,749 was brought into Canada duty free last year, and imports during the present season will likely be in excess of this figure.

The Rambler and Cariboo Consolidated Gold Mining Company, capital stock $1,000,000, has been incorporated by McArthur, Shea, Davenport and McClaine of Spokane, Wash.

### ALASKA.

The steamer Al-Ki, from Alaska brings late Juneau reports. The last clean-up of the Appolo mine at Unga was $87,500, the product of a three months run.

### IDAHO.

Reports from the mining region in the vicinity of Pierce City, Idaho, are that the backward season is seriously interfering with placer mining operations. The season is a month later than last year.

From Rocky Bar, in the eastern part of the Boise gold belt on the ground of the old Elmore company, E. C. Koch claims to have crosscut to the Alturas from the bottom level and found it larger and richer than weere the old company worked it 300 feet above.

### MONTANA.

At the recent meeting of the Helena & Frisco Mining Co. A. M. Holter was elected president and A. J. Seligman treasurer.

*News Bureau*. The Boston & Montana Mining Company has nearly $1,000,000 cash on hand and nearly another $1,000,000 due from guaranteed sales of copper. The company is sold a great many weeks ahead and can pretty nearly approximate its earnings for the present year. Some stockholders want the company to increase the dividend to $2.50 per share quarterly, but it is probable no such action will be taken this year.

A chemist has been making tests of the smoke at the Anaconda smelters with a view of ascertaining if sulphuric acid gas could not be made from it; the result is satisfactory. Sulphuric acid can be made from the sulphurous fumes as a by-product, and at a low cost. It is the intention to only make enough for the company's own use at present.
ad Montana

R. A. Ammon is at Great Falls with $35,000 to clear all indebtedness on the Gilt Edge properties and resume control.

H. S. Sherard, manager of the company which has been negotiating for the purchase of the New Year mine, near Lewiston, is reported to have advices from the agent of the company at St. Louis that the deal will probably be closed in a few weeks, the price to be paid being about $200,000.

The Golden Scepter Mining Co. has control of the Alps mine and 10-stamp mill adjacent to the Golden Scepter mines. Superintendent Babcock will put about twenty-five men at work on the property.

### SOUTH DAKOTA.

The Homestake Mining Co. at Lead has added forty stamps to the Star mill, making it 200 stamps. Work will soon be commenced enlarging the original Homestake 80-stamp mill to 100 stamps.

### COLORADO.

In Mint Director Preston's summary of the product of mineral values of Colorado for 1895 the report is made by counties and estimates the gold product of the State at $15,013,434. The total mineral product is estimated at $50,202,220, including gold, silver, copper and lead. Increased gold production over 1894 is shown in Chaffee county as $38,502; El Paso, $3,970,435; Gunnison, $32,445; Hinsdale, $179,128; Mineral, $84,165; San Juan, $176,647; San Juan region, $362,697; San Miguel, $700,930. Other counties are credited with small increases. The report gives Colorado an increase of $4,396,971 over the gold product of 1894, comparisons for the entire product of both years being as follows:

| | 1894. | 1895. |
|---|---|---|
| Gold | $10,616,463 | $15,013,434 |
| Silver | 30,701,375 | 31,075,296 |
| Lead | 3,199,175 | 3,017,590 |
| Copper | 761,575 | 1,065,900 |
| Totals | $45,281,588 | $50,202,220 |

The State Ore Sampling Co. of Denver is looking over the ground at Alma with the view to erecting sampling works and possibly adding a pyritic smelter.

H. C. Bolsinger, manager of the Vendome Mining Co.'s properties in Nevadaville, consisting of the Hubert and Shafts mines and the Vendome mill, has closed a contract to erect a 30-stamp mill at Nevadaville for $20,000.

A ten-stamp mill has been built at McCourt by the Buffalo and Colorado Development Co.

The officers of the Argentum-Juniata, at Aspen, report that the operating expense of the mine from January 1 to April 1, 1896, was $46,295.59, of which 22 per cent was in development, 13 in hoisting and tramming, 6.62 in breaking ore and the remainder for various other mine expenses. The ore shipped for the quarter was 1093 tons net weight; gross value of ore shipped, $84,490.16; net cash returns, $73,345.10; gross value of ore per ton, net weight, $77.30; the average gross receipts for silver per ounce, including lead, was 64.3 cents, freight was 8.4 cents, net returns at mine per ounce was 55.8 cents; deducting mine-operating expense per ounce, 35.2; leaves net profit on silver shipped per ounce at the mine of 20.58 cents, and total net profit for quarter, $27,047.51. The value per ton of ore shipped has increased, having been from June to January, $47.34 per ton; and from January to April 1st, $77.30 per ton; the net profit on silver per ounce having increased nearly 4 cents.

At Gillett, where the El Paso Reduction Company's works have been in operation for a year, the company tells the *Record* that the present capacity, fifty tons a day, will be increased to 100 tons during the season. The process is the improved chlorination method of treatment, securing a gold extraction of 95 per cent and upwards. The ore is crushed by Dodge crushers and rolls and put through a Pearce turret roasting furnace, after which it is passed on to the cooling floor. Thence it is fed into revolving lead-lined cylinders five feet in diameter by nine feet in length, charged with bleaching powder, composed of hypochloride of lime, saturated with sulphuric acid, which generates chlorine gas that separates the gold. The solution is then filtered into lead-lined tanks containing charcoal, which precipitates the gold afterwards placed in cast iron pans in which the charcoal is burned to an ash, which contains an average of 70 per cent gold and is melted in crucibles producing ingots of gold 990 fine and upwards. The management states it can successfully treat any ore thus far found in the district. The average charge is put through by chlorination in about nine hours, whereas by the cyanide process the vats are emptied but once in from four to six days.

A suit involving the Archer Consolidation at Leadville has been filed. L. M. Ballou of New York and A. M. Say of Kalamazoo, Michigan, are the plaintiffs. The defendants are the Ibex Mining Co and twenty-five mining men, chief among whom is J. F. Campion. The complaint alleges that defendants unjustly acquired the property now in possession of the Ibex Co.

### ARIZONA.

W. V. Frost has sold his mine, the Crystal Butte, at Tysons to B. G. Smith of San Francisco for $5000.

Reports from the Congress mine are to the effect that a crosscut drift is to be run from the 1600 foot level to tap a parallel ledge 700 or 800 feet distant. About one carload of concentrates per day is now the output from the 40-stamp mill. When the crosscut drift shall have reached the parallel ledge the mill capacity will be increased to eighty stamps and the working force increased. The pay roll will then carry the names of about 500 men.

### LOWER CALIFORNIA.

The Fortuna Mining and Milling Company will re-incorporate under the laws of Mexico, with $1,000,000 capital. The company has a group of prospects at the Agua Dulce in the Zaragoza district. Mr. Gay Lombard is general manager.

### MEXICO.

G. Freeman and J. Macdermott are placer mining in the southern part of Chihuahua. The nearest railroad station is 300 miles and the country is sparsely settled, mainly by Indians. Morales, the center of the silver mines, is sixty miles away. At San Jose de Grecio sixty miles from their grounds, there are five mines in gold ore and are making big shipments. Mr. Freeman says: "The Anglo-American company for a year past has paid from $5,000,000 to $6,000,000 in dividends from these properties. Now they are shipping from $250,000 a month upward.

"We have enough ground to last us five or six years. The gravel runs about 40 cents a yard and is quite easy to handle except in one thing. There are lots of big boulders about as big as a man can lift, and it takes a pretty heavy head of water to work successfully. We have a fine ditch about two miles long, and up to about March 1 things went all right. Then one day we suddenly found ourselves with only a half a head of water, and I started out on a mule to investigate. I rode up the creek for about six miles and found eight ditches taking water to irrigate wheat fields. Then we had to stop for the dry season which will last until July 1, after which there will be an abundance of water for everybody. It will then rain almost continuously for three months. That is, it will not rain in the early morning. The sun will come up bright and clear, but by 11 o'clock the water will be falling in sheets and the creeks and rivers will not be fordable. Our workings are on the Pacific slope, as are several of the important big producers. To get there we have to travel over the divide and cross the most precipitous country in the world and comparable only with the Grand Canyon of the Colorado. The deepest gulch in Mexico we have at the Huerichic river. This is just one mile deep and about four broad, and the crossing places are about seven miles apart."

### SONORA.

During the months of January, February and March, 3,899,937 pounds of ore were passed through Nogales, being shipped by the various mines throughout the State of Sonora. Following is a list of the mines making the largest shipments: La Dura, in the district of Guaymas, 361,150 pounds; La Mexicana, in the district of Arispe, 358,871 pounds; Las Chispas, in the district of Arispe, 333,772 pounns; Sacramento, in the district of Ures, 332,757 pounds; and La Luz, in the district of Altar, 313,400 pounds.

### SOUTH AFRICA.

South Africa *Mining Journal*, Apr. 4: The Witwaterstrand fields includes the districts of Johannesburg, Boksburg, Krugerdorp, Florida, Doornkop, and Blaauwbank, and the totals for the past year for these various areas campare as follows with the figures for 1894:

| | Year, 1894. | Year, 1895. |
|---|---|---|
| Metres driven | 80,828 | 110 176 |
| " sunk | 23,714 | 40,734 |
| Tonnage mined | 3,062,767 | 3,917,078 |
| " milled | 2,871,395 | 3,501,679 |
| Number of stamps working | 2,381 | Not given. |
| Days milling | 324.5 | " " |
| Tons per stamp per day | 3.716 | 4.086 |
| Concentrates produced (tons) | 26.074 | 40.359 |
| " work-d (tons) | 24,134 | 34,312 |
| " yield per ton (ozs.) | 3.159 | 2.898 |
| Tailings treated (tons) | 2,772,730 | 2,863,868 |
| " assay value per ton (ozs) | 0.233 | 0.240 |
| Whites employed | 4,946 | 6,524 |
| Natives " | 35,611 | 45,287 |
| Gold produced by mills (ozs.) | 1,294,539 | 1,494,094 |
| " yield per ton (ozs.) | 0.451 | 0.427 |
| " value, total | £4,664,542 | £5,383,540 |
| " per ton | 32s 6d | 30s 9d |
| " by concentrates (ozs.) | 83,411 | 105,390 |
| " yield per ton (ozs.) | 3 456 | 3.072 |
| " value, t tal | £315,653 | £382,621 |
| " per ton | 26s 7d | 22s |
| " by tailings (ozs.) | 570,973 | 623,480 |
| " yield per ton (ozs.) | 0.206 | 0.218 |
| " va ue, total | £1,734,586 | £1,926,844 |
| " per ton | 12s 6d | 13s 6d |
| Total production (ozs.) | 1,948,924 | 2,222,960 |
| Value | £6,714,781 | £7,693 010 |
| Alluvial gold (ozs.) | 1.015 | 105 |
| Value, ditto | £3,387 | £361 |
| Total production from all sources (ozs.) | 1,949,939 | 2 223,066 |
| Total value from all sources | £6,718,168 | £7,693,371 |

In purely mining development the footage driven exhibits an increase of 37 per cent over the previous year, while sinking operations give results nearly double. These figures are, perhaps, the best evidence of the extent of the increase in mining work during the year, as the figures for the tonnage mined or milled are not direct evidence of the increased work doing in mining proper. The capital represented by these figures is very large, as the footage driven represents, roughly, the expenditure of a sum of £300,000, and at £10 per foot, the sinking figures represent £400,000. These two represent an expenditure, therefore, of about one million; for in the deep levels the sinking cost, including timbering and extras, amounts to more than £20 per foot. There is a gratifying increase in the quantity of ore reduced per day per stamp, and Rand mills can now be dealt with on the basis of four tons of ore per day. This is a higher average than has ever been attained before over so large a field, but it by no means represents the limit, which must gradually rise to five tons in the near future. The noticeable increase in the tonnage of concentrates produced is accounted for the extension of the sizing process used in connection with the cyanide plants, the first grade obtained being regarded as concentrates. In this fact is to be found the explanation of the falling off in the grade and value, though the decrease in value per ton is more than counterbalanced, in the aggregate, by the larger quantity produced.

## Commercial Paragraphs.

A LARGE Dow steam pump has been sent via Redding for use in the Brown Bear mine at Deadwood.

A LARGE SHIPMENT, something over 100 tons of mining machinery, manufactured by The Edward P. Allis Company, Milwaukee, Wis., consisting of Allis crushing rolls, a complete chlorination plant, engine, boilers, etc., will leave on the P. M. S. S. Co.'s steamer, Colombia, on the 18th inst., for the Two Republics Gold Mining Co., Pijinto, Mexico, via San Blas.

IN these days of electrical power transmission anything pertaining to the cheapening of cost of transmission is of interest. The Power Development Co. of Kern county, this State, is putting in an extensive plant for the transmission of power, in connection with which they are building a flume some four miles long. As water is very valuable and it is essential that none should be lost in transmission, it was necessary to devise some means to insure the absolute certainty of conveying the water this distance with no loss save that caused by evaporation. The engineer, Mr. C. N. Beal, after investigating the subject most thoroughly, decided upon building a double-boarded flume. Between the two courses of lumber is laid a course of the heaviest grade of P. & B. paper. Over this paper is applied a coating of asphaltum paint or compound, in which the upper course of lumber is laid, and it is fully expected by this method to have a flume that is absolutely watertight. The paper is manufactured here by the Paraffine Paint Co., 116 Battery street, who have sold quantities for the same purpose, satisfaction being always had from its use in this manner.

THE following advertisement appears in the Sacramento, Cal., papers:

Bids will be received at the office of the City Clerk until 5 o'clock p. m. on Monday, June 1, 1896 for three (3) Water Tube Steam Boilers of 100 horse power each, or four (4) round Tubular Boilers of 75 horse power each. No bid will be considered under 300 horse power aggregate. Bidders on Water Tube Boilers must figure on nine (9) square feet of heating surface being equivalent to one (1) horse power. Bidders on round Tubular Boilers must figure on fifteen square feet of heating surface being equivalent to one (1) horse power. Boilers must be erected and connected to main steam pipe, feed pipes, below pipes, drains and smoke stack. All exposed steam surface to be covered with asbestos. Boilers must be set in position singly. Bidders must furnish all necessary valves, pipes, breechings, fronts, grate bars and fixtures complete. Bidders on Water Tube Boilers must furnish a regular detailed specification, giving number of tubes, diameter of tubes, and length of tubes. Tubes to be of first class quality and full No. 100 wire gauge. Boilers must be set in position within sixty days from approval of contract. Specifications must show the diameter of drum, length of drum, thickness of shell and heads in drum, and thickness of shell in water legs or wrought headers. No cast headers will be accepted. Bidders on round Tubular Boilers must furnish specifications complete. Boilers will be required to carry 150 pounds of steam for working pressure. Bidder obtaining award of contract will be required to remove old boilers now in position outside of Boiler Room at his own expense. Old brick found serviceable may be used in the construction of new walls and foundation. A certified check for 10 per cent of amount of bid must accompany each bid. The Board of Trustees reserves the the right to reject any and all bids.

Attest: M. J. DESMOND, City Clerk.

### Tours in the Rocky Mountains.

The "Scenic Line of the World," the Denver & Rio Grande Railroad, offers to tourists in Colorado, Utah and New Mexico the choicest resorts, and to the transcontinental traveler the grandest scenery. The direct line to Cripple Creek, the greatest gold camp on earth. Double daily train service with through Pullman sleepers and tourists' cars between Denver and San Francisco and Los Angeles.

Write S. K. Hooper, G. P. & T. A., Denver, Colorado, for illustrated descriptive pamphlets.

WANTED.—A young man with literary ability, having had practical experience in mining and metallurgy, for the editorial staff of a first-class trade paper. Applications will not be noticed unless stating full particulars as to experience, compensation, references, etc. Address "Charter," P. O. Box 2718, New York, N. Y.

V. BLANC, Analytical Chemist, Assayer. Graduate from Paris. 1620 California St., Denver, Colo. Gold and Silver Bullion, Old Gold, Placer Gold, Jewelers' Sweeps and Rich Ore Refined. Melted and Assayed or Purchased. Gold and Platinum Refined for Jewelers and Dentists. All work carefully done. Samples by mail will receive prompt attention.

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR THE WEEK ENDING MAY 5, 1896.

559,562.—SCENERY SUPPORT—T. H. Andrews, S. F.
559,344.—SPOOL BOX - C. Christensen, Oakland, Cal.
559,515.—STONE CUTTING MACHINE—Davidson & Walker, S. F.
559,530.—BOTTLE SEAL—W. D. Eitel, San Jose, Cal.
559,382.—DOOR BRACE—C Hoffman, Spokane, Wash.
559,778.—BED LOUNGE—L. G. Ihrig, Seattle, Wash.
559,779.—ORE CRUSHER—G. Johnston, S. F.
559,587.—SASH LOCK—I. W. Lewis, Portland, Or.
559,738.—CEMENT—H. Mizuhara, S. F.
559,595.—RAISING LIQUIDS—E. I. Nichols, S. F.
559,544.—TRACE AND HOLDBACK—J. D. Stanley, Honcut, Cal.
559,546.—BEE SMOKER—Street & Garrett, San Mateo, Cal.
559,549.—SAND BOX FOR CARS—C. H. Taylor, S. F.
559,651.—FLUME OUTLET—D. W. Millard, Redlands, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DRIP ATTACHMENT FOR UMBRELLAS.—Frank Hindes, San Francisco, Cal. No. 559,101. Dated April 28, 1896. This invention relates to an attachment to receive the drip of umbrellas when closed and prevent it falling upon the floor. It consists of a reservoir surrounding the point, or tip, of the umbrella, a disk situated above the reservoir having perforations made through it, and circumferential grooves or channels formed near the base of the umbrella and near the tip, which serve to hold the flexible rubber reservoir, the constricting edges of which fit these grooves so as to hold it in place and render it watertight. The funnel-shaped extention of the upper end surrounding the lower part of the umbrella directs the drip into the openings of the disk and into the interior of the reservoir. The reservoir is removable at any time when it is desired to empty it or to use the umbrella without it.

SAND-BOX FOR CARS.—Charles H. Taylor, San Francisco, Cal. No. 559,549. Dated May 5, 1896. The object of this invention is to provide a simple and effective sand-box for cars, from which the delivery of the sand shall, at all times, be accurate and positive and in which the sand shall always remain dry and loose enough to discharge with certainty. The box consists of a pair of hoppers, one on each side and under the seats of the car, each hopper having a discharge hole below, and a valve seat provided with slots arranged on each side of the discharge aperture, a valve in each valve seat, having a part adapted to be thrown into and out of line with the discharges, a shaft extending from one valve to the other and a flexible tube extending laterally from each discharge hole to the contiguous rail, agitator arms secured to the valves and projecting through the slots in the valve seats, a crank arm on the shaft and a connecting rod and power device by which the shaft is rocked.

BEE-SMOKER.—Charles Frank Street, San Mateo, Cal., and William Garrett, Briagolong, Victoria. No. 559,546. Dated May 5, 1896. This invention relates to that class of bee-smokers, in which are employed a smoke-generating chamber, a bellows or other source of air, and a connection between said bellows and the smoke-generating chamber, whereby air is forced therein and a current or flow of smoke is caused to issue from the smoke-generating chamber. The invention consists in an improvement relating to the disposition and comparative length of the connecting pipe or tube between the bellows and the smoke-generating chamber, the object of which is to guard against the passage of smoke and matters, such as creosote, which the smoke carries into the air pipe and bellows, tending to clog said pipe and to injure the bellows. It also consists in a novel open connection between said connecting tube or pipe and the smoke-generating chamber, which will further insure the object and result above mentioned.

SUPPORT FOR STAGE SCENERY.—Thomas H. Andrews, S. F., assignor of one-half to Harry W. Morosco, same place. No. 559,562. Dated May 5, 1896. This invention relates to a device for supporting such portions of stage scenery as have to be set up hastily and at points where there are no wall or other side supports, such pieces being known as "set" pieces. It consists essentially of a bar pivoted at the bottom of the movable frame of the scenery, a channel formed in the bottom of the frame equal in depth to the thickness of the bar, a rearwardly turning lug projecting from the upper part of the frame, a brace rod having its lower end fixed to the outer end of the horizontal turnable bar, and the upper end bent to stand in line with the pivoted pin of the bar and turnable in a hole in the lug into which it is entered.

BOTTLE SEAL.—W. D. Eitel, San Jose, Cal. No. 559,520. Dated May 5, 1896. The object of this invention is to provide a seal or safety device for bottles and packages whereby it will be impossible to refill such bottles after they have once been emptied. It consists of a bottle having a neck, the upper end of which is provided with a conical chamber diverging from the top downwardly, terminating in a seat provided with a central opening, a tube to be seated in the neck having a thickened upper end with divergent sides to enter the chamber and leave a circumscribing space, said thickened portion forming a shoulder adapted to rest upon the seat at the base of the chamber, a tube extending downwardly through the central opening, a filling of cement in the space between the thickened end of the tube and the walls of the chamber, an annular flange or disk at the top of the tube to extend over the filling and rest upon the top edge of the neck and a ball or valve in a chamber in the neck of the bottle.

COMBINED TRACE AND HOLDBACK AND SHAFT CONNECTION THEREFOR.—John D. Stanley, Honcut, Cal. Assignor of one-half to Austin P. Merrill of same place. No. 559,544. Dated May 5, 1896. This device consists of a combined trace and holdback, adapted at one end to be connected with the breast-strap or with the hames of the harness, as the case may be, and having means at the other end for readily connecting it with the ring or loop of the breeching, and a spring-controlled fastening lug or cockeye on the shaft with which combined trace and holdback is adapted to engage. The objects of the invention are to simplify the work of hitching up and to provide for such a yielding or spring connection with the shaft as will make the draft about equivalent in character to that obtained by connecting with a whiffletree, which latter, as well as a long trace may be dispensed with. These objects are attained by having the trace and holdback combined in one, provided with means for readily incorporating it into the general harness, and for fitting it over a yielding or spring controlled cockeye or lug upon the shaft, thus reducing materially the number of operations, minimizing the time expended, and effecting the necessary yielding draft, to avoid jerks and sudden shocks in starting and pulling.

## Colorado Newspapers.

The Denver *Republican* has acquired a standing second to that of no daily newspaper in the West, and to-day enjoys the largest daily and weekly circulation in Colorado. This claim is guaranteed by the American newspaper directory, the publishers of which have made a standing offer of $100 to any person who will successfully assail the accuracy of their rating. This enviable position in the newspaper world has been achieved by the constant aim of the *Republican* to insure the reliability of its news and the accuracy of all statements concerning the resources of Colorado and the West, an end which has been attained by the employment of none but the most experienced men in the several editorial departments.

The most complete mining reports published in Colorado are found in its columns, an entire page of the daily and from four to five pages of the weekly edition being devoted to this department alone. Every mining camp in Colorado, and all of the more important mining centers in the entire West, have correspondents of the *Republican*, who give not only the more important mining strikes, but the general condition of the mining industry in their respective localities. This feature of the paper renders it the most valuable medium for the dissemination of reliable mining news in the United States, and of special importance to the advertiser who desires to reach the miners and operators of kindred industries. The recognition of the value of this department is evidenced by the fact that, from British Columbia to Mexico, wherever there is a mining camp, the *Republican* is eagerly sought for, and has a circulation beyond that of all competitors, which is constantly increasing.

The *Weekly Republican*, lately enlarged and improved, is beyond question the best family paper published in the West. It has a condensation of all the news of the day, a carefully edited agricultural department in which special attention is paid to the conditions of farming in the West, particularly in the so-called arid regions, from four to five pages of mining news, the last quotations of all markets, short stories, miscellaneous matter of general interest—in fact, every class of reading matter calculated to instruct and inform the reading public. Since the recent improvement of the weekly, the circulation has more than doubled, and is increasing with such rapidity that it will soon cover the entire territory west of the Missouri. It is of special advantage to all readers who desire to inform themselves as to the conditions of Colorado and the greater West, and the low price at which it is offered—$1 per annum—puts it in reach of every one. The paper is in every respect what is needed by those interested in the West and in its enterprises, and gives a fund of information which can be obtained in no other way.

When the present conditions of the West are taken into consideration—the increased activity in mining, the great wealth that is annually produced from the mines, the improvement in methods of cultivation and the fact that the West affords the most profitable field for investment in the country—the importance of a medium for accurate and reliable information cannot be overestimated; and when to this necessity are added the facts that the daily *Republican* has the largest circulation in the West, and the weekly is increasing with such rapidity, it will be readily seen that the best medium for advertising in the West is the *Republican*, both daily and weekly editions. The standing of the paper is beyond question. It represents the best interests of the West; its circulation is vouched for by the best authority in the United States; in its contents it fully covers the entire field; and its daily, Sunday and weekly editions are without a rival in the West.

Terms of subscription, $7.50 per annum for the daily and Sunday; weekly, $1 per annum.*

## THE GOLD and SILVER EXTRACTION COMPANY, OF AMERICA.

LIMITED.

TRADE MARK.

(MacARTHUR-FORREST PROCESS)

## MacArthur-Forrest Process.

CAPITAL, - - - £110,000 STERLING

To MINE OWNERS and others having Refractory Gold and Silver Ores hitherto untreatable at a profit, the MACARTHUR-FORREST (Patent) Process of Gold and Silver Extraction offers a solution of the difficulty.

Advisory Board in the United States: Thomas W. Goad, Manager; Hugh Butler, Attorney; John F. Bell; P. George Gow.

California and Nevada Agency and Experimental Plant, 23 Stevenson Street, San Francisco, Cal. P. G. Gow, Sole Agent.

OFFICE: McPHEE BUILDING, DENVER, COLORADO.

## MILLS BUILT WITH GUARANTEE OF SUCCESSFUL OPERATION.

## KENDALL GOLD AND SILVER EXTRACTION CO.

The Kendall Process is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

*The Kendall system is covered by patents which this company will defend.*

The American Cyanide Gold and Silver Recovery Co., organized in Denver more than a year ago to introduce and operate the Kendall Process in several States, have closed contracts with some ten mines for the use of this process after exhaustive comparative tests with the ordinary plain cyanide method.

Capt. De Lamar has adopted the process at his Nevada mines, where a 250-ton plant is being completed. He writes that he is saving 95 per cent of his gold values, and regards the Kendall Process as the cheapest and best he is aware of for the treatment of gold ores.

*All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.*

Owners of mines and reduction works can obtain full information on application to

**KENDALL GOLD AND SILVER Extraction Company,**

PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

SAVE MONEY BY USING

# THE "DANIEL BEST" CRUDE OIL ENGINE
FOR POWER.

THIS IS WHAT THEY CAN DO:

**Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines,** using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

| | |
|---|---|
| Coal Gas, ten hours' run, 1000 feet | $2 00 |
| Gasoline (74 deg.), ten hours' run, 8¼ gallons @ 14c. | 1 25 |
| Coal Oil, ten hours' run, 7½ gallons @ 10c. | 75 |
| Crude Petroleum, asphaltum base, 16 gallons @ 3c | 48 |
| Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c | 65 |

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon—21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

**Improved Self-Contained Three or Five Stamp Mill,**

Saves bill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.

FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.

SECOND: The saving in millwright and mechanics' labor in framing and erecting.

THIRD: The large amount of space saved.

FOURTH: The great saving of freight,

# Market Reports.

## The Markets.

SAN FRANCISCO, May 14, 1896.

With warmer and clearer weather, general trade begins to show signs of improving. The call for goods is said to be increasing and enlarging. Low freights up north have stimulated business in that direction. Alaska continues to draw fairly free. Every vessel clearing for ports in that section take out full cargoes. Fine weather for growing crops has a favorable influence, causing some of the houses to extend larger credits in agricultural districts. From the mines orders are not only free, but steadily increasing. Manufacturers, without an exception, report good orders in hand. This is particularly the case with iron-workers. The sales of mining machinery have been quite large, with a good inquiry still ruling. For agricultural machinery the demand has been larger than for two years past. The gold mining boom continues to enlarge. Capital is still coming in for investment. The New York *Wall Street Journal*, referring to this, says: "One of the significant events of last week was the arrival in the city of one of London's expert miners, Mr. Hamilton Smith. He is said to have come here to look into American mines for people who have tired of South Africa because of the troubles there. One mine in Colorado is reported to have been sold already, and negotiations are reported under way for a number of others. Mr. Smith is here in the interest of those who are engaged in pending negotiations and his purpose is stated to be to examine certain properties. A great deal of money which has gone into South Africa is expected to come here, especially if the feeling grows stronger that the disposition here is to maintain the gold standard."

In the local money market there is a plethora of available funds. While there is a general easing up in the rates of interest, still it requires gilt-edge security or first-class commercial paper to secure lower discount. There has been a decided revival in mining-share speculation, which has tended to draw more money into circulation, but the failure of two brokers and fear that prices have been advanced too high are against banks lending on share certificates, unless amply secured against any break in values. For commercial and manufacturing purposes the demand is slow for accommodations. Mail advices report the New York market as follows: "The extreme ease in money in face of gold exports is due simply and solely to the heavy receipts of currency from the interior. These receipts still keep up in large volume and they more than offset the gold withdrawn and shipped week by week. It might be true in a sense almost to say that the money that comes in from the country displaces gold as fast as it comes in. Most people expected that a good deal of currency would come back from the country about this time, but the arrivals are larger than was thought would be the case and they show to what an extent business is depressed everywhere."

**New York Silver Prices.**

NEW YORK, May 14.—Following are the closing prices for the week:

| | London. | N. Y. |
|---|---|---|
| Friday | 31 | 67⅞ |
| Saturday | 31 | 67⅞ |
| Monday | 31 | 67⅞ |
| Tuesday | 30 15-16 | 67⅝ |
| Wednesday | 30 15-16 | 67¾ |
| Thursday | 31 1-16 | 67⅞ |

| | Copper. | Lead. | Iron. | Tin. |
|---|---|---|---|---|
| Friday | 10 75 | 3 05 | 11 50@12 50 | 13 25 |
| Saturday | 10 75 | 3 05 | 11 50@13 50 | 13 25 |
| Monday | 10 75 | 3 05 | 11 75@13 50 | 13 35 |
| Tuesday | 10 75 | 3 02½ | 11 75@13 50 | 13 40 |
| Wednesday | 11 00 | 3 02½ | 11 75@13 50 | 13 45 |

The local bullion, money and exchange quotations current are as follows:

| | |
|---|---|
| Commercial Loans, ⅌ per annum | 7@8 |
| Commercial Loans, prime | 6@8 |
| Call Loans, gilt edged | 6@7 |
| Call Loans, mixed securities | 7@8 |
| Mortgages, prime, taxes paid by lender | 6@8 |
| New York Sight Draft | 07½ |
| New York Telegraphic Transfer | 10 |
| London Bankers' 60 days | $4.88¼ |
| London Merchants | $4.86¼ |
| London Sight Bankers | $4.90 |
| Refined Silver, per oz., 1000 fine | 67⅞ |
| Mexican Dollars | 54½@55c |

SILVER.—The market sold lower the fore part of the week under review, but toward the close it began to strengthen. Private advices are to the effect that there is an improved demand from the Orient and India, but as yet it is not of a pronounced character, which is against buying in a speculative way. The last steamer for China took out $256,000 in silver bullion. Considering that shipments for a few weeks past have been small, the quantity sent out is considered quite favorable.

MEXICAN DOLLARS.—The last steamer for the Orient took out 13,076 dollars. They were shipped by Chinese. The demand is light but the market is steady to firm at 54½ @55 cents.

COPPER.—The market is strong for all kinds. From the East quotations come through slightly higher. Mail advices state that the domestic consumptive demand is light while the output of the mines is large, but the continued extraordinary consumption in Europe takes the available surplus. This export movement not only keeps the market steady but quite firm. There are those who look for better figures. This opinion is based on the belief that the domestic demand will improve as the summer months pass.

The market is quoted as follows:

| | |
|---|---|
| Bolt | ¼ & 5-16, 20c; ⅜ and larger, 17c |
| Lake Superior Sheathing | 20 |
| Ingot, jobbing | 13 |
| Ingot, wholesale | 12 |
| Sheet copper | 17 |

TIN.—The local market is quiet but steady. Plates for building purposes are in fair demand but for canning they are dull, the large bulk of the demand having been met. American plates are steadily gaining in favor. The East reports a strong market for both pig and plate, with an improving consumptive demand for the latter. The advance in silver favorably affects prices for pig.

The market is quoted as follows:

| | |
|---|---|
| Pig, per lb | 14½c |
| Plate, I C coke, heavy, per box | $4 25 |
| " " " light, " | 4 10 |

ANTIMONY.—The market is quiet and weak at 8½@9c cents in a jobbing way. New York mail advices quote 7½@7¾c for Cookson's, 6¾@6¾c for Hallett's and 6½@6¾c for Japanese, from store.

LEAD.—The local market is reported weak. The destruction by fire of W. P. Fuller & Co.'s works has temporarily lessened the demand for pig. The East reports a dull and easy market, but the outlook is promising for an improved demand later on.

The market is quoted as follows:

| | | | |
|---|---|---|---|
| Pig | 3 75 | @ | 4 00 |
| Bar | — | @ | 4 15 |
| Sheet | — | @ | 5 50 |
| Pipe | — | @ | 4 75 |

SHOT.—The market is quoted as follows:

| | |
|---|---|
| Drop, sizes smaller than B, per bag of 25 lbs | $1 40 |
| Drop, B and larger sizes, " " | 1 65 |
| Buck, Balls and Chilled, do, " " | 1 65 |

QUICKSILVER.—The market is practically unchanged since our last issue.

The market is quoted as follows:

| | |
|---|---|
| Home trade, per flask | 39 00 |
| Distant points up north | 38 00 |
| West coast of Mexico, for export | 34 00 |

LUMBER.—There is a continued free home and export movement. The market is steady at the last advance.

The market is quoted in this city from dock or yards as follows:

| | | | |
|---|---|---|---|
| Redwood, Fluming | 17 00 | @ | — — |
| Pine | 14 00 | @ | 19 00 |
| Spruce | 26 00 | @ | 31 00 |

POWDER.—The market is firm at full prices. Although it is officially denied that a combination is contemplated, yet the belief prevails that it will be done so as to put prices on a paying basis. The demand is very large.

The market is quoted as follows:

| | |
|---|---|
| Hercules, No. 1, per pound | 11½c |
| " No. 2, " " | 8½c |

BORAX.—The market is quoted as follows

| | |
|---|---|
| Refined, in car lots | 6⅛ |
| Refined, in sacks | 5⅞ |
| Powdered, in car lots | 6¼ |
| Concentrated, " | 5⅝ |

NAILS.—The market is reported active and firm. A New York exchange reports as follows: "Jobbers in wire nails have been getting the best of the combination. Their plan was to buy nails for export, ship them abroad, bring them back again and sell them 20 cents a keg cheaper than nails can be bought for domestic use. The difference in the price of nails to exporters and to jobbers has been about $1 a keg in favor of the exporter. People connected with the pool say that it has been done only in a few cases and the supply was at once cut off."

The market is quoted as follows:

| | |
|---|---|
| Wire, carloads, basis per keg | $3 22½ |
| " jobbing, " " | 3 35 |
| Cut, carloads, " " | 2 97½ |
| " jobbing, " " | 3 10 |

IRON.—The consumption is reported large, owing to the demand for machinery, structural and railroad purposes. The East reports a stronger market with a good demand ruling.

Our market is quoted as follows:

AMERICAN.

| | To Arrive. | Spot. |
|---|---|---|
| Sloss | $21 00 | $23 50 |
| Thomas | 22 00 | 23 50 |
| Salisbury | 30 00 | 33 00 |

ENGLISH.

| | | |
|---|---|---|
| Barrow | $21 00 | $23 50 |
| Gartsherrie | 21 50 | 23 50 |

COAL.—It seems quite impossible to advance prices, notwithstanding the advices from Australia. The supply of all kinds on spot and to arrive is ample for all requirements.

COKE.—The market is quoted as follows:

| | | | |
|---|---|---|---|
| Gas Companies' | — — | | — — |
| English, to load | 9 00 | @ | 10 00 |
| " spot, in bulk | — — | @ | 10 00 |
| " in sacks | — — | @ | 10 50 |
| Cumberland | — — | @ | — — |

## Mining Share Market.

SAN FRANCISCO, May 14, 1896.

At no time in the history of mining shares has the market shown larger transactions. Prices have been a great deal higher but the daily average transfer of shares were never so large. Another feature of the market has been an advance in the low-priced shares so soon in an upmove, some going up 300 to 400 per cent. Heretofore the "cats" did not show much sign of moving until the leaders were selling at a big advance. Taking last night's closing bids and the shares dealt in aggregate in value $3,000,000, whereas one month ago they aggregated $1,000,000. This is a large advance and should cause outsiders to think twice before venturing too far. While in some of the mines the ore found and present prospects justify higher prices than ruled six weeks ago, yet there is nothing so far reported in the others to warrant the advance, when this obtains, caution should be exercised in buying. The manipulation of the market is different in several respects from any former manipulation, which is somewhat of a mystery to traders—even old time dealers appear to be at sea. From all that can be learned a large majority of dealers that have been long on the market, some for two or more years, have been selling, but the advance in prices have drawn in new buyers, the most of whom pay cash. It is reported that there has been eastern buying but this we are unable to verify. While there may have been some, yet the East fight shy of shares not on a dividend-paying basis, for experience has taught that the bubble may break at almost any time. The present move seems to be based on the work under way in the Brunswick lode, for the heaviest advances have been in shares having ground on that lode, while the others move up more or less in sympathy under strong manipulation. The shares in the Bodie mines have done better the past week. It is stated that there is a contest for the control of Bodie which may have its effect on the market for shares in that district.

No assessments were levied the past week but several will have to be put on before long.

From the Comstock mines official letters, as a rule, are of an encouraging character, so far as concerns the middle and north end mines. In Alta the work under way is about the same as heretofore reported. In Overman they are making repairs, preparatory to again resuming active work. From Belcher and Seg. Belcher the reports are unimportant. No particulars are given as to the work that is being done. In Crown Point active work is still the order. The ore reported in last week's issue has increased in value. In the upraise the assays run from $8 to $12, gold. From Yellow Jacket we are not advised as to the work, if there is any, going on. Confidence still reports exploiting on the 200-foot level, with no ore extracted. Repairs are still under way in the Confidence, Challenge and Con. Imperial west crossdrift. From Alpha nothing new is at hand. The long west crossdrift in Bullion is still being pushed slowly ahead. It is in a little over one-third of a mile. In Potosi, Chollar, Hale & Norcross and Savage fairly active work is being done on the levels heretofore reported. While prosecuting the work some ore is being extracted and raised. In Savage, at last accounts, they were in 9 feet of good ore, which was increasing in width. Work is to be commenced in this mine so as to get ventilation, by which the ore found can be extracted more easily. This will take time. The long west crossdrift in Gould & Curry is being pushed slowly ahead, with no material change reported in the ground through which it is being run. Best & Belcher continues to report fairly active work, with no material change in the material encountered. Con. Virginia reports finding 3 to 4 feet of ore, assaying over $100 to the ton. Nearly 200 tons of ore were raised last week, which assayed over $50 to the ton. This mine is at present more than paying expenses, notwithstanding active exploiting. A report is current of an improvement in Ophir near the Mexican line, but we are not able to have it sufficiently verified to give assurance of reliability. The work, though, warrants close watching, as does that under way in Mexican, Union and Sierra Nevada. It may take considerable time before definite results can be ascertained. The work under way in Utah and Andes is about the same as heretofore made public.

Another Hale & Norcross decision was rendered the past week by Judge Hebbard. This time it is for over $400,000, which is considerably less than that before rendered. It has had no effect on the market value of the shares and this seems to indicate that the public have no confidence in its being right or just. Another appeal will be taken.

The work under way on the Brunswick lode continues the center of attraction. If reports are to be believed, they are opening up something big, but these reports may be accepted with a grain of allowance, but they are helping the manipulators to the market to advance prices and draw in new buyers. Yesterday a report was current that there was quite a change for the better in Occidental. Chollar is to resume exploiting work shortly. Some think that more and richer ore will be found, but there is nothing so certain as the uncertainty of mining. Hale & Norcross is to start up on the Brunswick lode. Good news is reported from the work in Gould & Curry and Savage ground. This has caused quite an advance in the shares of these two mines. It is to be feared that prices may be run up to figures considerably above what present advices from the mines warrant.

From the Bodie district there is nothing new to report. Active work is under way in Bodie, with some low-grade ore found. In Mono and Bulwer no change in the workings is reported in official letters.

The market opened this morning dull and topheavy which brought in the bear contingent who began hammering prices after call. The decline caused timid holders to let go. While the market did not seem to have any support yet all the shares sold went into the hands of strong parties. Towards noon the market rallied slightly only to sell on lower figures on the regular afternoon session. After the call the tone was weak with outsiders and bears still selling. The failure of L. W. McKee, a broker in the Pacific Board added to the distrust. This failure combined with that of C. P. Harris and Atkinson of the San Francisco Board, a few days ago, make operators suspicious and uneasy. It looks at this writing as if the market will make another advance soon for the pools have added to their holdings, while the work in the mines is quite important and the news generally good.

The following illustrates the changes of the week:

| Mines. | May 7. | May 14. |
|---|---|---|
| Alpha | $ 18 | $ 31 |
| Alta Consolidated | 09 | 20 |
| Andes | 35 | 55 |
| Belcher | 59 | 1 10 |
| Best & Belcher | 1 00 | 1 90 |
| Bodie | ..... | 1 00 |
| Bullion | 26 | 40 |
| Challenge | 50 | 75 |
| Chollar | 2 15 | 2 85 |
| Confidence | 1 15 | 1 80 |
| Consolidated California and Virginia | 2 90 | 3 35 |
| Consolidated New York | 03 | ..... |
| Crown Point | 60 | 95 |
| Exchequer | 18 | 17 |
| Gould & Curry | 111 | 1 80 |
| Hale & Norcross | 1 45 | 2 05 |
| Justice | 08 | 14 |
| Mexican | 66 | 1 25 |
| Ophir | 1 65 | 2 50 |
| Overman | 14 | 34 |
| Potosi | 85 | 1 65 |
| Savage | 58 | 1 20 |
| Sierra Nevada | 87 | 1 50 |
| Union | 68 | 1 35 |
| Utah | 15 | 27 |
| Yellow Jacket | 50 | 88 |

## San Francisco Stock Board Sales.

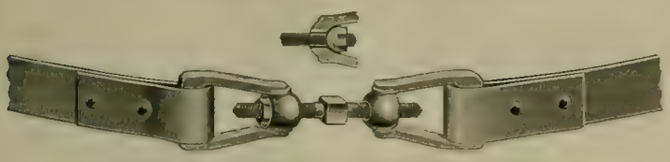
TO THE STOCKHOLDERS OF THE SOUTH PALOMA GOLD MINING COMPANY, LIMITED:

Notice is hereby given that by resolution of the Board of Directors of the corporation, adopted on the 21st day of March, 1896, a meeting of the stockholders of the corporation was called for the purpose of increasing the capital stock to the amount of two hundred thousand dollars, to be divided into one hundred thousand shares of the par value of two dollars per share, and of determining the disposition to be made of the increased capital stock; and it was resolved that such meeting shall take place at the principal place of business of the corporation, being the same building where the Board of Directors usually meet, to wit: No. 212 Sansome street, room 17, in the City and County of San Francisco, on WEDNESDAY, the 10th day of June, A. D., 1896, at 11 o'clock in the forenoon of that day.

Dated San Francisco, 2nd of April, 1896.

JOHN A. WRIGHT, President.
CHAS. WEBB HOWARD, JR., Secretary.

**Michigan Mining School.**



A high grade State technical school. Practical work. Elective system. Summer courses. Gives degrees of S. B., E. M., and Ph. D. Laboratories, shops, mill, etc., well equipped. For catalogues, address M. E. WADSWORTH, Ph. D., Director, Houghton, Mich.

Great Reduction in Light!
IMPERIAL
Automatic Gas Machine
Produces a Beautiful Light.
The difference between the brilliancy of light produced from gasoline gas and from coal gas is 3 to 1. The gasoline light is clear and soft, rests the eyes and brings comfort to the home.
The latest and most perfect Automatic Gas Machine now in use, particularly for illuminating private dwellings in the country, as well as residences in the suburbs of a city or town, public institutions, asylums, hotels, etc. The light is steady, soft, bright and pleasant to the eyes and can be furnished at an expense of but eighty cents per 1000 feet of gas. It is much safer than coal oil lamps, which are so dangerous to have in the house on account of an explosion.
These Gas Machines are perfectly safe, and free from any danger whatsoever. Every modern house built for gas should have one of these machines. No public institution should be without one. I have no hesitancy in saying that there is no other gas machine in the market that can compete with mine as to prices, and they surpass as to perfection in all its requirements.
For supplying gas for gas stoves for cooking or heating these gas machines have no equal. Address
JACOB SCHRIEBER,
East Berkeley, Cal.
Or H. E. STEMLER, Agent, Merced, Cal.

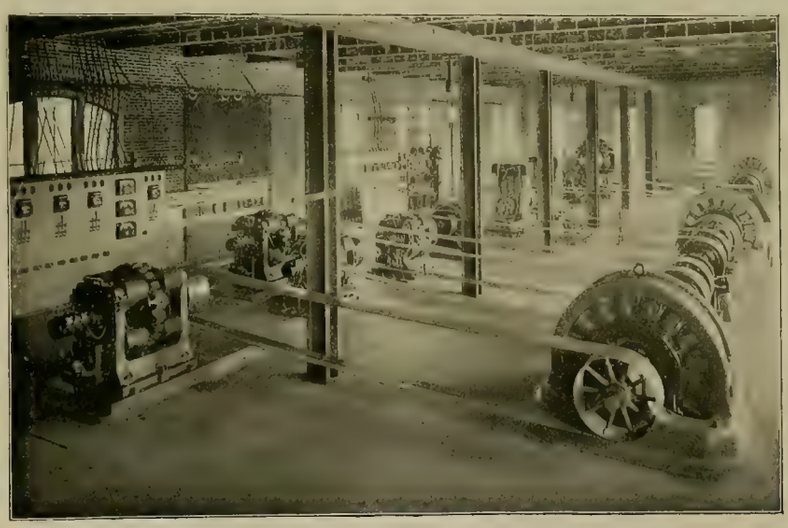
MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

No. 1872.—VOLUME LXXII. Number 21. SAN FRANCISCO, SATURDAY, MAY 23, 1896. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.



## Sacramento-Folsom Electric Transmission.

The completion of the power-transmission scheme between Folsom and Sacramento is the conclusion of a vast enterprise, undertaken in doubt, and terminated in a success which has electrified the State of California into a realization of the tremendous resources at its command, in the feasibility of electrical transmission over long distance, commercially. Preliminary sketches of the progress of the work have been given in several issues of the MINING AND SCIENTIFIC PRESS, but a short resume of it will not here be out of place.

STATE CAPITOL AT SACRAMENTO.

The scheme, as first conceived by Horatio Livermore, president of the Natoma Water and Mining Co., contemplated nothing more than the building of a dam across the American river at Folsom for the storage of water and the irrigation of lands lying in the Sacramento valley. For twenty-five years intermittent efforts were made to carry out the scheme and but little progress was effected. Calculations had also been made looking to the utilization of the power derivable from the difference in level of the water, and estimates had placed the possible power available at Folsom extremely high, while dreams of a huge manufacturing city to utilize this power at that point were indulged in; but the result turned out differently, and instead of the factories being brought to the power, the power is now taken to the factories.

DYNAMO ROOM SUB-STATION AT SACRAMENTO.

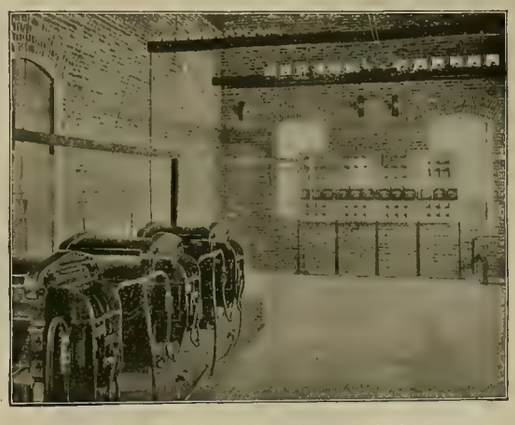
POLE LINE.

In 1881 the rights of the old company presided over by Mr. Livermore were taken over by the Folsom Water Power Company. Work had been begun on the dam, but the development of the scheme appeared so costly, that not until the company made a contract with the State of California whereby convict labor for the construction of the dam and canal was exchanged for the site of a State prison and a certain amount of power, was the work really put under way. In 1888 this contract was signed, the plans were expanded, and under these new plans work was begun in earnest.

The dam is a massive structure of granite, laid in Portland cement. It is 650 feet long, 89 feet high in the center, 87 feet wide at the base, 25 feet wide at the crest and contains about 48,590 cubic yards of solid masonry. It is provided with a heavy wooden shutter, or flashboard, 6 feet high, which at high water is lowered into a recess in the crest of the dam. At low water this shutter is raised by hydraulic pistons, the depth of the basin is increased by 6 feet, and additional storage capacity provided. Normally the dam forms a storage basin, or reservoir, three and one-half miles long, with a capacity of 13,000,000 cubic yards of water.

At each side of the dam are massive granite bulkheads and three head-gates, operated by hydraulic machinery, each head-gate 16 feet wide. The canal on the west side, intended principally for irrigation, is not yet completed.

The east side canal is divided into three sections. The first, stretching as far as the State canal, where the water falls about 7 feet, is cut out of the solid granite and extends a distance of 2,000 feet. The second section is 4,000 feet long, and on the completion of this the terms of the State labor contract were fulfilled. Thus far the canal is built along the face of the cliff. The third section of the canal is an earth ditch, excavated by the Folsom Water Power Co., and is 3,000 feet long. The outer wall of sections two and three carries a broad-gauge railroad track.



The total length of the canal is 9,500 feet. Section 1 is 53 feet wide on top and 45 on the bottom. Sections 2 and 3 are each 50 feet wide on top and 40 feet on the bottom. The depth is 8 feet.

All the water passes through the State power house, through Leffel turbine wheels, developing some 800 H. P., used for air-compressors, electric lighting and other purposes. Thence the water continues on to the Folsom power house, at the side of which is an immense log basin. Here the jurisdiction of the Folsom Water Power Co. ceases and that of the Sacramento Electric & Power Co. begins.

STEP-DOWN TRANSFORMERS AT SACRAMENTO.

The power house is built on the site of an old placer gold mine, where a fall of 55 feet is available at high water. It is on the west side of the town of Folsom, in a cut about 60 feet deep, 100 feet wide and 150 feet long, from which a channel 40 feet wide leads down to the river. At the power house the canal makes a sharp turn at right angles and widens out into a forebay 150 feet long, 100 feet wide and 12 feet deep, which forms a settling basin for debris. It is divided into two parts by a stone wall, provided with suitable gates, so that one side may be cleaned out while the other is in operation. At the lower end of each section of the bay a sluicing gate connects with the lower river by a sluicing canal, and through these the sand and debris are carried away and kept from the wheels. The hydraulic apparatus, manufactured by S. Morgan Smith, of York, Pa., consists of fourpairs of 30-inch wheels of the McCormick horizontal-shaft turbine type, each pair of 1260 H. P. capacity, at 300 revolutions, oper-

STEP-UP TRANSFORMERS AT FOLSOM.

# MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

*Office, No. 220 Market Street, Northeast Corner Front, San Francisco*
☞ *Take the Elevator, No. 12 Front Street.*

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada..... $3 00
All Other Countries in the Postal Union..... 4 00

*Our latest forms go to press on Thursday evening.*

Entered at the S. F. Postoffice as second-class mail matter.

J. F. HALLORAN.....General Manager

**San Francisco, May 23, 1896.**

TABLE OF CONTENTS.

ILLUSTRATIONS.—State Capitol at Sacramento; Pole Line; Dynamo Room Sub-Station at Sacramento; Step-Down Transformers at Sacramento; Step-Up Transformers at Folsom, 413. The Cyanide Mill at Mercur, Utah; Vats and Tanks in the Mercur Cyanide Mill; Zinc Boxes in the Mercur Mill, 418. Step-Up Transformers Showing Air-Blast Equipment at Folsom; Dynamo Room at Folsom; Power House at Folsom; Sub-Station at Sacramento; Penstocks and Turbines at Folsom; Exciters and Governors in Dynamo Room, 420.

EDITORIAL.—Sacramento-Folsom Electric Transmission, 413. A Right to Make and Sell if Not Patented; The Need for the Prosperity of Industrial Interests of This Country; The Merced G. M. Co., Mariposa County; "New Gold Process;" Thirty-six Years Old; Not "Fashionable" in London, 414.

SCIENTIFIC PROGRESS.—The Cyanide Process at the Mercur Mine, 418.

MECHANICAL PROGRESS.—Tesla's New Electric Light; Around the World in Thirty Days; Tin Roofs; The Operation of Tanning; Ball-Bearing; Rawhide Gearing, 421.

ELECTRICAL PROGRESS.—Sacramento-Folsom Electric Transmission, 420.

PRACTICAL INFORMATION.—Cast Iron Versus Steel Pipe; Timber in the Comstock Mines; The Tsetse Fly; Age of a Boiler; A Piece of Candle Made to Burn All Night; Prof. Langley's Aerodrome; A Secondary Storage Battery, 421.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 422–3–4.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 434.

MISCELLANEOUS.—Concentrates, 415. California Mines and Miners, 416. A Rejoinder from Mr. Lang, 417. Safety Hat for Miners, 418. River Mining, in the Present or Future; Alloy of Tin and Zinc; Longest Distance a Shot Has Been Fired, 419. Coast Industrial Notes; Commercial Paragraphs, 424. Personal, 426. Notices of Recent Patents, 428. Obituary, 434. Recent California Mining Incorporations; Recently Declared Mining Dividends, 435.

"If a thing is not patented, all men have a right to make and sell it, to the use of its name, and to every word in the language to aptly describe it." So says the Supreme Court of Alabama, in the case of Scott vs. Standard Oil Company, 19 So. Rep., 71.

THE *Manufacturers' Record* of Baltimore recently sent a letter to six hundred leading manufacturers asking the following question: "What is most needed to bring about greater prosperity for the general industrial interests of the country?" Ten pages of replies are printed in the last number of the *Record*. The general demand, apart from discussion of the currency question, was for a higher form of protection than the present.

A BOSTON paper, quoted on page 422, discoursing on the Merced G. M. Co.'s property in Mariposa county, this State, quotes "a Californian versed in mining" as announcing to it that "$5 ore, even if cheaply mined, will not pay to work, despite all assertions to the contrary." This will be a surprise to Californians who know of the Alaska-Treadwell Co.'s ore, which, though only yielding an average of $2.15 per ton in free gold is worked at a profit, and who have knowledge of results at the Spanish mine, Washington township, Nevada county, where ore which yielded 91 cents per ton was worked at a profit of 32.6 cents per ton.

M. RIGAUD'S "new gold process" briefly described in the issue of the 9th inst, wherein he claims to be able to successfully extract every particle of gold from the ore by using tetra-chloride of sulphur, at a total cost of $1.80 per ton, appears to be a modification of the famous "Zymean process" of Admiral Selwyn, which was advocated by that gallant naval commander in a paper read before the San Francisco Academy of Sciences, August 14, 1893, and adversely reviewed in these columns in the issue of September 2, 1893. The Admiral's process embraced the use of what he called dechloride of sulphur, but wrote $S_2Cl_2$, the formula of the monochloride. Whatever slight merit there may have been in Admiral Selwyn's process does not appear to be shared by that of M. Rigaud, but as the latter has succeeded in inducing French capitalists to put up sufficient capital to give his notions a practical trial, perhaps the commercial results of the Tancorville, Havre, experiment will be sufficient comment on its value.

## Thirty-Six Years Old.

This is No. 1872 of the MINING AND SCIENTIFIC PRESS, this issue completing thirty-six years of uninterrupted and useful existence.

The first issue of this journal was on May 24th, 1860, by Geo. H. Winslow, at 172 Washington street. Mr. Winslow was drowned in rescuing a child that had fallen in the bay, and Julius Silversmith assumed charge in June, 1860. From the first it devoted great attention to the mining and manufacturing interests of the State, and it is not more than the facts warrant to say that through the years it has been probably the most potent factor in publishing California's mining and scientific progress and development. Everything pertaining to the arts and sciences, the advance of industry and the working of the mines has been noticed at length, and no part of the Pacific coast has been ignored in its pages.

On Nov. 1st, 1862, Mr. W. B. Ewer assumed charge. This gentleman, hale and hearty, is still one of the owners of the paper; and after a long lifetime of use and universal benefit, lives to enjoy in his 83rd year a serene old age and to exemplify in his life the value of the temperate principles he always inculcated. Under his energetic management the paper soon became the recognized authority on mining and metallurgy all over the country, and nearly every step in the discovery or invention of improved processes in every department of mining and mechanical industry received its first notice in these columns, its history being the history of mining in this State and on this coast since its beginning. The paper early gathered round it a corps of practical miners and metallurgists, some engaged in office work, others traveling everywhere—a feature it has retained and to which it owes in a great degree its continuous success. In December, 1863, A. T. Dewey became associated in the proprietorship of the paper, and for nearly thirty years was actively interested in the business. In June, 1893, Mr. Dewey disposed of all of his remaining interests in the paper to J. F. Halloran, who since that date has been the general manager. During all those busy years the paper grew and strengthened, its constant policy being that to attain success it must deserve it.

In February, 1870, Mr. Geo. H. Strong became one of the proprietors and the active manager of the patent department, which under the management of Mr. C. W. M. Smith, whom Mr. Strong succeeded, had become an important part of the business.

From that time until now—for upwards of 26 years—Mr. Strong's energies have been devoted steadily to the patent agency in association with this journal; and under his administration it has grown into world-wide relations. Its work is carried on under unusual advantages of experience and acquaintance and of personal relationship to the officials of the patent bureau at Washington. Its record of successful applications now runs into the many thousands, and a steadily increasing volume of business attests the respect and value in which it is held.

In November, '80, the firm moved its entire plant, including the business and editorial offices, to the present large building, corner Front and Market streets, which it has since continuously occupied.

The history of this paper is a history of thirty-six years of California's life. It has seen the outlying frontier develop into populous States and has kept step with the progress of the coast, weekly going into thousands of homes, the recognized medium of communication between the customer and manufacturer and producer. Its proudest boast is its ability to say with truth that it never took a dollar to put anything in or keep anything out of its reading columns—and that is a good deal for any paper in California to be able to say.

Thirty-six years in the life of a paper or a person is a good deal. To a man it means that he has probably advanced beyond the fullest measure of usefulness; with a paper it is different: the connections, the business associations and friendships, the prestige of such long continuance, the reputation for reliability and integrity of character, all are so much capital, so much valuable assets, of which a newer or ephemeral publication is proportionately devoid. Then, again, when a man ages less and less is expected of him. 'Tis just the reverse with a journal: the older it gets the more is expected of it; little lapses that would be overlooked or excused in a fledgling publication are judged by a less merciful standard of criticism. This is probably right, for in the case of a long-established concern it is certainly "old enough to know better."

The MINING AND SCIENTIFIC PRESS is in no way hidebound, nor does it desire to be considered other than reminiscent in this modest little reference to its thirty-sixth birthday. In all that goes to make a paper useful or valuable it professes to keep up with the procession, if not a little ahead of it, and its proprietors believe that never in all its long history had it a larger field of usefulness, or filled it more worthily, than at present. Its pages attest the merit in which it is held by the business community, and its wide circulation is satisfactory evidence of its universal popularity.

## Not "Fashionable" in London.

Under date of the 2nd inst. an English mining man writes from London to a friend in this city: "I am having a lot of copies printed for distribution of the article in the MINING AND SCIENTIFIC PRESS of March 7th on 'The Mother Lode of California,' and I think you will feel the results. I have been talking it up for a year now and I am going to print its merits. Somebody will be benefited if I don't. I have spoken to hundreds about California's wealth, but they say the California mines are not fashionable. Then, if that is the case, I will make them fashionable, or at least try to. In London they are now offering over 1,000 gold and silver mines from all parts of the world. Holders of going mines are too afraid of their properties being examined without a money consideration, whereas other holders invite inspection and grant a reasonable option to intending buyers, without forfeit. This blocks the way. I admit sellers have had cause in the past for declining to tie up their mines; but there are buyers worthy of some consideration now."

So, it seems, California gold mines are not "fashionable" in the British metropolis! Letters received weekly abundantly show that there is a considerable degree of ignorance in London regarding California as a gold mining country. It is erroneously assumed by some Californians, as well as others, that there is a deep-seated antipathy, a settled prejudice, a general distrust, in London regarding gold mining enterprises in this State. Such is not the case. There is an honest absence of information there as to the facts. There is in London a general idea that California is a "has been," that a good many hundred millions of dollars of gold were taken out of the gulches and gravel deposits of this State a good many years ago, but that it is worked out. That mistaken idea is not the exclusive property of the intelligent Londoner. A few weeks ago one of the brainiest men in the United States, our foremost American in private life, was here on a visit from the East, and at a banquet at the Palace Hotel, in trying to say some nice things that would please his hearers, he said: "True, you have dug all the gold out of your hills, but you can raise oranges." He was in dead earnest, and said what he believed to be so. Now, if one of the best informed men in this country has such a mistaken notion about gold mining in this State, it is little wonder that the same idea prevails among the residents of a city 3,000 miles farther away! Of course, in the absence of better knowledge, it is natural to suppose that a region that has contributed $1,300,000,000 in gold would be pretty well worked over. But while this might apply to other localities, the fact remains that in this State the immense amount already produced is only an index, a surface indication, of the amount awaiting production. The gold wealth of California has been touched here and there in the last fifty years, and a total that would exhaust any other gold region has been produced. Were our British friends to realize this truth, California mines would at once become extremely "fashionable" in London. Were they possessed of the knowledge that in this State is a bigger and better gold field than all the British possessions and colonies put together, with a perfect climate, with all the necessities and many of the luxuries of life, and all the requisite accessories to mining in abundance, there would be a very fashionable and popular effort there to own and occupy it.

## Concentrates.

THE Dominion Parliament has placed mining machinery on the free list for one year.

DURING April the Arizona Copper Co., at Clifton, Arizona, produced 364 tons black copper and 388 tons matte.

AT mine No. 1, on the Amador Queen, Jackson district, Amador Co., Manager Dye has a shaft now 275 feet deep.

SACRAMENTO proposes to organize "The Central and Northern California Mining and Land Bureau of Sacramento."

FROM Feb. 14th to May 14th, '96, eighty three mining companies have filed articles of incorporation at Olympia, Wash.

MINING ASSOCIATIONS have recently been formed in British Columbia at Nelson, Revelstoke, Illecillewaet and Trout Lake.

THE *Free Press* learns that James Salee of Copper City has struck a body of copper ore of high grade, 24 feet wide, at a great depth.

SPOKANE, Wash., expects this summer to have direct telephone connection with every important mining camp in British Columbia.

THE May payroll on the Comstock will be some thousands more than for April. The April payroll was about $1000 more than that of March.

SUPT. MARTIN at the Machu, West Point, Calaveras Co., has a two-compartment shaft down 175 feet, and has a ledge which is expected to keep a mill going.

UNDERGROUND miners at the T. M. & M. Co.'s mine, Tombstone, this week struck for a raise from $2.50 to $3 per day. Work goes on at the cyanide mill as usual.

ON May 7th acting Secretary of the Interior Symms passed for patent to the railroad company list No. 32, containing 287,753 acres of land in the Redding land district.

THE California mineral land bill as amended and passed is as previously published herein, except that it has an amendment clause, making its provisions apply to Oregon also.

THE Coeur d'Alene, Idaho, country sends word that the production for '96 is expected to aggregate $7,000,000. At present it is turning out about 10,000 tons of concentrates monthly.

MOUNT MORGAN, Queensland's big gold mine, in April chlorinated 7,966 tons, which yielded 12,608 ounces gold. The total dividends paid by Mount Morgan amount to £4,075,000.

FOR the week ending May 7th, the yield of the world's greatest silver mine, the Broken Hill Proprietary, Australia, was 7,505 tons ore, yielding 474 tons, containing 145,842 ounces of silver.

THE Thistle shaft, Sierra Co., worked by about 100 men, and owned by a Scotch corporation, may be cited as an instance of a drift gravel mine worked through a shaft instead of a tunnel.

THE Hale & Norcross has contracted for 200 M ft. lumber for timbering at $16 per M. During the last six months the company has used 175 M. The present quantity will be used in the 900, 1100 and 975-foot levels, now being worked.

LA PANZA, CAL., is more than ordinarily fortunate. A San Luis Obispo paper says that La Panza mines yield gold "worth $22 per ounce." This is probably the long lost mine where the ore yielded 110 per cent of the assay value.

W. L. HISKY tells a Salt Lake *Tribune* man of the discovery of a mastodon, the bones of which assay high in gold. The self-restraint of the S. L. T. m. in not eliminating the second initial of his informant's name is worthy of commendation.

AS THE Standard Company at Bodie will do no more hoisting at night, they now propose, says the *Enterprise*, to light the town by electricity. This could not be done before on account of the unsteadiness of the lights while the hoist was running.

TWENTY YEARS ago B. C. Kingsbury, now of Spokane, Wash., shipped ore from the Copperopolis mine, White Sulphur Springs, Montana, to Philadelphia for reduction. Now a company of Chicago men has bonded the property and will exploit its value.

CHAS. SWAIN of the Confidence mine tells the Sonora *Democrat* that he will add forty stamps to the 40-stamp mill. The shaft is being retimbered and the largest pump in Tuolumne Co., with a daily capacity of 500,000 gallons, is unwatering the mine.

THE Executive Committee of the Northwest Mining Association will try to secure the passage of a Congressional enactment providing for another cabinet officer—the Secretary of Mines. They also plan a Miners' Convention in Spokane, Wash., the first of October, '96.

THE Boston *News Bureau* of the 15th says: "Calumet and Hecla has made a large sale of copper to domestic consumers at 11c, with deliveries extending three to four months. Quantity believed to be from 5,000,000 to 10,000,000 pounds. Market for copper is firm at 11c."

THE House Committee on Public Lands has ordered a favorable report on the bill for the maintenance of schools of mines in the public land States and Territories, by granting each State from the proceeds from the sale of mineral lands $15,000 for the current year and an annual increase of $1,000 per year for ten years.

CONSIDERABLE mineral land in California has passed to private control under agricultural patents. It now legally belongs to those who have secured Government title, and even though it lie within the gold belt, and be manifestly mineral land, no prospector or miner can work thereon without the consent of the owner.

THE United States Geological Survey in its compilation of the statistics of the coal production in the United States during 1895 shows that the total output was 192,421,311 short tons, with a total value at the mines of $197,572,477; an increase over the production of 1894 of nearly 22,000,000 short tons and in value of $11,500,000.

ON the Geyser mine, at Silver Cliff, is the deepest mining shaft in Colorado. The shaft is down 2100 feet. The machinery is capable of hoisting the ore from a depth of 4000 feet. A peculiarity about this Colorado company owning the property is that the stock is assessable. The plan is to go down 400 feet farther before drifting is begun.

IT is stated that at a meeting of the directors of the Hale & Norcross last Thursday evening a resolution was passed authorizing Superintendent Cronin to commence work on the 300-foot level on the Brunswick lode. This work is to be done jointly by Chollar, Savage and Hale & Norcross. At the point where work is to be started ore has been found of an encouraging character.

THE House Committee on Territories makes favorable report on the bill to amend the law restricting ownership of real estate in Territories to American citizens. It provides that alien bona fide residents may hold land and loan money on real estate, and if foreclosure be had, purchase the land. Such persons are also allowed to acquire mines and townsites.

THE Interior Department has ordered a retrial of the case of the Government against the Copper Queen Consolidated Company, Arizona, in which a jury disagreed at the September term of the Federal Court. The case involves about $30,000 alleged to be due the Government for timber cut by the defendant on public land, which the plaintiff contended was not mineral land.

IT is now considered a certainty that the river and harbor bill will pass with the $250,000 appropriation asked for by the miners of California; it is almost equally certain that the President will veto the bill, and likewise of extreme probability that if he vetoes it before Congress adjourns the national legislature will pass it over his head by considerably more than the requisite two-thirds majority.

AT Grass Valley, Cal., last Thursday afternoon, J. B. Gluyas, foreman of the Massachusetts Hill mine, while working in the shaft, was crushed by the cage coming down on him. The cage was loaded with car timbers and four miners. Gluyas, who is a large, strong man, held up the entire weight, estimated at over a ton. Only his strength saved his life, as the cage crushed him to within a foot of the floor.

WHAT is deemed by the miners excessive royalty led this week to the formation of a miners' union at Georgetown, Colorado, with 65 charter members. There were 178 additional applications for membership. The mines there are mostly worked by the lease system, and very few of the miners are leasing for less than 60 per cent royalty, which leaves them at present figures about 27 cents per ounce for silver gross.

THERE is now pending in Congress a bill in which the Blackfeet Indians, for the consideration of $1,500,000, agree to sell the western third of their reservation in northwestern Montana to the Government. It extends from the northern to the southern boundary of the reservation, and from the main divide, its present western boundary, from fifteen to twenty miles eastward, covering an area of about 600 square mineral sections.

THE Transatlantic steamship companies engaged in carrying export gold from New York to Europe have increased the rates from 3-32 of one per cent to ship $1,000,000 to 5-32 of one per cent. The effect of this will be to increase the rate of sterling exchange a little more than a quarter of a cent (31-100 of one per cent) per pound sterling. If it cost nearly 4.88¾ to lay down gold in London under the old freight rate, it will now cost 4.89 to do so.

"IF your mines are so good, why don't your people invest in their development themselves?" is sometimes asked. They do. California capital to the extent of millions is now being expended on California mines. It is safe to say $5,000,000 of San Francisco money has been put into development work in the last year. In eight mines in one county—Amador—the expenditure of a million dollars is now arranged for; of the fifty-seven counties in California, thirty-three produce gold.

THE London *Mining World* of the 9th inst. editorially announces that "there are those who are working night and day upon an oil process which bids fair to do for Westralia what cyanide did for the Transvaal." Well, well! It also states that "a method has been discovered and patented by Mr. William Herbert Hyatt, F.C.S., a well-known chemical engineer and metallurgist, by which the finest and lightest gold can be recovered without the use of a single drop of water."

THE Boston *News Bureau* of the 13th says: "The Merced gold mining shareholders are notified this morning of a telegram received from the mine yesterday: 'Mill returns show during the month of April 2303 tons of ore treated, the yield being $8700 gold and 25 tons sulphurets, assay value $75 per ton of 2000 pounds. This shows a yield of $4.59 per ton of rock treated. The first return was in the month of March, 1285 tons treated, showing gold obtained $1630 and 9 tons sulphurets, averaging $62.43 per ton of 2000 pounds.'"

A RECENT decision by the Interior Department is of considerable interest to applicants for public lands under the timber and stone act. The case decided was from the Duluth land district. The applicants for lands under this act, who were unable to make proof on the day originally set, will be allowed to readvertise and make proof in the absence of any adverse claims. The ruling has heretofore prevailed that in such cases the entries were held for cancellation when the applicant failed for any cause to prove up at the time stipulated.

THE Transvaal, South Africa, authorities are announced to have reached a decision in the case of their prisoners. Capt. Thos. Mein, C. Butters and H. J. King are to be released. V. B. Clement and J. W. Leonard are to be imprisoned for five months. John Hays Hammond, F. W. Rhodes, L. Phillips and Geo. Farrar, who were at first sentenced to death, have had their sentences commuted to fifteen years' imprisonment. It is not likely that the Transvaal authorities will enforce this sentence. The probability is that the four last named will be fined heavily and permitted to leave the country.

UNDER date of the 18th, a gentleman writes from Placerville, Cal., that in a letter he had received the day previous from a reliable informant he was told that a nugget had just been found "across the river from the Two Channel Mining Company's property, a distance of three miles, of unusual size, weighing forty-five pounds. The Two Channel Company operates twenty-six miles north of Placerville, and thirty miles above Georgetown. The site of the reported find is in Placer county." If a nugget of such extraordinary weight has been unearthed it will certainly receive extended notice.

THE requisite amount of annual work or improvement on unpatented mining claims can be put in the aggregate on one claim only when such work manifestly is for the common benefit of adjoining claims held by the same person or claimants. The Secretary of the Interior has recently decided that when such work is put on one of such adjoining claims it must represent $100 for each claim so held. A claim properly located cannot lawfully be filed on by any other than the original locator before it has lapsed to the Government or been forfeited by reason of noncompliance with the law on the part of the original locator.

IN the list of California mines and miners now appearing, any superintendent, mine owner, agent, or any one else acquainted with the facts, has the opportunity to send data, or, if any error appears, of correcting it. It is the first time that such a list has ever appeared; no one who has not tried to get out such a compilation can have any idea of the work and expense it involves. The only idea in publishing it is to meet the oft expressed demand for such a list. "Everybody is wiser than anybody," and it is only by co-operation that a satisfactory degree of correctness can be secured. Perfection in such a task is obviously impossible.

THE viceroy of the Liangkiang has contracted with the Shanghai firm of Burichester & Co. for the erection of a mint at Nanking, China, inside the city, for silver and copper coinage. According to accounts published in Shanghai, the mint will be capable of turning out 100,000 silver coins and 1,000,000 copper cash per day. The silver coins will be dollars exactly equivalent to Mexicans and fractional currency, and the dollars will not have on them the statement that they represent .717 of a tael; and this fact points to the dollar gradually superseding the tael as the unit of Chinese currency. At the present price of silver or copper and spelter, 1000 cash of the ordinary size cost considerably more than $1, and the size of the new cash will be accordingly reduced. It is stipulated that a foreign assayer is to be permanently employed, so that there may be no doubt of the purity of the silver coinage.

EVERY week items and statements appear in this column that are written in response to requests for information. Space being limited, it is deemed better to answer private inquiries in that way than to print the questions or letters in extenso, and then the answer. To publish the letters received asking for such information every week would take two or three pages. Many of them are answered by mail, but where, in the judgment of "Concentrates," the matter is of sufficient public interest, a concise answer is published, thus carrying the same information to many others who probably want to know on precisely the same point asked about by the writer. This is intended to explain why, so often, trite statements appear in this column concerning matters well known already to a majority of our readers, but not so clearly understood by a large number of men who naturally look to this paper for such information.

THE Executive Committee of the Anti-Debris Association met in the office of the Sacramento Board of Supervisors last Wednesday. Some farmers from Colusa county attended. Manager Phipps and the watchmen as to the hydraulic mines in operation visited by them reported. Attorney Devlin reported that an order had been issued by the United States Circuit Court, returnable June 16th, calling upon certain Chinese to appear and show cause why they should not be punished for contempt of court for engaging in illegal mining at Moore's Flat, in Nevada county. The case of the Government against the North Bloomfield Mining Company, that was to have been heard last Monday, testing the constitutionality of the Caminetti act, was postponed for one week. A report from the Legislative Committee as to the present condition of the mining bill now before Congress, relating to building restraining dams in the Sacramento and Feather rivers, was read, and the committee adjourned until June 16th.

THE report of the London Stock Exchange for the year ending March 25, 1896, shows that during the year the membership was the greatest on record, being 3660 as compared with 3421 in the previous year, while the net income was £184,191 as against £122,275 in the year ended March 25, 1894. The company managing the Exchange is not registered under the limited liability acts, but the capital consists of 20,000 shares upon which £12 each has been paid. The dividend paid for the past year is £7 10s per share—a record figure which the present quotation of the shares on which £12 has been paid is no less than £195. A sum of nearly £30,000 out of the profits was also carried forward to provide for structural alterations contemplated. In addition to the capital above mentioned, there is an issue of debentures amounting to £350,000 bearing interest at 3½ per cent. This is to be increased by a further issue of £500,000, which is to be devoted to acquiring adjacent property and to so enlarge the Exchange. During the whole of the recent boom, the space at the disposal of the South African mining market was inadequate.

THE Mineral Land bill, which is expected to become a law before Congress adjourns, provides for an examining commission of twelve men, four of whom shall be residents of this State. The twelve are to be appointed by President Cleveland. At a meeting of the Executive Committee of the California Miners' Association, held in the rooms of the Union League Club in this city last Wednesday for that purpose, the names of four California miners satisfactory to the association were selected by the Mineral Land Committee for recommendation to the President. The four who head the list as preferred candidates are E. H. Benjamin of Alameda, John McMurray of Trinity, Mark B. Kerr of Calaveras and George D. McLean of Nevada. In addition the following names were also adopted: H. Vischer, San Benito; Chris Runckel, Placer; J. D. McGillvary, San Francisco; E. C. Loftus, Calaveras; J. M. Kendrick, Tuolumne; F. Van Leicht, San Francisco; E. B. Preston, Lassen; S. K. Thornton, San Francisco. These twelve names will be forwarded to Washington to-day by Jno. M. Wright, of the Mineral Lands Committee, and, coming with the endorsement of the association, it is presumed that their selection will have considerable weight with the President in making his appointments, in the event of the passage of the bill.

THE Western Federation of Miners at Denver this week decided to amalgamate with the American Federation of Labor, and will elect delegates to the convention of that body. The selection of a site for a home for invalid miners has been left to the Executive Committee. Congress and State Legislatures will be asked to aid in establishing the institution. By unanimous vote the meeting on the 18th adopted the following: Whereas, the dangerous and hazardous vocation of mining, notwithstanding the modern inventions and scientific appliances, is constantly resulting in the disabling and maiming of a large number of our fellow-miners, rendering them incapable of earning a livelihood and leaving them wholly dependent upon the charity of the world, we feel that the time has arrived when the combined efforts of the miners of the West can do something for the alleviation of the sufferings of our unfortunate brothers. The suitable home to be erected can be paid for by popular subscriptions and by donations from the various local unions. When a sufficient sum has been realized by this means, it is proposed to apply to the Congress of the United States and to our several State Legislatures for the appropriation of a sum of money equal to the amount collected. Therefore, be it *Resolved*, That it is the sense of this convention of Western Federation of Miners of America to empower its executive board to solicit public subscriptions and to receive private donations to be set apart in a fund to establish and maintain an institution in some suitable locality to be known as the Disabled Miners' Home. Old age, permanent injuries of any kind, incurable diseases or the dreaded miners' consumption will be sufficient to permit the entrance of any miner to the home. Resolutions were also adopted pledging the federation to free silver. The following officers were elected: President, E. Boyce of Idaho; vice-president, J. Leonard of Victor, Colo.; secretary-treasurer, W. H. Eddy of Butte, Montana; executive board, T. Graham of San Coulee, J. Maher of Butte, R. Thomas of Butte, J. Ramburn of Leadville, J. F. McDonald of Virginia, Nev., and F. Wolfe of Cripple Creek, Colorado.

# CALIFORNIA MINES AND MINERS.*

## Name, Character and Location of Mines in This State—Name and Postoffice Address of Owner, Superintendent or Agent.

Continued from last issue.

### HUMBOLDT COUNTY—Continued.

| Name of Mine. | Character of Mine..... | No. of Men Employed. | Location. | Name of Superintendent or Agent. | Address. |
|---|---|---|---|---|---|
| Salstrun's | Gold. | 3 | 1½ m W of Orleans Bar | Jonas Salstrun | Orleans Bar |
| Swan's Beach | " | 2 | Mouth of Redwood Creek | R. Swan, Owner | Orick |
| Stone Lagoon | " | ..... | 16 m N of Trinidad | Abandoned | |
| Ucellena | " | 3 | 7 m E of Orleans Bar | L. Nelson, Own | Orleans Bar |
| Union (Lower Red Bluff) | " | 20 | 16 m S mouth of Klamath | Gold Bluff M. Co.; A. Caswell, Supt. | |
| Witchpec | " | 4 | Witchpec | Wm. Lord, Own | Orleans Bar |

(To Be Continued.)

## A Rejoinder From Mr. Lang.

TO THE EDITOR:—When Mr. W. L. Austin of Denver accuses me (see your issue of May 9) of a desire to deprive him of the fruits of his inventive genius, or of inciting others to do so, he commits a most unjust and unmerited act, and one of a nature most unexpected by me. Mr. Austin knows very well that I have not trespassed in any instance upon his inventions, nor have I advised others to do so. The apparatus in use here at Keswick bears not the slightest resemblance to his inventions, nor does the process resemble that which goes by his name, as far as I have been able to discover. There is a tone of violence and bitterness about the gentleman's writings that has no place in a moderate discussion, and much less in one devoted ostensibly to the discovery of truth. The attack which he makes upon me is wholly unjustifiable, and I propose to discuss it until I have proved it to be so.

If the world has failed to render him the praise that is due to the eminent scientist, or if his discoveries have been usurped by others, or his rights as an inventor trampled on unwittingly, he has himself to blame, because he has for years posed as the possessor of momentous secrets, which he was not willing to divulge—except for a consideration—and has left the public in complete ignorance as to the nature of his claims. Two or three years ago, when writing the book "Matte Smelting," I thought I understood the so-called Austin process; but I now take the opportunity of acknowledging that I was wrong. I did not understand it. This process—or what the inventor terms such—has taken on a new form with each change of the moon. It has more colors than a chameleon, more lives than a cat. If "science is progress, progress change," as an eloquent metallurgist has said, then the Austin process is the most scientific method of ore reduction ever yet discovered, for its mutations are innumerable. First I heard of great things accomplished by a central-feeding arrangement, which I am told was soon abandoned. Then came peculiar methods of feeding the ore, unnecessary to recount, because they, too, have passed the way of all such devices. Then I heard of gas being burned in the tuyeres or in the charge. This failed to work a revolution in metallurgy, and next comes a peculiar provision by which the formation of oxides is to be curbed by burning coal oil in the tuyeres.

I have before me as I write a number of drawings and sketches—one in Mr. Austin's own hand, showing different contrivances, presumably illustrative of the Austin process. There is the cut of a blast furnace, or what I take to be such, exhibited with a big umbrella over it, for what purpose I know not, unless it be to indicate that it is warranted good in all kinds of weather. Then comes a cupola, fitted with an extraordinary contrivance—an inside tube, which promises great usefulness, for aside from its proper function, that of admitting the ore, it would serve to feed in lumps of ice, did the temperature get beyond control, according to the inventor's characteristic experience. Then we view a furnace couchant between two gas producers, one on either side, like a sportive young blade between two pretty girls on May day. This, I doubt not, represents the very highest development of the Austin process, or at least I will assume as much.

Now we have nothing like these at Keswick, nor, to be frank, do we desire to have. Furthermore, I have never advised the erection of anything of the sort elsewhere. How, then, can Mr. Austin claim that I have injured him? These metallurgical curios may have merit which would influence their adoption in some localities, and I would hesitate to say anything to their disadvantage. But here in Keswick they would be useless; the inner feeding tube, which prevents the ore from sticking to the walls, because our ore doesn't stick to the walls; and the gas flame in the tuyeres, for preventing the formation of oxides, because we wish to form all the oxides we can, and are bothered by not being able to form more.

Now, lest it be asked: why do you not tell how you do it at Keswick, and an answer not be forthcoming, I will give a short account of our method, premising that the whole story cannot be told in a few lines, and, furthermore, while I wish to tell it all with the utmost candor, there is considerable that I am debarred from telling, because it would conflict with my duty to the company. I cannot, for example, satisfy a natural curiosity about the value of our ores and products, the destination and further treatment of the latter, etc. I may at some future time obtain the sanction of the directors to the publication of more; but not at present.

There are no professional secrets at this works, because I never had any; but there are quite a number of original devices in use, some of which I have patent applications upon, but the most of which are at the disposal of whoever can make use of them. The smelting is conducted simply enough, and consists in charging a mixture of three kinds of ore, namely: sulphides, about four parts; oxides, two parts, and gold-bearing quartz, one and a half parts, together with foul slags and scrap matte, whatever may be on hand, and melting the mixture down with 2 or sometimes 3 per cent of coke, and sometimes a little wood. When the stack works badly or from inattention becomes encrusted along the sides, we feed extra matte and slag, and also when the tray, which takes the place of the crucible in other furnaces, gets choked. When the furnace gets considerably "out of whack," as the men say, we let down the bottom, which rests in slings, and clean out the shaft and start again, the loss of time in the operation being but a few hours, depending of course upon the amount of hammering that is required to loosen the chilled material. I find it far more economical to let down the bottom, than to attempt to remove the obstructions by barring from above or cutting out by feeding slags, etc., the latter process being exceedingly slow and taking days, instead of hours. This convenient construction seems not to find favor with Mr. Austin, who, I judge, prefers the fixed bottom at the present moment, his former preference for movable bottoms resting on jackscrews, as shown in various drawings and cuts above referred to, apparently having given entirely away before his dislike for the things which I advocate.

The slags which leave the furnace are drawn into large pots, holding about 1500 pounds each, and mounted upon four small wheels. These are run into a brick chamber, a hundred feet long or more, and suffered to cool there, while they travel slowly toward the far end, propelled by a hydraulic jack which moves the whole line the length of a pot at each stroke. The heat which is radiated from the cooling slag heats the air within the chamber to quite a high temperature—to about 500°, in fact—and this air is blown into the furnace as the hot blast. How efficient it is may be gathered from the preceding statement of the fuel consumption. The furnace shaft is rectangular in section and is 15 feet (180 inches) in length, being the longest furnace within my knowledge. Its width is 3 feet and depth to the tuyeres 7½, which is a little too much for convenience. Six feet deep would answer a little better. The walls of the shaft are constructed of brickwork, resting on a shallow steel jacket 12 inches high, which serves as a girder to sustain the various strains which exist in a furnace of this kind. The brickwork is kept cool by a system of water pipes embraced within the walls, which preserve it most effectually from corrosion, so that we have not had to replace a single brick yet in our work. The cutting cannot proceed deeper than the plane of the pipes in any event, and rarely goes so deep. Undue heating at any point can be discovered by the steaming of the pipes and the exact location found, when a little fine ore fed along the wall at that point will remedy the trouble. The men acquire great skill in caring for the furnace, and in competent hands there is no trouble at all.

I cannot compliment Mr. Austin on his treatment of the subject of water-jacketed furnaces versus brick ones, for it appears to me that he has entirely missed the important points of the matter. It is absurd to try to make out a clear case in favor of the one or the other, for each is appropriate to its own sphere, and the character of the work to be done will guide an intelligent choice. Whether the one or the other is chosen depends largely upon individual preference and experience. The gentleman cites the experience and the views of those who have abandoned the brick stack for the water-jacket, and declares that no one has yet done the opposite. Now, I do not care in the least for evidence of this kind; and I think that to cite it shows a dependence on the presumed popular notion which is not at all creditable. The whole world abandoning the brick furnace would be a terrible spectacle, but it would not deter me from building one at the first opportunity, provided that I thought it appropriate to the surroundings. Still, he who takes upon him the management of the brick furnace assumes labors to which the manager of the water-jacket is a stranger. The latter can sit in ease and security, fully confident that if he blows hard enough, and feeds plenty of coke, the way is clear. But the former knows full well that the fuel and wind that give his rival the peace that passeth understanding will cause the brick stack to fall, perhaps, a mass of ruins in short order. The influences that act to deteriorate the walls are, first, the action of the blast, that scores them to some extent; second, the chemical effect of the smelting materials, which fluxes away the brickwork; third, the mechanical abrasion of the descending charges; and, lastly, the liquefying effects of the high temperatures produced. Against all these the water-coolod iron surfaces are proof. The water-jacket resists not through its refractory nature, but by abstracting the heat from its neighborhood and transmitting it to the water on the outer side. It is an apparatus mainly for the quick transference of heat from its one surface to the other.

Brick walls, on the other hand, resist destruction not by the transmission of heat (conduction), which cuts small figure here, but by their peculiarities of chemical and physical composition. Having treated this subject more at considerable length in "Matte Smelting," I will not pursue it further here.

The combination which I have effected between water-jackets and brick walls has enabled me to save something in the cost of construction, for jackets of the size of this stack would be very expensive. I save perhaps three-fourths of the water which would otherwise be required for the jackets, as well as an unknown amount of fuel, the proportion of which can hardly be arrived at. It must be quite a quantity, however, for the small flow of water is hardly blood warm. Without desiring to boast about the matter, I should say that the success of this furnace depends chiefly upon the fact that it is a combination, embracing the good qualities of both the brick and the water-jacketed stacks, including the durability and safety of the latter with the heat-conserving qualities of the former. I am so well satisfied of the advantages gained by this form of construction that I never expect to employ any other.

We are smelting at this time from 125 to 140 tons of mixture per day, and effecting a concentration of about four tons of sulphide into one ton of matte, which is somewhat less than we expect to do in future, when our at present unsatisfactory propelling and blowing power is suitably increased. I use five ounces, or a little more, of blast, which is not enough for the best work, but is all I can get now.

It is difficult to believe in Mr. Austin's seriousness when he speaks so confidently of "the ease with which complex sulphides may be smelted." I have given much attention to this very operation, but have never found such material so delightfully easy to smelt, and never expect to. In common with most people who have attempted it, my experience has been quite the contrary, and I have no hesitancy in openly avowing it. I do not blame Mr. Austin's enthusiasm in the advocacy of a process which he has been foremost in introducing; I am only sorry that I cannot share it to the full. I should like to see the time arrive when every man would be his own smelter; when the walls would be placarded, "Smelting of sulphurets taught in ten easy lessons;" "Smelting made easy;" "Get your ore smelted while you wait," and other cheering announcements, and when the humble and necessary cookstove becomes an instrument not only for the satisfaction of man's inner wants, but an efficient means for the conversion of rebellious or refractory pay rock into current gold and silver. At such a time the incautious miner, going about the lower levels with his dripping candle, may approach too near the walls, and, setting fire by a mere touch the highly inflammable sulphides, may find himself enveloped in a conflagration that will bring to a sudden end his hardy explorations. But enough of this. Seriously, I for one never expect to set fire to the solid rocks by touching a match to them.

Enthusiasm begets enthusiasm. When I read how Mr. Austin resurrects dying furnaces by merely charging fine pyrites into their cold and hardly palpitating bosoms, I began to wish that my stack would show signs of a freeze, so that I might rush down and sift a few handfuls of the heat-begetting pyrites into the top, and then stand back and watch her "breeze up," as the men call it, while a crowd of perspiring furnace tenders stood by to admire and to say to each other, "Good Lord, but isn't he onto her tricks?" But all such pyrotechnics are beyond my sphere, and I shall never be able to see the elements melt with fervent heat—at least not in this manner and in this life. Smelting with me will always be a striving and a prayer, not for more light, but for more heat.

Now for definitions and classifications and Mr. Austin's criticism thereon. The gentleman finds fault with my introduction of new terms in general, and with the phrases "German system," "gradual reduction process," and "a practicable cold blast pyritic process" in particular. As to the general impeachment, I reply that I have been so bold as to propose to introduce a few novel terms and definitions into an art which sadly needs them. Perhaps there is no branch of knowledge whatever that is so hampered by the lack of comprehensive definitions and brief and clean-cut designations as metallurgy is to-day. Every other pursuit of a progressive cast has, within the last decade or two, been forced to extend, if not remodel, its terminology. And be it remembered, those votaries who have been bold in making the changes have been censured and even denounced for it. Our inheritance from the dark ages of traditionary terms, of inept designations and indefinite commonplaces, conveyed to us by the iteration of writers who were content to echo and re-echo the ideas of previous ones, does much to retard that progress which the age and our opportunities demand.

In an humble way I have endeavored to advance the ordinary conception of metallurgical processes by referring them to groups and classes based upon scientific differences. No classification worthy of the name can have any other basis than a scientific one, and this can hardly exist where concise and exact definitions are not found. That I have attained at least the merit of conciseness is shown by the fact that my phrase, "German system," covers a meaning which Mr. Austin, in assailing it as an unheard-of and unjustifiable innovation, could not define the process it represents in less than ten words. This process, I will remark, since the gentleman seems unable to recognize it, is the matte smelting in cupolas with coke as fuel. I call it German in recognition of its presumed origin and a system be-

cause it is more than a process. Can Mr. Austin object to the brevity of my definition, or can he defend the indefiniteness of his own?

In endeavoring to classify the different pyritic methods, I found a place for Mr. Austin's process, as I understood it, and thought I had done quite well. But now comes Mr. A., and with some asperity, as it seems to me, brushes it impatiently aside—classification, process and all—and proceeds to erect a new classification all his own. I am sure that, as far as the classification goes, he is welcome to use his own; I prefer mine. But what I want to know is, Where is the Austin process to be put? Has it a scientific basis which would entitle it to a place by itself? Or, if not, what are its fundamental distinctions? I recognized, or thought I recognized, a considerable difference between the ordinary pyritic smelting, such as I practice for example, wherein the ores descend in the ordinary manner down the shaft, getting hot and losing the sulphur gradually, and that advocated by Mr. Austin, who feeds the oxidizable material directly into the smelting zone without the preliminary heating and partial decomposition. And in recognition of the difference, I gave the name "gradual reduction system" to the former in contradistinction to the latter, wherein, if I have apprehended correctly, a more rapid oxidation is held to prevail. I am not particularly in love with the term, and if another more acceptable can be suggested—or still better, if my assumption that a sufficiently radical difference to justify such a verbal distinction exists is shown to be wrong—I shall be very glad to consign the name to oblivion.

Concerning the expression "a practicable cold blast pyritic system," there is much to be said. Mr. Austin makes believe that there is no pyritic smelting aside from that carried on by means of the heated blast. That he is in error there is abundant evidence to show. I can cite numerous examples wherein smelting is or has been carried on partly by the aid of the heat given out by oxidizing sulphides, cold air being blown. There is no radical difference between such smelting and the most extreme degree of pyritic smelting favored by Mr. Austin, the heating of the air not altering in any respect the chemical nature of the effects produced, but only intensifying them. There is no hard and fast line dividing the different degrees of pyritic smelting, for they are pyritic to some extent in all forms of matting in cupolas, as I have remarked in my book, the difference being in degree, not in kind. Since it has been found out that the cold blast is able to oxidize sulphides to a noticeable extent (and I believe I can conscientiously claim to have first pointed it out), a great many furnaces are run with special reference to the fact, and we hear frequently of examples of abnormally low fuel consumption, or, which amounts to the same thing, of improved concentration of the matte product of cold blast cupolas. As it follows that the pyritic effects are not confined to the furnaces blown with hot air, the most that we can recognize in this connection are the differences in intensity, not in kind; whence I argue that it is unphilosophical to attempt to draw a basal distinction between the hot and cold blasts. We should rather avoid these terms as conveying an indefinite impression to the reader, and endeavor to specify more precisely the temperature of the blast. A blast of 300° or 400° F. is not a hot blast, but it is comparatively beneficial in any cupola, and capable of intensifying pyritic effects in a remarkable manner. I need enlarge no further upon this point, as it is treated more exhaustively in "Matte Smelting." I will simply add that as to the phrase "a practicable cold blast pyritic process," I meant just what the words imply—a method of smelting wherein the fuel is economized and the product concentrated through the oxidation of sulphides in the ore. Such a process will be practicable wherever the operator has the skill, the apparatus and the ore to carry it out.

I will trespass no further upon your space at this writing, but I will, with your permission, use your columns in later issues in pursuance of the subject. Especially do I desire to investigate the question whether any one, for the sake of bolstering up a metallurgical process, has perverted the teachings of science and experience, used the public prints as a vehicle for unjust criticism, and, worse than all, has ascribed dishonorable motives to those who have labored honorably in the cause of metallurgy.

Keswick, Cal., May 16, 1896. HERBERT LANG.

---

THE following is a description of a safety hat for miners recently patented: "The shell and brim of the hat are formed of a single piece of sheet metal, and inside the shell is a lining or inner shell of suitable textile material, to the edge of which is attached a leather head band. The inner shell and band are somewhat smaller than the exterior shell, and air holes provide for a circulation of air. The band and inner shell are secured to the outer shell by a series of spring clips, the spring of which allows the band or lining to conform to the head. On the front of the hat is a socket plate to receive the hanger of a miner's lamp. The hat is very durable, is waterproof, will not absorb grease from candles or oil, and the lining may at any time be taken out without ripping or tearing it."

# Scientific Progress.

## The Cyanide Process at the Mercur Mine.*

By B. E. JANES.

The Mercur mine is situated in Camp Floyd mining district, Tooele county, Utah, about fifty miles southwest of Salt Lake City, in the south end of the Oquirrh mountains. From nine to twenty-five miles north and northeast are the silver-lead camps of Ophir, Stockton and Bingham.

Camp Floyd district produced in 1870 to 1874 about a million dollars in silver. The ore was a free-milling chloride in rich pockets and was soon exhausted. Cinnabar was discovered at that time in a vein overlying the silver deposit. No one suspected it to contain gold, which fact was discovered years after.

In 1890 some Nebraska men purchased the Mercur and spent thirty to forty thousand dollars in an attempt to amalgamate the ore in pans. It was a complete failure, only fifteen per cent of the gold being taken out. The ore was calcined at an incipient red heat and treated in the pans with a variety of chemicals.

THE CYANIDE MILL AT MERCUR, UTAH.

VATS AND TANKS IN THE MERCUR CYANIDE MILL.

ZINC BOXES IN THE MERCUR MILL.

In the spring of 1891 the MacArthur-Forrest people were advancing their claims, and Mr. Peyton took a carload of the ore to the experimental cyanide plant at Denver. The experiment was successful and they began treating ore in barrels at the mill. When sure of success five 7½-ton tanks were put in, and at intervals since additions have been made, till the present tank capacity is one hundred and sixty tons per day.

Mr. Peyton relieved Mr. Brown as superintendent in May, 1893. I was employed by him as assayer. Mr. J. J. Trimmer, who had worked in the mill from the start, was made foreman, which position he has held since. Mr. Trimmer is a very close observer and together we worked out his ideas. September 1, 1893, the first $25,000 dividend was paid.

In the fall and winter of 1894 a railroad was built to haul the ore from mine to mill, which had been done by teams. It is eleven miles long and is built from Fairfield station, on the Tintic branch of the Union Pacific, four and one-half miles to the mill and six and one-half miles more to the mine. Between the mill and mine it is very crooked, and as the train climbs the divide magnificent views of the Wasatch mountains and of Utah lake are to be had. The town of Mercur is situated in the gulch below the mine.

With this introduction I shall describe the ore and its treatment.

*The Ore.*—The ore is in a vein six to fifteen feet thick, which is conformable to the silver vein as well as to the adjacent limestone strata, and is a few feet to one hundred feet above the silver vein. The dip is 18° to 20° northeast. The footwall is a hard, blue limestone. The hanging wall is a lime shale, and blue limestone above that. The croppings consist of silica, with limestone and clay, and are so varied and peculiar that some prospector sees another "Mercur" in nearly every quartzite or clay stratum.

Between the walls of the vein occur so many kinds of rock, which contain more or less gold, that a description can give but a faint idea of the true character of the ore. Silica, in a form similar to silicious sinter, or geyserite, characterizes the ore. I have always found this kind of rock to contain gold. This form of the silica doubtless gave rise to the theory that the deposit was formed by an ancient geyser. Cinnabar is most abundant in this rock and forms beautiful incrustations in the cellular varieties. Wherever found in the district, cinnabar is considered a sure sign of gold.

Orpiment and realgar occur in large quantities in some of the ore. The fossils I have found appear to be Brachiopods. There is about as much iron as is usually found in impure limestone and clay. Barite and gypsum occur more or less crystallized; also masses of limestone are found mineralized in rings, the outside assaying $6 to $8 and the center a trace in gold. No free gold is visible in the ore, even with a microscope.

It is the general opinion now, I believe, that the present heterogeneous rock was formed by impregnating the shattered original limestone and clay by hot alkaline waters containing the silica and gold in solution.

One remarkable feature is the absence of silver. Assays of the product from thousands of tons fail to show a trace of silver, and so far as I know none has ever been detected. The highest value of the ore in large bodies is $30 to $35 per ton. The average of the ore milled is kept close to $12 per ton.

*The Mill.*—The mill is built on the site of the amalgamating mill.

The ore is delivered by the railroad to the ore bin, which is about 40 feet long, 20 feet wide and 20 feet deep.

A short grizzly is placed before the Dodge rock-breaker, with jaw opening 11x14 inches. The breaker crushes the ore down to 1½ or 2 inches. Beneath the breaker is placed a set of Wall's corrugated rolls, 12 inches in diameter and 24 inches long, which take all of the ore, crushing it to 1 inch.

The ore is then elevated to the revolving screen, which has four holes per square inch. The tailings from the screen go to another set of the same size rolls. The ore passing the screen falls into a bin holding about one hundred tons, from whence it is drawn into a car which runs on the tramway above the tanks. The tanks, of which there are thirty-one, hold from seven and one-half to twenty-five tons. The most convenient size for emptying and rapid work is 12 feet 8 inches in diameter—

*This article was prepared at my request by Mr. Janes, one of the mining students at the University of California, to be read before his fellow students. As much interest attaches to the work at this mine, I have thought the readers of the MINING AND SCIENTIFIC PRESS might appreciate the following brief abstract of his paper. The first notable success with the cyanide process in America was made at the Mercur mine. It is one of the successful attempts to work an ore directly by this method. The peculiar nature of this ore, as described in the paper, explains this success. It seems to be peculiarly adapted to the cyanide process.

Attention is particularly called to the great reduction in time which was brought about by allowing the solution to flow on the ore and then drain out again at intervals. This change has reduced the time of treatment to such an extent that the success of the process may be said to depend upon the new method. Such a treatment, however, would pack most ores so that they would not filter. There are many other comments that might be made, but this is, perhaps, not the time to make them. S. B. CHRISTY.

holding fifteen tons. They are made of No. 10 or No. 12 sheet iron, and have bottoms of 3-inch redwood. The false bottom is of 1-inch pine, with a hole bored in every square inch. The filter cloth is burlap and lasts four to six weeks. Strips of quarter-round iron are tacked down 6 inches apart, to protect it from the shovels. The solution is drained from the ore into sheet iron launders, represented on the plan by dotted lines. They carry it to the tank, from whence it is pumped by Blake single-acting pumps to the tank in the precipitating room. From there the solution is run through the precipitating boxes to other tanks, and from there goes back on the ore. The zinc or precipitating boxes are 24 to 36 inches wide, 10 to 12 inches deep, and about 20 feet long. Partitions of 1-inch pine are placed 12 to 20 inches apart. Alternate partitions are caulked with oakum on the sides and bottom, so the solution passes over the top of one and under the next, and so on. A small tank is used to settle the gold slimes, whence it goes to a box in which the product is placed to drain. Two 12-inch swing lathes are used to turn the zinc shavings.

*The Process.*—Water disintegrates much of the ore into mud, so that fine crushing is not necessary, and in fact would be a disadvantage, largely increasing mechanical difficulties, with only a slight increase in extraction.

Being crushed coarse, the coarse and fine parts tend to separate when the ore is dumped into the tanks. After dumping three or four carloads of ore the charge is leveled, mixing it some, but unfortunately causing it to pack more.

*Treatment with Solution.*—Formerly the solution was kept running through the ore continuously, the ore being kept constantly covered until it was finally drained. Mr. Trimmer and I experimented and found that by alternately covering the ore with solution and allowing it to drain, and repeating this operation about every three hours for eighteen to twenty times, higher results were obtained in one-third to one-half the time required by the old method. This reduced the leaching time to fifty-five or seventy hours, the time depending much on the ability to handle the solution rapidly. After passing through the ore once the solution is each time run through the zinc boxes and the gold precipitated. About four hundred pounds of solution per ton of ore are required for each saturation. By the old method the solution was often allowed to stand in the ore several hours, and as high as ten days were consumed in treating a charge.

Two reasons are suggested by Prof. Christy for the difference in results. The alternate saturation with solution and then draining draws the solution out of the interstices of ore, which, on account of its clayey character, had been done imperfectly; and oxygen, which seems to be essential to the solution of gold in cyanide solution, is supplied in greater abundance. After the last solution the ore is covered once with clear water, which is run into the stock solution to maintain its volume. At one time two or three wash-waters were used, but were discontinued in favor of an additional solution.

*Strength of Solution.*—A solution containing one-tenth to three-tenths per cent pure potassium cyanide is used. The strength is determined with a standard solution of silver nitrate, preferably 13.07 grammes per litre of water. One c. c. of this solution will equal ten mg. of potassium cyanide, or one c. c. of a one per cent potassium cyanide solution.

Potassium bichromate is a good indicator.

The strength of the solution can be very accurately judged from the action in the "zinc" boxes, and by its alkaline feel.

For standardizing the solution the cyanide is added at the lower end of the "zinc" boxes, the judgment of the operator determining the time and amount.

*Consumption and Decomposition of Cyanide.*—The consumption has been reduced from over one pound to one-half pound per ton of ore. A dilute solution gives as good extraction as a strong solution, and saves cyanide, though an occasional strong one is used to completely precipitate the gold.

Arsenic, except in slight amounts, is very detrimental and fouls the solution, which gives off a peculiar odor. At one time the Marion mill in the same district used shavings turned from zinc, which contained arsenic, with disastrous results. The solution gave off a strong odor and but little gold was dissolved or precipitated. If at any time a strong hydrocyanic acid odor is noticed, something is wrong.

*Precipitation.*—Close observation and careful work are very essential to good precipitation; also, the character and condition of the solution can be accurately judged from the action in the zinc boxes.

The shavings for precipitation are turned from sheet zinc. A half-dozen sheets are tightly wound on the mandrel of the lathe and soldered down. The shavings should never be the least wiry.

They are placed in the first six or eight partitions of the zinc boxes, to start with. They fall to pieces and occupy considerable less space as the precipitation goes on. They are then moved toward the head and fresh shavings take their place, and should remain uncolored at the lower end about one hour. The shavings are chemically very active. Solutions containing no gold color them black after a time, and, if many other salts are present, the action becomes vigorous and their efficiency as a precipitant is lessened and a longer time practically destroys them. Water impregnated with carbonates also has a bad effect.

If, at any time after precipitation has begun, the damp shavings are allowed to stand even in a small amount of water or solution, a vigorous chemical action goes on and they soon become very hot. They are then of little use in precipitating gold.

From solutions containing less than one-tenth per cent potassium cyanide the gold is not all precipitated, and more time and zinc are required. Our experience seems to indicate that a certain amount of free potassium cyanide is necessary for a healthy action on the zinc. The solution from the ore assays $2 to $3 per ton, and the solution, after the gold has been precipitated in the "zinc" boxes, fifty cents to five cents per ton. The assay is made by evaporating five or ten assay tons with litharge in a small evaporating dish and fluxing in a crucible.

*Cleanup.*—Once a week the boxes are cleaned up; all the product in the first and possibly second partitions is taken out, if no coarse metallic zinc is seen. It has a honeycomb structure and should have a crisp feel, crushing to a gray-black slime. The rest of the zinc is washed in the solution remaining between the partitions, through about a No. 12 screen. The zinc failing to go through is returned to the box when the latter is cleaned. When the zinc is washed the partitions are knocked out and the solution, with suspended slime, is run into the slime tank beneath the precipitating room. The screenings are scooped into a tub and the box swept clean with water and the partitions caulked in again.

The slime in the slime tank is settled, the solution decanted off and the product and slime dried in an old retort built for the amalgamating mill. It is about 20 inches in diameter and 5 feet long and holds from 120 to 140 pounds of dried product.

The door of the retort is closed, but not luted, and the retort heated for three or four hours to a dull red. At about 150° C. or 180° C., the product ignites and produces a fearful lot of fumes of mercury, arsenic, cyanogen compounds, etc. They sometimes cause salivation and always headache. Some of the men attempt to counteract the evil effects with whisky, but it refuses to stay down. This "gold cure" is only temporary, however.

After heating, the retort is allowed to stand four to six hours and the charge drawn upon a sheetiron table, where the burning is completed.

When cool, it is sampled and sealed up in the zinc cans in which the cyanide is received and shipped to the Omaha and Grant Smelting and Reduction Company, Omaha, Neb. The reason for burning the product is that compounds in it which interfere in an assay are driven off with a loss in weight less by several per cent than the increase in assay value, and attended with very slight loss in the operation. The product assays from 1500 to 2000 ounces gold per ton. Beside the zinc and cyanogen compounds, it contains considerable slime from the ore. The tailings from $12-ore assay about $1.75, giving an extraction of 85 per cent.

## River Mining, in the Present or Future.

TO THE EDITOR:—It was in October, 1848, that echoed over the civilized world the fact of gold in California, and from that day to this the declaration has been verified by the production of $1,300,000,000. When the fact of this discovery of gold in California was first announced, the multitude doubted the reliability of the accounts, and they were only drawn into the whirlpool of adventure after the more enterprising had proved beyond all doubt that California was a land of gold. In these earlier days the rivers were loaded with it, and, in consequence, labor was worth from $10 to $50 per day, with many refusing to work at that. And why? Because they could make from $10 to possibly $500 per day, and this by washing the river margins and crevicing among the rugged rocks. The bars were all a source of great profit. Wing-damming the rivers were the larger operations of the time, and these were in special localities, and what man could not do with his hands and physical strength was left undone. Since these earlier days the rivers have been more or less worked, but mainly along shore, and until now there is but a scanty reward for manual labor. The consequence of this is that labor, not being able to control mechanical appliances, whereby the reward would be greater, has fallen year by year, until now it can be rated as low as $1.50 per day.

But a new era is before all, and with it should come more profitable employment for the many and also a large output of gold. This is in re-working the rivers by machinery. What was left undone in the earlier days, in consequence of having to depend on manual labor at a high rate per day, can now be done by the introduction of machinery and the various mechanical devices applicable thereto. In saying this, I will say I have some idea of what river mining is. I have a few thousands laid away in them; but this was in the days of high wages and manual labor. Between the two periods there is no comparison. This is a new age, new appliances, new ideas and more progressive ones. The main purpose of this article is to call attention of the enterprising to several stable facts.

First.—That along the gold-bearing streams of California are many localities that from certain causes have never been cleaned of their virgin gold deposits—causes which were formidable in the earlier days, but easily overcome by machinery and nerve at the present time.

Second.—In all the rivers, independent of the free gold that may be had in larger or smaller quantity, is the "black sand"—magnetic iron—that can be gathered, and in some places in large quantities. From the pioneer days to the present but little attention has been paid to the gathering of these sands, and yet it is well known that it all contains more or less gold, some of it having a high value per ton. Some seventeen years ago in the MINING AND SCIENTIFIC PRESS was published several articles on this subject, and in some I gave the yield per ton of many tests. It is safe to say that the "black sands" of the rivers have a gold value, if properly concentrated, of from $10 to $100 per ton. The rivers now not only contain the "black sands" of the pioneer days, but about all that has been washed into them from the hydraulic mines. To my mind, the gathering of this "black sand" with its accompanying gold, with suitable machinery for handling the body of sands on a large scale, can be made a profitable and expansive industry and would give employment to a very large body of men.

The third proposition is the associating with this river mining the elevating of the low lands with the debris of the rivers. The sands once raised for separating the gold and "black sands" could, by a system of sluices, be carried on to given localities, and the unproductive low lands be made valuable grain lands. It is clear to see that in handling the river sands by machinery, and for the purposes as stated, that the question of hydraulic mining is solved, and the solution, if carried into effect, means a million a month in gold from this source alone.

When we stop to consider the whole, and study the question of the yield of the precious metals from the working of the rivers, the starting of all the hydraulic mines, and the making of grain lands of the now unproductive low lands, why it seems that it is too important an enterprise to lay inactive much longer. The elevating of unproductive low lands into productive grain lands means a great deal for the State, and not for a year, but for all time. This enterprise inaugurated, we could say to the hydraulic miner, go to work and send down your gravel and your gold. This is to my mind all within the range of possibilities. It simply wants money and brains to carry it out. The matter of miles of ditches and flumes for carrying the debris to the low lands is of but little moment when the great riches to be gained are considered, by encompassing the three propositions into one syndicate, and also when we consider the advantages of electric power for handling large machinery along the streams. This, of course, is simply an outline. Mechanical and engineering skill will fill the details, while capital becomes an important factor. That it is an enterprise of the future if not of the present, and on a large scale, as it is now on a small one, in some localities, is as sure as that time passes.

It is a field in which could be employed all the surplus labor of the State, for their comfort, and a fair reward for capital.

ALMARIN B. PAUL, M. E.

San Francisco, Cal., May 20, 1896.

---

RECENT investigations pursued by Margot make it appear that an alloy composed of ninety-five parts of tin and five of zinc melts at 200° C., and becomes firmly adherent to glass, and, moreover, is unalterable and exhibits a metallic lustre. He has further ascertained that an alloy consisting of ninety parts of tin and ten of aluminum melts at 390° C., becomes strongly soldered to glass, and is possessed of a very stable brilliancy. With these two alloys it is possible, it is claimed, to solder glass as easily as to solder two pieces of metal, and this operation may be done by "sweating" the pieces of glass, when heated in a furnace, by rubbing their surface with a rod of the solder, the alloy as it flows being evenly distributed with a tampon of paper or a strip of aluminum—or an ordinary soldering iron can be used for melting the solder.

---

THE longest distance that a shot has been fired is a few yards over fifteen miles, which was the range of Krupp's well known monster 130-ton steel gun, firing a shot weighing 2600 pounds. The 111-ton Armstrong gun has an extreme range of fourteen miles, firing a shot weighing 1800 pounds, and requiring 960 pounds of powder. These guns, however, proved too expensive, being unable to stand firing one hundred times, and their manufacture has practically been abandoned. The 22-ton Armstrong gun hurls a solid shot for a distance of twelve miles, and the discharge of the gun can not be heard at the place where the ball strikes.

# Electrical Progress.

## Sacramento-Folsom Electric Transmission.

(Continued from page 413.)

ating under a head of 55 feet. The steel penstocks are 8 feet in diameter and each wheel has two draft tubes. The governors are of the Faesch-Picard type, and these are assisted by heavy flywheels, fitted to the water-wheel shafts. The hydraulic plant also includes two special horizontal wheels for the exciters. The water, after having passed the turbines, is discharged into a tail-race canal, which will distribute water for irrigation over the country south and west of Folsom.

The power house is a two-story brick building. The water wheels are placed in the open air between the forebay and the wall of the structure, through which the turbine shafts pass. To each shaft is coupled a 750 K. W. (100 H. P.) General Electric three-phase generator—the largest of their type yet constructed. Each is a 24-pole machine, delivering current at 60 cycles, 800 volts, and running at 300 R. P. M. The exciters are 4-pole 500-volt 30 K. W. generators, either one of which is of sufficient capacity to excite the fields of all four generators. From the generators the current passes to the generator switchboard, and thence to nine step-up transformers in the upper story of the power house. The capacity of each transformer is 250 K. W. They are cooled by an air blast from blowers driven by induction motors. In these transformers the pressure is raised from 800 volts to 11,000 volts, and the current passes to the high tension transmission lines carried out of the power house through porcelain lined holes in the wall.

The switchboards are so arranged that the generators may be run in parallel or on separate lines, as may be desired. The generator switchboard carries the necessary switches, instruments and other apparatus for synchronizing the generators. The boards in the transformer room carry switches for the high and low tension sides of the transformers and switches and current indicators for the transmission lines.

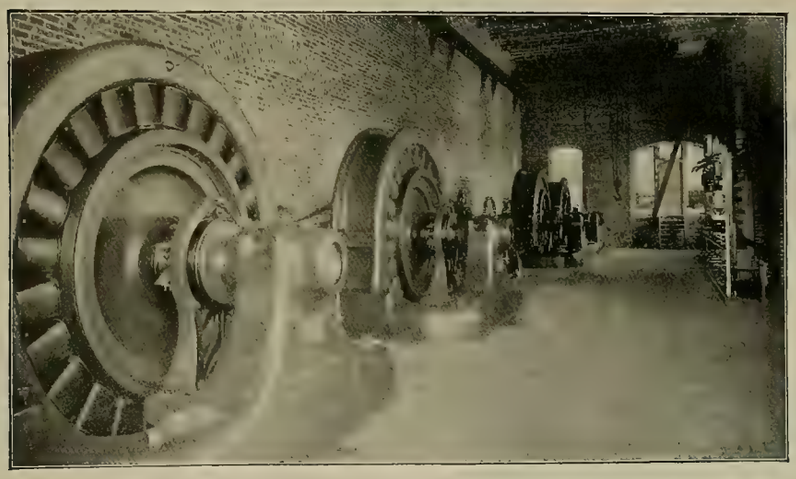
The pole line is double throughout, and follows the highroad from Folsom to Sacramento, a distance of twenty-four miles. Each pole carries two cross arms for two circuits, each circuit consisting of three bare copper wires supported on double petticoated porcelain insulators, especially designed and made for this installation at the porcelain factory of the General Electric Company at Schenectady. Each insulator before shipment was exposed to a test of not less than 25,000 volts, alternating. Each circuit can carry the output of one dynamo, and any dynamo can be thrown on any line. The loss is calculated 7.5 per cent when transmitting 3000 H. P.

The telephone line is carried on the same pole as the transmission line, and connects the power house with the sub-station in Sacramento. The transmission lines being spiraled every mile, and the telephone wire transposed every fifth pole, no induction is noticeable on the telephone circuits and conversation is not in any way interfered with.

STEP-UP TRANSFORMERS SHOWING AIR-BLAST EQUIPMENT AT FOLSOM.

The sub-station is a fireproof, two-story brick building on the corner of Sixth and H streets, Sacramento, having the transformers on the second floor and the dynamo room on the ground floor. In the transformer room the high tension switchboards receive the terminals of the 10,000 volt lines and operate the different combinations of the step-down transformers. These transformers, also ventilated by blowers, vary in size according to the duty required of them, the secondaries delivering current at 125, 500 and 1000 volts. They number twenty-one, fifteen of 125 K. W. and six of 40 K. W.

The transformers are connected to high and low tension switches on the boards, and from these the current passes to the distributing boards for the synchronous motors, power circuits and incandescent lighting. In the main or dynamo room of the sub-station a line shaft runs the entire length. To this are directly coupled, through friction clutches, three synchronous motors, each of 250 K. W. capacity, wound for a potential of 500 volts and run at a speed of 450 revolutions. To the line shaft are belted one 200 K. W. and one 90 K. W. multipolar General Electric railway generators, and two 100 K. W. Edison bypolar machines, all of 500 volts, and three 100-light and two 75-light Brush arc machines.



In this room are also the switchboards for controlling the synchronous motors, the railway generators and circuits and the arc dynamos.

For the operation of the synchronous motors 750 K. W. of transformer's capacity is utilized, the balance being used for low and high tension distribution. The low tension current is distributed by a three-phase four-wire system, combining the three-phase and Edison three-wire systems, i. e., three wires for the three-phase current and a fourth or neutral wire. Incandescent lights are connected between the neutral and any one of the three other wires, while motors are connected to the three-phase wires, giving at the mains 115 volts for lamps and 200 volts for motors. The feeders for this extensive system pass from the sub-station through a distributing switchboard, which carries potential regulators for maintaining constant pressure at the mains. Additional circuits run from the sub-station at 500 and 1000 volts, supplying current for lights and motors in the more distant parts of the city.

Power was transmitted for the first time from Folsom to Sacramento on July 14th, 1895, for the operation of the Sacramento street railway. On September the 9th a grand carnival was held to celebrate what up to the present is the longest commercial power transmission ever effected. The balance of the machinery has since been set up and the installation is now complete.

The power transmitted is now being used for manufacturing purposes, as well as for lighting the city and running the street cars. The power is stated by the company to be much cheaper than that generated by steam. Among the establishments now using the power are flour mills, box factories, machine shops and hotels.

The largest consumer is the street railway, which over its twenty-four and one-half miles of single and seventeen miles of double track operates thirty-two motor cars and trailers. The Southern Pacific Railway shops employ a large number of motors for drawbridges and elevators in freight sheds. The Buffalo Brewing Company is about to install five non-synchronous motors to replace steam engines which have been in use for years, and expect to save 40 per cent of the present cost of operation by the change. The entire equipment was carried out by the

General Electric Company, whose apparatus is exclusively employed.

This plant is a complete illustration of the possibilities of electric transmission, every problem to be met with in transmitting power over long distances at high potentials and utilizing it having been solved successfully.

The best indication of this success is reflected in the value of the interest paying obligations, the bonds of the Sacramento Electric Light and Power Company finding ready purchasers at par, although the plant has been in operation less than one year.

# Mechanical Progress.

### Tesla's New Electric Light.

A New York despatch says Nikola Tesla has solved the problem which he set before himself years ago, and which may revolutionize the system of electric lighting. It is thought to be the nearest perfect adaptation of the electric current for light uses. In his laboratory is a bulb three inches in length which, when the current is turned on, becomes a bulb of light. With it a large room is lighted so it is possible to read in any corner. This is done without the attachments necessary in existing lights. The rays are so strong that photographs may be taken by them. No new dynamo is required to produce the current. As compared with the incandescent light the Tesla bulb gives a greater per cent of light. The principle of the light is vibration. Illumination is secured by the means of what Tesla terms a vibrator within the bulb, which holds the vibrating needle within a vacuum. The needle vibrates so rapidly that the figures per second sound imaginary, but it is this intensity of energy which gives the light its brilliancy and its apparent steadiness.

### Around the World in Thirty Days.

When the trans-Siberian railway is completed, in 1900, it will be possible for a traveler to encircle the globe in thirty days. Over the new route the human projectile can be in St. Petersburg forty-five hours after leaving London, and 250 hours will see him in Port Arthur. A Russo-American steamship company now in the course of formation will land him in this city seven days later, whence he can proceed via New York to London in about ten days more. The price of the round-trip ticket need not be over $400, and might be as little as $250.

A WELSH newspaper, in discussing the subject of tin roofs, brings to public notice the singular fact that while Great Britain has for years made this material for the world, the tin roof is entirely unknown in England. The Welsh know next to nothing about methods of putting on a tin roof, and those interested in introducing the use of Welsh tin plates for roofing English homes have in contemplation the importation of an American tinner to introduce American methods of using terne plates.—American Manufacturer.

A FRENCH scientific periodical announces that the operation of tanning may be greatly hastened by passing pure hydrogen, or hydrogen mixed with a certain quantity of arsenic, through the fluid in which the hides are immersed. The gas is obtained either from the action of commercial sulphuric acid upon zinc or iron, or from that of steam upon iron, the calculation being, in fact, that in this case the hydrogen obtained will contain a sufficient quantity of arsenic.

IT is pointed out by Dr. Colman Sellers that one of the most notable examples of ball-bearings, now growing in vogue, is the diminishing of the friction of a collar sustaining the hooks of a large crane. Thus, by making the crane hooks with flat washers, between which numerous small balls are placed, resting upon hardened surfaces, there seems to be no difference between the friction of rest and the friction of motion, and hooks heavily loaded are turned with remarkable ease; in fact, the use of balls distributed over plain surfaces is becoming a settled practice, there being no basket or grooves to separate the balls, as the latter are allowed to move at their own tendency—that is, in whatever may be their inclination. As to the size of the balls adapted to different purposes, various experiments show interesting results. In the case of hooks for cranes carrying about fifty tons, between 250 and 300 balls, each of ¾-inch diameter, are scattered between the flat plates, on the assumption that the more points of contact the more lasting the balls; but some tests made with balls of different sizes, and motion kept up under loads to determine their durability, favor larger balls and fewer of them.

RAWHIDE gearing is now used on quite a variety of machines, and gives out a soft purring sound, instead of the almost deafening roar often heard in a mill or factory. The material is more like horn than leather, retaining a certain toughness, which allows the cogs to bend slightly. Lubrication is said to be entirely unnecessary. Such gearing has been tried on street railway motors and appears to stand the test.

# Practical Information.

### Cast Iron Versus Steel Pipe.

In summarizing the report of the expert commission on the Cincinnati, O., water supply in our issue of March 28th it was stated that in estimating the cost of a conduit six miles long, 78 inches in diameter, the commission found that a cast iron pipe would be cheaper than one of riveted steel. We have since received the exact figures showing how this conclusion was arrived at. The fall on this conduit varies between 52 feet and 22 feet, with the level of the water in the high-level roservoir. Before computing the size of the pipe careful tests made on a double line of 60-inch cast iron pipe 4952 feet long, on which velocities up to 2.72 feet a second could be obtained, showed that a coefficient of 123 in the Chezy formula was proper for that size, and accordingly a coefficient of 126 was apopted for the 78-inch main. The cast iron pipe was estimated on the usual lengths of 12 feet, with bell and spigot joints; the iron to have a tensile strength of 18,000 pounds per square inch of section. The steel riveted pipe was estimated in 8-foot lengths, with butt joints and single covers; the transverse seams to be single riveted and the longitudinal seams double riveted. Rivets were to be countersunk on the inside of the pipe, with button-set field heads on the outside. The material was to have a tensile strength of 55,000 pounds per square inch. The steel riveted pipe was further estimated upon the basis of punched, reamed and countersunk work. In either case it is estimated that the conduit pipe will be free from any unusual obstructions upon the inside, and in estimating the flow through cast iron and steel riveted pipe Kutter's formula was employed, with the coefficient of roughness $n=0.013$. In making their estimate there are some items common to both plans, the differing items being, for the iron pipe, 23,843 tons of cast iron pipe at $24 per ton; 32,571 lineal feet pipe-laying at $4 per foot, and six blowouts at $110 apiece, against 17,806,624 pounds of riveted steel conduit at 5 cents per pound, and eleven blowouts at $60 apiece. The difference of these items comes to $187,089 in a total cost of $1,045,183 for the cast iron and $1,232,272 for the steel. This is estimating the steel riveted pipe at $27 per lineal foot.—Engineering Record.

IN the *University of California Magazine* Charles H. Shinn, in writing of the lavish way in which the best parts of California forests have been cleared away, states that in the Comstock mines alone enough timber has been used to build all the houses needed for a city of 50,000 inhabitants. He has seen the bottom of a canyon crowded for miles with the trunks of pines, from each one of which a few flume blocks or a log of butt timber had been cut, while the remainder was left to decay. Not to mention the thousands of acres of the most magnificent coniferous timber known to man destroyed by fires which have burned out the soil itself into great pits, it is stated that the waste of timber in the redwood districts has been even more appalling than it has been in the Sierras. More than once the world's record for the number of feet cut in the day has been broken by some one of the sawmills of the coast redwoods. So much lumber is still produced by rival mill men that it has not paid for cutting, and some of the large California firms of lumber men have become bankrupt. Enormous trees that represent from 800 to 1000 years of symmetrical growth have been sawed up with no profit, or with actual loss, when, if they had been left to stand a few decades longer, the profit might have been $1000 an acre. At the time of the American occupation of California the forests covered perhaps 50,000 square miles. Half of this has been cut over or is inaccessible, or consists of species of less value than those which have heretofore been cut. It is often asserted that California still has 20,000,000 acres of magnificent forest land, but the truth is that there is left hardly 15,000,000 acres, and much of this has been cut away.

THE scourge of domestic animals known as the tsetse fly—including six species—has been one of the most formidable obstacles to the settlement of Equatorial and Southern Africa. It swarms in hot, low lands along the river banks, eagerly sucking the blood of man and animals, and in horses, dogs and cattle, setting up a wasting fever that is almost invariably fatal. On man and wild animals no effect is produced beyond temporary irritation. The Natal government, through Surgeon-Major Bruce, has at last sought out the cause of the mysterious fly disease, or Nagana, as it is called by the Zulus, and finds it to be due to the presence in the blood of a flagellated infusorian, very closely resembling the hæmatozoon, described by Dr. Lingard as the cause of "horse surra," a disease of horses—but not of cattle—in India. The flies inflict no injury on a healthy dog, unless they have previously drawn blood from a diseased animal. Where the flies obtain the parasite, except in diseased animals, which are not known in a wild state, has not been determined. but the fact that animals safely cross the fly-country at night, when the flies are at rest, goes to prove that the disease is not transmitted in the air. Arsenic seems to have so marked an effect that it is expected to serve as a preventive in future. Dr. Bruce confirms an overlooked observation—that the flies are viviparous—a fact which, it is pointed out, makes necessary a continuous supply of blood, if this is their only food, and explains the disappearance of the flies with the retreat of the large game.

GENERALLY speaking, the age of a boiler is by no means a criterion of the boiler's safety. Boilers often explode when brand new, and, on the other hand, they often do faithful service when old enough to vote. It is a good plan, though, not to place too implicit reliance on them when they get very far along in years. These remarks are called forth by a recent boiler explosion in the South, in which subsequent investigation showed that the boiler was thirteen-handed! It was thirty years old and had been sold twelve times. The last owner had been using it only a few minutes, when it blew up and killed him.—The Locomotive.

A SMALL piece of candle may be made to burn all night by putting finely-powdered salt on it until it reaches the black part of the wick. A small, even light may be kept in this way.

### Prof. Langley's Aerodrome.

The first public statement regarding the flying machine experiments conduct by Prof. Samuel P. Langley, the secretary of the Smithsonian Institute, is made with the authority of Prof. Langley. He has been guarded about the experiments, and the account of his latest attempts with the flying machine, embodied in the following statements prepared by Prof. Alexander Graham Bell, is published with the sanction of Prof. Langley, and is of interest:

On May 6th, I witnessed a very remarkable experiment with Prof. Langley's aerodrome, on the Potomac river. Indeed, it seemed to me that the experiment was of such historical importance that it should be made public. I should not feel at liberty to give an account of all the details, but the main facts I have Prof. Langley's consent for giving you, and they are as follows:

"The aerodrome or 'flying-machine' in question was of steel, driven by a steam engine. It resembled an enormous bird, soaring in the air with extreme regularity, in large curves, sweeping steadily upward in a spiral path, the spirals with a diameter of perhaps 100 yards, until it reached a height of about 100 feet in the air. At the end of a course of about half a mile, when the steam gave out, the propellers which had moved it stopped, and then, to my further surprise, the whole, instead of tumbling down settled as slowly and gracefully as it is possible for any bird to do, touched the water without any damage, and was immediately picked out and ready to be tried again.

"A second trial was like the first, except that the machines went in a different direction, moving in one continuous gentle ascent as it swung around in circles like a great soaring bird. At one time it seemed to be in danger as its course carried it to a neighboring wooded promontory, but apprehension was immediately allayed as it passed twenty-five or thirty feet above the top of the highest trees there, and then, ascending still farther, its steam finally gave out again and it settled in to the waters of the river not quite a quarter of a mile from the point where it rose. No one could have witnessed these experiments without being convinced that the practicability of mechanical flight had been demonstrated."

Prof. Langley also makes a supplemental statement, giving some data regarding recent experiments:

"The aerodrome, or flying machine, has not gas to lift it, as in the case of a balloon, but, on the contrary, it is about one thousand times heavier, bulk for bulk, than the air on which it is made to run, and which sustains it somewhat the way in which the thin ice supports a swift skater. The power is derived from a steam engine through the means of propellers, but owing to the scale on which the actual aerodrome is built, there has been no condensing apparatus to use the water over and over. Enough can be carried for only a very brief flight, a difficulty which does not belong to a larger machine than the present example, in which the supporting surfaces are but about fourteen feet from tip to tip. The distance flown each time was about half a mile. The rate of speed depends (as in the case of any vehicle on land) on whether it is going on a level or up hill. In the case of this last trial, on May 6th, the machine was ascending, that is to say, it was going up hill all the time, and went through a distance of one-half mile or more in one and one-half minutes, or at the rate of a little more than twenty miles an hour."

A NEW secondary storage battery has been patented for locomotion purposes, in which the liquid forming the electrolyte, while having free access to the plates, is contained in a suitable absorbent to prevent the free movement of such electrolyte. This corresponds in second batteries to what is known as the dry battery in primary cells.

# Mining Summary.

## CALIFORNIA.

### Amador.

At the South Eureka mine the shaft is down to the 1250-foot level and a station is to be cut as soon as the sump is sunk.

The *Republican* says: Chas. W. Haskins, who bonded the Wheeler gravel mine, together with the Chandler claim adjoining, has determined to forfeit his bond. He paid $5000 on the Wheeler and $1000 on the Chandler claim. He also expended $9000 or $10,000 in fitting up and working the claims. After what was considered a fair test, the yield fell below expectations and he determined to stop. The mine is thought to be rich. Before purchasing, a small test was made which yielded handsomely. The ground seems to be pocketty. He has ordered all the pipe to be taken up and it will be shipped back to San Francisco.

J. G. Mayborn & Co. are working on the Lighthouse property, near Big Bar bridge. They have started a tunnel from a point near the river, and expect to tap the ore body after reaching a distance of 230 feet, at a depth of 150 feet from the surface. They have already run 40 feet. The ore is low grade, said to average $4 a ton.

The shaft of the Zeila is in bad shape. It is expected another shut-down will be necessary next fall in order to repair the shaft. The directors are considering the question of sinking another shaft.

The Anita and Alma shafts are still in hard rock.

The Argonaut shaft is in soft gouge. Sinking will be continued until they reach harder ground.

T. W. Jeffries, superintendent of the Oleta drift mine, reports to the *Record* office considerable activity in mine development in Oleta district. At his mine, located on Loafer Hill, the hoisting plant is completed and an incline sunk from the surface to the bedrock, a depth of 90 feet, which taps the channel. A tunnel has also been run a distance of 125 feet to the bottom of the incline, which drains the mine. A crosscut has been run across the channel a distance of 70 feet, the pay gravel being about three feet in thickness and prospects an average of 3 cents to the pan.

### Butte.

At the Golden Summit a drift is being run on the 300-foot level. At present ten men are at work. The snow is reported to be 15 feet deep. As the season advances the present force will be doubled.

### Calaveras.

The Utica mine is now running 186 stamps: the ore mills $15 per ton, free gold.

George C. Tryon of Angels has sold to the Thorpe Mining Company for $11,000 a one-fifth interest in the Thorpe quartz mining claim, together with a ditch and water right, conveying water from the South Calaveras to the mine.

A twenty-stamp mill is to be erected on the Thorpe mine, near San Andreas.

The ten-stamp mill on the Rose Hill mine, near El Dorado, has been started up.

### El Dorado.

The Boulder Mining Co., sixteen miles southwest of Placerville, are re-opening an abandoned property. One old tunnel 700 feet in length, and another of 300 feet, are in perfect working order. A new one is over 300 feet, and being continued. A contract has been let for a 10-stamp mill.

G. W. Harvey of Shingle Springs, is authentically reported to have sold the Pyramid mine under two years' bond, to C. B. Rixford and Mr. Gilman of Santa Rosa for $80,000.

The Starlight Co., are erecting a 10-stamp mill on their property seven miles west of Placerville. It is said to be a matter of. record, made by J. Ross Browne, that thirty years ago this was an extraordinarily rich property, three tons of ore having produced $20,000.

Lumbering and teaming to the mines is becoming quite lively. The town is taking on a new appearance in business generally, since the revival of mining interests has begun.

Marshall Bros. are developing the extension of the old Flagstaff mine, four miles west of Grizzly Flats. They are sinking a shaft on a 4-foot ledge of high-grade ore.

Millar and McCuen are developing a claim a half mile above Big Canyon mine, seventeen miles west of Placerville.

The Co-operative Mining Co. has been organized to operate near Indian Diggings. This is a gravel proposition containing about 100 acres. The officers are: J. M. Taylor, president; Chas. F. Weed, vice-president; J. McComb Jr., secretary; Dr. E. B. Robinson, treasurer; D. Shakespear, general manager, all of San Francisco.

The machinery on the Salisbury started on the 20th.

### Inyo.

*Register:* L. Lee, in charge of the Pacific Coast Borax Co's works at Amargosa, a resident for twenty-five years, says that the desert hobo is a peculiar specimen of the genius tramp. His method is to get some one to back him with a "grub stake," as much as he can load onto a couple of jacks, and then strike out. Crossing the desert, he reaches some watered place, like Ash Meadows for instance, and there camps for the season. He never leaves the road a hundred yards, and avoids the mountains as being altogether too dangerous. When beans and bacon run short, he visits the dump of some mine or mill and selects a piece of ore with which he returns to the outfitting point, and reports having found rich "float," and has no doubt whatever about finding the ledge if he could only get another supply. Of course he is as careful as the gold brick swindlers of running against any well-informed assayer, who could not be fooled with ore from any operated mine. The hobo and his jacks are on hand the next year.

### Mariposa.

A Boston paper speaking of the Merced mines reports that "A Californian versed in mining and familiar with the Merced and other mother lode properties, has reached these conclusions regarding the Merced proposition: That the Merced company owns a large and prospectively valuable property. That speculation carried its shares far beyond its relative value in the absence of any known bonanza strike. That it has a large quantity of low-grade ore, and that $5 ore, even if cheaply mined, will not pay to work, despite all assertions to the contrary, and that it is a question whether its present stamp mill and saving process have been successfully demonstrated. That it is unreasonable to suppose that bonanzas of good and rich ore will not be found in the company's mines, and that at least deep work should have been prosecuted for the finding of a bonanza—i. e., an ore shute—before a mill was completed and run. That it may be questioned if an abundant supply of water power has yet been established for large milling work. That a successful saving of the percentage of sulphurets in the ores will be essential to the profitable workings of its ores and conjunctive chlorination works. That the present cash capital of the company, estimated at less than $100,000, and allowing that no impairment of this amount shall occur from present indebtedness, will be entirely inadequate for the company, and that several hundred thousand dollars will probably be required for the expenditure before the property will be put upon a profitable basis. That the working management of the property, subject to careful supervision, should be put under an experienced mining engineer, familiar with the local features of mining and milling of ore from other mines on the mother lode, where such notable successes have been secured. That the connection of Mr. Bigelow with the property has been entirely loyal to his associates, and that the Merced property can most likely be made very profitable for its owners."

### Mono.

About 400 feet of 11-inch pipe is on the road from San Francisco, to be used in the hydraulic claims at Mono lake.

The Bodie southend cyanide plant, the largest in the State, started up in full blast last Monday, with Lester Bell in charge.

R. N. Graves has arrived in Bodie to start up the hydraulic works near Mono lake. About 20 men will be put to work.

### Nevada.

Supt. Coflin tells the *Telegraph* that work underground in the Electric mine will be resumed on completion of the new hoisting machinery. It is the intention to reach the north chute as soon as possible.

The last crushing of ten tons of ore from the Brunswick mine is reported to have yielded at the rate of $81 to the ton.

The Red Hill Mining Co. has received its dynamo and will hereafter run its mine by electricity.

The Brunswick is turning out good ore. The pay chute has increased from 10 to 18 inches in width.

A 200-horse power electric motor has been ordered for the Gold Hill mine.

*Union*, 19th inst.: The Spanish mine, owned by R. R. Colgate of New York, will resume operations to-day. The mine closed down last fall on account of an expected transfer of the property. A. L. Begbie will again act as superintendent of the mine and Henry Fuller will be foreman. The mine before it shut down had bright prospects and employed between 30 and 40 men.

*Union*: Schubert & Co., working the Doolittle gravel mine in Willow valley, are putting up a five-stamp mill to crush the gravel. A hoisting rig is also being erected.

### Placer.

At the Hogsback country the French company recently organized by W. C. Ralston is about to work about 30,000 acres of ground located by Messrs. Ralston and Grayson in the upper end of Placer county. Mr. Ralston tells the *Herald* that he believes that the Breece and Wheeler channel runs in that locality, and boring will be the mode of prospecting. Active work will begin this summer.

From the Central Tunnel in Ophir mine six tons of $30 ore was taken last week.

### San Bernardino.

Nearly 150 notices of record were filed last week for mining for coal and petroleum in San Timoteo, five miles south of San Bernardino, and several companies have been incorporated.

A strike is reported in the Queen of New York mine at Vanderbilt, north of Needles, near the Colorado river, at a depth of 90 feet, which is 3½ feet across the ledge.

George Thompson, a mining engineer, whom the Holcomb Valley people have employed, thinks it advisable to deepen the shaft on the claim 50 feet, and arrangements have been made with that view. He estimates the cost of collecting the gold as not likely to exceed $1 per ton, leaving a profit of $1.50, says the *Mining World and Engineering Record* of the 9th inst.

### San Diego.

At the La Fortuna mine, R. M. Straus has twenty 1350-pound stamps dropping. The ledge has been developed to a depth of 225 feet, drifts have been run for sixty feet each side of the shaft, all in ore, and a cross-cut of the ledge shows it to be twenty-five feet.

Yuma *Sentinel:* On the California side of the Colorado river are a number of large square timbers for the Buena Vista mine, six miles above the Potholes, where a 10-stamp mill will be built on that promising mine. The shaft on the Buena Vista is down 150 feet.

### Shasta.

An Igo correspondent of the *Courier* says a meeting of mine owners of South Fork, Muletown and Sunny Hill districts are considering the erection of a smelter on Clear creek below Muletown. They estimate that in the aggregate they could furnish from 70 to 85 tons per day.

*Free Press:* The Mountain Mines, Ltd., are about to resume extensive operations. The number of miners employed in the mine at Iron Mountain will be increased and contracts will be let for the construction of a ditch from the famous Horseshoe Bend tunnel on the Sacramento river to the smelter at Keswick, where a large electric plant will be put in. A large force of men will be required to do this work, and this city will again be overrun with men.

The Redding *Free Press* says the work of reopening the Niagara mine near French Gulch is progressing rapidly. W. T. St. Auburn, sold the Niagara mine to a syndicate of Dutch capitalists, composed of a number of the members of the royal family of Holland: Their American representative of the syndicate is James De Fremery of New York city. The entire property, consisting of a number of claims, is under the direct management and superintendency of R. E. Hanley. A short time before the sale of the mine was made a 2100-foot tunnel was run into the mountain with a view of tapping the ledge at a depth of 800 feet, but the ledge could not be found. The tunnel cost $25 per foot. For the following four or five years considerable prospecting and development work was done in the upper levels with a view to relocating the ledge. Supt. Hanley concluded that the 2100-foot tunnel had passed under the ledge, which slopes off down the mountain in a westerly direction. He commenced to run a 300-foot crosscut from the long tunnel. The ledge, which was soon encountered at a depth of 800 feet, has since been followed for a distance of 300 feet and measures from 6 inches to 4 feet in width. A shaft was sunk on the ledge in the crosscut to a depth of twenty feet, but as the mine is very wet, the water soon drove the miners out of the shaft. A pumping plant will have to be put in to rid the shaft of the water when sinking is again resumed.

Much development work has been done on the properties by lessees, who secure leases from the company, run drifts and take out the ore, which is worked in the company's mill.

The free-gold milling plant now in operation consists of two 4 and two 5 stamp batteries, making eighteen stamps in all. The 4-stamp battery is run exclusively on ore taken out by the lessees, and the 5-stamp battery is kept constantly at work on the company's ore.

The mill crushes about thirty-six tons of ore per day and about twenty tons of the rock belongs to the company and averages $25 per ton. About a ton of sulphuretic ore per day is taken from the ledge and shipped to the Selby Smelting and Lead Company at Vallejo Junction. This ore runs as high as $500 per ton, and thirty tons which were shipped during the month of April averaged $236 per ton.

An effort has been made to have this ore worked at the smelter of the Mountain Mines, limited, at Keswick, but the ore is too rich to be worked satisfactorily by the last named company, as they require low-grade gold ores to combine with their high-grade copper ore for smelting purposes.

Mr. Hanley now has forty miners employed, and there are twenty-six independent lessees who are at work for themselves. The lessees get three-fourths of the net proceeds of the ore which they take out. Among them are Hoskins & Co., who have a lease on the Scorpion claim and have gotten out 120 tons of ore, which is now being crushed at the mill and is expected to yield $100 per ton. Nearly all of the lessees have made money, and a few of them have struck it rich.

One of them—a man named Murphey—took a lease on a piece of ground in the upper workings. He struck a vein of ocher ore and worked industriously for fourteen days, averaging a ton of ore per day. The rock was shipped to Selby and netted $3760. Mr. Murphey received $2820 as his share, or at the rate of over $200 per day.

The lessees on the Scorpion will do almost as well, as their ore is being worked at the mill. Mr. Hanley deserves credit for his efforts in reopening the property. The property is now yielding a net output of $9000 in gold bullion per month.

*Searchlight*: At Harrison Gulch within the past six weeks Fowler & Rhoades have taken $4,000 from the Gold Hill and Lucky Baldwin mines, with only two men at work. The ledge in the Gold Hill has a width of 3 feet, while the ledge recently discovered in the Lucky Baldwin is 12 inches wide.

On May 16th articles of agreement were filed with the Country Recorder over the bonding for six months of a group of claims in the Harrison Gulch mining district, by Fowler, Rhodes & Benton to J. W. Frank of Red Bluff for $37,500. A 50-inch water right is also included in the bond.

### Sierra.

*Messenger:* The Crœsus Gold Mining Company (formerly the Plumbago) at Minnesota employs twenty-two men. As soon as supplies can be brought in the force will be doubled.

The Dutch company at Forest City took out 348 ounces; last week, 342 ounces. The Buckeye, Live Yankee and Empire companies average from 30 to 40 ounces each per day. A short time since, a nugget was found in the Forest Hill claim weighing 44¼ ounces. At Rock Creek the prospects are represented as very encouraging. One company "dry digging," without water, are picking out of the bedrock three or four ounces a day.

At the old Kruse ledge, two miles from Downieville, Mr. Barnes has crushed at the Gold Bluff mill five tons of quartz which yielded an average of $12 per ton. The company is about to build a 20-stamp mill.

At the Blue Banks, Gaton & Co. took out of their tunnel 131 ounces last week and 130 ounces the week before. Hoskins & Co. make from 30 to 49 ounces weekly. The Blue Banks flume is now in operation. About three-fourths of a mile of the bed of the stream is completely dried, and the several companies are busily engaged clearing away the sand and gravel deposited in the bed of the stream by the sluices on the bank during the winter. There are six derricks in operation by water power.

At Cox's Bar the Strike Co. took out last week 102 ounces; this week up to Friday morning 66 ounces. The Ravine Co., joining the above, have recently struck the same channel, having run their tunnel 320 feet and are doing well.

*Enterprise:* At Forest the South Fork mine employs nine men, and the tunnel is in 1150 feet. Gravel is expected after July 1st at North Fork; 2200 feet has been run. Thirteen men are employed. Five men are working at the Lucky Dog. The rock still continues hard but good progress is being made. The channel is 160 feet from the mouth. The Hope mine has followed the ledge for 650 feet and employs seven men. Oscar Jones is superintendent of these four mines.

### Siskiyou.

*Journal*: At the Mabel mine, on the divide between Oak Bar and Scott Bar, Chamberlain & Timmons have taken out fifty tons, which they expect will average as good as that taken from the mine last season.

Billups, Quigley & Humphrey brought over sixteen pounds of gold from their Barkhouse mines last Friday.

Three of the Distlehorst dredging boats are nearing completion at Klamath river, just above Quigley's ferry, and will soon be ready to launch. One of them is at least 75 feet in length, and two others nearly the same length. They will be anchored in the stream where they are being built and also secured by stout lines stretched out towards the banks on each side.

Some of the miners on the divide between Scott Bar and Oak Bar complain of too much water, saying it interferes with their work. They also say it has been a common occurrence during the past few months to find several inches of snow on the ground on getting up in the morning.

A few tons of quartz from the Wademan mine, on Greenhorn, were crushed at Lamb's mill, on Yreka creek, the first of this week, which yielded good returns.

### Tuolumne.

The *Democrat* hears of a strike at the Jumper. The lumber is ordered for a new 20-stamp mill, and the figures for the iron-founder's work will be handed in and the contract let next week.

At the Dutch mine Supt. Trittenbach reports a new chute of ore in the 200.

Hayward & Preston are reported to have sold the Mooney, McCann and Trio gold quartz mines at Whisky Hill to a Boston company for $150,000. B. M. Newcomb will be the superintendent.

*Independent:* In Summersville mining district the Sunny South & Wallace mine has sunk a 75-foot shaft and reports good prospects.

At the Deadhorse & Consolidated Eureka they are sending up ore from the 1400-foot level. The mill is constantly at work and shows good results.

At Soulsbyville mining district the Mountain Belle is drifting to the south from the 60-foot level.

Arrangements have been perfected for the resumption of work at the Old Draper mine.

At the Belle View they are stoping from the 600-foot level. The 10-stamp mill is going night and day.

*Democrat:* At the Soulsby Supt. E. W. Hebard is sinking a perpendicular shaft and drifting north and south on the 100-foot level. The hoist and air compressor are both run by water power; power drills are used. The shaft house is almost in the center of the town of Soulsbyville.

At the App the mill has been started a double shift since the old workings on the 200 have been reached, where the ledge shows up fine about fifteen feet in width. Over 100 tons were shot down in one blast during the week. The number of men has been increased to 45 and over 60 tons of rock are being crushed daily, all of which comes from the 200. The stamps are the largest in the county, weighing 1012 pounds each.

William Sharwood has bonded the Walling Ranch. A working shaft will be sunk on the vein.

At the Seminole group J. Coles has two contracts, one a 200-foot tunnel contract on the Mayflower to tap the chute of ore; the other to sink the working shaft on the Seminole 100 feet, to open another level.

At the Dead Horse Supt. Thomas reports the ore in the mine improving in character. Twenty stamps are kept dropping steadily and thirty men are employed. This is the mine much of whose product is credited to Calaveras county, as they have all their sulphurets shipped to Angels to be treated.

## NEVADA.

### STOREY COUNTY.

Of the West country Dan de Quille, in the Salt Lake *Tribune*, says: The new prospecting venture in the Brunswick lode having proved a decided success thus far, with every indication of a continuance of favorable developments with the pushing forward of future explorations, it is hoped that our leading mining men may now feel sufficiently encouraged to undertake the opening up of the mining section known on the Comstock as the West country. This "west country" is the region lying immediately west of the main Comstock lode. It is a belt of country showing mining veins, several of which exhibit huge masses of croppings. In 1860, when it was supposed that the Comstock lode dipped to the west into Mount Davidson, these veins were all claimed and cuts and short tunnels were run on a number of them, showing them to be gold-bearing in and about the croppings. But when it was presently found that the dip of the Comstock was to the east the West country

veins were looked upon as having been left out, as the main vein with all the rich ore was going away from them. When it was found that the dip of the Comstock had changed to the east on the 500 level of the Ophir there was a great commotion. Men who had located on the west pulled their stakes and went off to the east. Nobody would look at a west vein. Thus it happened that the West country was deserted. It seems strange, but in all the years that have since passed no mining has been done to the west of the footwall of the main line of the Comstock—all the work has been to the eastward. At times there has been some scratching about the croppings of the West country veins by men of no means, when good prospects in gold have been obtained, but there was no real mining in all these years. Originally the West country was very wet. The footwall and west clay of the Comstock seemed to have held back and dammed in the water on that side to such an extent that it rose almost to the surface, but the Cob tunnel drained the ground to the depth of 300 or 400 feet, and now, by connections with the deep Comstock levels, it might easily be drained to the depth of 1600 feet. One of the west veins—the Cob—yielded several hundred thousand dollars in gold from grouud near the surface when a drain tunnel was run. This tunnel tapped such a big stream of water that the owners gave up running and turned their attention to distributing and selling water, which was at that time very scarce and dear. The present water company finally bought this Cob tunnel, but nothing was done with the mine, which must have been drained to the depth of at least 300 feet. Thus all this West country lies undeveloped, but now that good strikes have been made in the Brunswick our people may feel encouraged to try their luck among the gold veins of the western belt.

Men who were sluicing in Seven-Mile canyon, near the old Winfield mill site, cleaned up over $400 after a two weeks' run. It is amalgam and sulphurets, very little pure gold being found.

The Danderburg Company has raised the wages to $4 per day. Each miner is charged $1.50 per day for board and lodging.

Last week Savage worked 60 carloads of ore, assaying $66.37 per ton; Seg. Belcher 13 carloads of ore, assaying $18.10 per ton; Belcher 31 carloads of ore, assaying $23.58 per ton. Crown Point ore was worked at one point worth from $8 to $12, at another point from $2 to $5 per ton.

HUMBOLDT COUNTY.

The New Era Company at Kennedy tell the *Silver State* that the electrical plant for the reduction of ores will start up next week with James Sutherland as superintendent.

ELKO COUNTY.

The Dexter mine at Tuscarora, fifty-two miles from Elko, formerly paid dividends aggregating $100,000. It is now in control of the Dexter Mining Co., which has resumed ore shipments and is going to build a stamp mill. R. G. Legg is manager.

LINCOLN COUNTY.

A correspondent of the De Lamar *Lode*, writing from State Line, the new camp on the line between Utah and Nevada, says the discovery of gold in paying quantities has caused all properties to enhance in value rapidly.

## OREGON.

It is announced in southern Oregon that John Bouse, whose connection with the Black Channel Co.'s mines has elicited so much comment, has left that section "for good."

Sheriff Hiatt of Josephine county will sell the property belonging to the Hammersly Mining Co., in Jump-off-Joe precinct, Josephine Co., on June 15th, under an execution issued in favor of Jones & Otten.

W. H. Miller, owner of the Denver City mine on Soldier creek, Josephine county, has entered into a contract with San Francisco parties whereby, in consideration of $10,000 in cash, they are to be allowed to prospect the ledge for a period of sixty days, the amount to be credited on the purchase price of $75,000 if the property is taken. The deed has been placed in escrow with the Grant's Pass bank.

C. A. Hogoboom of Baker City, writing to his brother, W. Hogoboom of Marysville, Cal., under date of May 6th, says: "Twelve miles from Britten station is located the Eureka & Excelsior mine. Last Monday they took out and milled ninety cars of ore, from which they got $45,000—all in one day. This mine has been paying $25,000 per month clear of all expenses for the last year. The Bonanza is close to Parker station. They have just finished enlarging the mill to twenty stamps. On a run of nine days they cleaned up $10,000. They have taken out $150,000 in the last year. The Virtue mine, twelve miles east of town, brought in two cleanups last week, one of $30,000, the other of $34,800, for twenty-eight days' run with a 20-stamp mill. Besides these there are many smaller mines whose earnings are kept a secret." (Ninety cars of ore taken out and milled all in one day is considerable.) This sounds somewhat scopy.

LINN COUNTY.

*Tidings*: W. B. Lawler, who has developed mining properties in Quartzville district, has returned from London and Paris. A 20-stamp mill erected early in the year has been running, and until the present has paid all expenses. Arrangements are now being made to add twenty stamps to the mill and also to put in a full line of machinery necessary for the concentration of some portions of the ores. During his visit in London, Mr. Lawler placed twenty-six mines in the Quartzville district with the London Bankers' Development Company, and preliminary work will commence about June 1st. He also secured from another syndicate 5000 guineas for the purpose of investigating other Oregon mining properties, with a view of purchase and permanent operations.

## WASHINGTON.

At Boundary the International Mining Co. has the old ditch, built in 1861 for placer mining its grounds in and around the town, repaired from Cedar creek, and will soon begin ground sluicing.

E. F. Boyle and ten men have gone to Northport to develop the Grey Cliff, seven miles from there on the reservation.

At Boundary there was on the 14th a successful test of the machinery department of the Kootenai water supply plant. The hydraulicking work has been under the supervision of J. Coulter, with three shifts a day of 24 hours. Manager Goodhue says the company will wash the gravel on about 1100 acres of land owned by them at Waueta, at the mouth of the Pend d'Oreille river. They will also furnish power and put in an electric plant.

## BRITISH COLUMBIA.

W. Pellew Harvey tells the *Spokesman-Review* that at Alberni, Vancouver's Island, the Consolidated mines, chiefly owned by the Dunsmuirs, have a 50-foot shaft, with favorable showing as to width of vein and grade of ore.

E. Blewett is working copper properties on Texeda island, and Victoria capitalists have made investments. Around Phillip's Arm, off the north coast of Vancouver island, there are several properties showing quartz carrying all the way from $4 to $60 in gold per ton.

In the Kamloops, Adams lake and North Thompson districts there is a large amount of prospecting being done, with encouraging results. The Adams lake group—viz., the Homestake, Troublesome, Lytton and others—show ore running $22 to $40 in silver and $3 in gold.

The cinnabar mine is situated at Savonas Ferry. Col. Lightner, formerly of the Almaden mines in California, is in charge, and everything runs in a satisfactory manner. There are large bodies of sulphide, which can be retorted at a small cost. This will run from 2 to 25 per cent mercury. About 120 bottles of mercury have been shipped.

At Golden, in East Kootenay, ore from the Windemere, Spillimacheen and Jubilee mountain contains all the way from 20 to 50 percent copper, 10 to 20 ounces of silver and traces of gold. Shipments are now being made to the Nelson smelter.

The Big Bend, in the Revelstoke district, is a dry ore belt. Outside of the placers, the quartz reefs so far discovered are considerable in width, and mill tests have shown $10 to $50 in gold. There are also ledges of arsenical pyrites containing gold.

The Nelson *Tribune* says the Hall mines smelter runs as if it had been in operation for years, instead of a few weeks. Four shipments of matte were made during the week. Three hundred tons of the coke shipped from Wales has arrived at Vancouver and will reach Nelson next week.

The Northern Belle group, near Kaslo, including the Northern Belle, Kootenay Star, Dublin Queen and Ophir, was sold last week to George Alexander for $60,000.

## ALASKA.

The Apollo mine on Unga Island, Alaska, this week sent down $87,500, the product of a three months' run.

## IDAHO.

Concerning the strike in force at the Yellow Jacket mine, the Salmon City *Recorder* says; "The employees of the Idaho Yellow Jacket Company went out on a strike Wednesday night, and at last accounts the difficulty was no nearer settled than at first. Notices have been posted everywhere requesting all miners and laborers to keep away from there. The men claim that P. J. Cirkel, the general manager, has violated the agreement in regarg to the hours the night shift were expected to work, the manager requiring ten hours after agreeing upon nine hours. The union had notices posted requesting all non-union men to join the union after the first pay-day. These notices were torn down and replaced by the following, signed by the company: 'On and after this date the Idaho Yellow Jacket Mining Company will be under new management. All men in said company's employment, whether union or non-union, will be treated with equal consideration, the only requirement being a good shift's work. When the company deem it expedient, contract work will be done.' This precipitated the strike. A great many of the strikers are in town and will in all probability find their way out of the country."

At Gem the Poorman lessees are putting the Granite mill in order and building a tramway from the Northern Pacific siding to the ore bin.

The new Formosa flume will be half a mile long with 70 feet fall. The Standard flume is now finished for 6500 feet.

At Burke the new plant of the Poorman-Tiger mine is fast being built. Contracts have been awarded for all of the concentrating machinery, power and hoists and repairs to the compressors. The company will also put in a repair shop of its own.

In the placer mining district near Pierce City reports are to the effect that the season is fully thirty days behind last year. One of the owners in one of the large placer companies says that his company was unable to commence work from the fact that their ditch and flume were filled with slush and ice.

## UTAH.

Director W. S. McCornick, who spent Sunday in the underground workings of the Bullion-Beck, tells the *Tribune* it is now productive of about thirty tons of concentrates daily, in addition to the crude ore, and that the mill is working perfectly. There is, he adds, a great deal of ore in sight, but the grade is low and to explore virgin ground, the drill has been raised from the eighth to the seventh level, where it will now be operated.

The *Tribune* says that Park City is at present hoisting more ore, and employing a greater number of men, than at any time since it began its career as a producer—more than twenty years ago.

The *Tribune* is told that the Mammoth, which has distributed $1,000,000 among its stockholders, will resume the payment of dividends next month, and that blocked out in its levels were ores that will enable it to pay dividends for an indefinite period. The Mammoth has not been a dividend-paying investment since 1891, when in November it paid ten cents a share on $40,000.

## MONTANA.

The Butte & Boston Company have leased the Blue Jay mine down to the 500-foot level to Messrs. White and Parry.

On the 15th the Iron Mountain paid a May dividend of $5,000. It has advertised for bids for running a 5600-foot tunnel.

Helena *News*: The Golden Cloud property under the superintendency of Prof. Kerr, employs fifty men. It is practically a mountain of ore. It is being pulverized in Bryan mills, and the tailings are treated by a solution process. At the last clean-up $12,000 was obtained, though only about $9,000 was expected.

Deer Lodge *Northwest*: There are many evidences of improving conditions in the State. No more active season in mining was ever promised than the present, and the forecast is for the largest output in this field in all classes than has been known for years. An immense plant is being erected by the Parrot Company at Gaylord, to cost $1,000,000; new works are to be added at Anaconda and Great Falls; the new camp of Quigley is showing signs of becoming a second Cripple Creek; the Porphyry Dyke district is opening favorably; the East Helena smelter is to be doubled in capacity; a dam is to be built across the Missouri river near Helena, which will develop a large extent of placer ground, and everywhere there are signs of an energetic movement in every branch of mining and its subsidiary interests.

Dillon *Tribune*: The Meade Brothers are operating the Underwood mine in Bannack and are using the Archie Gilson mill to treat the ore.

Messrs. Zorn and Smith on Steel creek have entered into a contract with Anaconda parties to build a 5-stamp mill, to be furnished early in June.

Articles of incorporation of the Bannack Mining and Milling Company were filed with the Secretary of State at Helena last week. The incorporators are T. M. Hodgins, et al., of Butte. The capital stock is placed at $25,000.

The Golden Leaf mill and mines, owned by the Western Mine Enterprise Company, will be operated this season by Mr. Hand and others, of Butte. The group of mines to be worked contains the Excelsior, Wadams, Golden Leaf and Blue Grass.

*Miner* 14th inst.: The differences between F. Aug. Heinze and his employees in the Rarus mine were, according to Manager McGinnis, settled yesterday, when a petition signed by about 300 miners was presented to Mr. Heinze. Manager McGinnis stated last night that this petition asked that the Rarus employees be reinstated, on the grounds that they had withdrawn their demand concerning the engagement of the old superintendent and bosses. Mr. Heinze replied that he was willing to employ such men of the former force as he might select, but gave the petitioners to understand that the Rarus would not resume with as many men as it had before the shut-down. Manager McGinnis said that the mine would be started at 7 o'clock this morning, when the new force would be picked out of the old men.

The Bloomington mine, near the Royal, in Deer Lodge county, has been bought by Schar and Sadler, of Chicago, who will immediately erect a 10-stamp mill and employ 20 men in developing the mine. Peter Scherr, of Deer Lodge, is superintendent.

## WYOMING.

Casper reports the oil business active. The refinery is turning out a carload of refined oil a day and has contracts with a number of railroads which will keep the plant worked to its full capacity for some time. Work on the French syndicate oil well will be resumed at once, a carload of casing for the well having arrived. It is expected that oil will be struck with several hundred feet of additional boring.

Dr. J. Meyer of St. Joe, Mo., and A. F. Washington of Sheridan, at Bald Mountain, Big Horn range, have a two-stamp mill from which they recover only $6 per ton, losing about seventy per cent of the assay value, as assays can be had from $36 to $126 per ton. They propose to build a twenty-stamp mill and put in a fifty-ton cyanide plant. They are sixty miles from Sheridan and at an elevation of 9500 feet. The winters last eight months, and at the present time the mountains are covered with snow to a depth of four feet.

## COLORADO.

DENVER, May 19, '96.

(Special Correspondence.)—The Washington, Washington Extension and Bonanza mines, located in Lake district, have been sold to Chicago parties for $55,000.

The Elkton Consolidated Mining Company, of Cripple Creek, is the latest addition to the dividend payers of the district.

Saw Pit ore shipments are steadily increasing.

Idaho Springs mine owners are anxious for the establishment there of both chlorination and cyanide plants.

Hahn's Peak is coming to the front as one of the rich camps of the State.

E. R. Holden, of Denver, closed a deal last week for twenty acres of ground at Florence, where he will immediately commence the erection of a large chlorination plant.

A streak of $10,000 per ton ore was uncovered by Bob. Porteous in the Lloyd lode on the northwest side of Hayden's Peak, San Juan district, last week.

More properties are being operated in the Ophir district this year than last. The principal gold properties there are owned by the Buffalo-Globe Company, and their output is treated at a 40-stamp mill of the company which is located at Ophir. The ore is conveyed to the mill by two aeriel tramways, one of which is 4700 feet in length and the other 7000 feet. The company employs about 70 men and the output runs about $18 to $25 per month.

The State Ore Sampling Company, of Denver, is looking over the ground at Alma, with a view of erecting sampling works and possibly adding thereto a pyritic smelter.

The statement is made from Idaho Springs that there is not an idle miner in the district.

The immense new plant of machinery on the Portland mine was started up for the first time last week. The equipment is all of modern type and is sufficient for the needs of the mine for many years.

Ground is being cleared for a new mill of fifty tons capacity for the Mineral Creek Mining Co. at Ice Basin, Silverton district.

Shipments of ore from the Mollie Gibson to the smelter, without sorting, average from 250 to 300 ounces per ton.

There is great activity in mining operations at Silverton.

For nineteen years Leadville has been a producer, the quantity ever on the increase, until now the tonnage of the camp is the first in the country and greater than ever before.

The continued activity in development work by mine operators of Central City is giving employment to hundreds of miners.

Conservative estimates based on the results of the first four months place the gold product of the Cripple Creek district at $10,000,000 for 1896.

The Golden Fleece Co. has purchased the Governor Pitkin, a contiguous property, which has developed an ore body similar in character to the Fleece.

The Little Annie, on Richmond hill, near Aspen, has been drowned out. A heavy flow of water broke into it recently and the pumps were unable to handle it. The men were taken from the lower workings and will be idle until larger pumps can be put in place.

Reports from Greeley are to the effect that there is much excitement over the rich finds in the gold camp of Moody, on the Buckhorn. The development on the Mammoth and two other adjacent properties show such excellent ore bodies as to cause a rush of prospectors, and the territory for miles has been staked off in claims.

Many properties in Pine Creek are making an excellent showing. A rich strike was recently made in the Gilbert group, on Michigan hill, the property of H. A. Butler and S. A. Gilmore of Denver and H. B. Gilbert of Pine Creek. The find was made in the Side Issue shaft at a depth of 20 feet, the vein matter being 6 feet wide, with 18 inches of honeycomb quartz. Average assays give a value of $150 to the ton.

The Banker Co. is now shipping some very rich ore. A recent return on 7880 pounds shipped from their Grouse mine was $1997.18, or $506.90 to the ton.

Empire is to have another concentrating mill. Mr. Craig of Denver will soon begin the erection of a fifty-ton plant at Empire station.

The old Summit mill at Gillett has been started up by J. L. Moffet and associates and is running through the dump of the Iron Clad and some old tailings left in the mill when it was closed down two years ago. Four batteries are in operation and the full thirty stamps are dropping.

The Golden Fleece paid its regular monthly dividend of $18,000 on the 10th inst. Recently single carloads of ore shipped to the smelter have yielded as high as $50,000. The May payment to its stockholders is the thirty-first consecutive dividend.

The Robert Emmet mine in Chaffee gulch, near Central City, has encountered a strong lead in their deepest workings. The smelting ore runs from $75 to $100 to the ton.

T. A. Rickard, Colorado State Geologist, claims that the San Juan region is to be one of the greatest gold-producing districts in the State. He presents figures showing the increase of the gold product of San Juan county from $155,624 in 1892 to $536,967 in 1894. Satisfactory figures for last year are not obtainable, owing to the jumble in the mint reports wherein large amounts are accredited to the San Juan "region," which covers a much wider area than the county. About $1,000,000 in gold, however, would be a fair estimate for the county for 1895.

Cripple Creek district claims the distinction of having a greater number of dividend-paying gold mines than any camp in the world.

Recent developments are bringing the Tin Cup region into prominence as one of the important gold districts of the State. The mining centers of the Tin Cup region are Tin Cup, La Croix, Forest Hill and the old camp of Hillerton. Some of the finds are extraordinarily rich.

The Portland mine, Cripple Creek district, has resumed the payment of its regular one cent per share dividend.

The American Reduction Works at Florence, which had been shut down for three weeks for the purpose of enlarging the plant, has resumed operations. They will now treat seventy-five tons of ore per day.

Above Twin Lakes, the Crystal Lake Mining and Milling Co., are actively preparing for a summer's work in opening up their placers. They have 130 acres on either side of the mouth of Echo canyon, below Larimer. They have tunnels, drifts and shafts to the extent of 1800 feet and 1200 feet of track and will immediately add an electrical plant at an additional cost of $25,000.

The Prospect Gold Mining Co., of Cripple Creek district, is doing a large amount of development work. The Prospect and Pine Ridge tunnel, on the Prospect, has been driven in 230 feet and a shaft sunk 130 feet and 100 feet of drifting has been done from the shaft all in ore. The Pine Ridge has been

exploited by two tunnels 40 and 80 feet respectively and shafts and drifting to the extent of 200 feet. On the Pine Ridge property assays show values of $2 to $80 per ton, while the average of the Prospect ore is $28.50 per ton. H. C. Brown, of the Brown Palace Hotel, is one of the officers and a heavy stockholder in the company.

Town lots in the burned district of Cripple Creek are higher than before the fire.

The Allen Gold Mining Co. are about to start up their mill in Basin Gulch, near La Plata, on ore from the Little Kate mine. The mill has 20 stamps and is operated by water power. The ore is free milling.

Denver *Republican:* Ore buyers and samplers agree in declaring that the Cripple Creek district is now producing more ore than ever before in its history. While this is true, there is a difference in the grade that reduces the total value to probably $700,000 monthly. The monthly output appears now to be about 6500 tons of smelting ore, worth on an average $80 a ton, and 250 tons of milling ore, averaging $25 a ton. There are more men working in the opened mines and more on prospecting work than at any previous time and the camp in a mining way was never in so good shape as it is to-day. There is a strong demand for properties from outside buyers and the outlook is good for much eastern and European capital coming in for investment throughout the remaining half of the year.

The increase in low-grade ores can be directly attributed to the reduction in charges for milling and smelting, allowing the marketing of any reserve bodies that have been left in the vein by owners and lessees. Ore that would not pay at a $14 treatment rate can now be transported for $5 and treated for $3, giving a saving of $6.

The Colorado Springs *Investor* of the 16th declares that it "is in a position to state authoritatively that a strike of considerable importance has been made in the Mollie Gibson mine at Aspen. The ore is where it was expected to be found and is an extension of the Smuggler chute. A shipment of several cars has already been made, which shows the ore to be of good grade, the average value being about 100 ounces to the ton."

T. Freeland, manager of the Isabella mine, Cripple Creek, gives the production of that property for the month of April at 980 tons, from which was extracted 2,800 ounces of gold, having a gross value of $56,000. One hundred and fifty miners are on the pay-roll, and are working in a fine body of ore in the south levels. As compared with April of last year, the output of the Isabella has doubled. The production is now about $2,000 in value per day, and the outlook is favorable for an increase of this production.

During the week the Elkton company shipped ten cars of ore, six to the smelter and four cars to the cyanide works at Florence, from the Walter mine. The water in the bottom of the Elkton shaft has all been pumped out and the connections made with the drill pipe. A drift has been started at the 400-foot level. The six drills the company recently purchased are now all in operation. The introduction of steam drills to take the place of hand work will probably reduce the grade of ore a little.

*Republican:* It is very gratifying to see that the great fires in Cripple Creek have not had even a temporarily injurious effect upon mining. Mine owners have gone ahead with development and the output of the camp for May will almost equal that of last December. It looks now as though the product of the closing months of this year would far exceed that of the same months of 1895. Development will be pushed rapidly and it will be done in a more effectual and extensive way than formerly. Deep shafts are needed to show what different properties contain, and yet there are but few such shafts in the district. But they will be put down this year.

At Ward a few weeks ago the manager of the Dew Drop crosscut from the vein, when a large ore body of good value was encountered.

At the Utica, the mine that is netting its owner $25,000 a month, the drift was being run along the vein in the 575-foot level, the foot wall of which was porphyry. A crosscut was run into this wall. When the wall was gone through another vein was encountered, in which they have a streak of smelting ore 2½ feet wide, besides a large body of mill dirt. The smelting ore is said to be the finest ever taken out of the Utica.

Another strike is reported from the Modoc. A crosscut was run in the 300-foot level and an ore body encountered, through which the miners have now gone 42 feet. As with the most of the ore in the Modoc, it is low grade, but with the enlarged milling facilities now being put in it should afford a handsome profit.

### NEW MEXICO.

The Las Vegas *Optic* says there are ten or a dozen mines in Cochiti district which, were the grant question settled, would guarantee to supply 1000 tons of ore daily for milling purposes. At present, despite the decision of the United States Land Court in favor of miners and against the grant claimant, J. P. Whitney, capitalists decline to invest in mill plants and the industrial life of the camp is seriously handicapped. During the past three weeks petitions have been circulated in Santa Fe, Cerrillo, Bland, Las Vegas and Albuquerque, and more than 2000 citizens have signed them, praying Attorney General Harmon to come to the rescue of this bonanza camp and push the grant case for hearing in the United States Supreme Court as rapidly as possible.

The foundation has been put in for a cyanide mill at Hematite, of 30-ton daily capacity. The MacArthur-Forrest process will be used.

At Hanover the company has 30 men assorting the old dumps on the Romero mine belonging to the Santa Rita Copper Company. Pay ore is being taken out of the waste discarded when richer ore was worked years ago.

### ARIZONA.

The Congress mill has forty stamps. No attempt is made to plate the gold, the values all being left in the concentrates. About 100 tons of ore goes through daily. The first-class ore is shipped without concentration. The company has bought forty miles of P. & A. C. Ry. rails to be used in their underground works. The capacity of the mill is to be doubled. The cyanide plant is running steadily on tailings from the early mill runs with good results. About 300 men are employed in the mill and mine. Upon the completion of the proposed new plant the working force will be doubled.

Suit has been brought in Maricopa county by the State Trust Company of New York against the Phœnix Mining Company for $75,000, interest and costs. The Phœnix Mining Company has a 100-stamp mill.

In the Florence *Tribune* appears the following in double-column display:

"Copper and gold mines bought and sold. Parties or owners of free-milling gold or high-grade copper prospects that will stand investigation, that are developed, have all the machinery, etc. to work the plant, with mill and smelter records, undisputed title, etc, can apply to ——."

Would it be presuming, says the *Orb*, to ask if the advertiser wants anything else? It is barely possible he has his ideas a little elevated. If Arizona's mineral wealth is to be developed by such investors, the Lord save us. It seems hardly credible to an unbiased person that anybody who had been able to get his mining property into the condition required by this person, has any need to sell, though the chances are that a sale to such a party would be more of a gift.

Under an order of court at Tucson work is to be resumed on the Old Glory mine at Oro Blanco. Stilson Hutchings, chief creditor of the company, is granted permission to erect a 30-stamp mill and operate the mine at his own expense, the product to go toward discharging all the debts. Work will be commenced at once.

A Flagstaff dispatch reports the Arizona mine, Cherry Creek district, sold to Kennedy, Smith and Stein. Development work is to commence at once.

The Commonwealth Mining & Milling Co. has incorporated to work the Pearce mine, Cochise Co., Arizona; capital stock $2,000,000; J. Brockman, R. A. F. Penrose, Jr. and D. M. Barringer.

At Mineral Hill, ten miles north of Florence, the Great Northeastern Lead & Silver Company, under the superintendency of L. S. Tibbals, is developing some lead-silver properties recently bonded by T. F. Weedin, district clerk of Pinal county. A sixty stamp-mill will be built.

The old Belcher mine on Big Bluff creek, Arizona, has been sold to Kansas City and Nashville capitalists. In its day the mine has produced $100,000 in gold. It has been opened up by over 2000 feet of development work.

At Chemehuevis mountain Messrs. Harshberger and Gill recently picked up a three-ounce nugget, and Messrs. Lattin and Defrance secured another yellow piece weighing $40. There are eleven men running dry washers within eleven miles of Franconia, and all making good money. The quartz veins are showing up well also.

O. F. Kuencer has ten men at work on the Esmeralda mine at Campbell, and has cleaned out the shafts and drifts and is prepared to stope out the large bodies of ore recently opened up. The ore will be hauled to the Ark mill where it will be concentrated and shipped to the Colorado smelters. The ore runs well in gold, and will make a high grade of concentrates.

Prescott *Courier*: Mr. Dodge, of Cleveland, Ohio, who bought the Blue Dick mine, is preparing to start up that property. He also bought the Ella mine, on the head of the Groom creek divide, and is preparing to sink a 200-foot shaft on same.

### MEXICO.

What is probably the largest hoist in the republic of Mexico, and possibly the best, has just been received at Minas Prietas for use in the Creston mine. It is designed for a triple compartment shaft 2000 feet deep.

The *Oasis* reports that Howell Hinds has bought the Esmeralda mine at Minas Prietas for $75,000 gold.

A Durango, Mexico, dispatch says: "It is announced here that the Promonterio mine, situated 100 miles west of here, has been by its owner, Damu, sold to an English syndicate, the purchase price being $2,500,000 in gold. This mine is one of the richest producers in Mexico. All the workings are lighted with electricity, and hundreds of thousands of dollars have been expended in improvements."

### SOUTH AFRICA.

*Mining Journal:* At the Robinson the output for March is as follows: Stamps at work, 120; net running time, 29 days; tons crushed, 16,350; tons per stamp per diem, 4.7; gold won from above, 10,098 ozs. 14 dwt.; chlorination and cyanide works—gold from own concentrates (by chlorination), 960 ounces; bullion from tailings (cyanide process), 1,638 ozs. 12 dwts.; bullion from slimes (recovered by Rand Central Ore Reduction Company), 1,591 ozs. 17 dwts.; total from own ore, 14,289 ozs. 3 dwts.; gold from bought concentrates (by chlorination), 1,977 ozs. 6 dwts.; grand total, 16,266 ozs. 9 dwts.

The Johannesburg *Mining Journal* of April 11th says the output of gold for March was 173,952 ounces.

A Johannesburg dispatch of the 19th inst. says: "The mining and industrial outlook here is very bad, owing to the decision of the Government in fixing the penalties of the Reform Committee prisoners. Barney Barnato has postponed the threatened sale of mining and other property pending political developments."

## Coast Industrial Notes.

—The Sunset Telephone Co. have completed their line to Georgetown, Cal., and will soon commence on their branch to the Forest hill divide.

—Work on the new railroad to connect Congress, Arizona, with the Santa Fe, Prescott & Phœnix road is making progress. Twenty-five men and sixty teams are employed.

—The Seattle, Lake Shore & Eastern Railroad was sold at Seattle, Wash., this week to H. G. Struve, representing the bondholder's committee, for $1,000,000.

—Parties are reported at DeLamar, Nevada, negotiating for the purchase of the railroad grade built a few years ago by the U. P. Company in Lincoln county.

—The Placer *Herald* says that for the South Yuba's electric plant the poles are all up from Newcastle to the American river bridge near Sacramento, and the wire has been ordered.

—The Nevada Southern railroad has passed sheriff's title under the control of the California Eastern Company. The road is about fifty miles long and runs from Blake on the Atlantic & Pacific to Manvel, near the State line.

—San Diego's City Council has fixed the $1,500,000 water contract satisfactorily to the wishes of the Southern California Mountain Water Company, and adopted an ordinance calling for a special election to vote for this scheme on June 27.

—Pacific coast trade with Ecuador, via San Francisco and Guayaquil, is reported threatened with destruction, from competition of the Chileans, due to high charges made by the steamship company which no longer has to meet competition.

—The Market Street Railway Company now proposes to operate the Omnibus Cable Company routes by electricity, changing the Howard street cable line and equipping the cable cars now in use with motors, to be placed in the front end of the cars.

—This season there will be shipped from Tucson, Arizona, 600 cars; from Willcox, 1200; from Benson, 500; from Geronimo, 200 and San Simon 200 cars of cattle. The average capacity of a car is 35 head, so the total shipments will amount to 94,000.

—General Manager Copman, of the Standard Oil Company in Japan and China, recently returned from the Orient, says Japan will soon be a competitor with Europe for the Oriental trade in many kinds of manufactured goods. This competition, he says, will affect Europe more than this country.

—Representatives of Seattle trades report that an extensive business can be done with Guatemala and Salvador, but that it will take some time to fully develop it, since the people there are slow to move or accept innovations. About all the flour used there goes from Washington, the flour mills having their agents on the ground.

—Secretary of the Treasury Carlisle instructs J. R. Crowley, agent for the seal islands, that he may permit the North American Commercial Company to take male seal skins the coming season to the number of 30,000. Last year the company was allowed to take 15,000 skins, but the secretary has concluded that as the seals after leaving the rookeries are slaughtered in great numbers by poachers and hunters outside the sixty-mile zone, the Government might as well realize profit on skins as private parties.

## Commercial Paragraphs.

THE hoisting engines for use at the Corral Hollow mines, near Stockton, were made by the Rix Compressed Air Machinery Co.

THE Colorado Iron Works recently shipped two sets of 40-ton rolls, 14x27; one revolving dryer; two revolving screens; two steel cyanide tanks and an elevator to Red Rock, Montana.

THE Victor Amalgamator Co., 703 South Main street, Los Angeles, Cal., manufacture a machine that they claim will save the fine flake gold found in various placer mines, and in black sand.

H. H. SCOVILLE & Co., Chicago, have about ready for shipment one of their 10-stamp mills to San Marcial, New Mexico, and are building a special copper conveyer which goes to Salt Lake, Utah.

A PERMIT has been granted to the Washburn & Moen Manufacturing Company to rebuild its wire factory recently burned at Worcester, Mass., and build a new addition 248x234 feet in rear, 119 feet deep and 24 feet high adjoining its present iron works.

AMONG recent sales made by the Parke & Lacy Co., 21 and 23 Fremont St., S. F., are a three-drill Ingersoll-Sergeant compressor plant to the Oneida G. M. Co., Jackson, Cal., a complete hoisting plant including engines, boilers, heaters, etc., to the Amalie Mining Co., Kern Co., and a 100x14 foot Ropp straight-line furnace to Philip Argall, for the Metallic Extraction Co., Cyanide, Col.

THE Fulton Engineering and Shipbuilding Works have sent a complete 10-stamp mill, including concentrators, crusher and water wheel, to the Berners Bay district, Alaska. The machinery arrived at Juneau on the Mexico on the 7th. The claims are three miles from tide water, 750 feet up the mountains, in a heavy timber belt. C. H. Pearce, recently "underground boss" at Treadwell's, will have charge.

FOR some time the Penberthy Injector Co., of Detroit, Mich., have been looking forward to the rounding out of their first 100,000 injectors. They had anticipated reaching that number about the 1st of July, but the demand for their goods has been so heavy that they have turned out a larger number than anticipated, and have just reached the number 100,000, which was placed on a ½-inch injector on May 12th. In honor of this event the company will give their employes a holiday and excursion next month.

THE M. C. Bullock Manufacturing Co., Chicago, report the following orders: Two 20x60 Corliss engines, steam reverse with driving. 2x13 feet diameter reels with reel capacity of 2,500 feet of 6⅜-inch rope for the Daly West mine at Park City, Utah. A duplicate order for a 360-horse power engine for the electric street railroad at Terre Haute, Ind. One 400-horse power engine which goes to San Francisco. A duplicate order of two 200-horse power engines for the Chicago Eclectric Railroad Co., Chicago. All of the above engines are of the Willaus central valve pattern.

THE Fulton Engineering and Shipbuilding Works is putting in machinery at the Pioneer mine, Placer county. Mr. Dyer has charge of the installation of the plant, which is a temporary one. The original idea of the Pioneer company will be eventually carried out of having an extensive air-compressor plant at Towles, where water-power to the extent of 3000-horse power will be available. The compressed air will be conveyed by a pipe line to the mine, seven miles distant, where it will be reheated. The machinery now being transported from Colfax includes two sets of 12x16 Duplex air compressors; two sets steam engines, 14x16; a pneumatic hoisting plant, etc.

## Personal.

HENRY JANIN has returned from London to New York.

HAMILTON SMITH of London is visiting Butte, Montana.

F. DAWSON will have charge of the Gold Hill mine, Nevada Co.

GEO. W. DICKIE, of the Union Iron Works, has returned from Japan.

M. B. KERR, superintendent South Paloma, Calaveras Co., has returned to Valley Springs.

HERBERT LANG of Shasta, Cal., is in the city for a few days, preparing plans for his new furnace.

A. A. ABBOTT, manager of the Santa Rosalia mine at Santo Domingo, Mexico, has returned from a visit to California.

PROF. JOSEPH LE CONTE of the University of California will spend the remainder of this year in the East and Europe.

CECIL RHODES' income as managing director of the Consolidated Gold Fields Company last year was more than $1,650,000.

W. E. DARROW of Nevada City goes to Australia under engagement as assayer for the Anglo-German Mining Co.

TIREY L. FORD will return from Washington, D. C., next Wednesday. R. I. Thomas has got back from the national capital.

C. F. MCGLASHAN, the chief instigator of the Truckee *Republican*, has received the Populist nomination for Congress in his district.

THE *Free Press* says Alexander Hill, superintendent for the Mountain Mines, limited, is expected to return from London, England, on May 23d.

HERBERT C. WHITEHEAD, long time auditor for the Southern California Railroad Company, has been appointed general auditor of the Santa Fe system.

MR. MONTGOMERY, of the Denver Whim Co., recently returned from a business trip through Mexico, where he arranged for the placing of several large plants.

W. J. MILLER, president of the Denver Engineering Works, has returned from Old Mexico, where he arranged for installing some large electrical plants in Mexican mines.

THE *Independent* hears that C. H. Holbrook, secretary of the Good Hope Mining Co., will have charge of the Young America mine, Sierra City, recently purchased by S. M. Green.

MR. ALF TREGIDGO, manager of the Nevada County Electric Power Company at Grass Valley, is delivering an interesting series of lectures there on the practical advantages of electricity.

J. PARSONS who put in the wire rope tramway at the Hall mines, B. C., has returned to this city. He says the tramway is working successfully, and can take down ten tons of ore every hour.

GEORGE W. DUNN, the oldest naturalist on the Pacific coast, has been employed by Baron de Rothschild to make collections of butterflies from this State and the peninsula of Lower California.

THE *Transcript* says that Prof. Kimball and F. Hiller, who have been conducting experiments in locating pay chutes of ore in the mines at Nevada City by the use of what they term a magno-electric battery, have surprised the mine owners by some of their locations.

A PRIVATE LETTER from Matabeleland, South Africa, says that Mr. Cavill, who recently went from here to take charge of a Buluwayo mining property, narrowly escaped being murdered in a recent onslaught on the part of the natives. The letter states that the hostility of the natives to Americans and Englishmen is largely due to the efforts of the Dutch.

THE *Union* learns that E. R. Abadie, formerly of Grass Valley, has resigned the superintendency of the Bufflesdorn mines, about 100 miles south of Johannesburg, in South Africa. The mines have not been doing well of late, the ore being low grade and unprofitable to work. No explanation has yet been received of the cause of Mr. Abadie's retirement. He had about 1,000 men employed under him.

THE American Institute of Electrical Engineers, in session at New York, last Wednesday elected the following officers: President, Dr. Louis Duncan, Baltimore; Vice-Presidents, C. P. Steinmetz, Schenectady, N. Y., Prof. Harris J. Ryan, Ithaca, N. Y., and Prof. William M. Stone, Chicago; Treasurer, George A. Hamilton; Secretary, Ralph W. Pope, New York; Managers, L. B. Stillwell, Pittsburg, Prof. W. L. Puffer, Boston, J. W. Lieb, Jr., and F. A. Pickernell, New York.

A NOTED manufacturer and mine owner, Carl Weisshuhn, of Vienna, is at present visiting San Francisco. Mr. Weisshuhn has inspected the gravel deposits of the Picacho district, near Yuma, and after having for some time studied the auriferous black sands of Germany, now proposes to make himself familiar with our gold-bearing gravels, with a view of adapting his methods, if practicable, to the extraction of gold from our black sands. He is accompanied in his travels in California by Major Ruiz de Rojas, of Vienna, a prominent officer in the Austrian service.

M. H. WALSH. Secretary and Manager. C. G. BACON, President.

**Sonora Land and Mining Abstract Bureau.**

Sonora, Tuolumne Co., Cal.

Abstract of Titles to all lands in Tuolumne County made under the Durfee Self-Correcting and Adjusting System.

Mining properties for sale or bonded on desirable terms. Correspondence invited from principals desiring investments in quartz mining properties or in the development of promising claims. Reliable information given on all matters.

UTAH'S NEW EL DORADO.

Wonderful Development of the Camp Floyd Mining District.

The Camp Floyd Mining District of Utah, distant but forty miles from Salt Lake City, is now attracting the attention of the mining world as the only Western rival of Crippie Creek, Colo. The district has had a most remarkable history. The town of Lewiston rose, flourished and passed into decay twenty-five years ago, on the very spot on which Mercur has been built within the last eighteen months. It was renowned as a silver camp in '71, and from that time until 1890 old timers tell of the many big strikes in the district, but it was not until 1890 that gold was found. Attention was then called to the MacArthur-Forrest cyanide process, and a test of the ore was made in Denver, with such elaborate results that the old mines and many new ones were put on a dividend-paying basis. The formation at Mercur is very similar to the region about Johannesburg in South Africa, except that the Camp Floyd ore bodies are larger and richer. Geologists and mineralogists differ as to the origin and formation of the ore body, some claiming three distinct gold-bearing veins, while others seem to favor the single blanket vein theory. On one point, however, all agree, that no such gold deposit has ever before been discovered. In the Mercur mine the ore bodies average $15 in gold to the ton, while some assays run into the hundred's mark. With the aid of the cyanide process this ore is mined and milled at an average cost of $2.50 to $3 per ton, leaving a profit of $12 to $12.50 per ton. On this basis the mine has, in the year just passed, paid dividends to the extent of $300,000. The adjoining properties—the Golden Gate, Marion and Geyser—are equally as rich. The vein or veins have already been traced from the cluster of mines at Mercur to Sunshine, a distance of six miles, where the Sunshine mine and mill, another large property, is located, together with numerous claims of less magnitude. If the discoveries recently made, twelve miles west of Mercur and far to the south, are uncoverings of the same vein, then there is strong evidence that the great deposit covers an area of from 100 to 150 square miles and is the greatest ore body in the world.

Mercur or the Camp Floyd Mining District is best reached by the Rio Grande Western Railway to Salt Lake City. For further particulars or for printed matter apply to F. A. WADLEIGH, General Passenger Agent, Rio Grande Western Railway, Salt Lake City. *

## MINERS, ATTENTION!

We beg to call attention to our "RISDON HAMMERED" Shoes and Dies, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend it to all mine owners and mill men.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BRUSH RAKE.—William C. Anderson, San Jose, Cal. No. 559,882. Dated May 12, 1896. This invention relates to that class of brush rakes in which an approximately vertical rake operates in conjunction with an inclined or slanting guard or shield. Its object is to provide a simple and effective brush rake, adapted to be easily operated to place it in position for collecting the brush or to relieve itself from said brush in the act of dumping. The device consists of shafts having a fixed cross-bar, a rake having arms hinged to the cross-bar, an inclined guard or shield having bars playing between the rake teeth, and a head hinged to said cross-bar, and means for depressing or raising the rear ends of the shafts.

COMBINED HARROW AND ROLLER.—Martin Gottshall, Oakland, Cal., assignor of one-third each to Leopold Kiefer and Andrew Krueckel, same place. No. 559,975. Dated May 12, 1896. This invention relates to an apparatus for cultivating the soil either independently or in connection with a seeding device. It consists essentially of a longitudinal bar having a frame fixed to its rear end, crushing rollers journaled in the frame transversely to the bar and comprising independently turnable sections, a castor wheel by which the front end of the bar is supported, a vertical stem or shaft of the castor wheel passing through a sleeve upon the bar or frame and being adjustable so that the frame may be raised or lowered upon the wheel. A pair of harrows having their meeting edges hinged together is connected with the bar by chains which extend from the harrows to rollers or drums journaled above the shaft, so that by turning them the harrows may be raised or depressed about their hinges. A draw bar is connected with a central longitudinal bar, to which draw bar the team is attached, and it is also connected by chains with the front ends of the harrows.

WINDOW LOCK. — William Madison, Los Gatos, Cal. No. 559,982. Dated May 12, 1896. This invention relates to an improved device for locking the sashes of windows to limit the amount of opening or altogether to prevent their being opened. It consists of a case secured to the top of the lower sash, having a sleeve or collar at its front provided with a segmental slot or channel, sockets fixed to the upper sash in the line of travel of the case, a bolt movable through the case having a locking head upon the inner end adapted to engage corresponding slots in the plates of the opposing sash, and turnable to lock within the slots, said bolt having also a pin to engage the segmental slot or channel, a vertical sliding plate with a rectangular channel and a correspondingly shaped enlargement upon the bolt, which is engaged when the plate is moved upwardly, a lug or stop on the plate, a spring pawl adapted to engage it when it has has been raised to lock the bolt, and a key whereby the plate is raised or depressed and the spring pawl forced out of engagement to allow the plate to be depressed when the device is unlocked.

BICYCLE BRAKE.—Charles F. Choate, Benicia, Cal., one-half assigned to A. Robinson, same place. No. 559,996. Dated May 12, 1896. This invention relates to a brake which is especially adapted to be used upon bicycles. It consists of concentric rollers, the inner one of which is fixed between the arms of a fork, and the outer one is turnable loosely about the inner one. The fork is so connected with the machine that the roller may be depressed against the tire of the machine, and this causes a friction between the two rollers, which increases with the pressure of the outer roller on the wheel rim, thus retarding the rotation of this roller and correspondingly checking the movement of the wheel to which it is applied.

AMALGAMATOR.—Alexander C. Rumble, San Francisco, Cal. No. 559,986. Dated May 12, 1896. This invention relates to an apparatus for amalgamating and saving valuable precious metals. It consists of a cylinder formed in two segments, having flanges along the edges of each and hinges by which the flanges upon one side are connected, while the other side is provided with clamps to lock the two together when closed. A tight joint is made upon both sides by electric gaskets, to prevent leakage when the apparatus is in use. The cylinder is journaled at a slight inclination from the horizontal, and has interior radial plates formed with the lining of the cylinder, so that the plates project toward the center, the whole being heavily coated with silver plating. At one end of the apparatus is a feed tube and distributor to deliver the material and pulp into the cylinder, and at the other end is a discharge opening and trap.

**"HISTORY OF CRIPPLE CREEK."**

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo.

UNITARIAN LITERATURE sent free on application. Address Postoffice Mission Committee, First Unitarian Church, corner Geary and Franklin streets, San Francisco. Mention this paper. *

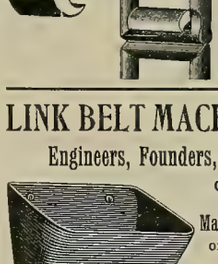
**Great Reduction in Light!**

**IMPERIAL Automatic Gas Machine**

**Produces a Beautiful Light.**

The difference between the brilliancy of light produced from gasoline gas and from coal gas is 3 to 1. The gasoline light is clear and soft, rests the eyes and brings comfort to the home.

The latest and most perfect Automatic Gas Machine now in use, particularly for illuminating private dwellings in the country, as well as residences in the suburbs of a city or town, public institutions, asylums, hotels, etc. The light is steady, soft, bright and pleasant to the eyes and can be furnished at an expense of but eighty cents per 1000 feet of gas. It is much safer than coal oil lamps, which are so dangerous to have in the house on account of an explosion.



These Gas Machines are perfectly safe, and free from any danger whatsoever. Every modern house built for gas should have one of these machines. No public institution should be without one. I have no hesitancy in saying that there is no other gas machine in the market that can compete with mine as to prices, and they surpass as to perfection in all its requirements.

For supplying gas for gas stoves for cooking or heating these gas machines have no equal. Address

(MACARTHUR-FORREST PROCESS)

## MacArthur-Forrest Process.

CAPITAL, - - - £110,000 STERLING

To MINE OWNERS and others having Refractory Gold and Silver Ores hitherto untreatable at a profit, the MACARTHUR-FORREST (Patent) Process of Gold and Silver Extraction offers a solution of the difficulty.

Advisory Board in the United States: Thomas W. Goad, Manager; Hugh Butler, Attorney; John F. Bell; P. George Gow.

California and Nevada Agency and Experimental Plant, 23 Stevenson Street, San Francisco, Cal. P. G. Gow, Sole Agent.

OFFICE: MCPHEE BUILDING, DENVER, COLORADO.

## MILLS BUILT WITH GUARANTEE OF SUCCESSFUL OPERATION.

## KENDALL GOLD AND SILVER EXTRACTION CO.

The Kendall Process is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

*The Kendall system is covered by patents which this company will defend.*

The American Cyanide Gold and Silver Recovery Co., organized in Denver more than a year ago to introduce and operate the Kendall Process in several States, have closed contracts with some ten mines for the use of this process after exhaustive comparative tests with the ordinary plain cyanide method.

Capt. De Lamar has adopted the process at his Nevada mines, where a 250-ton plant is being completed. He writes that he is saving 95 per cent of his gold values, and regards the Kendall Process as the cheapest and best he is aware of for the treatment of gold ores.

*All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.*

Owners of mines and reduction works can obtain full information on application to

KENDALL GOLD AND SILVER Extraction Company, 47 BROADWAY, - - - NEW YORK CITY.

Manufacturers and Importers of
Assayers', Mine and Mill Supplies, Chemicals and Chemical Apparatus.
We frequently have Second-Hand Assay Balances, which we put in order and sell at reduced prices. We can now offer for sale a fine new portable balance, made by Oersterland, Freiburg, Germany. This balance, including glass case, will fold up to 6½x12x4½ inches. Beam, 7 inches long; sensible to 1-10 milligram. New movement to release pans. All parts nickel plated. Specific gravity bottle and hook pans; 3 sets removable pans, one set of horn; pincets and weights; 1 platinum gram down to 1-10 milligram. Formerly listed at $85, now offered for $56.
Oertling's Assay Scale, No. 10, in glass case; powers, 10 grains down to 1-100 grain and riders, with weights; price, $60, offered for $40.
Oertling's Pulp Scale. No. 1, in case; power, 500 grains to 1-50 grain; without weights; price, $40, offered for $30.
German Assay Scale, not in case; steel bearings, 10-inch open beam, index pointing below; mounted so as always to be level; pans suspended by three platinum wires and hook; all packs in drawer 12½x6½x2 inches; without weights; price $35, offered for $25.
German Scale; agate bearings for center knife; all packs in drawer 12½x6½x2½; price $30, offered for $22.
German Chemical Scale, in glass case, with two folding doors in front and one at each end; long open beam with 8-inch radius; center knife rests upon agate; pans suspended by platinum wire chain and jewelled hooks; rider movement; beam graduated into 100 parts. This is a new scale left on sale; price $70, offered for $30.
German Assay balance cat No. Z; solid beam, 8 in. long; index pointing upwards; pans suspended by platinum wires and hooks; in glass case with sliding door; price $40, offered for $30.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.

## THE ..... DANIEL BEST CRUDE OIL .. ENGINE.....

CAPACITY, 2 to 200 HORSE POWER.

**The Cheapest Power Known; Invaluable Where Fuel is Scarce.**

The most economical motive power ever invented, costing but 10 cents per H P. per ten hours' run, using crude oil. Cheap, safe, reliable and clean. Strong and simple to operate. Requires no engineer, and when you stop, all expenses cease, and no fire is left to endanger your building. Send for Illustrated Catalogue with full particulars, and mention the MINING AND SCIENTIFIC PRESS.

## THE KINKEAD QUARTZ MILL.

**The Kinkead Quartz Mill** will do the work of five stamps with less than half the power, and can be built and put into operation for less than half the cost of stamps. The only wear is the shoe and die, which is less than that of one stamp. The cheapness in first cost and operation of this mill makes it possible to work with profit ores so low in value that they have heretofore been treated as waste. Each mill will crush 10 tons in 24 hours through a 40-mesh screen.

It requires only a 2-horse power Daniel Best Crude Oil Engine, to operate this Mill and one concentrator. Engine and Mill can be set up and running in 48 hours.

**Price of Mill $1,000, f. o. b. San Francisco,** including Self-Feeder, Ore Hopper, Frame and Foundation Timbers all framed, and one Silver Copper Plate. Weight, 2¼ tons; heaviest piece, 1350 pounds.

One ordinary mortar for a 5-stamp battery will weigh more than our whole Mill. This Mill can be made in 300 lb. sections, if desired, at extra cost. Send for Catalogue.

# RISDON IRON WORKS,

SAN FRANCISCO, CAL.

READ WHAT MINERS THINK OF THE BRYAN IMPROVED ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO. {
SAN DIMAS, DURANGO, MEXICO, October 25, 1888. {

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.

One set of dies will crush from 1500 to 1600 tons.

One set of tires will crush 1500 tons.

One ring plate will crush from 2200 to 2300 tons.

The mills require very little attention. At our mill an ordinary peon," earning one dollar per day, has complete charge.

In regard to slimes, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a much less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator it is unequaled by any mill now in existence. Yours truly,

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY. {
EUREKA, UTAH, August 24, 1895. {

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK. Pres.

SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec't'y.

BULLION-BECK AND CHAMPION MINING COMPANY. {
EUREKA, UTAH, Aug. 24, 1895. {

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly, JOHN BECK. Pres.

SIMON BAMBERGER, Director. W. J. BEATIE, Sec't'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY. {
S. BAMBERGER, President and Manager. {
SALT LAKE CITY, UTAH, October 10, 1895. {

B. R. TAWNDRAW, ESQ., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly,

[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO. {
C. C. MCIVER, President; D. CUSHMAN, Secretary. {
MISSION SAN JOSE, CAL., Oct. 17th, 1895. {

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. McIVER, President.

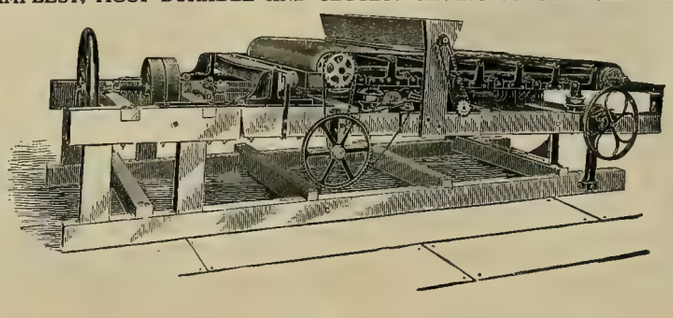
# The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.



NINETY-FOUR AND ONE-HALF PER CENT
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.

THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,

E. L. BALLOU, Propr. Ballou Reduction Works.

# Market Reports.

## The Markets.

SAN FRANCISCO, May 21, 1896.

Cold and unseasonable weather has interfered with trade in dry goods lines, but for groceries and hardware there has been a good trade demand, chiefly from mining districts. A general canvass among the trade in all branches of business discovers the fact that there is a pronounced feeling of confidence in the future. The concensus of opinion is that the fall consumption demand for goods will be the largest for several years past. This belief is largely predicated on confirmed advices that in the agricultural districts consumers have been buying in a hand-to-mouth way for many months past, and if farm crops turn out well, which it now looks as if they will, and fair to good prices rule, farmers and their dependents will be liberal consumers. The merchants also say that the influx of people into the gold mining districts is unprecedented within the past ten years, and in consequence the call for goods will be very large. Of necessity, one branch of business cannot improve without helping others. It is affirmed that in all manufacturing lines the favorable influences are already felt. Foundry men and machine men report running on orders in hand, while bids are asked for new work. The work is structural, machinery and railroad materials.

The local money market does not present anything new worthy of special mention. As confidence returns and business improves, there is a growing disposition to place idle funds but as yet the banks do not shade much in their rate of discounts, but some private parties will. The speculative movement in mining shares has not drawn out much outside capital, but if it should be found that the higher prices have something more to rest on than prospects in the mines and interested or paid writeups in the daily papers, history in Comstock dealings will repeat itself and considerable money be drawn out and put in circulation which will unquestionably help all branches of trade and business in general. New York mail advices are to the effect that money shows a gradual hardening tendency, notwithstanding a higher demand. Evidently the shipment of gold out of the country has its influence, as has the near approach of the time for holding national conventions by the three political parties for nominating presidential candidates. After the nominations have been made and platforms adopted a much better feeling is not unlikely to set in.

**New York Silver Prices.**

NEW YORK, May 21.—Following are the closing prices for the week:

| | Silver in London. | Silver in N. Y. |
|---|---|---|
| Friday | 31⅛ | 68 |
| Saturday | 31 1-16 | 67⅞ |
| Monday | 31 1-16 | .... |
| Tuesday | 31 1-16 | 67⅞ |
| Wednesday | 31 1-16 | 67⅞ |
| Thursday | 31 1-16 | 67⅞ |

| | Copper. | Lead. | Iron. | Tin. |
|---|---|---|---|---|
| Friday | 10 95 | 3 05 | 10 75@13 50 | 13 45 |
| Saturday | 10 95 | 3 05 | 10 75@13 50 | 13 45 |
| Monday | 10 95 | 3 05 | 10 75@13 50 | 13 45 |
| Tuesday | 10 95 | 3 05 | 10 75@13 50 | 13 50 |
| Wednesday | 10 95 | 3 02½ | 10 75@13 50 | 13 55 |

The local bullion, money and exchange quotations current are as follows:

| | |
|---|---|
| Commercial Loans, % per annum | 7@8 |
| Commercial Loans, prime | 6@8 |
| Call Loans, gilt edged | 6@7 |
| Call Loans, mixed securities | 7@8 |
| Mortgages, prime, taxes paid by lender | 6@8 |
| New York Sight Draft | 12½ |
| New York Telegraphic Transfer | 15 |
| London Bankers' 60 days | $4.88¼ |
| London Merchants | $4.86¼ |
| London Sight Bankers | $4.90 |
| Refined Silver, per oz., 1000 fine | 67⅞ |
| Mexican Dollars | 54@55c |

SILVER.—The market has held remarkably steady, not changing the fraction of a point the past six days. The East continues to report a light export movement for the season of the year. London advices are essentially unchanged. The demand while fairly steady is less than usually rules at this season of the year. In our market there is a light inquiry. Orders for silver are distributed in such a way as to avoid competitive buying and consequently values are not run up on purchasers. The steamer for China took out $91,300 in bullion.

MEXICAN DOLLARS.—The market has been fairly steady the past week. While New York quotes 53½ cents, ours is quoted at 54 cents from first hands, but in the absence of any marked demand, no large quantities can be placed. The steamer for China took out 19,863 Mexican dollars and 32,000 Peruvian soles.

COPPER.—The market is steady with a fair movement in a jobbing way. At the East the markets shaded off about 5 cents per 100 lbs. The receipts at Atlantic tidewater continue exceptionally large, but the heavy export shipments keep values from steady to firm. From all we can learn, the extraordinary consumption abroad is likely to continue through the calendar year. The demand in Europe is for shipbuilding, electrical purposes and cartridge manufacture.

The market is quoted as follows:

| | |
|---|---|
| Bolt | ¼ & 5-16, 20c; ⅜ and larger, 17c |
| Lake Superior Sheathing | 20 |
| Ingot, jobbing | 13 |
| Ingot, wholesale | 12 |
| Sheet copper | 17 |

QUICKSILVER.—The market is practically unchanged.

The market is quoted as follows:

| | |
|---|---|
| Home trade, per flask | 39 00 |
| Distant points up north | 38 00 |
| West coast of Mexico, for export | 34 00 |

TIN.—All kinds of plate are said to be firmly held, but with no advance reported. This strength is due to higher cost of iron and steel plate and also slightly better prices for pig. The markets at the East and abroad for pig have strengthened under a good consumptive demand and slightly smaller stocks.

The market is quoted as follows:

| | |
|---|---|
| Pig, per lb | 14½c |
| Plate, I C coke, heavy, per box | $4 25 |
| " " " light, " | 4 10 |

ANTIMONY.—The market is quiet and weak at 8¼@9c cents in a jobbing way. New York mail advices quote 7½@7¾c for Cookson's, 6⅝@6¾c for Hallett's and 6½@6⅝c for Japanese, from store.

LEAD.—Business is light at unchanged quotations. Eastern advices are to the effect that the demand is light, but an improvement is looked for. While a better business is looked for, no special advance in price is expected to set in.

The monthly report of the Bureau of Statistics gives the following data of imports of lead into the United States during the nine months ending with March:

| From— | 1896. Pounds. | 1895. Pounds. |
|---|---|---|

| Other Europe | 1,897,437 | 1,904,927 |
| Other countries | 1,109,503 | 324,936 |
| Total | 149,090,307 | 127,003,520 |

The stock in bonded warehouse, March 31st, 1896, is returned as 16,015,553 pounds, against 14,659,284 pounds at corresponding date last year.

The market is quoted as follows:

| | | | |
|---|---|---|---|
| Pig | 3 75 | @ | 4 00 |
| Bar | — | @ | 4 15 |
| Sheet | — | @ | 5 50 |
| Pipe | — | @ | 4 75 |

SHOT.—The market is quoted as follows:

| | |
|---|---|
| Drop, sizes smaller than B, per bag of 25 lbs | $1 40 |
| Drop, B and larger sizes, " " | 1 65 |
| Buck, Balls and Chilled, do, " | 1 65 |

LUMBER.—There is a continued free home and export movement. The market is steady.

The market is quoted in this city from dock or yards as follows:

| | | | |
|---|---|---|---|
| Redwood, Fluming | 17 00 | @ | — — |
| Pine | 14 00 | @ | 19 00 |
| Spruce | 26 00 | @ | 31 00 |

POWDER.—There is a continued good demand. The market is strong at unchanged quotations.

The market is quoted as follows:

| | |
|---|---|
| Hercules, No. 1, per pound | 11½c |
| " No. 2, " " | 8¼c |

BORAX.—The market is quoted as follows

| | |
|---|---|
| Refined, in car lots | 6⅛ |
| Refined, in sacks | 5⅞ |
| Powdered, in car lots | 6⅛ |
| Concentrated, " | 5⅝ |

NAILS.—Jobbers report a good demand at quotations.

The market is quoted as follows:

| | |
|---|---|
| Wire, carloads, basis per keg | $3 22½ |
| " jobbing, " " | 3 35 |
| Cut, carloads, " " | 2 97½ |
| " jobbing, " " | 3 10 |

IRON.—Our market is practically unchanged. New York advices state that there is more or less underselling on late combined prices, which has an unfavorable effect.

Our market is quoted as follows:

AMERICAN.

| | To Arrive. | Spot. |
|---|---|---|
| Sloso | $21 00 | $23 50 |
| Thomas | 22 00 | 23 50 |
| Salisbury | 30 00 | 33 00 |

ENGLISH.

| | | |
|---|---|---|
| Barrow | $21 00 | $23 50 |
| Gartsherrie | 21 50 | 23 50 |

COAL.—The market is steady at current quotations. The consumption of both steam and household is quite free but supplies on spot and to arrive are ample.

## Mining Share Market.

SAN FRANCISCO, May 21, 1896.

From Thursday to yesterday morning the market hung heavy, with short-lived rallies in one or more of the shares. The closing bids each day did not show the falling off in values which the action of the market would have led dealers to believe, for the variations did not change more than 5 to 10 per cent. Take Friday's closing bids and compare them with Tuesday's closing bids and there were no material changes, except in Hale & Norcross, which showed an advance. It was the way in which the market was made to look that disgusted operators and caused the large majority to sell, in expectation that the time for a "big break" was at hand. This would have taken place had not the manipulators taken the shares thrown on the market. Under this buying it was only reasonable to expect a turn for the better, which took place yesterday under bull reports from the mines. While the news is of an encouraging character, yet it is not such as to cause buyers to enter the market for an investment only for a gamble. There is nothing so uncertain as mining in the Comstock district, and therefore the shares are at all times a gamble, both on the long and short side. The shares that have the run at present are those of the mines having ground on the Brunswick lode, and the vagaries of their movements make them attractive to professional traders. There is no denying that even at present values they are a gamble, for the prospects in them are of such a nature as to justify the belief that the shares will be subject to radical changes for some time to come. So far the work done on the Brunswick lode does not warrant asserting that the finds on that lode are such as to justify the belief that a large deposit has been run into; but they do warrant, as above stated, gambling dealing, for it may result in something good, or else in nothing more than has, as yet, been found good prospects. Under such a condition the market should be a good trading market, particularly in shares of the mines working on that lode, until further work demonstrates whether they have something good or else nothing more than stringers or bunches of good to high-grade ore.

During the past week the Gold Hill shares have done comparatively little, only moving up and down in sympathy with the shares in the middle group of mines. Official letters from them are not of an encouraging character, while more assessments are sure to come in the near future. Yet, in prosecuting the work under way, ore may be run into which might, if conditions are right, have a favorable effect on the market values of the shares. Bodie made one of its usual skyrocket moves. After selling up to $1.10, it broke slightly more than 30 per cent, and then began to react.

The news from the Comstock mines, except in one of them, is practically the same as heretofore made public. In the Alta group work is only reported in Alta, but it does not indicate anything of an encouraging character. In the Gold Hill group repair work is still the order in Overman. Seg. Belcher and Belcher report that a few tons of ore is being raised, but from what level it is extracted or on what level or levels work is being done the letters are as dumb as an oyster. It would seem that the managers ought to give instructions to have more definite information reported so as to conform to the laws under which the companies are incorporated. In Crown Point the usual exploiting work is reported, but nothing to encourage shareholders is given out. No work is reported being done in Kentuck and Yellow Jacket. In Confidence they are still working on the level heretofore reported. Work has been resumed in the joint Challenge, Confidence and Con. Imperial west crossdrift, but official letters do not report any change in the formation of material encountered. In Alpha they are prosecuting work on the 500-foot level, while in Bullion the long west crossdrift is being slowly pushed ahead. In the middle group there is no essential change reported from Chollar and Potosi. In Savage the work is of quite an encouraging character. At one point on the 850 foot level they have run into several feet of good ore. Reports give the assays from $65 to $85 a ton. They raised the past week about seventy tons, which assayed, as per car sample, over $64 a ton. In Hale & Norcross they are running for this ore. The returns of the ore milled by this company show very little loss, comparatively, from the car sample and battery assays. Work is still being done on the long west crossdrift in Gould & Curry, while in Best & Belcher work is being done on the same level as heretofore reported. Con. Virginia continues to raise and mill enough ore to more than pay all running expenses, including active exploiting work. The work in Ophir, Mexican, Sierra Nevada, Union, Utah and Andes is carried on on the same levels as those heretofore reported, with no essential change in the material encountered.

Attention continues to be centered on the work under way on the Brunswick, where there is encouraging prospects. Experienced miners are quite hopeful that they will develop one or more bodies of good ore, but it will take time to do so. In Occidental active exploiting on a lower level has been started. In Chollar they will soon start a cross-drift on the 300-foot level. It is stated that they will have to run about 200 feet before they can expect to strike the downward continuation of the ore found on the 200-foot level. Hale & Norcross had not started work at last advices. In Gould & Curry work has been commenced to run for the continuation of the ore found in the Chollar ground. Miners are quite hopeful of good results, but we have seen them deceived more than once. It looks as if the work on the Brunswick lode will be the attractive feature for the next month or two.

From the Bodie district nothing new of importance is at hand. The usual exploiting work is still the order, with no particular change reported.

The market opened at lower figures this morning under realizing sales and some short selling. After the call it began to strengthen, with Gould & Curry in demand. The advance ranged from 5 to 15 per cent on call prices. Towards noon a weaker tone set in, causing a decline of from 5 to 10 per cent. At the regular afternoon call the market was generally firmer and active, with an advance in Gould & Curry, Hale & Norcross and the Gold Hill shares.

The following illustrates the changes of the week:

| Mines. | May 14. | May 21. |
|---|---|---|
| Alpha | $ 31 | $ 28 |
| Alta Consolidated | 20 | 11 |
| Andes | 55 | 43 |
| Belcher | 1 10 | 75 |
| Best & Belcher | 1 90 | 1 70 |
| Bodie | 1 00 | 77 |
| Bullion | 40 | 32 |
| Challenge | 75 | 50 |
| Chollar | 2 85 | 2 65 |
| Confidence | 1 80 | 1 45 |
| Consolidated California and Virginia | 3 35 | 3 10 |
| Consolidated New York | .... | .... |
| Crown Point | 95 | 70 |
| Exchequer | 17 | 10 |
| Gould & Curry | 1 80 | 1 85 |
| Hale & Norcross | 2 05 | 2 50 |

The Jno. G. Morgan Brokerage Company,

BANKERS and BROKERS,

1015 Seventeenth St., Cooper Blk.

Telephone 1293.

DENVER, COLO.

STOCKS, BONDS, GRAIN AND PROVISIONS.

Direct private wires to Chicago, New York, Cripple Creek, Colorado Springs and Pueblo.

Orders executed in large or small amounts for cash or on *reasonable* margins. Out-of-town orders by mail, telephone or telegraph will receive prompt attention. Daily market circular mailed free on application.

FOR SALE!

A Large and Well-Equipped Gravel Mine.

This is a regular producer, netting from $1500 to $3000 per month. Reasons for selling will be explained to a bona-fide purchaser. Address, GOLD MINE, P. O. Box 66, Placerville.

## Recent California Mining Incorporations.

California Mining Development Company, San Francisco; capital stock, $1,000,000; $2500 subscribed; P. McAuslan, Nevada City, G. E. Robinson, W. G. Mizner, B. F. Louis, M. Levingston, San Francisco.

Nonpareil Quartz and Gravel Mining Company, Sacramento; capital stock, $100,000; $76,400 subscribed; W. Gardner, F. C. Hyde, C. A. Palm, W. A. Root, Sacramento, S. Rodini, Iowa Hill.

The Defiance Mill and Mining Co., San Francisco; B. G. Smith, M. M. Smith, E. B. Cushman, H. H. Ferns, F. H. Price; capital stock $100,000; $500 subscribed.

River Bedrock Mining and Manufacturing Co. of California, San Jose; capital stock $1,000,000, $15,076 paid up; J. M. Thorpe, J. J. Cherrie, E. E. Cothran, H. Dreischmeyer, Jr., G. K. Hostetter, M. Phillips, C. W. Quilty, G. F. Salisbury, F. D. Wolfe.

Humboldt Placer Mining Co., Blocksburg; capital stock, $10,000,000, $1,300,000 subscribed; E. W. Dyke, J. E. Wood, of Harris: W. A. Stowers, P. Asbill, J. Van Matre, Minersville; W. S. Carless, Blocksburg; W. P. White, Hoaglin.

Laguna Mining and Milling Co., San Diego; capital stock, $500,000; subscribed, $262,500; G. H. Hubbs, G. J. Magly, A. B. Cairnes, H. J. McCain, T. J. McCain.

## Recently Declared Mining Dividends.

THE Calumet and Hecla, of Michigan, this week paid a dividend of $500,000; Moon-Anchor, $6,000, and Victor, of Colorado, $20,000.

THE Boston and Montana mine, of Montana, paid a dividend of $300,000 on the 20th inst.

THE Homestake Mining Company paid a dividend of 25 cents per share on the 25th inst.

WANTED.—A young man with literary ability, having had practical experience in mining and metallurgy, for the editorial staff of a first-class trade paper. Applications will not be noticed unless stating full particulars as to experience, compensation, references, etc. Address "Charter," P. O. Box 2718, New York, N. Y.

WANTED.

TWO ROCK BREAKERS, ANY MAKE. Capacity 1 to 2 tons per hour.
I. S. VAN WINKLE & CO., 413-415 Market St., SAN FRANCISCO.

WANTED.

For free milling and smelting property (gold) near Prescott, Arizona, competent mine superintendent who can make his own assays and run his own levels. Must have gilt-edged references; developed property. Address,

L. A. DAVIES,
189 La Salle Street..... CHICAGO, ILL.

GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 66, Placerville, Cal.

FRANK R. FIELD,
ENGINEER,
712 Cooper Bldg
Denver Colo.

Detachable chain belt, sprocket wheels, malleable and steel elevator buckets, elevating and conveying appliances.

SACRAMENTO FOUNDRY,
COR. FRONT AND N STS., SACRAMENTO, CAL.

Machinery and Castings of all Kinds
Made and Repaired.
Manufacturer of Steam Engines, Ripples, Pumps, Water Wheels, Horse Powers, Etc.
CHILLED CAR WHEELS A SPECIALTY.
Guttenberger's Roller Quartz Mills, Larabee Street-Car Indicator. Write for estimates.

The Russell Process.

For information concerning this process for the reduction of ores containing precious metals, and terms of license, apply to

THE RUSSELL PROCESS CO.,
Park City, Utah.

## DELINQUENT SALE NOTICE.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the Tenth (10th) day of February, 1896, the several amounts set opposite the names of the respective shareholders as follows:

| Names. | No. Cert. | No. Shares. | Amt. |

And in accordance with law, and an order from the Board of Directors, made on the 30th day of March, 1896, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at their office, Room 323 Phelan Building, San Francisco, California, on THURSDAY, the 4th day of June, 1896, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

M. A. CAHN, Secretary.

Office, Room 323, Phelan Building, San Francisco, California.

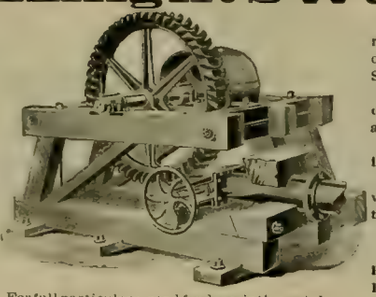
TO THE STOCKHOLDERS OF THE SOUTH PALOMA GOLD MINING COMPANY, LIMITED:

Notice is hereby given that by resolution of the Board of Directors of the corporation, adopted on the 21st day of March, 1896, a meeting of the stockholders of the corporation was called for the purpose of increasing the capital stock to the amount of two hundred thousand dollars, to be divided into one hundred thousand shares of the par value of two dollars per share, and of determining the disposition to be made of the increased capital stock; and it was resolved that such meeting shall take place at the principal place of business of the corporation, being the same building where the Board of Directors usually meet, to wit: No. 212 Sansome street, room 17, in the City and County of San Francisco, on WEDNESDAY, the 10th day of June, A. D., 1896, at 12 o'clock in the forenoon of that day.

Dated San Francisco, 2nd of April, 1896.

JOHN A. WRIGHT, President.
CHAS. WEBB HOWARD, JR., Secretary.

THE OLD RELIABLE
COMMON SENSE STEEL WHIM
STILL STAYS TO THE FRONT.



Over 2800 now in use, which is more than all others combined. We make them for all purposes, all sizes and prices. **Steel Ore Buckets,** all sizes from a windlass to a ton. We press "'em out" 'cause hammer dents make holes, "savy?" **Common Sense Easy Dump Ore Cars.** Center of car body over center of truck, equal weight on each axle, makes equal wear on all the wheels. Incline turn table makes the car dump itself when you press the latch. Send for Catalogue showing dozens of styles of cars for all purposes.

THE WHIM CO.,
1220-1222 Curtis Street.....Denver, Colo.

RUPTURE CURED.

Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absolutely without danger. Usually but a single treatment required.

Knight's Water Wheel.

The accompanying cut shows the general arrangement of **Knight's Standard Water Wheel,** of which there are **hundreds in use** in different States of the Union.

These Wheels are made from **2 feet to 6 feet in diameter, from 10 to 1000-horse power, and adapted to all heads and purposes.**

**Wheels inclosed in iron cases, from 6 to 24 inches.**

Wheels for electrical power can be furnished **with or without Governors. Highest regulation guaranteed.**

For full particulars, send for descriptive catalogue.

# FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of
April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.
" " " Improved Belt Frue Vanner..... 600, f. o. b.

AND PACIFIC ELECTRICAL REVIEW.

No. 1873.—VOLUME LXXII. Number 22. SAN FRANCISCO, SATURDAY, MAY 30, 1896. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

## A California Production.

California is variously represented as the land of sunshine, flowers, wine, fair women, brave men and other desirable attributes of life. It is further noted as being the greatest gold-producing area in the world. It is also possessed of the sterner attributes of war, as well as the valuable elements of peace, as was abundantly proved last week when the biggest and best battleship in America came in, in triumph from her official test off Santa Barbara, where she developed an average speed of 16.88 knots and won $175,000 extra bonus for her enterprising builders, the Union Iron Works, beside a million-dollar advertisement for the State. Herewith is a representation of the queen of the American navy as she arrived in this city with the finest record ever achieved by any American vessel of her class. All emblems of supremacy in this line, all prestige of victory, passed with her that bright May afternoon from the shipbuilders of the Atlantic coast to those of San Francisco, fairly won and well deserved. Whether in a fight or a fast chase, whether in speed, strength, offensive or defensive qualities, the product of California—the great battleship now lying in San Francisco bay—has shown her superior efficiency, and should the cloud of conflict shadow the land, those who man the armament of the Oregon can well feel that the great vessel is fitted to uphold the dignity and honor of the nation. The Oregon has been described before. She is 350¾ feet over all, 69¾ feet beam, has a displacement of 10,298 tons and cost $4,500,000. She is so far the latest and greatest vessel built by the Union Iron Works, which has already built the United States war vessels Charleston, San Francisco, Monterey and Olympia.

U. S. BATTLESHIP OREGON.

The official speed requirement was fifteen knots per hour. For every quarter knot in excess the Government agreed to pay the builders $25,000. The 1.88 extra knots thus earns them $175,000, and .13 of a knot to spare. A speed of 16.75 knots would have secured the $175,000, and as the extra .13 is in excess of one-half of another extra quarter, it may be that they will secure another $25,000. The Government takes this method of getting the maximum in a cheaper way than by setting the requirement higher. Had the official requirement been, say, 16.75 knots, it would have entailed a bid in excess of the accepted contract price of several hundred thousand dollars; but by making the requirement 15 knots, and then offering a bonus for anything in excess of that, the Government gets a superior vessel at less cost. In this connection a word as to "knots" and "miles" is not amiss. As a matter of fact, there is no such distance as a "knot." Miles, leagues, etc., are regularly defined distances, but the term "knot" can only be correctly used in determining the rate of speed at which a vessel moves through the water. The distance between two knots on the logline is 6082 feet. A mile is a mile, regardless of time; a "knot" is always correctly spoken of in connection with time. The official speed record of the Oregon is, in miles, 19.4438 per hour. This is reckoned on the basis of 16.88 knots. A Washington dispatch reports Admiral Beardslee as officially stating that the record of the Santa Barbara trip for the Oregon is 16.791. On this basis, the speed would be 19.34 miles per hour. When her vast weight and great depth in the water is considered, the force with which she is propelled appears tremendous, moving such a mighty mass at a speed once deemed unattainable by a railway train.

---

A DEPOSIT of magnesite is reported from the headwaters of the Sacramento river, at Flat Creek, Shasta Co., Cal. Its extent is still uncertain. The mineral is known to exist in Alameda, Fresno, Mariposa, Monterey, Placer, Napa and several other counties, but so far has been mined for commercial purposes only in Alameda and Napa, these two localities being believed to be the only two magnesite mines in the United States. In '91, 761 tons were produced in this State, with a spot value of $5397; in '92, 1402 tons, worth $9814; in '93, 1143 tons, $8000; '94, 1370 tons, $4864. Last year 2200 tons were produced, valued at $17,000.

The largest worked deposit of magnesite is near Rutherford, Napa Co., where the white carbonate of magnesia is about six feet thick, imbedded at an angle of about 65° between walls of serpentine and talcose schist. It is used in the manufacture of paper, for hearths of basic steel furnaces, stone paint and furnace linings.

There is a duty of 20 per cent on the calcined article; the raw ore is free. As taken out it is picked over, then calcined and shipped. Better transportation facilities will doubtless result in a greatly increased product of this mineral, in which California holds the monopoly of production.

## That New Gold Process.

Considerable inquiry has been received at this office since the publication in the issue of the 9th inst., regarding M. Rigaud's new "gold process," wherein he claims his ability to successfully extract all the gold from any ore at a total cost of $1.80 per ton. Till the result of the experiments by the Tancarville Co., at Havre, France, are announced, a suspension of judgment is just; but it appears from the details furnished by the originator of the process that, like many other new process men, M. Rigaud claims too much.

A noticeable feature of the comment by English mining engineers, metallurgists and assayers is the unanimity with which they decry the new process and the complaisance with which some of them make equally extravagant claims. One gentleman, writing in a London journal, says:

> There have been a long series of experiments, some of them on the ton scale, which have proved to satisfaction to be capable of extracting not only the whole of the gold, but the whole of every other metal contained in the ores, and this is done at a cost considerably below M. de Rigaud's statement of 9 francs per ton, as in the case of his treatment — in fact, the case of the process I refer to is not above one-ninth of his—viz., 1 franc.

That is, this gentleman, who is a mining engineer of some repute, claims to know of a process whereby "not only the whole of the gold, but the whole of every other metal" in the ore can be extracted at a total cost of twenty cents per ton! This is too precious a secret for one human breast to hold. Its custodian should take pity on the mining world and divulge the details of how all the gold and every other metal in a body of ore can be extracted at comparatively no cost at all. The resultant wealth from the possession of such knowledge would make the richest man in the world seem a pauper by comparison; this apart from the glory and fame accruing to the alleged discoverer. Another metallurgist, in the same issue, in discussion of the Rigaud process, epigrammatically says: "What is now more needed is a process to treat hitherto untreatable ore." Just so.

Other gentlemen—one a major-general in the British army—take up arms in defense of the Zymean process of the gallant naval hero, Admiral Selwyn, whose teachings were exploited and exploded in these columns in September, '93, and assert that the admiral's process is proved to be a success, and that it "bids fair to even more than double the value of every gold share in the market." All of which is "important if true." Meanwhile, when British military heroes on land and sea and London metallurgists can, over their signatures, seriously make such extravagant statements, it were invidious to express surprise when an Arizona prospector thinks he has $75 ore when it only assays $40.

## Chiefly Commercial.

In its issue of the 7th inst. the Denver *Republican*, a newspaper which is to Colorado what the Salt Lake *Tribune* is to Utah, has some kindly references to this journal. It notices especially what *Printers' Ink* says. In these days of business effort the circulation of a publication is considered of considerable importance. While an advertisement in this paper is justly considered to be of great value because of the quality of its circulation, yet it is gratifying to know that in the matter of quantity, so eagerly sought, this paper also enjoys distinguished pre-eminence.

The proprietors of the journal for advertisers called *Printers' Ink* publish annually a classified list of all the publications in the country, a regular newspaper directory, giving name, location and (most important of all to the business advertiser) circulation. Many years' issuance of this directory and care exercised in compiling it give it a standing that makes its statements authoritative. In its issue of April 22nd, 1896, in talking of papers devoted to engineering and mining, etc., and giving some extracts from the forthcoming issue of the American Newspaper Directory for 1896, *Printers' Ink* says:

> Among the engineering and mining papers of California, none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS, published weekly at San Francisco. In fact, it fully equals five times the combined issue accorded to all the others, and the publishers of the American Newspaper Directory will guarantee the accuracy of the circulation rating accorded to this paper by a reward of one hundred dollars, payable to the first person who successfully assails it.

Again, discoursing of scientific publications, it says:

> Among the scientific papers in California none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS. It fully equals three times the combined issue accorded to all the others, etc.

Likewise, in speaking of electrical journals, it says:

> Among the electrical papers in California none has credit for so large a regular issue as is accorded to the MINING AND SCIENTIFIC PRESS.

Again in its issue of April 29, 1896, further reference is made, as follows:

> In all the States of the far West and the Pacific slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded to the MINING AND SCIENTIFIC PRESS, a weekly, published at San Francisco, Cal., and the publishers of the American Newspaper Directory will guarantee the accuracy of the circulation rating accorded to this paper by a reward of $100, payable to the first person who successfully assails it.

All these statements appear in the current issue of the Directory, and are made the subject of complimentary reference on the part of our Denver contemporary, which, enjoying like preeminence in its field, evidently appreciates the value of such a standing.

In view of all this, it is perhaps not too much for this paper to say that while it believes everyone engaged in business in any way related to the mining industry thoroughly understands that in no way can a business announcement be better made to reach those whose business is desired than through the advertising columns of this paper, it is satisfactory to also know that this fact is recognized and widely stated by those who are experts on the subject of newspaper circulation.

## Mining Legislation in the 54th Congress.

What the miners of California and the few journals that have espoused their just cause have to fight was during this week well exemplified in the attitude of the Speaker of the House of Representatives, who, in two or three important legislative respects, is the most powerful man in the country, in determining what shall or shall not be a national law. When Senator Mitchell of Oregon (who with Senator Stewart of Nevada and the entire Interior Department is hostile to the bill) injected an amendment in the Mineral Land bill ostensibly to include Oregon in its provisions, but really intended to kill the measure, the House Public Lands Committee, with honest intention to aid the effort, agreed to the amendment. This compliance was not expected, and when Speaker Reed found that a member of the California delegation was to favorably report the bill as received, amended, from the Senate, he promptly ruled that it could not be so brought up for passage, as it was not "a privileged question," and could not be called up any time, having been referred back to the House committee from the House. So that on this miserable subterfuge of a technicality the Speaker of the House of Representatives did his powerful best, or worst, to prevent the passage of a just bill, which has so long been striven for by a few in California who realize its necessity. Meanwhile a swift and silent Government approving of railroad lists is going on. Since the 7th inst. the General Land Office has approved the issuance of patents to the railroad company for over 300,000 acres in this State of the very lands under discussion, a large part of the area the character of which it was the province of the commission to be appointed under the Mineral Land bill to determine.

Had Senator Mitchell of Oregon refrained from putting in that amendment, the bill would now be a law. The Senator's railroad cases in the Supreme Court of the United States are personally profitable in the large sums received purely for legal services therein, he usually appearing as corporation counsel and defense. Of course it is not to be assumed that he would prostitute his high position as a Senator of the United States from the great commonwealth of Oregon to aid his powerful railroad client in blocking the passage of a law obnoxious to it. Yet it would have looked better had the senior Senator from Oregon delegated that disagreeable duty to some one else, especially in face of the fact that his colleague, Senator McBride, had honestly introduced a separate bill, which would have given Oregon miners more than the Mitchell amendment to the California bill possibly could.

The MINING AND SCIENTIFIC PRESS originally directed attention to the threatened corporation absorption of California mineral lands, and two successive conventions of the California Miners' Association declared unanimously for such a measure as the bill introduced last January. This paper takes the displeasure of corporation parasites as a high compliment. Praise or congratulation from such sources would be to it grave cause for concern, for their friendship is always fatal to the life or integrity of any publication. The silence of so many California papers on this subject is eloquent, and it is a matter of regret that they should so fail in their plain duty.

In common with a large number who hoped for success in this session of Congress, this journal deplores the trickery in high official places that has temporarily defeated the wishes of the California miners. We have little hope of seeing the bill pass this session. True, the California delegation has had the House Public Land Committee reconsider its previous action in agreeing to the Senate amendment, report its disagreement and ask for a conference, which restores the matter to the status of a "privileged question" and brushes away Speaker Reed's cobwebs; but as Congress will adjourn in a few days, and long before the parliamentary procedure of formally rescinding previous agreement, disagreeing, asking for a conference, appointment by the Senate of its members, and of the House by its members of the proposed conference committee, the meeting of that committee, its deliberations and final action, its report and joint action of both houses on that report—long before all this tedious rigamarole can be got through with, Congress will have adjourned.

It is due to the entire California Congressional delegation, and to T. L. Ford, who spent four months in Washington in the interests of the miners, to say that every one of these ten men worked faithfully for the interests entrusted to them, labored diligently and harmoniously, and they cannot be justly blamed for any failure or delay.

The River and Harbor bill with the $250,000 appropriation asked for by California miners passed both houses, and had it received the President's signature, would now be a law. As President Cleveland has never signed a river and harbor bill, always vetoing it or allowing it to become a law without his signature, it is not likely he will sign this one. The magnitude of the items and the coming party fight over Presidential nominations and elections will doubtless influence him in vetoing the bill, but he has not the power of Speaker Reed; he can not block legislation, he can only delay it a few days. Congress will undoubtedly pass the bill over the veto, for there is more than the necessary two-thirds majority.

No other national legislation concerning miners has received Congressional attention. In accordance with the desire of the California Miners' Association, Senator Perkins and Congressman Johnson introduced simultaneously in the Senate and House, early in the session, three bills, one amending Chapter 6, Title 32, U. S. Revised Statutes, one appropriating money for the construction of works to impound mining debris, and one amendatory of the Camenetti Act. The last mentioned was not pushed, being subsequently deemed unwise and impolitic; the second was passed in a modified form; the first was not acted upon. Senator Stewart, of Nevada, considers himself the only man in the United States competent to formulate legislation on that subject and has a perennial bill which he introduces, every Congressional session, securing by "Senatorial courtesy" the exclusion of other mining bills looking to necessary changes. However, he cannot live forever, or, some day Nevada may tire of two corporation Senators and surprise itself by for once sending some one to the U. S. Senate who owns himself.

"TO THE progressive scientist nothing is considered impossible." Some "impossibilities" of a generation ago are now in daily general use, and familiarity dulls the wonder with which they were at first received. In the domain of electrical progress, as weekly portrayed in these columns, great advances have recently been made. During this month interest in the newly discovered "Roentgen rays" is eclipsed by the announcement that Nikola Tesla has about perfected the vacuum-tube system of electric lighting without wires, of which he first spoke in '92, and Thos. A. Edison believes that, by means of a vacuum tube of his own construction, he can change the shadow rays recently discovered by Roentgen into ordinary white light, capable of refraction and separation into primary colors. In these sunset years of the nineteenth century is shadowed forth some of the wonderful possibilities of the twentieth century.

NOW THAT A San Francisco institution has built the finest battleship on the continent, the Secretary of the Navy makes further substantial recognition of California's importance. The recent passage of a bill by Congress creates a naval training school at Goat Island. Secretary of the Navy Herbert, to further the work, has ordered that, till the new institution is ready, the Independence at Mare Island shall be constituted a receiving ship for 100 apprentices, thus virtually making the practical life and usefulness of the institution begin with the passage of the bill creating it.

AFTER several annual attempts, it now seems certain that at this session of Congress those who favor the addition of naphtha launches of fifteen tons or over to the list of vessels subject to Government inspection in the harbor will succeed in their effort.

## Concentrates.

THE Pueblo and Victor, Colorado, Mining Exchanges have suspended.

A SIERRA COUNTY mining company has levied an assessment of one mill per share.

DEADWOOD, S. D., gets a Congressional appropriation for a Government assay office.

THE April gold yield of the Witwatersrand, South Africa, district was 174,518 ounces.

IT costs a member of the De Lamar, Idaho, Miners' Union $30 fine for "a plain drunk."

THE Sunny South, Placer Co., Miners' Association, a model local organization, has bought a $100 organ.

THE Feliciana mine, Sweetwater, twelve miles from Mariposa, Cal., is sold to E. S. Davis, of Fresno.

THE Rossland, B. C., Miners' Union wants a Government mine inspector appointed for that Province.

YREKA, CAL., is now in telephonic communication with many of the principal mining towns of Siskiyou county.

THE hour schedule has gone into effect at the Ajax, Utah, mine, the men working ten hours at 25 cents per hour.

AT the San Cristobal mine, Zacatecas, Mexico, reduction works and a 20-stamp mill are to be erected this summer.

A MINERS' DRILLING CONTEST for $150 and the British Columbia championship was held at Rossland, B. C., on the 24th inst.

THE *Echo* says that 130 miners are employed in the Sutter Creek district and 500 in the Jackson district, Amador county.

DURING this week Mining and Stock Exchanges were organized at Los Angeles, Cal., Prescott, Arizona, and Rossland, B. C.

THE Gillespie mine, an extension of the Congress, is reported sold to the Congress, Arizona, Gold Mining Company for $30,000.

IT seems odd, says the Bodie *Index*, to see a plow running near the Standard slum-pound, digging up tailings for the cyanide plant.

SATISFACTORY arrangements have been made by Supt. Lipman, Eagle Bird mine, Washington, Nevada Co., to resume work this week.

THE management of the Mercur, Utah, mine will push the incline shaft, now 190 feet deep on the dip of the vein, to a depth of 1000 feet.

BUTTE'S, MONTANA, new directory estimates that city's population at 44,662. It calculates that 6400 men are there employed in mining.

THE Western Federation of Miners, which recently closed its convention in Denver, has 76,500 members and $740,000 cash in its treasury.

THE Slocan Star Mining Company in Milwaukee last week declared a dividend of 10 cents a share on the capital stock, aggregating $100,000.

AT Chili Gulch, near Mokelumne Hill, Calaveras Co., Geo. Emerson is sinking a double-compartment shaft 500 feet. The hoist is run by water power.

MANAGER MAITLAND of the Trinity Gold Placer M. Co. is going to run a 525-foot tunnel, 6x8, in the company's property at Coffee Creek this summer.

"THE invasion of foreign capital" so dreaded by some silurian meat dealers of this city is not similarly viewed by the mining men of the State.

TWENTY THOUSAND Johannesburgers have signed a petition and forwarded it to Pretoria asking for the release of John Hays Hammond and associates.

TRINITY COUNTY is unaffected by the anti-debris restrictions and offers in its unworked deposits one of the most promising fields for investment in hydraulic mining.

WICKENBERG, the pioneer mining camp of central Arizona, is waking up again; and if all that adjacent prospectors report is true, that section will soon be a lively one.

THE labor troubles and political turmoil in the South African mine districts have closed the Pacific coast lumber trade, which for a while was large in that direction.

IN these renewed days of life in the Comstock shares a good many seem in or going in on the proposition, "Sell what you have if you wouldn't buy it if you didn't own it."

MONTANA papers are publishing numerous notices of forfeiture signed by co-owners who have done their proportion of the annual work required to hold an unpatented claim.

THE Pioneer mine, Plymouth, Amador county, listed on the stock board, is about twelve miles from the Kennedy. It is incorporated for $2,000,000. There are several "Pioneer" mines.

WHITELAW REID has bought a gold mine in Mariposa Co., and when he next meets Chauncey Depew can tell him more than the latter now knows about "nuts and oranges" in California.

ANACONDA, MONTANA, is beginning to ask why it is necessary to send its great copper output to Eastern factories, and looks to see a time when it will be a manufacturing as well as a mining center.

WHITLOCK, WELLS AND SNYDER are sinking a double-compartment shaft on the San Andreas quartz mine, Calaveras Co. They claim that the ore will pay $40 to the ton in free gold besides the sulphurets.

AN estimate of the life of the Wemmer, South Africa, mine, the superintendency of which Emil Abadie, formerly of Grass Valley, recently resigned, concludes that in eight years time the pay ore will be exhausted.

AUSTIN CORBIN proposes to give $1,000,000 for the War Eagle mine, Trail Creek, B. C., and $500,000 for the Iron Mask, to be paid on Aug. 1, '96. The shareholders of both companies have voted to give him the desired option.

AN increasing percentage of copper and silver in the ore of the Apollo mine at Unga, Alaska, has caused the owners to close their chlorination works, they determining in future to ship their sulphurets and not attempt the continuance of any process at the mine.

FROM the Stanislaus to the Mokelumne in Calaveras county is a mineral belt averaging four miles in width that has never been wholly explored and which will be heard from. It is one of many such regions in California rich in mineral, but so far passed over or overlooked.

"THE biggest gold mine in the United States" is now variously located in Arizona, Colorado, Alaska, Utah and elsewhere. There are three or four in this State that are believed, apart from size, to be the most profitable of any similar enterprises in the Union.

E. C. LOFTUS, who made the Golden Gate mine at Sonora, Tuolumne Co., a dividend-paying mine, is now developing the Keystone mine, Railroad Flat, Calaveras Co., where he has built a hoist and mill run by water under a 200-foot pressure. The shaft is now over 200 feet.

IT is understood that a British syndicate is negotiating for the purchase of the De Lamar mine, De Lamar, Nev., for $2,500,000. The present output of the mine is about $100,000 per month; it has considerable ore in sight, is thoroughly equipped and has been intelligently managed.

SINCE the article on the first page on Manganese was printed, a report is received from Monroe, Sevier Co., Utah, to the effect that large deposits of manganese ore have been found there by Messrs. Loring & Christie, who figure on a daily production of 200 tons at a profit of $25 per ton.

THE Oregon *Mining Journal* thinks if the people of Gold Hill would quit talking about their gold pockets and would develop some of their quartz ledges, they might induce capital to buy some of their many good prospects. People are looking for mines to buy, not pockets with $10, $50 or $100 in them.

J. BROWN of this city met his death in a singular manner last week while visiting his mines near Colville, Wash. While driving a band of horses he struck one with the butt of his rifle. The horse kicked, striking the trigger and firing the rifle. Brown fell dead, the bullet having pierced his heart.

A PETITION for the voluntary dissolution of the Oneida Mining Company has been filed by Ignatz Steinhart, P. N. Lilienthal and the other directors. The property of this corporation was transferred to a new company some time ago, and dissolution is asked for the purpose of ending the corporate existence.

A JOHANNESBURG, South Africa, dispatch says: Twenty-three companies have seceded from the old Chamber of Mines and will form a new chamber. These companies won't have anything to do with the companies controlled by the others, since the attempted revolution. They announce a separate output of gold each month.

SINCE its start last January the water-jacket furnace at Nelson, B. C., has smelted between 8,000 and 9,000 tons of Silver King ore. A recent day's work was 340 charges run through, a total of 300,000 pounds of ore, 34,000 pounds lime rock, 34,000 pounds slag, and 51,000 pounds coke—150 tons ore and sixty tons fluxes and fuel.

THE Sulphuric Acid Manufacturing Co., Blacksburg, S. C., claims to produce sulphuric acid for use in the manufacture of fertilizers, with gold as a sort of a by-product. It owns a gold mine, and its process is said to recover 97 per cent of the gold in the ore. The production of sulphuric acid for manure is a new feature in the metallurgy of gold.

JOHNSON AND WILLOUGHBY have sold eleven mining claims, the Mountain King Group, adjoining the Alaska, Willoughby property, Funter Bay, Admiralby Island, Alaska, for $50,000. Geo. Garside, representing the purchasers arrived here on the Mexico to buy a ten-stamp mill, a saw mill, and other requisite machinery for development work.

NEAR San Andreas, F. J. Horswill is running a 1200-foot tunnel to tap the ancient channel at a depth of 350 feet. It is expected that will open a gravel bed 2100 feet wide at the junction of the old Craner channel, and the bed of the prehistoric Calaveras river, and is interesting as illustrative of one of the many forms of California gold mining.

COLORADO papers say considerable work will be done in the Gunnison country this season. That section attracted considerable interest sixteen years ago, but the prospectors then were looking for nothing but carbonates. Gold indications justify vigorous prospecting, and reports from there say gold discoveries are confidently expected this summer.

THE Cripple Creek *Mail*, the first number received since the fire there, reappears. It has 232 advertisements of notices for application for patent, and room for one column of editorial, in which it furnishes figures from a local geologist arguing that the temperature at the recent fire was the highest of any similar event in the world's history—2000 degrees. Returns on this subject are, however, incomplete.

FOLLOWING is the report of the Robinson, South Africa, mine for April: Mill: 120 stamps at work; 13,505 tons of ore crushed; yielded in smelted gold, 10,118 ozs.; from concentrates (by chlorination), 750 ozs.; from tailings (cyanide process), 2216 ozs.; from own ore, 13,084 ozs.; from concentrates bought (by chlorination), 2059 ozs.; from slimes, 784 ozs.; total gold recovered, 15,927 ozs. Profit for month, 27,500*l*.

LAST Saturday Secretary Smith approved as basis for patent list 28 of the selections by the Southern Pacific Railroad Company on account of its main line grant, embracing 58,737 acres in the Visalia land district. The mineral land bill slumbers, and the pliant cabinet officer is rapidly approving railroad patents to some of California's mineral area. To those who have taken up and carried on the fight for the preservation of mineral lands to the State the spectacle is a shameful one, but general indifference permits the existence of the present situation.

GOLD MINING is now fast becoming a regular legitimate business that is being worked with the same careful attention to income, outgo and details that characterizes any other form of business, yet it differs some from many other kinds of business: if a man has a paying property no one threatens to start another mine alongside and divide the business: there is no competition: the buyer seeks the seller, instead of the producer looking for a purchaser: there is little likelihood of overproduction: the price does not fluctuate: the terms are always cash: the transportation problem never troubles, freight rates being reduced to a minimum. Taken altogether, the gold producers form to-day the most independent class of workers in the United States.

THE gold brick industry is languishing in Oakland, Cal., and elsewhere, at present. In Idaho an old trick is being revived. Last week, at Idaho Falls, a man presented to the bank of Anderson Bros. a ball of amalgam, asking them to weigh and send to the mint on his account. As the stuff looked well, Anderson Bros. did not hesitate to advance a small sum of money on it, a note being taken for the money advanced, signed George Hanson. He was an innocent-looking fellow, about twenty years of age, and represented that he and two others were working a claim up the river, about fifteen miles from Idaho Falls. The ball of "amalgam" was an iron ball well covered with gold, the fact having been disclosed very soon after it fell into the hands of the assayer at Boise City.

A MESSAGE from Abraham Lincoln to the mining men is worthy at this day of a prominent place. The very last words Lincoln delivered on the afternoon before his assassination—last of those great utterances that for six or seven years electrified and enlightened half the world—were a message of suggestion and encouragement to the miners of the nation. Schuyler Colfax was coming out here and was paying his final call at the White House. Lincoln said to him: "I want you to take a message for me to the miners. I have large ideas of the mineral wealth of our nation. During the war, when we were adding $2,000,000 a day to our national debt, I did not care about encouraging the increase in the volume of our precious metals; but now that the rebellion is overthrown, and we know pretty nearly the amount of our national debt, the more gold and silver we mine makes the payment of that debt so much the easier. Now, I am going to encourage that in every possible way. Tell the miners for me that I shall promote their interests to the utmost of my ability, because their prosperity is the prosperity of the nation." These were the last public words of the immortal, and they were as prophetic and true as the rest.

THE San Francisco dailies are doing good work in aid of the mining industry of the State by publishing items of news collected from the local journals. Time was when it was difficult to find an item from a California mine in a San Francisco daily, but of late each one of the six dailies devotes considerable space to the subject. The most recent to recognize the value of the matter is the *Examiner*, which has now begun a mine department edited by Mr. Chas. G. Yale, statistician of the Mint. Since the *Call* passed under new control, that paper has also given considerable attention to collecting mine news. Too much publicity cannot be given facts regarding California's mineral wealth, and an advertisement of the State's gold resources in its newspapers is as much of an aid to the commonwealth as any one thing can be.

SUPT. HUNTLEY, of the Tom Boy at Telluride, Colo., says the company loses $200 or $300 a week by stealages of ore. He says "occasionally one of the men comes into the office and tells us that So-and-So last week pounded out a couple of hundred dollars from some rock from his claim down the mountain. At the same time we find that the same man had just a few days before asked for a leave of absence. He wanted to go down the hill to rest up—felt sick on account of the altitude. Well, the fellow's name comes off the payroll, and possibly he is searched, but it stops the leaks for a few hours. Then, if we are in good ore it begins again, and in a few days some other fellow is removed and a new man goes on. But occasionally we get hold of a man we feel we can trust. That fellow is taken care of and there is nothing too good for him as long as he stays with us."

THE *Investor* thinks it will probably never be known how much mining stock was burned in the Cripple Creek fires. Many owners kept their stocks in desks and trunks and when the fire broke out were either in the hills, out of town or beyond the reach of their holdings, and in many cases trunks, desks and all burned together. The custom of trading in stocks signed in blank now arises as a bar to the owner ever recovering from the loss of his certificates. Few kept any record of the numbers of the certificates or to whom they were originally issued, and it will be next to impossible to convince the companies that a loss has been sustained or to guarantee against duplicate issuing. Other brokers can trace back their certificates sufficiently well to get a reissue, and in cases where the stock was in first hands it will be comparatively easy to replace them.

LAST Tuesday Senator Dubois of Idaho succeeded in having inserted in the deficiency bill the item for lead sampling which was made a part of the administrative bill pending in both Houses. Should the amendment inserted become a part of the law, it will fully meet the dishonest competition of Canadian and Mexican ores crossing our frontier. The amendment in full is as follows: "The Secretary of the Treasury is hereby authorized to expend from the appropriation for collecting the revenue from customs a sufficient sum, not to exceed $45,000, to provide for the purchase of the necessary land and for the construction and equipment of sampling works thereon, or for the leasings of suitable buildings and equipment for the sampling and assaying of imported silver ores and other ores containing lead at the ports of El Paso, Tex., North Port, Wash., and Bonner's Ferry, Ida., and at such other ports as in the judgment of the Secretary of the Treasury the interests of the revenue demand; and the Secretary of the Treasury is hereby authorized, in case of importation of said ores at ports at which no facilities as above are provided, to send a portion thereof to a port having said facilities, at which port said portion may be sampled and assayed. In no instance shall a less portion than one-fifth of any importation of ores be sampled and assayed."

THE frauds in the mining world are not confined to those who attempt to foist worthless stock on credulous purchasers, or sell a mine on the strength of a spurious assay. All great industries have their parasites, barnacles and blood suckers, and the present activity in the mining industry has brought out several who advertise in such mining journals as admit their announcements. These fellows play a double game. They swindle the publisher of the paper, for they never pay a bill, and they swindle the customer they secure by sending him inferior apparatus. Two concerns in particular are now scattering advertisements wherever they can induce the publisher of a paper to unconsciously aid in their nefarious scheme. One is the notorious Hartsfelt, who has been exposed over and over again: the other is a New York concern whose real name will be given as soon as it can be ascertained. In general, publishers will do well to decline publishing an advertisement from obscure or veiled sources that promises too much, and customers need to be chary about answering advertisers that offer too much. A cleverly worded announcement may cajole a prospector into sending good money for a snide outfit, but prudence suggests that would-be purchasers of supplies or outfit of any kind from this class of dealers should at least demand opportunity for inspection of what they propose to buy before parting with their money. The better way is to deal only with reliable firms that have reputations to maintain and who cannot afford to be caught in any trickery.

THE House Committee on Public Lands recommends the passage of the bill authorizing an annual appropriation out of the fund derived from the sale of public lands, of $15,000 to each State which shall establish schools of mines, that amount to be increased $1,000 annually until it reaches the sum of $25,000. A mining school entitled to the benefit of this appropriation must provide for instruction in mining, metallurgy, the English language and the various branches of mathematical, physical, natural and economic science, with special reference to their applications in the interests of mining and metallurgy. The bill has been along the lines of the Morrill and Hatch acts, which gave similar aid to agricultural colleges throughout the country, and it is intended that mining schools and the mining industry shall receive like recognition in this bill. Some time ago a committee interested in mining schools appeared before the Committee on Public Lands and were heard in advocacy of a measure of this kind. Representative Wilson of Idaho prepared the bill mentioned above, which practically gives mining schools the same advantages that agricultural colleges enjoy, and submitted it to the Committee on Public Lands. It is also provided in this bill that any State which may elect to apply said appropriation for the endowment and maintenance of normal schools in lieu of schools for mines, may have the option of so doing. A similar bill has been reported from the Committee on Mines and Mining, and there is a strong sentiment in the House for its passage. While the depleted condition of the treasury may prevent action by this Congress, the justness of the measure is such that its friends believe a report should be had and an effort made to secure its passage. Sooner or later a bill of this kind will undoubtedly be enacted. When it does become a law the fund thus divided in this State will probably be used to aid in defraying necessary expenses of the Mining Department of the State University at Berkeley.

## Matte Smelting.

NUMBER V.

Written for the MINING AND SCIENTIFIC PRESS by W. L. AUSTIN, Ph. D., Denver, Colorado

It has been the experience in most, if not all, of the Western mines that as soon as permanent water level is reached the ores become more heavily sulphureted. In some cases veins which have been quite free from sulphides above water level at that point suddenly changed their character completely, and within the space of a few feet were found to be altered from a free milling quartz into a massive sulphide containing comparatively little silica.

Thus as the mines deepen the amounts of sulphides which it becomes necessary to handle increase. In Leadville, Colorado, for instance, from 1878 to 1880 the ores were, as far as could be determined by the eye, wholly of an oxidized character, and the furnaces produced no matte of any consequence; but in the year 1891 oxide ores had become comparatively scarce, and the enormous ore bodies then exposed to view in that camp were mostly massive sulphides, so poor in silica that barren quartzite had to be smelted with them to afford the necessary acid for taking up the bases. Approximately the same state of affairs has been found to exist at Butte, Montana. In 1887 and 1888 iron was scarce at the Butte smelters and a premium was paid by some of them for iron sulphides to assist in fluxing their silicious ores; now the ores are heavily sulphureted. At Bisbee, in Arizona, in 1882 the ore was all oxidized and no matte was made in the furnaces, the product being black-copper bars; in 1895 the product of the blast furnaces was all matte, and a plant of Manhes converters had to be added to reduce the matte to crude copper in order to save on freight charges in shipping the final product to market.

Many other illustrations might be given to prove the prevalence of massive sulphides in the deeper levels of many of our prominent mines; but this is scarcely necessary, for that such is the case is common experience in nearly all mining camps where the ores are of a smelting character. In some places, however, the sulphides occur in massive bodies before permanent water level is reached; for instance, at several points in Shasta county and elsewhere in California, and at Trail Creek in British Columbia; and the relative percentages of sulphurets and gangue in the veins vary, of course, greatly in the different districts.

The occurrences of large bodies of massive sulphides (such as contain from 60 to 95 per cent of iron sulphide) scattered over North and South America, Spain, Italy, Norway, Australasia, India, Africa, etc., are too numerous to mention here. The writer, by means of a rather extensive correspondence carried on for several years past, has become informed of the location of hundreds of such deposits which are eminently suitable for treatment by the pyritic smelting process; that is, by the true pyritic smelting, where the iron and sulphur contents of the ore are used to furnish all, or nearly all, the fuel necessary for its reduction in the blast furnace.

It can be safely stated that there is now no scarcity of massive pyritic ores, and it is evident from the many samples received by the writer that most of them contain the percentage of iron sulphide necessary for economic treatment by this process. If large quantities of heavily sulphuretted ores are already developed in so many mines, it can be reasonably assumed that the amount will be increased as deeper workings are reached and other districts opened, and that the smelting process best suited to the reduction of such ores will become of more and more importance as time goes on.

Mr. Lang, in treating of the general character of the base metal ores of western mining districts which might be made amenable to pyritic smelting methods (see page 55 of his book), makes the following statement: "The bulk of the so-called base or refractory ores of gold, silver and copper will not exceed 15 per cent sulphur, and possibly will not average 10 per cent." Where the gangue ("stony matter") exceeds two-thirds of the material to be treated, Mr. Lang (see page 56) no longer considers it a smelting ore, but classifies it as "best adapted to water treatment." Possibly he may be justified in his statement that the "bulk" of mineralized vein matter included by those elastic and very indefinite terms, "refractory," "base"—or, as some prefer to call them, "rebellious"—ores (each user of such terms reserving to himself a private definition of just what he means) contains, on the average, not to exceed 10 per cent sulphur; but probably the majority of practical metallurgists will be astonished to learn that such 10 or 15 per cent material has been classified as smelting ore at all! Certainly it seems strange that one who advocates the smelting of 80 per cent quartz ores—as will be presently shown—should characterize as "somewhat radical" and "extraordinary" a method whose purpose is to use an ore mixture containing sufficient iron to flux off the silica associated with it; but this Mr. Lang does in his allusion to "Mr. Austin's idea of the proper functions of pyritic smelting."

A visit to Butte, in Montana, to Leadville and the San Juan in Colorado, to Sudbury and Trail Creek in Canada, to Ducktown in Tennessee, to Orange county in Vermont, to Shasta and Amador counties in California, or to many other known places on this continent, will amply demonstrate the fallacy of Mr. Lang's statement in regard to the scarcity of massive sulphide deposits. At all the points designated such ores will be found to exist in large quantities.

But Mr. Lang, having first settled to his own satisfaction that such ores do *not* exist in sufficient quantities as to warrant the introduction of a system of smelting which aims to use their own fuel qualities, then proceeds to elaborate in his book a "metallurgical plan which *is* adjusted to the treatment" of "so-called base or refractory ores of gold, silver and copper," which he tells us "will not exceed 15 per cent sulphur, and possibly will not average 10 per cent." At some future time the writer may take up the subject of Mr. Lang's "metallurgical plan" in detail, but first let us see what constitutes a smelting ore and makes profitable smelting, and then it will be easier to see how far the proposed plan is applicable to "existing conditions" in the mining regions.

In the first place, location has naturally a great deal to do with the method of treatment to be adopted in the case of any given ore. At large smelting centers, such as Denver and Pueblo, almost any class of ore may be smelted. Different mining regions furnish ores differing radically in their mineralogical and chemical characteristics, ranging from basic material such as hematite and calcite on the one side to quartzose ores and straight silica on the other, and therefore they may be advantageously mixed at such metallurgical establishments. Experience has shown that a diversity of ores can be collected at certain central points and that smelting at such places is more profitable than treatment at the mines would be, because these ores can be so mixed as to assist each other in the smelting process and require a minimum of dead fluxes.

But when an ore comes up for treatment in some district so far from the central smelting points that it is impossible for economic reasons to ship it away from the mine, then it will always pay to consult some experienced and competent metallurgist before committing the future of the enterprise to any metallurgical plan whatever. This caution is especially to be recommended in cases where any smelting process is contemplated.

It is safe to assert that a pyritic ore, carrying at the most 15 per cent and on the average 10 per cent sulphur, in the form of sulphide of iron, galena or blende, with a quartzose gangue, is not a self-contained smelting proposition, to begin with, and that an attempt to smelt such an ore by itself will in nine cases out of ten result in failure. For if 15 per cent of sulphur is combined with iron as bi-sulphide (ordinary iron pyrites) then the ore will contain only 28.12 per cent of that mineral; and if there is not over 10 per cent of sulpur in it, the percentage of pyrites will be only 18.78, leaving, respectively, 71.88 and 81.22 per cent unaccounted for! From the smelting point of view, it is of the first importance to learn what these other constituents are, because upon them depends the selection of a metallurgical process suitable to the reduction of the ore in question.

Quoting again from Mr. Lang's book (page 56): "We find a large proportion on the average of stony matter, perhaps not less than two-thirds, in those ores under consideration. * * * The gangue is prevailingly quartz, but in more favored localities is calcite, spathic iron (seldom), heavy spar (less seldom), and, not unfrequently, in some felspathic rock, usually somewhat decomposed." The instances in this western country where calcite occurs as the predominating gangue of pyritic ores are exceedingly rare. The writer can recall only two or three cases among the many hundreds of such deposits which he has examined, and the other minerals (except quartz) named as occasional gangue in pyritic veins, are too rare to deserve serious consideration, being very much rarer than the bodies of massive sulphides which Mr. Lang declares do not occur as a general rule. The usual gangue of pyritic veins is quartz—that is to say, practically straight silica—and in this Mr. Lang agrees, for he admits above that "the gangue is prevailingly quartz." Now, accepting Mr. Lang's statement that the general average of pyritic ores is 10 per cent sulphur (equivalent to 18.78 per cent pyrites, or 13.77 iron proto-sulphide), then, if such ore could be smelted down without the addition of fluxes, and all the pyrites contained in it were utilized to form matte, the matte-fall would only amount to 14.4 per cent. This would be equivalent to putting seven tons of ore into one ton of matte, assuming that the gangue is mostly quartz, and the loss in moisture, carbonic acid, etc., is inconsiderable.

A matte-fall of 14.4 per cent is none too large to effect a reasonable percentage of saving in the majority of cases, especially when copper is scarce, and the old text books will be found to be not so far wrong in the latter case in recommending a heavy matte-fall to protect the valuable contents of the charge.

But if 10 per cent is the average sulphur contents of Western pyritic ores, and if all of this element must be utilized to produce the necessary matte-fall in order to protect the valuable metals contained in the charge, and if the prevailing gangue of such ores is quartz, then there is in the great majority of cases about 81.22 per cent of silica to slag off in subjecting such ores to the smelting process. Fluxing off this amount of silica will in nearly every instance require the addition of great quantities of barren material to the charge, because in isolated districts no such advantageous ore mixtures can be made as at the great smelting centers.

If the iron of the pyrites could be used for fluxing purposes, then the question of slagging off the silica would be simplified; but it is evident that in ores averaging 10 per cent sulphur, when quartz prevails in the gangue, there is no possibility of employing the pyrites for any other purpose than to produce matte, for after the addition of the necessary fluxes the quantity of matte produced from such an ore will barely suffice to collect a reasonable percentage of the gold and silver contents. Therefore, it is evident that the necessity exists of adding other elements to the charge, to furnish the requisite bases with which the silica can unite to form fusible compounds, and such additions to the ore charge must greatly increase the amount of material to be treated.

Mr. Lang mentions in his book (see page 58) that in his metallurgical plan: "It becomes necessary to maintain such a composition that the slags are not greatly less fusible than the ordinary lead slags," and therefore it is assumed that the mono-silicates will be the ones employed. In forming such slags the following amounts of the more commonly occurring slag-building elements are necessary:

TABLE SHOWING AMOUNTS OF BASES AND SILICA NECESSARY TO FORM MONO-SILICATE SLAGS.

| | SILICA. % | BASE. % |
|---|---|---|
| Iron mono-silicate | 29.41 | 70.59 (iron protoxide) |
| Lime " " | 34.88 | 65.12 (calcium oxide) |
| Magnesia mono-silicate | 42.86 | 57.14 (magnesia) |
| Alumina " " | 46.68 | 53.32 (alumina) |

An inspection of this table shows that lime will go further towards satiating silica than an equal weight of iron will, and that magnesia and alumina go further still. Just how much of these various bases it is best to use in a given case is a matter to be determined by the experience of the metallurgist in charge; but on a basis of a mono-silicate slag it would require to flux a ton of the 81.22 per cent silica ore mentioned above about two tons of iron-protoxide, or a slightly larger amount of hematite, about two and one-fifth tons. Or, if lime were used as the base, it would require about two and seven-tenths tons of pure lime rock. These amounts of dead fluxes added to the charge will be found to reduce the matte-fall in either case to less than 7 per cent, which in the absence of copper will only effect a very low percentage of saving.

Now, as the most of such ore bodies as Mr. Lang has under contemplation in his "metallurgical plan" are low grade as to values, the number of places where such a scheme could be put into profitable operation is exceedingly limited. Of course, if fuel and fluxes can be provided, and if the values in the ore are sufficient to cover the great expense of them, there is nothing, metallurgically speaking, impossible about it; but as there would be no iron and sulphur to burn, the smelting system used in treating such an ore in the raw state could hardly be termed pyritic smelting, in the modern acceptation of the term, but would come under the head of the old German "roharbeit" (see MINING AND SCIENTIFIC PRESS of March 28th, p. 245).

Almost any one familiar with the best modern ore treatment would, in such cases, advocate some other method than smelting, or at least that some attempt should be made to bring the iron-sulphide contents up to a higher percentage before putting it in the furnace. For instance, such an ore could, in most cases, be cheaply jigged, and the sulphide contents of the result thereby brought up to almost any requirement; and in that case the necessity for Mr. Lang's metallurgical plan would be still less apparent, for the product could then be more economically handled by pyritic smelting pure and simple. The degree of fineness of the concentrates is of little moment in such treatment, because there are various expedients which may be adopted in such cases; and furthermore, no matter how coarse the pyrites is when charged into the furnace, it usually, as soon as it is hot, flies to pieces (decrepitates) and becomes a sand under any circumstances.

Now, in reducing Mr. Lang's proposition to figures, so that the uninitiated can estimate the approximate cost of smelting an ore containing about 10 per cent of sulphur in a quartzose gangue, we have the following results:

APPROXIMATE COST OF FLUXES AND FUEL REQUIRED IN SMELTING 100 TONS OF QUARTZOSE ORE CARRYING 10 PER CENT SULPHUR.

| | *Tons.* | *Cost.* |
|---|---|---|
| Amount of silica to be fluxed off, assuming the ore carries 18.78% pyrites | 81.22 | |
| Amount of hematite required | 166.66@$3 ₱ ton | $ 499 98 |
| " " limestone " | 90.00@$2 " | 180 00 |
| " " coke " | 50.68@$15 " | 760 20 |
| Total for fluxes and fuel | | $1,440 18 |

The cost of fluxes and fuel per ton of ore smelted,

provided pure hematite and limestone can be had at above rates, will be $14 40, and the total matte-fall, if no sulphur at all is lost, will be 8 per cent. In addition to the cost of fuel and fluxes must be considered the cost of labor, power for blast, transportation of the matte to market, refining charges, interest on cost of plant, sinking fund, insurance, office expenses, salaries of superintendent, assayer, etc. The metallurgical losses which are sure to be met with in operations of this kind must also be given due consideration.

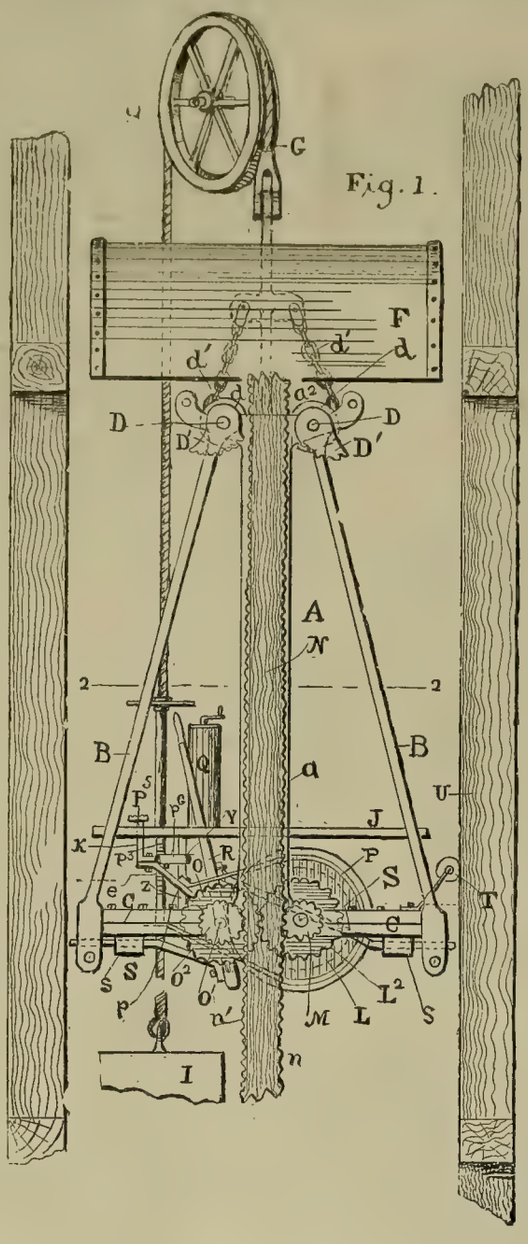
There may be some few isolated mines scattered throughout the mineral districts of the great West to whose ores Mr. Lang's proposed smelting treatment could be advantageously applied. Indeed, it would be strange if this were not so. Such cases, however, are rare. Undoubtedly Mr. Lang's methods will appeal strongly to the inexperienced; but if those who may be entertaining such a proposition will take the pains to have made an accurate silica determination of their average ore, and then ascertain the amount and cost of the bases required to flux off that silica, they will be "wise in their generation," and their wisdom will undoubtedly save them, not only from mental worry incidental to having attempted the impossible, but also from serious financial losses.

It is not the purpose of the writer to decry any particular method of ore treatment. Every mining proposition which comes up must be considered separately from a metallurgical standpoint, and no one smelting process, even when the ore to be treated is manifestly of a smelting character, can be applied in all cases. In treating matting ores the ordinary water-jacketed blast furnaces will, in some cases, be found to give the best results; in others, the large modern reverberatories should be given the preference, while with many classes of material pyritic smelting presents substantial advantages. As remarked above, there *may* even be instances where Mr. Lang's "metallurgical plan" can be used to more or less advantage, but probably less.

W. L. AUSTIN.

Denver, April 4, 1896.

# Electrical Progress.



## Electric Mine Cage.

Chas. J. Cutler of Butte, Montana, thinks that electricity can be utilized to run a cage in a vertical shaft just as well as an elevator in an office or store building, and has patented a device that he thinks will be found practical wherever a cage or mine elevator is used. The power is had from a trolley wire. The inventor says that a sixty-horse power motor will thus raise a ton 1000 feet per minute; but by using as a counterbalance another cage or elevator a 120-horse power can be obtained which will raise one ton 2000 feet per minute. If there is one cage the regular weight counterbalance could be made 1000 pounds heavier, working on the plan of a Cornish pump.

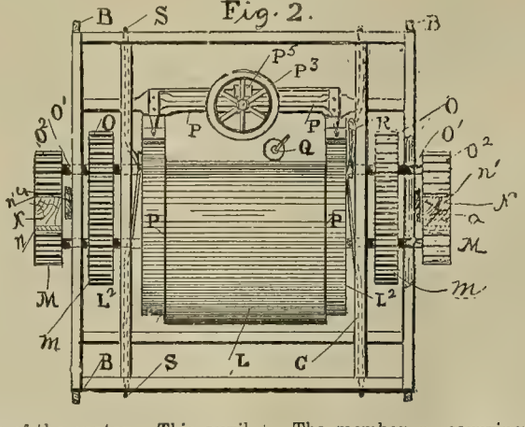


Figure 1 is an end view of the elevator cage, in position in the shaft. Figure 2 is a horizontal section on the line 2 2 of figure 1. Figure 3 is a view, partly in vertical and partly in side elevation.

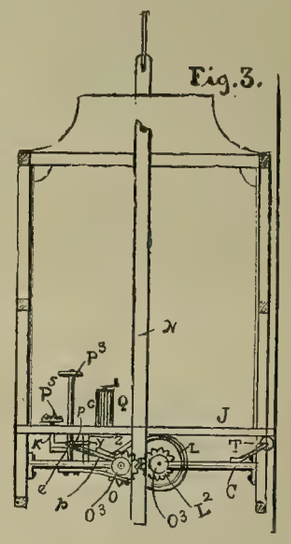
*D D* are a pair of rock shafts journaled in the cross-heads *a2*, carrying near their centers pulleys *d*, to which are connected chains *d* depending from a swivel secured to the lower end of the lift-bar *E*, to the upper end of which lift-bar the counterbalance cable *G* is attached. On the outer ends of these rock shafts are toothed cams *D*. *F* is a cover portion through which passes the lift-bar *E*, connecting with the counterbalance cable *G*, which latter passes over the large sheave *H* and supports at its lower end counterweight *I*, of suitable form and size.

*J* indicates a platform mounted on the cage frame at a point above the motor frame *C*. Upon it is mounted or disposed the controlling lever, rheostat and brake mechanism. *L* is an electric motor having its shaft journaled in the frame *C* of the cage. Upon the outer ends of the motor shaft are cog pinions *M*, which are held to engage the racks *n* on one side of the guide timbers *N*, which are secured within the shaft at opposite sides of the cage. The motor shaft is provided at intermediate points near each end with cog pinions *m* of larger diameter than those on the ends. These pinions mesh with similar cog pinions *O* on an auxiliary shaft *O1*, journaled in frame *C* alongside of the motor. This auxiliary shaft is provided on its ends with smaller pinions *O2*, which engage the racks *n* on the opposite sides of the guide timbers *N*. The motor shaft is provided near the supported motor with enlargements or pulleys *L2 L2*, over which pass the steel brake bands *P*, having wooden brake blocks.



The lower end of each brake band *P* is secured on the under side of a fixed portion of the cage frame, as shown in figures 1 and 3, and its opposite or upper end is secured to the legs of the pivoted transverse member *p*, as shown in figure 5, whereby the bands may be clamped or tightened around the pulleys *L2 L2* or loosened when it is desired to apply or release the brakes.

The member *p*, carrying the upper ends of the brake bands, is depressed by either foot or hand power. To the center of its transverse portion is affixed a vertical standard *k*, projecting upward through the platform and terminating in a head or foot rest *v*, thus forming a foot lever *P5*, by means of which the operator is enabled to readily depress said member and clamp the spring brake bands with his foot. A transverse slot or opening *W* is also formed on the rear side of member *p* by means of projecting lugs *e e*, adjacent to each other, for the accommodation of the hand brake *P3*. This hand brake consists of a vertical screw rod surmounted by a hand wheel and extending down through the platform *J*, through the slot *W*, and having its lower end revolubly secured in the motor frame *C*. This rod is screw-threaded where it passes through the slot *W*, and upon the screw-threaded portion above the member *p* is placed a nut *p6*, designed to be forced down the screw-threaded portion of the rod and carry with it the member *p* when the rod is revolved by hand. In order to prevent the nut from turning with the rod, it is provided with a perforated shank *Y*, intended to fit over and move upon a vertical guide rod *z*.

*Q* represents a rheostat mounted on the operator's platform for controlling the motor. *R* is a hand lever fulcrumed on the shaft *O*, to which are secured—one above and one below the fulcrum—chair blocks or plungers *S S*, secured in guides on the under side of frame *C*, and projecting in opposite directions. These plungers are adapted to be projected outward through the medium of the lever *R*, so that their ends will engage a rack or openings in the sides of the shaft at any desired point for the purpose of arresting and sustaining the cage when ascending or descending.

*T* indicates a trolley or contact maker flexibly secured to the frame *C*, and which engages the wire or circuit plate *U*, secured to the side wall of the shaft, as shown.

By referring again to figure 1 it will be seen that the rack guides *N* occupy position between the toothed-faced cams *D D* when the cage is in position, said cams being held out of contact with the racks *n n* by the chains *d*, while the cage is suspended by the counterbalance cable *G*. Should the latter break, the inventor claims the rock shafts *D* would be caused to turn by the weight of the cams, throwing the toothed faces of the latter in contact with the racks *n n* on the guides N, and they would operate as automatic safety clutches, arresting the downward movement of the cage. At the same time the chair blocks or plunger rods *S S* might be forced outward by the lever and serve as an additional means of supporting the cage.

The lower ends of the pendent members *B* of the cage are provided with eye-holes for conveniently attaching a lower cage or compartment, it being the purpose in mining work to have a two-compartment cage—one above the other—the upper to be occupied by the operator.

---

A COUNTERPART to the story of the college professor who was driven almost to a frenzy by the behavior of the galvanometer while he was mak-

ing some tests, and who on removing his hat, in the rim of which there happened to be a strip of metal, found that the needle swung true again, to his infinite relief, has been met in Berkeley, where in the electrical department of the girls' high school the professor in charge has for some time been grievously perplexed and disturbed. His delicate testing instruments would play him all manner of tricks, and experiments which he had always made with the certainty of a specific result would turn out in a most inexplicable way. These curious phenomena were exhibited only when certain of the students approached the galvanometer. The professor discovered that the disturbance was caused by the wearing of corsets with ribs of steel; the instruments were entirely unaffected by the proximity of the students who wore health waists or webbing braced with whalebone or other substitute for steel. The position was a delicate one, and the professor became strategic. He took counsel with two of the women teachers, who lectured the girls on hygiene and physical development, and warned them of the evils of corsets. But the real motive of the new crusade leaked out, and many of the girls found plenty of excuses for declining to make the sacrifice suggested. Finally the professor was obliged to issue a rule forbidding corseted girls from entering the electrical laboratory, and the governors indorsed the rule. Some of the girls who thought that they could surely succeed in gaining admittance to the laboratory without obeying the edict reckoned without the professor, and were promptly turned back. At the entrance to the department was placed a sensitive galvanometer, alongside of which the professor stands unobtrusively. On the approach of a girl wearing steel-ribbed corsets the needle gyrates frantically, and the wearer is respectfully but firmly reminded of the rule. It is impossible to beat the game and expostulations are useless.

SUMMARIZED REPORT OF SEVENTEEN ELECTRIC STREET RAILWAYS TO RAILROAD COMMISSIONERS OF STATE OF CONNECTICUT FOR YEAR ENDING SEPT. 30, 1895.

## Niagara Falls' Roar Heard in New York City.

Written for the MINING AND SCIENTIFIC PRESS by ORRIN E. DUNLAP, Niagara Falls, N. Y.

One of the truly novel features of the electrical exposition in New York city was the transmission of the roar of Niagara Falls by telephone. After investigation, it was decided that some point near the Cave of the Winds would be the best point at which to gather the sound. Here one can get closer to the falls than at almost any other place. So here the telephone was placed. To reach this point one descends the Cave of the Winds' spiral stairway and walks toward the Center Fall about 200 feet. There on the rocky ledge a wooden box about 3½ feet long, 3 feet high and 1½ feet wide was placed. In this box a telephone with a solid back-transmitter was placed and a sheet-iron funnel 20 inches long and about 14 inches in diameter at the fall was fitted to the transmitter. Three standard batteries were placed in the box, but two only were used. About the box white canvas was wrapped, to protect the apparatus from the constantly falling spray.

At the point where the telephone is placed there are two distinct sounds produced by the falling tons of water. One is a sharp, hissing sound, like escaping steam, made by the water as it curls over the rocks below and goes sweeping out into the river. The other is the deep-pounding roar made as the fall strikes the rocks or water below. First experiments made with the telephone placed some 12 or 15 feet further away from the falling water were successful in catching the sharper hiss of the waters. This sound was plainly heard in New York, but the deeper roar was not caught. It was for this reason that the change in location was made, and the roar as heard in the world-famed Cave of the Winds was dispensed in New York, 462 miles distant.

ASSOCIATED in small quantities with argon, which in turn occurred with its apparently inseparable companion, nitrogen, helium has been found issuing in a stream into the air in the gas springs of the Black forest; hence, according to Prof. Kayser, to whom the discovery is due, free helium must be found in the air along with argon. The spectroscopic lines, says Prof. Kayser, though very faint, are distinct enough to show that its presence in the air is a matter of no doubt. Prof. Ramsay, the actual discover of helium as now known to the world, states that the most searching attempts to demonstrate the actual existence of helium as a normal constituent of the air have failed.

THE report of the Commissioner of Patents, John S. Seymour, for the year ending December 31st, 1895, was submitted to Congress last week. It shows that aggregate receipts from all sources during the year were $1,245,247, expenditures $1,084,496. In every year since 1861 there has been a surplus over all expenditures. During the year there were issued 21,998 patents and designs, exclusive of 59 reissues, and inclusive of 2049 issued to foreigners, 1829 trade marks and three prints registered, and 46,899 applications filed for patents, trade marks, labels, prints, etc. There were also 12,348 patents which expired and 3428 patents forfeited for non-payment of final fees. The four foreign countries leading in the number of patents issued to their citizens by the Government are: England, 614; Germany, 539; Canada, 302; France, 202. In the United States the States leading in the number of patents issued to their citizens are: New York, 3529; Pennsylvania, 2246; Illinois, 2130; Massachusetts, 1259; Ohio, 1233. During the past twenty-five years twenty-five inventors have been granted more than one hundred patents each, the whole number granted to them within that period being 4894. In these "Wizard" Thomas A. Edison of Orange, N. J., leads with 711, Elihu Thomson, the electrician, coming next. The greatest activity of the year was shown in detail inventions and accessories to bicycles and in machines and processes for making the parts. Pneumatic tires have attracted the inventor because of their almost universal use on sulkies as well as bicycles.

DURING a recent voyage around the world Mr. E. D. Fridlander made observations with a pocket dust counter of the amount of dust in the atmosphere in various places. The dust was found not only in the air of civilized countries, over the water near them, and up to 6000 or 7000 feet in the Alps, but was fairly abundant over the ocean far from land, while it has been proven to exist at a height of more than 13,000 feet.

OBSERVATIONS upon the preservation of timber have shown that the more warm and humid the atmosphere the more rapidly the wood deteriorates; also that timber felled in winter is more durable than that felled in summer, and that timber raised in cold climates is most durable, while the best timber is produced on meager soil. When under water the most lasting woods are oak, alder and pine, the least so being birch, linden and willow. In the air timber is exposed to the ravages of insects, this being the case with sap wood more than the hard wood. Woods rich in resin, like the elm and poplar, are not so much troubled as those like the alder, willow, birch, yoke elm and red beech, which have an abundance of sap, and are rapidly deteriorated. Timber construction which is protected from heat and humidity is only endangered by worms, and, on the contrary, that which is in a damp and badly aired place injures by rotting, which is really the result of microscopic vegetable growths. The primary cause of the decay of wood is the presence of albuminoid substances in the sap and incrusting materials, these naturally affording nourishment to insects and microscopic vegetations and their destructive work.

POTASSIUM PLATINO-CYANIDE is still preferred by Jackson, the English physicist, as the fluorescent substance in experiments with Roentgen rays. He gets twice as much light as from calcium tungstate, and is able, with moderate electric energy, to see distinctly the bones in the thickest part of the body, the jawbones in action, and the outline of the skull. He uses two-thirds of an ounce of the potassium salt in a mucilaginous vehicle over a six-inch disk of black cardboard, and affirms that Edison tried too little. Zickler, a German experimenter, has made radiographs with and without visible fluorescence, and finds the latter results equal or better than the former, with the same exposure, thus demonstrating that the rays have a direct chemical action on the plates.

THE great telescope of the Berlin exhibition, when completed, will have two objectives—one of 43 inches aperture and about 20 feet focus, the other of 28 inches aperture and 68 feet focus—in one mounting. It will have no dome, but will be curiously mounted in an immense cylinder, supported only at the inner end.

# Mechanical Progress.

## Lead Production.

The United States Geological Survey gives the following statistics of the production of lead:

| State or Territory. | 1894. Net tons. | 1895. Net tons. |
|---|---|---|
| Colorado | 50,613 | 46,984 |
| Idaho | 33,308 | 31,638 |
| Utah | 23,190 | 31,305 |
| Montana | 9,637 | 9,802 |
| Nevada | 2,254 | 2,583 |
| New Mexico | 2,973 | 3,040 |
| Arizona | 1,480 | 2,053 |
| California | 478 | 949 |
| Washington, Oregon, Alaska and South Dakota | 150 | 381 |
| Missouri, Kansas & Wisconsin. | 8,614 | 13,706 |
| Total lead contents of ores smelted | 132,697 | 142,441 |
| Contents Mexican and Canadian ores | *21,000 | †21,477 |

*Estimated. †Of which 5040 are Canadian.

Assuming that the waste and loss in smelting amounted to 6 per cent, then there were derived from the ores mined in the United States, worked by smelters and desilverizers, 124,700 net tons in 1894 and 134,900 net tons in 1895. Adding the production of soft lead from Kansas, Missouri and Illinois ores, which was 37,686 net tons in 1894 and 39,890 net tons in 1895, the following amounts are reached as closely representing the product of lead from American mines: 162,386 net tons in 1894 and 174,790 net tons in 1895.

According to direct returns the total production of desilverized lead was 201,992 net tons. Of this a certain quantity was obtained from refining Mexican and Canadian base bullion (returned at 54,696 net tons), and from the lead contents of Mexican and Canadian ores (21,477 net tons as per returns).

Making an allowance for waste of 2 per cent on base bullion and 6 per cent on ores there was, therefore, included in the above 201,992 net tons of soft lead, 73,792 of foreign material, leaving 128,200 net tons of lead from domestic sources. This compares with 134,900 tons found by estimating on the basis of direct returns of the lead contents of ores from the smelters. This apparent discrepancy is probably accounted for by changes in the stocks of base bullion carried by refiners, by changes in the quantity of material in transit from smelters to desilverizers, and by difference between the actual metallurgical loss and that estimated. Under the circumstances it seems justifiable to estimate the lead product of

the United States for 1895 at 161,440 net tons.

### Unusual Fly Wheels.

The great velocity at which fly wheels are driven and the consequent casualties that have become a matter of weekly report are evidence of slow evolution in providing for known wants. The sudden advent of electrical apparatus and its high speeds found people making fly wheels of cast iron, with a narrow factor of safety, or, indeed, no factor of safety at all if we consider the impossibility of detecting inherent strains and imperfections in this material. No one can know the value of material molded into form at a temperature of 2,000 degrees and then cooled down to a fortieth of this temperature, nor can they judge internal structure by surface indications. The fact is that cast iron is not suitable material for fly wheels that are to be driven at high speed, nor is it necessary to make them of this material. There is not even the claim of cheapness in their favor, if the methods of making such wheels of wrought iron and steel were once worked out. Twenty years ago a Scotch firm, who had to make a large fly wheel for a spinning mill, riveted up a box rim, made from rolled plates, and filled it with cemented masonry or "grout," and did a very sensible thing. The strength of rolled sections is tolerably well known, their integrity is beyond doubt or can be so, and all that is wanting is some ingenuity and experiment to substitute this kind of material. One reason for using cast iron for fly wheels is to attain a section and stiffness of the arms that will, in the plane of rotation, resist the inertia and momentum of the rim. The sections of wrought-iron spokes required for radial or centrifugal strain are by far too weak for the driving strains, but this is easily provided for by diagonals as in the case of other iron structures.—Cassier's Magazine for June.

THE Helena, Montana, Water and Electric Power Company incorporated on the 21st inst.; capital stock, $200,000. Incorporators—G. T. Hauser, A. M. Holter, T. A. Maslow, Helena; B. Jewell, O. R. Peck, Chicago; A. G. Hewitt, W. G. Gurnee, New York; object, to build a dam across the Missouri river at Stubbs, Mont., and by the falls generate electric power to be used in Helena and East Helena, fourteen miles away, in the shape of mining, factories and car lines. The company will start out with an 800-horse power plant. The smelting works at East Helena will be run by power generated by this company.

## Practical Information.

### Preserving Small Skins.

As the camping season is at hand, and many of our young men may take to the mountains, prey upon the inhabitants and wish to preserve mementoes of the slaughter, the following directions from the *Country Gentleman* may do to put in their gun-cases:

Clean off all the flesh and fatty matter on the flesh side, after which wash that side with a strong lye made from wood ashes, and follow that washing very soon with one of sperm oil. Rub such parts as are not soft enough until they are, and the work is done. Skins of animals of the squirrel size may be tanned in from five to ten minutes; of the cat and rabbit in ten to fifteen; lambs in fifteen to twenty, and calf skins in thirty minutes. The lye must not be allowed to work too long, or it will consume the fiber, and, eating through the skin, will loosen the hair. The design is to have the lye consume or destroy the gluten only, and to use the oil to preserve the fiber and hair, all of which will be realized if the lye and oil are properly used. Rubbing the hair with dry sawdust will cleanse it and give it a bright, glossy appearance.

Stretch the skin on a piece of thick plank and tack the edges, the flesh side being uppermost. Then scrape off all the flesh, fat, etc., being careful to avoid cutting the skin. Then mix equal parts of salt and alum, finely powdered, with rye flour into a paste sufficient to cover the skin a quarter of an inch thick. If there is only one, it should be doubled and pressed by laying a shingle or piece of board upon it, with a weight upon this. If there are several, they may be laid in pairs, the flesh sides together and then pressed. In this state they are to lie for ten days, when for a thick skin the dressing should be repeated. When the skin is fully "tawed" (not tanned) it is shaken out, and again stretched and rubbed with a piece of chalk, and then with pumice stone until it will take in no more chalk, and is quite dry and nice. It is then well shaken and beaten, and is ready for use. Mole skins dressed in this way make beautiful gloves or trimmings.

First soak the skins in cold water until soft. (If just taken off, they will not need soaking.) Then scrape the flesh and grease off. This can be done over a half-round post. Set one end on the ground and have the other as high as the hips. Place the skin over the post so as to lean against the end of the post, and hold the neck of the skin. In place of a beam-knife, a long carving-knife can be used by winding a cloth on the point, so both ends can be held to scrape the skin with the middle of the knife. Next make a liquor by dissolving one pound of alum and one pound of salt together in two or three gallons of water. Set the liquor to cool and put the skins in. Stir them so that the liquor reaches all parts of the skin, and let them remain in the liquor from six to ten days, or longer, if in no hurry for the skins. Then dry them in a cool place.

Dampen them by hanging up in a cellar over night, and then stretch them out. This can be done over a spade turned handle down. (Or a stretcher can be made by nailing a piece of 1½-inch plank, 2½ feet long by 8 inches wide, in the center of a 2-inch plank, 10 inches wide by 3 feet long, in the form of a T, and sawing a slit in the top of the upright piece and fitting in a piece of iron or an old hoe blade.) To clean the fur, put 6 or 8 inches of hardwood sawdust (the finer the better) into the bottom of a barrel and put the skins in, putting more sawdust among and over them; then stand in the barrel and tread them until the fur is clean. The liquor will keep a long time, and as used can be renewed by adding alum and salt.

Take of saltpeter one part; salt, two parts; alum, two parts; pulverize finely and mix thoroughly. From the skins remove all fleshy parts; if they have been dried, you must soak them in water to soften them. Then give the skins a thin coating of the mixture, turn the sides in, roll them up, and lay aside for a few days. The thicker the skin, the longer they must lie. A squirrel requires about three days and a rabbit skin would require, probably, four or five, and perhaps six days. A little practice will be the best teacher in this. Now take them and rinse thoroughly, removing all the mixture; wring them out well; keep rubbing them between the hands and pulling them in every direction until perfectly dry. By following the above directions you will have skins as soft as velvet.

ELECTRIC light wire men frequently carry a small compass in their pockets and before they touch a wire hold the compass near it. If the needle is not deflected, they know there is no current in it and that it is safe to handle; but if the needle is deflected, they use the utmost caution, lest they receive a severe shock and be perhaps killed.—N. W. Perry.

WHAT is probably the largest vein of coal in the world occurs at the strippings near Shenandoah, Pa. It is 50 feet thick, and so near the surface that it is simply quarried like stone. No fewer than 7,145,000 tons of coal were extracted from it last year by the Philadelphia & Reading Coal and Iron Company.

## CALIFORNIA MINES AND MINERS.*

### Name, Character and Location of Mines in This State—Name and Postoffice Address of Owner, Superintendent or Agent.

Continued from last issue.

#### MARIPOSA COUNTY—Continued.

# Professional Cards.

**HERBERT LANG,**
Mining and Smelting Engineer,
Albany Hotel, Oakland, Cal.

**WADE & WADE,**
Analytical Chemists and Assayers,
109½ Commercial St., Los Angeles, Cal.

**D. B. HUNTLEY,**
Mining Engineer and Metallurgist,
TELLURIDE, - COLORADO.

**ALMARIN B. PAUL, M. E.,**
ROOM 49, CROCKER BUILDING.
Cor. Market and Montgomery Sts., San Francisco.
Will act as AGENT for the sale of RELIABLE Mining Property. Principals desiring valuable quartz or gravel investments at reasonable prices will do well to see what I may have. Only legitimate mining properties handled.

**W. J. ADAMS, E. M.,**
PRACTICAL MINING ENGINEER.
Graduate of Columbia School of Mines. Expert on general mill work and amalgamation. Fifteen years' experience. Specialties: The saving of fine gold; vanner concentration and chlorination. Address, 132 Market St., Room 15, San Francisco, Cal.

**COBB & HESSELMEYER,**
MECHANICAL ENGINEERS.
GENERAL MACHINERY.
HYDRAULICS, POWER, TESTS, ETC.
109 California Street,
Rooms 30 and 31.....San Francisco, Cal.

**The Evans Assay Office.**
W. N. JEHU, - - - - Proprietor.
Successor to Jehu & Ogden.
628 Montgomery Street, San Francisco.
Rooms 46 and 47 Montgomery Block.
Ore Assays, Analyses of Minerals, Metals and their Alloys, Etc.
LESSONS GIVEN IN ASSAYING.

**School of Practical, Civil, Mechanical,**
Electrical and Mining Engineering.
Surveying, Architecture, Drawing and Assaying.
723 Market St., San Francisco, Cal.
OPEN ALL YEAR.
A. VAN DER NAILLEN, President.
Assaying of Ores, $25; Bullion and Chlorination Assay, $25; Blowpipe Assay, $10. Full Course of Assaying, $50. Established 1864.
☞ Send for Circular.

F. H. HARVEY. W. S. HUTCHINSON.
**HARVEY & HUTCHINSON,**
GALT, CAL.,
Mining and Metallurgical Work in All Branches.
Assays, Chemical Analysis of Ores and experiments on rebellious ores for treatment by cyanide or other processes. Surveys and reports upon mining properties.

**LOUIS FALKENAU,**
STATE ASSAY OFFICE,
434 California St., near Montgomery.
Analysis of Ores, Metals, Soils, Waters, Industrial Products, Foods, Medicines, etc., etc.
Court Experting in all branches of Chemical Technology. Working Tests of Ores and Investigation of Metallurgical and Manufacturing Processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

**MINING PROPERTIES WANTED.**
We are in a position to buy and sell. Have a cash customer for a gold or copper proposition. Reports furnished. GRIDER & DOW, 139 So. Broadway, Los Angeles, Cal.

**A. SCHIERHOLZ,**
MECHANICAL ENGINEER.
Drawings, Specifications and Estimates of Mining, Milling, Pumping and General Machinery, Marine and Stationary Boilers.
HYDRAULIC MACHINERY a Specialty.
Office, No. 22 California Street,
Rooms 21-22, San Francisco, Cal.

**Thomas B. Everett, M. E.**
Twenty-six years practical experience in metal mining. Will make reports upon property, or furnish properties to purchasers, if desirous to invest in the Cripple Creek gold district, all on short notice.
References furnished in Denver or San Francisco. Branch office, Room 25, tenth floor, Mills Building, San Francisco, care S. K. Thornton, or THOMAS B. EVERETT, Box 195, Denver, Colo. Registered cable, Everett, Denver.

**EDWARD C. BROADWELL,**
Chemical Assayer.
2006 Champa St., Box 840, Denver, Colo.
Chemical assayer; no loss by fire test; truth only; gold, 75c; gold and silver, $1; gold, silver and platinum, $1.85; copper, lead, nickel, zinc, etc., according to difficulty of precise determination; tests for chlorination, cyanide or proper method of treatment.

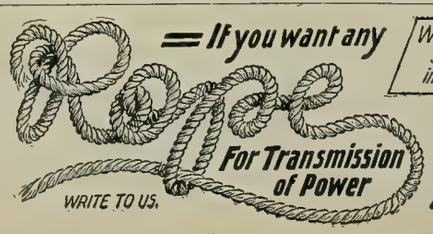
**Saville, MacLymont & Co.,**
MINING and CONSULTING
Engineers and Metallurgists.
Examine and report on mines, ore bodies, and all metallurgical processes connected therewith.
Practical mill tests, assays and analyses of ores and general analytical work undertaken at the
CALIFORNIA METALLURGICAL WORKS,
10 Annie St. (opposite Palace Hotel),
Between Market and Mission Sts.,
SAN FRANCISCO, CAL.
References to leading mining men on application.

**JOHN TAYLOR & CO.,**
63 First St., San Francisco, Cal.
Manufacturers and Importers of
Assayers', Mine and Mill Supplies, Chemicals and Chemical Apparatus.
We frequently have Second-Hand Assay Balances, which we put in order and sell at reduced prices. We can now offer for sale a fine new portable balance, made by Oersterland, Freiburg, Germany. This balance, including glass case, will fold up to 6½x12x4½ inches. Beam, 7 inches long; sensible to 1-10 milligram. New movement to release pans. All parts nickel plated. Specific gravity bottle and hook pans; 3 sets removable pans, one set of horn; pincets and weights; 1 platinum gram down to 1-10 milligram. Formerly listed at $85, now offered for $56.
Oertling's Assay Scale, No. 10, in glass case; powers, 10 grains down to 1-100 grain and riders, with weights; price, $60, offered for $40.
Oertling's Pulp Scale, No. 1, in case; power, 500 grains to 1-50 grain; without weights; price, $40, offered for $30.
German Assay Scale, not in case; steel bearings, 10-inch open beam, index pointing below; mounted so as always to be level; pans suspended by three platinum wires and hook; all packs in drawer 12½x6½x2 inches; without weights; price $35, offered for $25.
German Scale; agate bearings for center knife; all packs in drawer 12½x6½x2½; price $30, offered for $22.
German Chemical Scale, in glass case, with two folding doors in front and one at each end; long open beam with 8-inch radius; center knife rests upon agate; pans suspended by platinum wire chain and jewelled hooks; rider movement; beam graduated into 100 parts. This is a new scale left on sale; price $70, offered for $30.
German Assay balance cat No. 2; solid beam, 8 in. long, index pointing upwards; pans suspended by platinum wires and hooks; in glass case with sliding door; price $40, offered for $30.

W. B. TAYLOR. Established 1869. H. C. WARD.
**Nevada Metallurgical Works.**
Ores and Sweeps Crushed and Sampled and Working Tests Made by Any Process.
Assaying in all its branches. Analyses of Ores, Minerals, Water, Etc.
NOTICE.—We have just added to our plant a 3-Stamp Mill and Concentrator, and are prepared to work ore in lots of from 1 to 10 tons.
C. A. LUCKHARDT & CO.,
MINING ENGINEERS AND METALLURGISTS,
71 and 73 Stevenson Street..... Near Second and Market Streets, San Francisco.
Telephone, Main 5104.

**Thomas Price & Son,**
Assay Office, Sampling Works
And Chemical Laboratory.
524 Sacramento Street, San Francisco, Cal.

**GENERAL ELECTRIC COMPANY.**
COMPLETE EQUIPMENTS FOR
Electric Lighting. Electric Power.
Electric Railways.
Long Distance Power Transmission.
ELECTRIC MINING APPARATUS.
SALES OFFICES: SAN FRANCISCO, CAL., 15 First St. DENVER, COL., 505 Sixteenth St. PORTLAND, OR., Worcester Building,
Boston, Mass. New York, N. Y. Syracuse, N. Y. Buffalo, N. Y. Philadelphia, Pa. Baltimore, Md.
Pittsburg, Pa. Atlanta, Ga. Dallas, Texas. Cincinnati, O. Columbus, O. Nashville, Tenn.
Chicago, Ill. Detroit, Mich. Omaha, Neb. Kansas City, Mo. St. Louis, Mo.



**ELECTRICAL ENGINEERING CO.,**
MANUFACTURERS OF
Dynamos and Electric Motors
FOR THE TRANSMISSION AND DISTRIBUTION OF POWER.
ELECTRIC POWER APPARATUS
For QUARTZ MILLS, HOISTING, PUMPING, DRILLING, and all Mining Work where Long Distance Transmission is required, a Specialty.
OFFICE AND WORKS:
34 and 36 Main Street, San Francisco, Cal.

**P. & B.**
**Manilla Roofing.**
A SUPERIOR ARTICLE AT A SMALL COST.
250 Square Feet, with Nails and Paint Complete.....$4.00
PARAFFINE PAINT CO. 116 BATTERY STREET, SAN FRANCISCO. 524 SOUTH BROADWAY, LOS ANGELES.

**The General Gold Extracting Co., Ltd.,**
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

**HORACE F. BROWN,** CONSULTING ENGINEER.

Special attention given to preparing plans for the Chlorination and Bromine Processes of Treating Gold Ores.
PATENTEE { Brown's Complete Automatic Mill Process. Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces, Etc.
821-822 Manhattan Building, Chicago, Illinois.

## Coast Industrial Notes.

—The proposed Mexican exposition has been indefinitely postponed.

—The movement of Florida orange growers to this State still continues in large numbers.

—The Monterey, Mexico, Water Works Co. has been organized at San Antonio, Tex.; capital stock $2,000,000; president, A. French of Pittsburg; chief engineer, S. M. Gray of Providence.

—Butter and eggs were never so low in price in California as since March 1st, and the fact is antagonistic to those who contend that all low prices are due to overproduction by means of machinery.

—The deadlock between Columbia river salmon canners and fishermen continues. On the Washington side, about seventy miles inland, one fisherman has been murdered, the act being disavowed by members of the union, and minor acts of violence have been committed.

—At a meeting last Tuesday of the Manufacturers' and Producers' Association a trade mark was adopted to protect its members against the competition of convict-made goods, and to enable all wishing to patronize home products to readily identify the article of local manufacture.

—At the forty-ninth annual meeting of the Pacific Mail Steamship Co. on the 27th 118,000 shares of stock out of 200,000 shares were represented. The old board of directors was re-elected. The financial report for the year shows: Total receipts, $4,210,036; total expenses, $3,501,655; net earnings, $708,381.

—The San Francisco & San Joaquin Valley Railroad has let a contract to the Pullman Car Co. for six passenger coaches and eight cabooses, to be delivered at Stockton by Sept. 1, '96. Engineer Storey says the track is now laid half way between Merced river and the town of Merced. South of there to the San Joaquin river 200 teams and 400 men are grading.

—Los Angeles oil, which was 35 cents in January, is now over $1. If it goes much higher the action of those forcing it up may retard its general use in a number of instances where its advent was welcomed in competition with higher priced fuel. It is a simple case of supply and demand, and should the price prohibit the consumption it will be another case of "overproduction." Salt water flow is a present source of fear to the oil district.

—Just before the Oregon made her official trial trip Eastern papers published the figures made by the Massachusetts and Indiana, and claimed with some show of justice that those two vessels were at the head of their class of battleships, and that their builders were therefore the foremost shipbuilders in the United States. Now that the Oregon has distanced her sister ships and carries the broom as the boss battleship, the same unerring logic argues that California leads the country in its ability to turn out first class battleships for strength or speed, and that the Union Iron Works has beaten the Cramps, their foremost Eastern competitor.

—G. W. Vaughn, formerly chief engineer Mexican Central, has begun at White Water, N. M., a trip westward to complete preliminary examination of the proposed route for an extension of the Santa Fe Railroad. He has reconnoitered the line from Victor, Cal., east to Ash Fork, Ariz., and will examine the country from White Water to Phœnix, via Solomonville, and Florence, Ariz., with a view to determining the practicability of western connection for the Santa Fe. Mr. Vaughn does not pretend to say what the Santa Fe will do, but as an engineer he thinks it will be obliged to build westward from White Water to Phœnix, and from Ash Fork to the Colorado river, and then, if satisfactory terms cannot be made with the Southern Pacific, from the river to Victor or Barstow.

## Recent California Mining Incorporations.

Gowanus Mining Co., San Francisco; capital stock, $1,000,000, $51,020 subscribed; C. E. Brown, G. A. Crux, W. W. McNair, M. W. Kirwan, B. D. Dean, San Francisco.

Price Mining Company, Stockton; capital stock, $300,000; subscribed, $75,400; C. H. Bulson, J. D. Pelvis, J. C. Castle, C. C. Castle, Stockton; C. Zinch, Plymouth.

Indian Diggins Co-operative Mining Co., Indian Diggins; capital stock, $25,000, $1500 subscribed; J. M. Taylor, D. Shakespear, E. B. Robinson, E. Grautz and C. F. Weed, of San Francisco; J. McComb, Jr., North Temescal.

Knob Hill Gold Mining, Milling and Development Co., Fresno; capital stock, $50,000; subscribed, $30,000; J. H. Hall, W. H. Cavin, Auberry; J. B. Halton, Selma; H. C. B. Gill, J. W. Shanklin, Fresno.

Kings County Oil and Development Co., Grangeville; capital stock, $100,000; all subscribed; E. Mohr, San Francisco; T. L. Hameoh, H. Kirschbraun, J. McKenzie, S. Sampson, Grangeville.

California Sand, Gravel and Supply Co., Los Angeles; capital stock, $20,000; subscribed, $10,000; J. J. Osmer, W. A. Cooper, T. L. Stringham, R. S. Darrach, J. M. Talbert, Los Angeles.

Charity Gold Mining Co., San Francisco; L. L. Alexander, C. N. Fox, G. H. Haines, S. A. and C. L. Kelley; capital stock, $250,000; $1875 subscribed.

UNITARIAN LITERATURE sent free on application. Address Postoffice Mission Committee, First Unitarian Church, corner Geary and Franklin streets, San Francisco. Mention this paper. *

T. L. FORD has returned from Washington, D. C.

J. A. EDMAN is gone back to Meadow Valley, Plumas Co.

THOS. PRICE is visiting the Rawhide mine, Tuolumne Co.

A. J. BOWIE is visiting the North Bloomfield mine, Nevada Co.

PRESIDENT J. H. NEFF has presented a large grey eagle (stuffed) to the Union League Club.

GEO. GRANT of Juneau, Alaska, is here to buy machinery for the electric light company there.

FOREMAN HAMPTON of the Brunswick mine has resigned, and will work at the Fortuna under Capt. Nihell.

E. K. STEVENOT is in El Dorado county to examine and report on some quartz gold mining properties there.

JNO. A. GILL, of Sacramento, has been appointed Pacific Coast Freight Agent for the Vanderbilt railroad system.

GEO. MAHON, recently assayer at the Apollo mine, Unga, Alaska, is here to take a four years' course in the mining department of the University.

CAPT. THOS. MEIN, who has been lucky enough to be liberated from a South African prison, writes that he expects to be in Oakland about July 1st.

WALDEMAR LINDGREN of the United States Geological Survey goes to Idaho next month to investigate the Boise gold belt and the Owyhee mines, thence to Wood river.

J. M. PHILCHER of London is expected in Downieville, Sierra Co., next week to investigate the Big Grizzly mine, which has been bonded by British capitalists for one year.

E. A. ASHCROFT, the inventor of the process for treating sulphide ores, which is to be put into operation by the Sulphide Co. at Newcastle, N. S. W., is superintending the erection of the works there.

GENERAL MANAGER COUCH, of the Merced G. M. Co., is in New York city, on his way for a ninety days' sojourn in Europe. 'Tis stated in Butte that he has resigned the managership of the Merced G. M. Co.

B. E. JANES, one of the students of the mining department of the State University at Berkeley, whose article on the cyanide process at Mercur, Utah, appeared in the issue of the 23d inst., leaves next week for St. Michaels, Alaska, on a year's trip of mining exploration in the upper Yukon country.

A PRIVATE LETTER to a Grass Valley resident from Mrs. Geo. Starr, Johannesburg, S. A., under date of April 12th, says Mr. S. had just received news of the death of Mark M. Elliott of Oakland, Cal., superintendent Salisbury Reef G. M. Co., Mashonaland, S. A. Mr. E. was reported dead some time ago, but incorrectly, and it may be that this is also a mistake.

GARDNER WILLIAMS, manager of the Kimberly, S. A., mine, who was one of the Americans arrested by the Boer Government, has been "released" on payment of $150 "fine." Had there been the slightest probability of ability to prove complicity, the "fine" would have been a thousand times that amount. Here such a "fine" is usually called a "cinch."

IN Virginia, Nev., it is reported that H. M. Yerington will resign the superintendency of the V. & T. road and go to Europe. He will be succeeded by R. J. Laws of the C. & C. G. T. Mills, paymaster of the V. & T., has resigned; his place will be filled by E. Yerington. H. Yerington has also resigned, to take effect June 1st. It is said the Virginia office will close.

**"HISTORY OF CRIPPLE CREEK."**

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books. $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colo.

# Mining Summary.

## CALIFORNIA.

### Amador.

At the Central Eureka, near Sutter Creek, Supt. Thomas expects to start the hoist by June 15th. The speed of the plant is figured to hoist a two-ton load, independent of skip and rope, 2500 feet at the rate of 500 feet per minute. Sinking will be resumed as soon as the plant is ready for operation, and the shaft cleaned out and retimbered to its old depth, 700 feet, where there is a 135-foot drift south in ore.

The Union Consolidated Company, now operating the old Wieland property, has thirty men repairing old machinery and putting in new.

Ransome and Sargent are working the White Swan mine, northeast of the Gwin. A hoist will be erected; a depth of 1000 feet will be reached.

The Newton copper mine came to a standstill last Saturday. All the miners were discharged, about thirty-four in number. The low price of copper is given as the reason for the shut down. The mine, it is claimed, could not be profitably operated at the present price of copper. H. D. Ranlett, the owner, says that the force, which was only employed in development work, was laid off, but the water will be pumped out and the mine kept dry, and that when times improve and the price of copper advances a larger force than ever will be put to work. It is reported that twenty stamps of the New London mill are to be moved to the Gover, which will give that mine a capacity of forty stamps. Reale and Bell, owners of the '49 Flat cement gravel claim at Rancheria, have a two-stamp mill crushing between 20 and 30 tons a day. The Argonaut shaft this week passed the 1300 foot mark. It is still in soft gouge, with no indications of a change in the formation. This soft formation has existed for the past 300 feet; indicating that the pitch of the shaft is the same as the pitch of the vein. If the situation remains unchanged, it may be necessary to change the course of the shaft slightly in order to get out of the soft formation, and get in ground that will admit of drifting.

*Republican:* At Middle Bar Walker & Ransom will work the White Swan mine, below the Gwin. Four men are employed at the Delray mine. They are down 30 feet and have struck the ledge. At the Amador Queen, in Hunt's gulch, they are sinking and crushing the rock taken out of the shaft. At the Doyle mine they have finished the contract in running a crosscut, and the property is at a temporary standstill, pending the letting of another contract. Work at the Butte basin tunnel is being vigorously prosecuted.

### Butte.

*Mercury:* The Cherokee Flat mining suit is ended at last. After being in the courts for over ten years past, during which time the property has been virtually closed down, the end has suddenly come and the mine will soon pass into new hands. The Bank of California and Rideout & Smith, who have been fighting the validity of the mortgage all these years, have just finally concluded to abandon the contest and the big $280,000 foreclosure judgement recently obtained against the mine by the bondholders will be allowed to take its course, unobstructed by any action on the part of the two banks. Their withdrawal ends all delay. The mine will now be duly advertised for sale, by Receiver Whitcomb under the foreclosure order and will in all probability be bid in by the committee representing the bondholders. The bonds are held by various parties. The principal holders in California are: Louis Glass of San Francisco and David Gage of Oakland. Both gentleman were for over twenty years prominently identified with the active operation of the mine and are the only two bondholders familiar with its practical worth and development. The other bondholders are all residents of New York. The suit to foreclose the bonds was filed back in 1888, but the bondholders did not secure judgment until three months ago. At the time of the foreclosure proceedings, the mine was indebted to the Bank of California for some $40,000. That corporation, together with Rideout & Smith, the holder of ten bonds, began a search for technicalities in the issuance of the mortgage, and, thinking they had found one, obtained judgment against the mine for the amount and sold it at sheriff's sale, bidding it in. Since then the mine has been owned by the banks, subject to the lien of the mortgage. The attempt to defeat this mortgage, which has been so stubbornly carried on, has just ended in the banks at last giving up the struggle. The Cherokee mine is one of the largest and richest hydraulic mines in the State, having a record of producing $13,000,000 in gold, with the lead apparently as inexhaustible as ever. The company owns its own system of water supply, which is one of the most extensive in the State. The water is brought over two hundred miles in ditches, pipes and flumes, and controls the largest water shed in this part of the Sierras. The original cost of bringing in the water was $750,000. At the time of closing down the mine employed 250 men. During all these years of litigation Cherokee Flat is generally spoken of as a dead mining camp, but for years 100 men have been mining on a royalty in the blue gravel of the lead that was formerly abandoned by the company as worthless.

### Calaveras.

In the Gwin mine at a depth of 1213 feet a 12-foot ledge of good ore is reported.

*Citizen:* Fine ore has been struck in the Santa Anna mine. The Poorman will probably soon resume. Work has been started at the Jackson mine, near North Branch. Work at the Colliers mine, near Murphys is soon to be started. The machinery for the Tulloch mine was hauled to that property last week. The Jones mine near Angels is being worked. A full force of men is being employed. Work of erecting the machinery on the Hedrick placer mine is going forward. Work of pumping the water out of the Brunner mine near Angels has been completed. Work has been temporarily suspended in the shaft of the Shaw mine, owing to the amount of water. Twenty tons of machinery were hauled to the Woods mine at Robinson's Ferry last week. At the Updergraff mine the tunnel is being rapidly pushed northward in order to tap the old river channel. The Bald Hill mine near Angels has been bonded. A $4000 payment has been made on the property. Work is progressing well at the Thorpe mine. The mill-site is graded and ready for the buildings. J. W. Provard has men at work in the Mester mine. G. W. Telford has bonded 3000x600 feet of a quartz vein running through his ranch in the Jenny Lind district. The Lucky Tom, or Martin placer mine near El Dorado, has been sold. It is stated that the price paid was $2250. The Central Hill gravel mine is making rapid progress. So far over 200 feet of the old river channel has been laid bare. The water is about pumped out of the Ghost mine, near Angels. When the work is completed sinking will commence. A shaft has been sunk on the ranch of G. W. Hayes, near Copperopolis, a depth of 12 feet, and shows a vein of ore six feet wide, which assays $4 in free gold. M. A. Hurley has started work at the Lone Star mine. He will sink a winze 200 feet from the tunnel and then continue it to the surface, making a shaft. E. C. Loftus at the Keystone mine near Railroad Flat has a three-stamp mill running twenty-four hours a day on good ore. W. B. Swank and men are up on Esperanza creek sinking a shaft through the lava cap. Their intention is to sink and tap the old river channel, which runs through that section. The mill at the Hedricks gravel mine will be in working order next week; twenty men will be employed. At the Pine Tree prospect near Copperopolis a shaft has been sunk 40 feet and a level run 50 feet. The vein at the bottom of the shaft is about 14 inches wide and at the end of the drift widens out to three feet. The quartz carries free gold. The five-stamp mill at the Rose Hill mine has started up to crush enough ore to test its value; if the quartz proves to be paying a forty-stamp mill will be erected. The sale of the Specimen is completed, price $2750.

*Prospect:* The shaft at the Gwin mine is now 1215 feet deep. The bottom of the shaft is in quartz of a very promising character. A thickness of 9 feet has been reached by a drill hole, but did not reach to the foot wall. The flow of water from the old works has decreased very much the last week. The hoisting works at the South Paloma is nearing completion. Sinking will be resumed as soon as the machinery is ready.

### El Dorado.

Placerville, May 24th.

(Special Correspondence).—J. Forbes has secured a bond on the Slide Gulch mine near Grizzly Flat twenty miles east of here and is succeeding satisfactorily in his development work. A tunnel on a 4-foot ledge has reached 180 feet.

The Star Light Company has been reorganized and active work on a systematic plan has been started. This property has a good record as a gold producer.

Everson, Chinnick & Stevens are progressing favorably on the old Stockslayer mine, which they bonded from McKinney & Grube. The ore is Roscoelite and has been found in richly paying quantities when worked for hand mortar. The present holders are systematically doing extensive development work. The main tunnel is 476 feet. At a distance of 286 feet from the mouth a shaft runs vertically 80 feet. Engine and hoist are placed at this station in the tunnel. The shaft follows the hanging wall. The property is 9 miles southwest of Placerville, near Lotus.

In the Greenwood district on the Georgetown divide much activity is displayed in development work.

The Eagle King near Grizzly Flat owned by Melton & Wittner opened up a large ledge last week of very good ore. A ten-stamp mill is in continuous operation on this mine.

Development work on the Blue Gouge progresses satisfactorily. At 250 feet in the new tunnel a 3-foot ledge of ore was struck last week that runs from $10 and upwards. Should this discovery lead to a continuous ore body of this quality the Blue Gouge will rival the largest mining camps in existence. It is a mountain of ore that needs but to be quarried. Water and timber are in abundance on the land, of which there is over 300 acres. Col. A. E. Head is at present inspecting the work. He holds the property under a bond.

The five-stamp mill on the Stillwagon mine in the Brownsville district twenty miles east of here was started this week. The ore body at 130-foot depth is small but rich in free gold and sulphurets.

### Kern.

At Havilah, some of the old works at the Warrington are being retimbered. G. Miller is working an antimony deposit. The Amalie mine at Rogers sends encouraging reports. The Carolina shaft is expected to strike the lead at 150 feet.

The *Eyrie* reports that Jones' stamp-mill is at work. The old Gold Hill mine is turning out good ore. In Randsburg the well-boring at the Cow wells is at an end, as they have struck sufficient water to run the eight-stamp mill. Stockton, three miles from Randsburg, expects to put up a ten-stamp mill at once.

Koehn and Stanton will soon have a five-stamp mill in operation at Kane springs.

### Mariposa.

Coulterville, May 26.

(Special Correspondence). — Recent news from Boston in regard to share complications in the Merced G. M. Co.'s affairs have made no change here, work continues as usual. The forty-stamp mill at the Potosi is running night and day. It is working on 100-ton parcels of rock taken from different points in the campany's workings in its various mines, for trial purposes. It is said that there has been some pilfering of specimen rock at the Malvina mine but correct information is hard to get, as the company's officials are very reticent about what goes on.

At Pinon Blanco, Captain A. H. Ward is continuing prospecting work. This mine was the first to be patented on the Pacific Coast under the existing mining laws. Captain Ward has proved the property to his satisfaction on the northeast side of the Pinon Blanco mountain all of which is comprised in his patents, and he is now driving an exploration tunnel from the southwest side. This tunnel is in between 700 and 800 feet.

At the Red Banks eight miles southwest of Coulterville twelve men are employed blocking out ore bodies. Little can be done at Red Banks till the early fall when the snow waters have ceased and it is possible to put a dam in the Merced river. The tunnels of the Red Banks mines come right out on the North Bank of the Merced and the situation for power and milling purposes is excellent.

The Virginia 3½ miles east from Coulterville was bonded recently by Paul Blackmar and Professor Clarence King. The superintendent is J. J. Dolan. Work was begun at the Virginia the first week of this month About twenty-five men are employed. The old shaft and tunnel have been cleaned out and retimbered, and the mine will soon be turning out ore again.

The Tyro mine one mile southeast of Coulterville is running steadily. The ten-stamp mill is working on ore from the 700-foot level. This ore is as good as any yet put through the mill. The Tyro is owned by the San Francisco Gold Mining Company, president J. Buttgenbach, cor. 4th and Bryant St., S. F.

Hite's Cove's mine continues shut down for the present, as are also the Santa Rosa, and Persia mines, each with new ten-stamp batteries on the ground.

John D. Ludwig, the local superintendent of the Mariposa Grant is at Washington urging upon Senator John P. Jones the necessity of immediately erecting a twenty-stamp mill at Mount Ophir. There is now no mill for crushing ore on the grant, the little five-stamp mill having been sold and removed.

There are many more prospectors out all over Mariposa this summer than for a long time past. No remarkably rich finds are reported but a great many claims have been located.

There is rumor of another electrical power distributing concern being started at a point on the Merced river above Benton mills. No details yet to hand.

The following circular has been sent to Merced Gold Mining shareholders: "Mill returns show during the month of April 2303 tons of ore treated, the yield being $8700 gold and 25 tons sulphurets, assay value $75 per ton of 2000 pounds. This shows a yield of $4.59 per ton of rock treated. The first return from the mill was in the month of March, 1285 tons treated, showing gold obtained $1630 and 9 tons sulphurets, averaging $62.43 per ton of 2000 pounds. Judging from the assays of the tailings, and what was probably absorbed by the plates, and other losses necessary in the first operations of the mill, we consider that the first mill-run showed the value of the rock something over $3 per ton."

### Nevada.

The North Banner Tunnel Co., has levied a five cent assessment, payable June 23.

*Union:* The Champion Mining Company has brought suit in the Superior Court of this county against the Providence Gold Mining Company, A. Walrath, R. C. Walrath and John V. Hunter, defendants. This action is brought against the Providence Mining Company and others to recover damages in the sum of $100,000, the value of ore alleged to have been taken out by the Providence company from lands decided by the courts to belong to the Champion Company. It is an outgrowth of the recent litigation between these companies concerning the end line between the two claims, said end line having been established by the courts. The plaintiff sues for the value of all ore that has been extracted north of said end line.

The Lane and Haywards syndicate, after running the Mayflower mine, in this district, for a year, have decided to give it up The property will revert to its original owners on June 5th.

Sacramento parties have made arrangements to work the bed of the South Yuba river from French Corral up the stream for a mile and will also work the old Milton dump.

The *Transcript* says everything continues to look prosperous at the Champion mine and the outlook is better than it ever was. At present there is enough quartz being taken from the mine to keep fifty stamps pounding away steadily night and day. Twenty stamps are running at the new mill and thirty at the old mill. There are employed in the mine and the hoisting works, mill and chlorination works about 140 men.

### Placer.

J. B. Smith of Grass Valley has leased the Foss mine, at Lowell Hill, for a year and will put twenty men at work.

### Plumas.

*Bulletin:* During the last storm 6 feet of snow fell.

E. C. Robinson, owner of the Morning Star, has let a contract to sink the shaft on the Morning Star mine to the 1100-foot level, which is now the water level. This is the pioneer shaft of the Basin. The shaft is already down nearly 60 feet and is showing up in fine order, the ledge widening as depth is gained. Mr. Robinson intends to put his 20-stamp mill in good order, piping the water to the mill from the upper reservoir site, where he expects to put in a dam, and, by means thereof, impound millions of gallons of water. He has already received several bids for the erection of chlorination works.

J. A. Hall has sold a one-sixth interest in the Ella mine. It is expected that Mr. Wagner will start up the Fraser mine next month.

### Riverside.

The Good Hope mine at Perris has resumed. W. J. McIntyre, for H. B. Johnson, the owner, has paid $12,000 in settlements of bills incurred by Receiver Naftzger, and the mine is now run by him. The main shaft will be sunk 400 feet, the levels extended and a reservoir for water made. Then, under the management of Supt. Sigafus, the stamp mill will resume.

### San Diego.

W. H. Storms of the State Mining Bureau has been making an examination of the mines near Mesa Grande. He will examine the Banner, Julian, Rice and Pine Valley districts. He is quoted as saying, after spending a week in the Escondido region: "There may be possibilities for the development of some good mining properties in that section, but in the absence of definite, reliable assays of the ores in the ledges now being opened up, I must decline to express an opinion as to the mining situation there."

### Shasta.

(Special Correspondence).—Mining matters are quiet. A small smelter on Clear Creek, near Igo and Muletown, is in prospect. Some bonding of mines is reported, but very little actual mining is being done. The abundance of water has helped the gravel miners. The prospects are good for quartz mining the balance of the season.

Igo, May 26th.

### Sierra.

*Enterprise:* The stockholders of the Buttes Saddle mine held a meeting last Saturday. Eleven men are working at the Northern Bell mine. Four men are working at the Rising Sun.

*Messenger:* Because of deep snow and stormy weather at St. Louis, the miners are doing but little.

At Cox's Bar drifting is prosecuted with vigor and success.

### Siskiyou.

At Sawyers' Bar the Fort Jones *Reporter* says the owners of the Star of the West will build a ten-stamp mill this summer. Thomas Smith & Co. at the old Casey claim, are cleaning bedrock. S. L. Findley is the manager of the Gold Nugget. Cleaver & Co., at the old Bigelow ledge on White's gulch, are taking out pay rock. The White Swan, on Tanner's peak, is producing $40 ore. Bigelow brothers have commenced in their river claim. The Paymaster is idle at present. The Whistle Bear has resumed.

*Journal:* The cleanup of $3200 by Billups, Humphrey and Quigley, owners of the Barkhouse Creek mines, demonstrates that these mines are the richest quartz ledges yet discovered in that section. The owners will soon commence the erection of a five-stamp mill. The quartz heretofore has been crushed in a twin arrastra at the Commodore mine.

The Distlehorst Dredging Co. are fast getting their machinery in order for working the river with their patent dredger.

The Blue Gravel mine at Greenhorn was shut down a few days ago, and will remain closed until fall, when the owners will begin sinking a new shaft. The old shaft began caving in, and, as the pay was poor, the manager concluded to pull the machinery out and start a new shaft next fall.

*Journal:* Amorel and Dutra, of Hawkinsville, cleaned up $1400 a few days ago from their placer claim. At the Nebraska mine on Cherry creek, a new 5-stamp mill is in course of construction. The hydraulic mines at Oro Fino are running full blast. The river miners on the Klamath are getting along rapidly with the work of opening up their claims, and all will soon be sinking cuts to bedrock, with a number already hoisting pay gravel. The miners at the Espey, Hunter & Co. claim at Hawkinsville are preparing for another cleanup.

### Trinity.

The Altoona Quicksilver Mining Company received six new ore cars last week.

The *Journal* hears that the Armentrout brothers have discoverd a rich gravel mine on Democrat gulch, the bank is from 5 to 8 feet in depth. Some of the dirt has yielded fifty cents to the pan. They have located and had surveyed about eighty acres.

### Tuolumne.

*Independent:* The Crystalline group is mining steadily, shaft sinking and drifting. The Clio mine is reported sold to Boston parties. The Trio mines, Whisky hill, have been sold for $150,000 cash to Boston and English people combined. The Mammoth mine, Jacksonville, is sinking a shaft from low tunnel level, now down 150 feet. The ore improves as sunk on. The Shawmut mine has just completed the erection of their large compressor, which will run eight drills. The Stanley group of mines are at present under negotiation and will very shortly be started up in full blast. There is found on this property a body of low-grade ore from 200 to 300 feet wide, and assays $6—a veritable bonanza. The formation is diorite in a metamorphic condition, intersected and traversed by innumerable quartz veins and oxidized iron stringers, besides, can be obtained from 30 to 300 feet and worked as open quarry.

At the Nourse mine, Jacksonville district, is a low-grade ore body, consisting of diorite and quartz mixed, the quartz being interstratified with the eruptive formation. It is of great extent, probably 100 to 150 feet wide. Surface prospect holes have been sunk all

over the huge croppings. In each instance good prospects are found.

### NEVADA.

ELKO COUNTY.

A mill is to be erected upon the property of the Dexter Mining Company, near Tuscarora. A shipment of ore to Salt Lalt city is reported to have returned $180 per ton in gold. The mine was a gold producer several years ago, but was closed down by litigation. It is said there are 25,000 tons of ore on the dump carrying from $12 to $30 in gold per ton, while the tailings from the old mill are found to contain $22 per ton.

ESMERALDA COUNTY.

At Silver Peak the mill and leaching works are running steadily: gold bullion is being shipped to the mint every month. At Alida valley, Barnes and Keyser have out a shipment of 1000-ounce silver ore. There is a little gold being shipped from Tule canyon; L. Chiatovich has a mill on the way which he will erect on a mine south of old Gold Mountain. Having made a thorough test of the ore, he feels confident of being able to cyanide it to good advantage.

HUMBOLDT COUNTY.

A Kennedy correspondent of the *Silver State* says the electric process is a success.

The New Era Mill and Mining Company has bought from Blossom, Wiggins & Murphy the Kearsarge mine.

The Star Mining Company has bought from King, Duncan & Young the Poorman mine.

LINCOLN COUNTY.

*Tribune*: From a shipment of nineteen tons of gold ore sent in by the April Fool Mining Company of DeLamar, Nev., Wells, Fargo & Co. yesterday placed $8710.77 to the company's credit. From the April Fool proper there were eight and one-half tons of the value of $715 a ton, and from the Swifter ten and one-half tons that yielded $195.50 a ton.

A Carson dispatch says all work in the placer mines in Pine Nut was shut down two months ago, pending a suit brought by a ranch owner to prevent the miners from using the water. The case was decided in favor of the miners, and they will at once resume work.

STOREY COUNTY.

The changes in the management of the Brunswick went into effect on the 25th; preparatory work in the Chollar south drift, where the new find was made, has begun.

Supt. Gorham will have charge of the Chollar-Potosi end of the lode. Supt. Cronan will have charge of the workings in Hale & Norcross ground of the Brunswick lode.

Supt. Gorham says: "The Chollar drift where the new find was recently made will be extended at once. Work will be begun at the face of the drift in the ore and the deposit will be exploited. The preparatory work, however, will require two or three days. Considerable earth has caved from the sides of the drift in the first two or three days and this will have to be taken out. Work was suspended in the drift while the new arrangements for the working of the lode were being effected, but it will now be resumed with vigor."

### OREGON.

Baker City reports that the Bonanza gold quartz mine has been sold for $370,000 to Eastern capitalists; also the Rachel and another gold quartz property in connection, near the Virtue, for $11,000.

### WASHINGTON.

P. Langhammer, Chapaca, Wash., is putting in a sixty-ton mill, hoisting and pumping machinery for the Wyandott M. & M. Co., at the Wyandott mine, on the Similikameen river.

A stock company with a paid-up capital of $75,000 has been organized to tunnel Palmer mountain in the Okanogan country. The tunnel will be over 3000 feet in length and is expected to tap twenty-eight leads.

At Methow, Squaw Creek mining district, Okanogan county, the Friday mine of Durr & Griggs has made a shipment of 403 sacks of high-grade gold sulphides to the Great Falls, Mont., smelter. Twenty-four men are at work.

The Seattle Reduction Company's representatives have located a mill-site at the mouth of Black Canyon creek on the Methow river and propose to put in a plant to treat the ores.

The *Review* reports activity in the Okanogan country. A. C. Coward says the proposition of running a big tunnel into Palmer mountain is assuming a definite shape. The $75,000 required has all been subscribed and $30,000 has been paid in, and the work will commence very shortly. The new 50-ton cyanide plant for the Wyandotte is now on the way in.

The mill at the Triune mine was started up recently and a clean-up of 75 ounces of bullion was made after a run of eight days, and the company have on the ground a large quantity of concentrates running from $100 to $200 per ton. This mine is owned by May of Davenport and Del Hart of Loomiston.

Preparations are being made to start work again on the Ivanhoe, a property from which $10,000 worth of ore has been shipped. The first ore ever shipped from this mine went to Denver and cost the owners $100 a ton freight. Now it can be shipped, freight and treatment charges, from $20 to $30.

### BRITISH COLUMBIA.

Nelson *Tribune:* The force at the Silver King mine is getting out about 125 tons of ore a day. It would be increased were there bunkhouse room. The snow is still deep, there being at least eight feet on the level.

### ALASKA.

*News:* The announcement has appeared that Copper river will be open to prospectors this season and that the Pacific Steam Whaling Company will run a steamer from Nucheck to the mouth of the river, charging a fare of $5. It does not say, however, what a prospector will do on arriving at the mouth of the river, nor how it will be possible for him to ascend the stream to the auriferous regions.

### UTAH.

A deficiency judgment for $54,111.85 has been entered in the Third District Court in favor of the plaintiff in the case of Amos Townsend against the Utah Gem Mining Company.

*Tribune*: With the payment of its dividend in the sum of $15,000 on Wednesday, the Ontario's total dividends will have reached $13,235,000, with $30,250,000 as the total that has been paid by the companies whose dividends are made public.

*Tribune*: Since March 25th the Daly has produced 55,530 ounces of fine silver and the Ontario 75,228 ounces. The last statement submitted by the management of the Daly revealed the fact that there was $330,000 in the treasury and it is very likely that the amount has now reached $400,000. The management of the property has not found it consistent to pay a dividend since May, 1893, at which time the total paid amounted to $2,850,000, and it is not unlikely that dividends will be resumed before many days have passed. The new strike in the property makes it possible for Daly to largely increase its earnings, and it is said of the bonanza that never has Supt. Chambers had it in better condition.

### IDAHO.

At the Hydraulic Placer Company's workings on the John Weiss bar, eight miles below Lewiston, the water is pumped from the river by two large pumps. One is a centrifugal that throws the water through a 15-inch pipe for sluicing. A cylinder force pump forces the water through an 8-inch pipe to the giant, which tears down the bank and forces by hydraulic pressure 1000 yards of sand and gravel into the sluice boxes every twenty-four hours. The main sluice box is 24 inches wide and its bottom is covered with steel plates and steel riffles. From this main sluice box are six under currents which lead off onto six riffle tables; from these the sand passes into smaller boxes over brussels and blankets onto burlap tables, where the slime and black sand are separated from the sand. The tables and smaller sluice boxes are treated four times every twenty-four hours by the blankets, brussels and burlaps being thoroughly washed, and the fine gold, slime and black sands going through a chemical process preparing it for amalgamation. It is then put through an amalgamator and is ready for shipment.

### MONTANA.

Butte *Miner*: Montana mines yielded $47,115,000 worth of minerals last year. The copper production of the State was about sixty-five per cent of the whole output of the United States. The gold product amounted to $4,100,000; silver to 4,500,000 ounces; copper to 212,000 pounds and lead to 24,500,000 pounds. The gold output was 10 per cent greater than in the previous year and 47 per cent greater than in 1893.

Helena *Chronicle* Correspondent: The Poorman mining district which for years past has been practically dead to the world, is opening up again. The largest mine in that district is the old Jay Gould, from which over a million dollars in gold has been taken. When it closed down some years ago, that district was soon lost sight of. Mining experts claim that with a little development work as rich ore as has ever been taken out of it would be uncovered. Men are now at work retimbering the mine and the station on the 300-foot level. As fast as it is retimbered development work is being pushed rapidly. The ore bins at the 10-stamp mill have been filled and the noise of the dropping stamps is soon expected. In that same district are the Hubbard, the Prize and the Poorman mines. Men are at work upon them, and this summer the output of that district will be larger than ever. Superintendent Owen Byrnes of the Prize mines is in the city, awaiting the arrival of new machinery for his mill. At the Poorman mine men are doing development work, and if the work exposes an ore body warranting it, a stamp will be put up on the property this summer.

The Heddleston district, at the headwaters of the main Big Blackfoot, is attracting considerable attention.

The Big Dick is another wet mine in this district. It is owned by Blydenstein & McComb, and was recently bonded to W. Bennett of Helena for $30,000. As soon as it is possible to haul large quantities of ore to the smelters, the force of men will be increased. The first-class ore runs all the way from 500 to 1,800 ounces in silver, 7 per cent copper and 20 per cent lead. The second class runs 129 ounces in silver.

M. D. Pinkston, who purchased the Blizzard mine at Wicks a couple of months ago, has at last succeeded in freeing the mine of water. For six weeks past he has been pumping night and day. Three weeks ago he had the mine half empty, when an interior reservoir broke loose and filled it up in a few hours. This took six weeks of constant pumping, at the rate of 420 gallons per minute, to empty it. But it is empty now and he has commenced shipping ore to the smelter.

This summer will probably see a chlorine mill of about twenty-five stamps erected in Duck creek district. J. H. Casey, one of the big mine holders in that district, says that the coming season will see great changes in that bottom. When the chlorine mill is up and running Mr. Casey alone will give employment to fifty men.

A rich strike comes from the northwestern territory. A party of prospectors have been prospecting on the south fork of the Belly river, a short distance from Chief mountain, within the border of the Montana line. These parties have run against several veins of argentiferous galena ore, which has assayed 50 per cent lead and 80 ounces of silver. On the south side of the Blackfoot reservation a body of sulphurets has been located which runs three ounces of gold to the ton.

In the Nearhart district things look promising. Between the Benton and the Big Seven, forty-eight men are employed and that force will be increased soon. The latter mine is shipping more ore than was ever expected of it.

### WYOMING.

Laramie reports that assays made on the copper ore discovered on the Big Laramie gave 32% per cent copper and $2.40 gold per ton near the surface.

The new town of Morgandale, in the Copper Hill district, is filling up.

The Saratoga *Lure* says Chicago capital is working the Cummins City mines. This was at one time the richest mining proposition in the State, but, like many others, was the victim of mismanagement and ignorance of the men in charge of the works.

### SOUTH DAKOTA.

Deadwood *Times*: Few realize the quantity of siliceous ore that is brought down from the various sections of the siliceous district daily, for treatment at the plants in this city. The Burlington Company delivers about 100 tons at the plants in the First ward, and from 110 to 125 tons to the Pluma mill every day. The Elkhorn train Thursday had 260 tons and the traffic will average 225 tons a day. These shipments are frequently exceeded, and this ore is all treated by the home mills. The product of the siliceous district, including the concentrates from the Homestake treated at the D. & D. smelter, will aggregate 550 tons daily, at $20 a ton. The daily output is $11,000, or $330,000 a month, close to $4,000,000 a year.

### COLORADO.

DENVER MINT GOLD RECEIPTS.—*Republican:* May 14—El Paso county, 25.04 ounces; Gilpin county, 30.25 ounces; Boulder county, 8.78 ounces; San Miguel county, 23.32 ounces; Denver assay offices, 370.91 ounces; South Dakota, 5 90 ounces; Arizona, 34 16 ounces; total, 806.41 ounces; value, $12,000. May 15—El Paso county, 216.04 ounces; San Miguel county, 20.12 ounces; Colorado (unknown), 2,530.65 ounces; Wyoming, 4.62 ounces; jewelry, 12.87 ounces; total, 2,784.62 ounces; value, $55,000. May 16—El Paso county, 145.03 ounces; San Miguel county, 292.32 ounces; New Mexico, 12.13 ounces; Idaho, 5.23 ounces; total, 455.01 ounces; value, $7,000. May 18—El Paso county, 101.62 ounces; Chaffee county, 9.27 ounces; San Miguel county, 27.85 ounces; Clear Creek county, 14.93 ounces; Arizona, 9.31 ounces; Denver assay offices, 311.16 ounces; total, 474.14 ounces; value, $7,500.

E. R. Holden of Denver is reported to have secured 20 acres near the Florence reduction works for a chlorination plant.

The Boulder county mine, Ward, reports a discovery of an 18-inch ledge of black oxide of copper.

The stamp mill at Spencer, which has been shut down since New Years, is now in charge of W. H. Gowdy, who is putting in an electric process.

Work has about ceased in the lower workings of the Argentum-Juniata mine, at Aspen, on account of water.

### NEW MEXICO.

On the 18th, Bell & Stevens, of Pinos Altos, brought to Silver City eight gold bricks, weighing 109½ pounds troy, 1314 ounces, worth $15.50 per ounce, at total value of $23,367—the result of a forty-six full double-shift run of a 10-stamp mill on ore from the Pacific and Ohio mines. The mill was run 23 full day and night shifts in February, 21 day shifts in March and 21 day shifts in April. The dry weather caused a shortage of water so that the mill could not be run on full time. The mines have an abundance of ore.

### ARIZONA.

The Pearce mine, near Wilcox, which was recently sold in this city for $275,000 cash, will pass into the possession of an English syndicate. A stock company has already been formed with a capital stock of $2,000,000, papers for which have been filed at Tombstone. Work has been commenced by the new owners, and ore is being shipped to Wilcox. A 100-stamp mill is to be erected. The previous owners of the mine were Mr. and Mrs. Pearce, their two sons and sons-in-law. Mr. and Mrs. Pearce receive one-fifth and the others one-fifth each—$55,000.

The Planet-Saturn Company at Fool's Gulch has made a strike in the main shaft of its Planet mine, at the 300-foot level—a body of sulphurets which appear to be rich in value. While no assays have been made, it is claimed that the ore will go $200 per ton.

The La Fortuna gold mine is fourteen miles from Blaisdell station, twenty-seven from Yuma, and in Arizona. The work on the La Fortuna consists of three levels. The first is down 65 feet, showing 14 feet of ore. A drift has been run last on this ore body 120 feet. On the second level, at a depth of 130 feet, the ore body is larger and shows 18 feet. One hundred feet of drifting has been done on this level. The third level is at a depth of 215 feet, with a crosscut showing ore body to be about 30 feet. The quartz is equally divided between white and pink; the pink quartz seems to be the most valuable. The estimated value of the ore is $40 per ton. The mill consists of twenty stamps, erected on the mine. The working shaft is on an incline of 60°. The steam hoist operates a grizzly directly to the rock broken and then by gravitation to the stamps. The stamps weigh 1350 pounds each. The framework is the heaviest in the Territory. The runs are each 25 feet long and of heavy plates. There is a drop after the first run, making 50 feet of plates to be run over. The water reaches the mine from the Gila river through a four-inch pipe twelve miles long, at an elevation of 650 feet. There are sixteen men employed in the mine. R. M. Straus is superintendent; J. Golden foreman.

At Bisbee the Copper Queen Company is making improvements and additions to its works. At the Holbrook mine new ore bins of 600 tons capacity are being constructed. At the smelter two new boilers have been added to the power plant, making eight in all. The roasting capacity is to be trebled by the addition of two 25-ton rotary roasters to the one now in use, and provision made for discharging the sulphur fumes outside the town limits.

At Ainsworth the Skyline mine will probably close down until the roads are in a condition to make shipments possible. About $60,000 worth of ore has been shipped from the mine by the present owner. No arrangements have been made looking toward the putting in of a 20-stamp mill, nor has anything definite been done in regard to a stamp mill at all, nor will there be for the present.

### MEXICO.

*Oasis*: A new mining camp is springing up at Santa Barbara, about sixty miles east of Minas Prietas, Sonora. There have been discovered a number of large ledges of auriferous rock which gives large returns. Recently no less than 147 denouncements of mines have been made there.

A Nogales report says at Minas Prietas, Sonora, representatives of the Rothschilds are examining the mines of the Colorado Creston Co., with a view to their purchase. A six months' option has been given and the price is stated to be £2,000,000. The mines are La Colorado, Las Amarillas, Las Minas Prietas, the Grand Central and some outlying claims. In 1895 they produced $3,000,000.

### SOUTH AFRICA.

Johannesburg *Mining Journal*, April 18: The monthly output of the Chamber of Mines for March is greatly curtailed by the secession of certain companes from the Chamber, and the list embraces only thirty-four companies, as compared with forty-three in February. It is sincerely to be hoped that such an occurrence is but temporary, and that the relatively small band of malcontents will once again, in the interest of the whole industry, join with the majority. For the present, however, the number of companies sending returns to the Chamber has, as already stated, fallen from forty-three to thirty-four. The missing companies are the George Goch, Lancaster, Langlaagte Estate, Block B, Meyer & Charlton, *Minerva*, *Orion*, *New Kleinfontein*, Princess Estate, United Main Reef and Van Ryn; the companies italicised, however, not seceding, but having their operations suspended owing to want of water or of native labor.

On the other hand, there are two additions to the list, the Roodepoort Deep Level and Porges Randfontein—the latter reappearing after a short interval, while the former, the second deep level to join the list of producing companies, makes its bow for the first time. And it may be noted that the yield of this company on the plates has been 6.94 dwts. per ton, while the tailings yielded 1.51 dwts., giving a total of about 8¼ dwts. per ton. This, after due allowance made for absorption in the mill and on the zinc or in the solutions, should mean a considerably higher yield for the future. The number of stamps in this list of the Chamber is 2055, as opposed to 2675 for February; the duty per stamp has risen from 4.18 tons per diem to 4.34 tons, while the grade of the ore milled is unchanged, as regards the yield on the plates, standing at 8.01 dwts.: the return in the cyanide has, however, fallen from 5 dwts. to 4.83 dwts.

While the decrease in the number of companies sending returns is about 21 per cent of the former number, the fall in the number of ounces is from 167,018 to 147,015 ounces, being a fall of 12 per cent. It is, therefore, immediately apparent that the seceding companies cannot claim to represent the wealthier and more important contributors to the output, and that they are, with the exception of the Langlaagte Estate and the United Main Reef, of second and third-class proportions. No details have been received from the new association regarding its companies, and a full analysis cannot accordingly be made; but if possible, the usual monthly supplement issued by us will contain details of both output statements.

### AUSTRALIA.

*Standard*: The Madame Berry and the Berry Consols, two adjoining mines near Creswick, (Vic.), are the greatest alluvial mines known in Australia since the early fifties. The former has just ceased work after fifteen years of prosperity. They have already distributed £848,700 in dividends, and the assets of the company are set down at over £6000, or equal to over 6s 6d per share. If the amount paid in royalty, £128,342, and other items not actual working expenditure, are added to the foregoing, it will be found the profits on the workings of this mine amount to nearly £1,000,000.

In the old days of mining in Victoria—or for the matter of that, Australia—the miners, from the managers down, laid down certain theoretical rules upon which they worked for the discovery of gold. For instance, in Victoria a reef running east and west, according to local theories, did not carry gold, or if it did it would soon cut out. Again, if a lode did not exist between two well defined "walls," generally slate on one side and sandstone on the other, that reef could not "live." But the experience of other countries has dispelled these pet fads. To go further afield, the auriferous formation of Johannesburg is unlike anything yet met with in Australia. The ore deposits are neither veins nor irregular masses, but huge beds of conglomerate, which can be followed with the regularity of ordinary stratified rocks. This conglomerate, probably the shore deposit of an

ancient sea, consists of pebbles of quartz, much crushed, embedded in a silicious matrix, which is now a hard quartzite, but may have been originally a loose sand. From the resemblance of the quartz pebbles to almonds in a certain sweetmeat, the Boers have called the conglomerate "banket"—a name which has now firmly rooted itself in mining phraseology. It is in the matrix and not in the pebbles that the gold normally occurs, the metal being sparsely distributed in a very fine state of mechanical division through the iron pyrites, which is present in the banket, whilst near the outcrop of the rock, where the pyrites have been decomposed by meteoric action, the disseminated gold has been set free in a visible form.

WEST AUSTRALIA.

Mention was made in last week's issue of W. H. Hyatt's new "oil process," by which he claims that the water difficulty in gold extraction from the fields of Western Australia, the Transvaal and other auriferous countries has been solved. He describes it as follows: "A coil of iron tubing with detachable lower bends is fixed on a light barrow for easy transit. This coil is fitted with a fitting-hopper, placed immediately above the entrance for a blast of air. A second light barrow carries a suitable blower. In operation, the blower is instantly attached to the amalgamating coil, the lower bends of which are partially filled with mercury. As the crushed ore passes through the feeding-hopper, it is caught up by the blast and driven into the mercury, the mercury being sprayed and violently agitated by the force of the blast; so much so, that every particle of the gold-bearing material is washed and re-washed by the mercury itself, the effect being that the mercury rapidly amalgamates with the gold and leaves the tailings, after the gold is fully extracted from the ore, to be blown out by means of and with the same blast. The loss of mercury in the operation is positively fractional. To remove the gold the bends are detached, and the mercury passed through wash-leather, the amalgam remaining in the leather. The amalgam is retorted, the mercury recovered, and pure gold in a metallic state is obtained, the whole of this operation occupying but a few minutes, independent of water except for drinking purposes."

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR THE WEEK ENDING MAY 19, 1896.

560,184—SEPARATOR—F. J. Barnard, Seattle, Wash.
560,252—ROTARY ENGINE—E. O. Bennett, Haywards, Cal.

560,467—ENGINE VALVE—S. F. Brousseau, S. F.
560,394—HYDRAULIC ENGINE—A. J. Collar, Yreka, Cal.
560,611—PEN EXTRACTER—A. A. Dayton, S. F.
560,261—FILTER—E. J. Durant, Pasadena, Cal.
560,399—WELL CASING—G. W. Durbrow, Salton, Cal.
560,402—EGG CUTTER—H. B. Everest, Riverside, Cal.
560,358—ANNUNCIATOR—G. Y. King, Oakland, Cal.
560,589—WATER MOTOR—A. R. Lewis, Shelton, Wash.
560,593—SWIMMING DEVICE—W. Luce, Nehalem, Or.
560,273—LEMON SQUEEZER—H. Malinow, Los Angeles, Cal.
560,516—REFRIGERATOR—H. & R. R. Maxwell, Fresno, Cal.
560,398—FILTER—W. L. Murphy, S. F.
560,325—CAR COUPLING—V. Pfaff, S. F.
560,328—CAR COUPLING—V. Pfaff, S. F.
560,436—DRAW BAR—J. Shaw, Woodburn, Or.
560,237—SCISSORS—J. F. Shultz, San Jacinto, Cal.
560,457—HAND TRUCK—York & Slaughter, Colton, Cal.

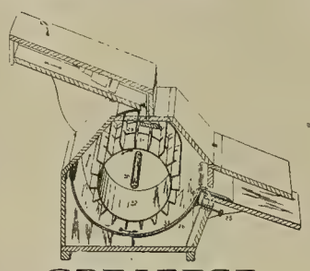
NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HYDRAULIC ENGINE.—A. J. Collar, Yreka, Cal. No. 560,394. Dated May 10, 1896. This invention relates to an engine which is adapted to be actuated by liquid under pressure. The object of this invention is to provide an apparatus in which a liquid under pressure is admitted successively to connected cylinders, and a mechanism whereby the pressure of the liquid acts at the proper time upon pistons reciprocating within cylinders, the piston rods being connected with cranks upon the shaft so as to convert the alternate reciprocating motions of the pistons into a continuous rotary motion of the crank shaft. It consists of cylinders arranged in pairs, one of each pair receiving water under pressure at one end and delivering it into its mate at the opposite end; a diagonal pipe by which water is delivered from the second cylinder of the first pair to the first cylinder of the second pair; a connection between the opposite ends of the second pair; open pistons reciprocating within the cylinders connecting with cranks upon a common crank shaft, and valves closing the pistons so that the pressure of the water is alternately applied to the various pistons.

FOR SALE!



A Large and Well-Equipped Gravel Mine.

This is a regular producer, netting from $1500 to $3000 per month. Reasons for selling will be explained to a bona-fide purchaser. Address, GOLD MINE, P. O. Box 66, Placerville.

VICTOR Amalgamator.

(PATENTED.)

FOR MILL OR PLACER USE.

GREATEST Gold-Saving Machine Ever Invented.

The Following Speaks for Itself:

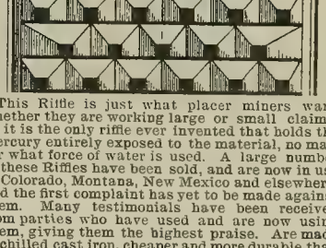
TO THE VICTOR AMALGAMATOR CO., 703 SOUTH MAIN ST., LOS ANGELES, CAL.

*Dear Sirs:*—Referring to the run made by me of fifty tons of the black sands near Santa Monica with the Victor Amalgamator, I have to say that the results were quite satisfactory, considering the crude arrangements employed in feeding the machine.

During the run, in all the panning (of over one hundred) I never missed finding gold before passing through the machine, and after passing the machine I found only two colors in panning after going through; in other words, only two colors were found in the tailings after panning over 120 pans.

Of the many methods that have been tried for saving the gold from the sea sands on this coast for the last twenty-five years, none have given as satisfactory results as the Victor.

I have no hesitation in saying that the machine, properly handled, will save a larger percentage of gold contained in the sea sands than any other process in my experience of over thirty years.



The machine is equally well adapted to saving the free gold from mill tailings, when it is too fine to amalgamate on ordinary plates. In milling talcy ores, I know of no other process so well adapted to saving gold as the Victor Amalgamator.

The above run showed the capacity of the machine (small size) to be about twenty-five tons per day. Respectfully, GEO. O. KILBOURNE.

For catalogue and full particulars, address

VICTOR AMALGAMATOR CO.,
703 South Main Street, LOS ANGELES, CAL.

PAYNE'S PATENTED GOLD SAVING RIFFLE.

This Riffle is just what placer miners want whether they are working large or small claims, as it is the only riffle ever invented that holds the mercury entirely exposed to the material, no matter what force of water is used. A large number of these Riffles have been sold, and are now in use in Colorado, Montana, New Mexico and elsewhere, and the first complaint has yet to be made against them. Many testimonials have been received from parties who have used and are now using them, giving them the highest praise. Are made of chilled cast iron, cheaper and more durable than any other process. Agents wanted. County and State rights for sale. These Riffles are manufactured at Denver only. Address all orders and communications to

JOSEPH J. PAYNE, Sole Owner,
1647 Champa Street, DENVER, COLORADO.
☞Would sell an interest to right party.

THE GOLD and SILVER EXTRACTION COMPANY, OF AMERICA.
LIMITED.
TRADE MARK.

(MacARTHUR-FORREST PROCESS)

MacArthur-Forrest Process.

CAPITAL, - - - - £110,000 STERLING

To MINE OWNERS and others having Refractory Gold and Silver Ores hitherto untreatable at a profit, the MACARTHUR-FORREST (Patent) Process of Gold and Silver Extraction offers a solution of the difficulty.

Advisory Board in the United States: Thomas W. Goad, Manager; Hugh Butler, Attorney; John F. Bell; P. George Gow.

California and Nevada Agency and Experimental Plant, 23 Stevenson Street, San Francisco, Cal. P. G. Gow, Sole Agent.

OFFICE: McPHEE BUILDING, DENVER, COLORADO.

MILLS BUILT WITH GUARANTEE OF SUCCESSFUL OPERATION.

KENDALL GOLD AND SILVER EXTRACTION CO.

The Kendall Process is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

*The Kendall system is covered by patents which this company will defend.*

The American Cyanide Gold and Silver Recovery Co., organized in Denver more than a year ago to introduce and operate the Kendall Process in several States, have closed contracts with some ten mines for the use of this process after exhaustive comparative tests with the ordinary plain cyanide method.

Capt. De Lamar has adopted the process at his Nevada mines, where a 250-ton plant is being completed. He writes that he is saving 95 per cent of his gold values, and regards the Kendall Process as the cheapest and best he is aware of for the treatment of gold ores.

*All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.*

Owners of mines and reduction works can obtain full information on application to

KENDALL GOLD AND SILVER
Extraction Company,
47 BROADWAY, - - - NEW YORK CITY.

DETACHABLE BUCKET WIRE-ROPE TRAMWAYS,

Roller Grinding Pans, Desulphurizing Furnaces, Etc.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

**The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Setf-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.**

**FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.**

**SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.**

**THIRD: The Large Amount of Space Saved.**

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

CORRESPONDENCE SOLICITED.

# CHEAP IRRIGATION!

UP TO DATE!

SAVE MONEY BY USING

## THE "DANIEL BEST" CRUDE OIL ENGINE

FOR POWER.

THIS IS WHAT THEY CAN DO:

**Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines, using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:**

| | |
|---|---|
| Coal Gas, ten hours' run, 1000 feet | $2 00 |
| Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c. | 1 25 |
| Coal Oil, ten hours' run, 7½ gallons @ 10c. | 75 |
| Crude Petroleum, asphaltum base, 16 gallons @ 3c. | 48 |
| Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c. | 65 |

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon—21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

# Market Reports.

## The Markets.

SAN FRANCISCO, May 28, 1896.

General trade was fairly active the past week. In several branches jobbers report an increased volume of goods going out on orders. In comparison with the corrresponding time last year it is larger in every line. This, no doubt, is due to the lateness of the season preventing stocking up to any extent. With the warmer and clear weather dealers in the agricultural and mining districts have bought more freely. Crop advices continue favorable for both fruit and grain. The decline in the market value of the latter has somewhat of an unfavorable influence, but even at present quotations for spot and future delivery the market is higher than at the like date in 1895, while the outturn to the acre promises to be fully up to last year's. Iron workers report a continued business with several running full handed and on full time.

The local money market is practically unchanged. The demand is light while the available supply is large. It is expected there will be an improved demand when the crops begin to move, but it must not be forgotten that interior banks are in a fairly independent position and can put out large sums of money before requiring assistance from San Francisco. Merchants report collections fair to good for the season of the year. New York mail advices are to the effect that there is a plethora of funds with next to money changing hands owing, it is said, to borrowers having supplied their wants. European advices state that money is in good supply and that gilt edge security secures a low range of interest. All kinds of gilt edge bonds are readily placed at higher figures than has ruled for several years. European banks of issue report the quantity of gold and silver on hand as follows: May 7, 1896, gold $1,602,200,000; May 9, 1895, $1,436,200,000. The silver held was May 7, 1896, $511,200,000; May 9, 1895, $537,200,000. The above comparison shows a gain of $165,900,000 in gold and a decrease of $26,000,000 in silver.

**New York Silver Prices.**

NEW YORK, May 28.—Following are the closing prices for the week:

| | —Silver in— | |
|---|---|---|
| | London. | N. Y. |
| Friday | 31 1–16 | 67⅞ |
| Saturday | 31 1–16 | 68 |
| Monday | 31½ | 68⅛ |
| Tuesday | 31 3–16 | 68¼ |
| Wednesday | 31¼ | 68⅜ |
| Thursday | 31¼ | 68⅜ |

The local bullion, money and exchange quotations current are as follows:

| | |
|---|---|
| Commercial Loans, % per annum | 7@8 |
| Commercial Loans, prime | 6@8 |
| Call Loans, gilt edged | 6@7 |
| Call Loans, mixed securities | 7@8 |
| Mortgages, prime, taxes paid by lender | 6@8 |
| New York Sight Draft | 12½ |
| New York Telegraphic Transfer | 15 |
| London Bankers' 60 days | $4.88¼ |
| London Merchants | $4.86¼ |
| London Sight Bankers | $4.90 |
| Refined Silver, per oz., 1000 fine | 62⅜ |
| Mexican Dollars | 53½@54½c |

SILVER.—The market has advanced ¼c an ounce the past week, closing fairly steady. The improvement is due to France and Russia buying, but as their wants will probably cover several months it is not at all likely they will force prices up against themselves, but buy as required. The demand from India and China is light—almost nothing—which has disappointed dealers.

MEXICAN DOLLARS.—The market is stronger, in sympathy with silver, but the demand is light. Our advices from the East are to the effect that fair shipments are going out at from 53½ to 54 cents.

COPPER.—Our market is very strong for ingot and manufactured in sympathy with European and Eastern markets. New York mail advices are as follows: "The market for all varieties of the metal is very firm. The undertone is strengthened more or less by the semi-monthly European statistics, showing that in the face of enormous exports from this side of the Atlantic, the foreign visible supply decreased 1600 tons during the first half of May. This assurance of enormous consumption in Europe has, in fact, dispelled the suspicion that was more or less generally entertained a short time ago that copper has been 'hidden' by foreign operators for speculative purposes. The extent to which home consumers have placed orders recently would indicate that the outlook in this country is not dark, although manufactured goods may not be selling in wholly satisfactory manner at the present time. Lake Superior ingot appears to be more difficult to secure for any delivery during the next three months."

The exports from this country for the first four months of the calendar year aggregated 38,148 tons, against 19,431 tons during the corresponding time last year.

The market is quoted as follows:

| | |
|---|---|
| Bolt | ¼ & 5-16, 20c; ⅜ and larger, 17c |
| Lake Superior Sheathing | 20 |
| Ingot, jobbing | 13 |
| Ingot, wholesale | 12 |
| Sheet copper | 17 |

QUICKSILVER.—There is a continued good export movement.

The market is quoted as follows:

| | |
|---|---|
| Home trade, per flask | 39 00 |
| Distant points up north | 38 00 |
| West coast of Mexico, for export | 34 00 |

ANTIMONY.—The market is quiet but steady at 8@9c cents in a jobbing way. New York mail advices quote 7½@7¾c for Cookson's, 6¾@6¾c for Hallett's and 6½@6⅝c for Japanese, from store.

TIN—The market is fairly firm for the pig and plate. The east reports a firmer market. An advance in silver has improved the price of pig tin.

The market is quoted as follows:

| | |
|---|---|
| Pig, per lb | 14½c |
| Plate, I C coke, heavy, per box | $4 25 |
| " " " light, " | 4 10 |

POWDER.—There is a continued good demand. The market is strong at unchanged quotations.

BORAX.—The market is quoted as follows

| | |
|---|---|
| Refined, in car lots | 6⅛ |
| Refined, in sacks | 5⅞ |
| Powdered, in car lots | 6⅛ |
| Concentrated, " | 5⅝ |

LEAD.—The market is steady. At the East an improved demand is reported, but free supplies are against sellers.

The market is quoted as follows:

| | | | |
|---|---|---|---|
| Pig | 3 75 | @ | 4 00 |
| Bar | — | @ | 4 15 |
| Sheet | — | @ | 5 50 |
| Pipe | — | @ | 4 75 |

SHOT.—The market is quoted as follows:

| | |
|---|---|
| Drop, sizes smaller than B, per bag of 25 lbs | $1 40 |
| Drop, B and larger sizes, " " | 1 65 |
| Buck, Balls and Chilled, do, " " | 1 65 |

POWDER.—The market is reported very strong at full figures, with a continued good demand for mining purposes.

The market is quoted as follows:

| | |
|---|---|
| Hercules, No. 1, per pound | 11½c |
| " No. 2, " " | 8½c |

IRON.—The local market is practically unchanged. There is a continued larger consumption of pig. The Philadelphia *Press* reports that market as follows: In the iron trade, another uneventful week has passed, and there are no present indications of any material change. A quiet, steady business is doing, and a slight improvement in the demand for manufactured material is noticeable. Contrary to expectation the May statement showed no falling off in the output of pig iron, but from information now at hand a number of furnaces are known to be blowing out, as will appear in the next monthly statement. Western market reports all show a continued quiet state of trade, but makers are still looking for a revival in the demand and prices are held with considerable steadiness. There has been a pressure to secure some rebate on coke, but there is no announcement of any change either in fuel or ores.

Our market is quoted as follows:

AMERICAN.

| | To Arrive. | Spot. |
|---|---|---|
| Sloso | $21 00 | $23 50 |
| Thomas | 22 00 | 23 50 |
| Salisbury | 30 00 | 33 00 |

ENGLISH.

| | | |
|---|---|---|
| Barrow | $21 00 | $23 50 |
| Gartsherrie | 21 50 | 23 50 |

COAL.—There is very little Australian on the way, while the labor strike at the collieries is against vessels loading. This shortage will be met by coast collieries, which will prevent much of an advance in prices. The consumption of steam will increase steadily from now on.

COKE.—The market is quoted as follows:

| | | | |
|---|---|---|---|
| Gas Companies' | — — | | — — |
| English, to load | 9 00 | @ | 10 00 |
| " spot, in bulk | — — | @ | 10 00 |
| " in sacks | — — | @ | 10 50 |
| Cumberland | — — | @ | — — |

NAILS.—Jobbers report a good demand at quotations.

The market is quoted as follows:

| | |
|---|---|
| Wire, carloads, basis per keg | $3 22½ |
| " jobbing, " " | 3 35 |
| Cut, carloads, " " | 2 97½ |
| " jobbing, " " | 3 10 |

LUMBER.—There is a continued good home and export demand.

The market is quoted in this city from dock or yards as follows:

| | | | |
|---|---|---|---|
| Redwood, Fluming | 17 00 | @ | — — |
| Pine | 14 00 | @ | 19 00 |
| Spruce | 26 00 | @ | 31 00 |

## Mining Share Market.

SAN FRANCISCO, May 28, 1896.

The depression reported last week culminated with Friday. After the regular Call on that day a raid was made on Chollar, sending the price, within a few minutes, down to $1.55; but in less than three minutes the price jumped back to $2.10, closing the day's transactions at $2 bid. Every share on the list, except Hale & Norcross, sold some lower and then closed slightly better. Hale & Norcross did not go off much. At the decline and recovery there were heavy transactions. The break came unexpectedly and caused a more or less demoralized feeling. Saturday's closing was firm at a slight advance, with Hale & Norcross the leader. On Monday the market opened strong, active and higher under a good demand for shares in the above mine. At the advance many outside holders are said to have sold, fearing that the market would sell down; but up to this writing it has not, although trading has been more quiet with no great strength in any of the shares except those of Hale & Norcross. Taking the list as a whole, and there is no denying there is a good undertone, at each shading there is a quick recovery. Many of the traders deal for cash, not caring to take chances on margin buying. Owing to the rapidity, an account can be uncovered when not protected by a 75 per cent margin. Commission brokers report very small holdings by outside dealers; the majority seem to have taken their profit and are waiting for lower prices to buy back. The movements of the market, combined with the work in the different groups of mines, particularly those having grounds on the Brunswick lode, warrant the assertion that there will be good fluctuations in prices which ought to make it attractive to professional traders—those at hand to take advantage of the turns at a moment's notice. At this writing it looks as if the general market will fluctuate to higher prices. Yet dealers should be prepared for the worst, which may come any day. At this writing the most attractive shares are of the mines having ground on the Brunswick lode. This, no doubt, is largely due to their having two chances of making a development—one on that lode and the other on the Comstock. Besides this, a new field of operation is at all times attractive when backed by sharp manipulation.

In the Gold Hill shares trading has been more active in Yellow Jacket, Belcher and Crown Point, but prices did not show more than a 10 per cent fluctuation. It looks as if some strong party is opposing an upmove in them, and the work that is being done in the mines is carried on in such a way as not to encourage buying by outsiders. No assessment was levied the past week, but some are expected to be levied the coming month.

The news from the Comstock mines is practically unchanged since our last week's issue. While there is more or less work reported in every mine, except a limited few, yet official letters do not contain much of an encouraging character to shareholders who have visions of big bonanzas near at hand. The work in several of the mines is in the direction to strike ore, but how much is an unsolved problem which time alone can solve. It is the uncertainty of mining that makes the gamble, but it is the certainty that destroys it. From the Alta group work is only reported in Alta. It is on the same levels as heretofore made public, with no change in the material encountered. From the Gold Hill group the news is about as heretofore reported. The official letters are as void of encouragement as a bitter almond is of a pleasant taste. In Overman work will be resumed next week. Both Seg Belcher and Belcher report more ore raised, with the assays higher. In Crown Point the ore on one of the levels assays from $5 to $7 a ton, but on the other levels only porphyry is reported. No work is reported in either Kentuck or Yellow Jacket. In Confidence they are still prospecting from the raise above the 200-foot level. This is the level where rich ore was found, but which, it is said, was lost in the shuffle for lower prices for shares. The joint west crossdrift being run by Confidence, Challenge and Con. Imperial is in more favorable material. It is out over 500 feet. In Alpha the usual work is reported on the 500-foot level. Work on the long west crossdrift in Bullion is continued. The work in Potosi is on two levels, as it is in Chollar. The official letter from Hale & Norcross is quite important, so far as the direction of the work is concerned. In Savage the improvement reported last week on the 850-foot level is continued. The company raised nearly 100 tons of ore, which assayed over $61 to the ton. They are having 225 tons milled. If the ore is worked as close as was that of Hale & Norcross, shareholders will not have cause for complaint. In Gould & Curry and Best & Belcher the work is the same as heretofore given out. The work in Con. Virginia is on several levels, with miners watching that on the 1000-foot level. In Ophir, Mexican, Union and Sierra Nevada the work is on the same levels as heretofore reported. There are those who look for an improvement soon.

The Brunswick lode continues to attract attention. The work in Occidental is said to be quite important, but there are those who have very little faith in their finding enough ore of a free milling character to warrant any undue excitement. Meetings have been held and combinations formed for the purpose of working to better advantage the ground owned by Potosi, Chollar, Hale & Norcross, Savage, Gould & Curry, Best & Belcher and Con. Virginia. It has been decided that the particular work in each of the above companies' ground shall be prosecuted under direction of the superintendent of each mine. This will call for a larger expenditure of money—but what do shareholders care for this, so long as the market is active and there are opportunities of making a big find of ore. There is enough work outlined to take several months to carry out. While this work is being done the shares of the mines will be a gamble and ought to have lively fluctuations as it is pushed forward.

From the Bodie mines the news is about the same as has been given out the past few weeks.

The market opened this morning barely steady and only fairly active. After regular call prices shaded off about 5 per cent, but closed at noon at call prices. At the 2:30 P. M. session Ophir sold slightly higher and Chollar a shade lower; the rest of the list was unchanged. Trading was light. It is stated that outsiders sold to-day more than they bought, and as the shares have drifted into strong hands it is not at all unreasonable to affirm that we can look for better prices soon. Advices from the Comstock state that when some necessary work is done in Crown Point active exploiting will be begun in quite interesting ground on three different levels.

The following illustrates the changes of the week:

| Mines. | May 21. | May 28. |
|---|---|---|
| Alpha | $ 28 | $ 27 |
| Alta Consolidated | 11 | ..... |
| Andes | 43 | 38 |
| Belcher | 75 | 79 |
| Best & Belcher | 1 70 | 1 35 |
| Bodie | 77 | 68 |
| Bullion | 32 | 28 |
| Challenge | 50 | ..... |
| Chollar | 2 65 | 2 80 |

And in accordance with law, and an order from the Board of Directors, made on the 30th day of March, 1896, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at their office, Room 323 Phelan Building, San Francisco, California, on THURSDAY, the 4th day of June, 1896, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale. M. A. CAHN, Secretary.

Office, Room 323, Phelan Building, San Francisco, California.

TO THE STOCKHOLDERS OF THE SOUTH PALOMA GOLD MINING COMPANY, LIMITED:

Notice is hereby given that by resolution of the Board of Directors of the corporation, adopted on the 21st day of March, 1896, a meeting of the stockholders of the corporation was called for the purpose of increasing the capital stock to the amount of two hundred thousand dollars, to be divided into one hundred thousand shares of the par value of two dollars per share, and of determining the disposition to be made of the increased capital stock; and it was resolved that such meeting shall take place at the principal place of business of the corporation, being the same building where the Board of Directors usually meet, to wit: No. 212 Sansome street, room 17, in the City and County of San Francisco, on WEDNESDAY, the 10th day of June, A. D., 1896, at 11 o'clock in the forenoon of that day.

Dated San Francisco, 2nd of April, 1896.

JOHN A. WRIGHT, President.

CHAS. WEBB HOWARD, JR., Secretary.

## WANTED.

For free milling and smelting property (gold) near Prescott, Arizona, competent mine superintendent who can make his own assays and run his own levels. Must have gilt-edged references; developed property. Address,

**L. A. DAVIES,**

189 La Salle Street.....CHICAGO, ILL.

### WANTED.

TWO ROCK BREAKERS, ANY MAKE. Capacity 1 to 2 tons per hour.

I. S. VAN WINKLE & CO., 413-415 Market St., SAN FRANCISCO.

WANTED.—A young man with literary ability, having had practical experience in mining and metallurgy, for the editorial staff of a first-class trade paper. Applications will not be noticed unless stating full particulars as to experience, compensation, references, etc. Address "Charter," P. O. Box 2718, New York, N. Y.

# MERCUR.

## UTAH'S NEW EL DORADO.

### Wonderful Development of the Camp Floyd Mining District.

The Camp Floyd Mining District of Utah, distant but forty miles from Salt Lake City, is now attracting the attention of the mining world as the only Western rival of Cripple Creek, Colo. The district has had a most remarkable history. The town of Lewiston rose, flourished and passed into decay twenty-five years ago, on the very spot on which Mercur has been built within the last eighteen months. It was renowned as a silver camp in '71, and from that time until 1890 old timers tell of the many big strikes in the district, but it was not until 1890 that gold was found. Attention was then called to the MacArthur-Forrest cyanide process, and a test of the ore was made in Denver, with such elaborate results that the old mines and many new ones were put on a dividend-paying basis. The formation at Mercur is very similar to the region about Johannesburg in South Africa, except that the Camp Floyd ore bodies are larger and richer. Geologists and mineralogists differ as to the origin and formation of the ore body, some claiming three distinct gold-bearing veins, while others seem to favor the single blanket vein theory. On one point, however, all agree, that no such gold deposit has ever before been discovered. In the Mercur mine the ore bodies average $15 in gold to the ton, while some assays run into the hundred's mark. With the aid of the cyanide process this ore is mined and milled at an average cost of $2.50 to $3 per ton, leaving a profit of $12 to $12.50 per ton. On this basis the mine has, in the year just passed, paid dividends to the extent of $300,000. The adjoining properties—the Golden Gate, Marion and Geyser—are equally as rich. The vein or veins have already been traced from the cluster of mines at Mercur to Sunshine, a distance of six miles, where the Sunshine mine and mill, another large property, is located, together with numerous claims of less magnitude. If the discoveries recently made, twelve miles west of Mercur and far to the south, are uncoverings of the same vein, then there is strong evidence that the great deposit covers an area of from 100 to 150 square miles and is the greatest ore body in the world.

Mercur or the Camp Floyd Mining District is best reached by the Rio Grande Western Railway to Salt Lake City. For further particulars or for printed matter apply to F. A. WADLEIGH, General Passenger Agent, Rio Grande Western Railway, Salt Lake City. *

# Great Reduction in Light!

# IMPERIAL

# Automatic Gas Machine

### Produces a Beautiful Light.

The difference between the brilliancy of light produced from gasoline gas and from coal gas is 3 to 1. The gasoline light is clear and soft, rests the eyes and brings comfort to the home.

The latest and most perfect Automatic Gas Machine now in use, particularly for illuminating private dwellings in the country, as well as residences in the suburbs of a city or town, public institutions, asylums, hotels, etc. The light is steady, soft, bright and pleasant to the eyes and can be furnished at an expense of but eighty cents per 1000 feet of gas. It is much safer than coal oil lamps, which are so dangerous to have in the house on account of an explosion.

These Gas Machines are perfectly safe, and free from any danger whatsoever. Every modern house built for gas should have one of these machines. No public institution should be without one. I have no hesitancy in saying that there is no other gas machine in the market that can compete with mine as to prices, and they surpass as to perfection in all its requirements.

For supplying gas for gas stoves for cooking or heating these gas machines have no equal. Address

# THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

**MINING AND SCIENTIFIC PRESS,**

220 Market Street..... San Francisco, Cal.

### *Assaying.—Part I—Gold and Silver Ores.*

Second edition. By C. H. Aaron. Embraces 130 12-mo pages, with illustrations, well bound in cloth; 1893. Price, postpaid.....$1 00

### *Assaying.—Parts II and III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.*

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

### *Notes on Assaying and Assay Schemes.*

By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

### *Prospector's Field Book and Guide.*

By H. S. Osborn.....$1 50

### *A Practical Guide for Prospectors and Miners.*

By C. W. Moore. With numerous Illustrations.....$4 75

### *The Explorer's and Assayers' Companion.*

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$5 00

### *Aaron's Leaching Gold and Silver Ores.*

By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men in cloth, postpaid.....$3 00

### *Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.*

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid.....$3 00

### *The Lixiviation of Silver Ores with Hyposulphite Solutions.*

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

### *Modern Copper Smelting.*

By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated.....$5 00

### *The Metallurgy of Gold.*

By M. Eissler. Profusely illustrated.....$5 00

### *Losses in Gold Amalgamation.*

By W. McDermott and P. W. Duffield.....$2 00

### *Electricity in Mining.*

By Sylvanus P. Thompson.....80 cts.

### *Practical Treatise on Hydraulic Mining.*

By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, postpaid.....$5 00

### *Practical Hydraulics.*

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

### *The Metallurgy of Silver.*

By M. Eissler. Profusely illustrated.....$4 00

### *Manual of Hydraulic Mining for the Use of the Practical Miner.*

By T. E. Van Wagenan.....$1 00

### *The Sampling and Measurement of Ore Bodies in Mine Examinations.*

Well printed on fine paper, with plates; complete. Price, postpaid.....25 cts.

### *Manual of Mining.*

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

### *A Text Book of Mineralogy.*

Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

### *Manual of Determinative Mineralogy.*

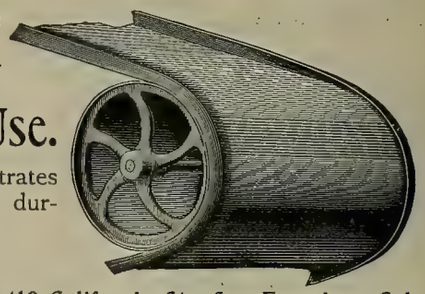
With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth...$3 50

### *Metallurgy of Silver, Gold and Mercury in the United States.*

Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7

### *Metallurgy of Silver, Gold and Mercury—Continued.*

Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50



### *Notes on the Treatment of Gold Ores.*

By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

## Wanted—A Secretary of Mines.

A Shasta county correspondent takes issue with us as to the need of a Cabinet Secretary, who would have Government charge of the mining industries of the country, and says that we as a people have too many departments and secretaries now, that we are ceasing to be a democratic republic or a republican democracy, and are fast becoming ruled by bureaucrats and commissioners and heads of departments; that to-day the will of the people is overruled and overridden by Washington satraps.

It does look a little that way, but we do not despair of the republic. The hard deal that the miners are now getting at the hands of arrogant and ignorant department heads is, however, the best argument we know of for the establishment of a bureau of mines, the creation of a Cabinet officer, whose sole business it shall be to attend to the great mining industries of the country. As things are, it is necessarily a part of governmental functions that the affairs of the country shall be administered by a presidential Cabinet, and it is better for the miners of California and of this coast to recognize this fact and unite in a demand for just recognition than to content themselves with decrying existing systems. Whether good or bad, it is the way things are done, and the way they will be done, and the creation of a Secretary of Mines is in direct line with the policy and outgrowth that has made the Cabinet. At first the Cabinet of the President of the United States was composed only of a Secretary of State, a Secretary of War and a Secretary of the Navy. In the century of our existence there have been added successively a Secretary of the Interior, an Attorney-General, a Postmaster-General and a Secretary of Agriculture. In the order of evolution or development, the time has arrived for a Secretary of Mines. The MINING AND SCIENTIFIC PRESS said this ten years ago; it has continued to press the subject; it has probably made itself a little tiresome by repetition; but all great results are gained only by continuity of effort. Any intelligent man who will note the trend of affairs as regards the mining industry in the past decade will be likely to give affirmative echo to the statement that the creation of a Cabinet officer to have charge of the country's mining industries is not only of immediate necessity to the miner, but of pressing importance to the interests of the nation in its entirety. Without more than passing reference to the dignity of the mining profession, or to the fact that upon the prosperity of its mineral industry primarily rests the prosperity of any country, it is but necessary to cite the present value and extent of the mineral industries of this nation and the evident increase. An industry that represents an annual output with a value of more than six hundred million dollars, and an investment of nearly four times that amount, can justly demand the recognition asked. In this State and elsewhere the ignorance displayed by the Interior Department is lamentable. With no disposition to find fault or blame; fully cognizant of the fact that these officials are overworked, and that they can not be expected to know anything about those matters, yet the fact remains that the great mining industry is, in their Government charge, a little dump heap in a corner of a big office, and that constant injury to the mining public is the result. Take, for instance, a common experience. Every day a point comes up involving interpretation of that maze of modern mystery, the mining laws of the United States. A letter to the Secretary of the Interior will bring a construction or ruling on a disputed point, and a letter to the Commissioner of the General Land Office will bring a construction or understanding on the same point exactly opposite to that of his superior.

These men know nothing about mining. This is not their fault, but it is our misfortune.

We need a new department of the Federal Government—the Department of Mining—with a competent mining man in charge, possessed of equal standing with other Cabinet officers. There are a great many things in the mining world that need straightening out, and they will never receive the attention their importance justifies till there is a Cabinet officer of mines. At present the mining interests of this country, and of this west half of the nation in particular, are harassed and held back at the mercy of a few petty officials, who don't know a shaft from a shift, who never saw the inside or outside of a mine, and who, largely left to their own devices, become imbued with the idea that the miner is a sort of a nuisance. It is hard enough at best for the miners of this country, without having things made harder still. Between the grab of the corporation and the merciless ignorance of those in power, matters are made harder still. Things are getting no better very fast, and the creation of a department of mines, in charge of a Cabinet officer, will alone bring permanent or satisfactory solution of this important question. If the miners of the country (and that term is meant to include everyone directly connected with the mining industry) will work together in a united demand for such recognition, it will be forthcoming.

GREENSTONE OUTCROP ON THE MOTHER LODE.

## Greenstone Outcrop.

Contrary to the generally accepted theory that development of greenstone veins on the Mother Lode does not pay, experiments and developments at the Mayflower and elsewhere lend practical interest to the idea entertained by some that a greenstone vein may be found of sufficient value to at least thoroughly prospect. Herewith is an illustration of a greenstone outcrop at Rancheria Creek, Amador county.

---

AFTER considerable delay the diplomas and medals awarded by the World's International Columbian Exposition in Chicago in 1893 are being at last sent to the successful competitors. Whatever of advertising value they possessed has been largely lost by lapse of time, and they are now chiefly of interest as historical mementoes of a great event. The MINING AND SCIENTIFIC PRESS last Monday received the bronze medal and diploma awarded to it by unanimous vote of the commissioners. The medal is a massive one, appropriately inscribed; the diploma is handsomely executed. The award was for the high character of this paper, its accuracy and reliability, and is valued as a fine tribute from competent critics So far as known it is the only journal thus honored, and the distinction is appreciated. The medal will be placed in the archives of this office and the diploma handsomely framed will grace our walls.

## The $250,000 Appropriation.

The President of the United States is not so powerful in influencing National legislation as the Speaker of the House of Representatives. The latter can absolutely block legislation: the former can only delay it. On the 29th ult. the President vetoed the River and Harbor bill, which contained the $250,000 hydraulic appropriation asked for by miners and valley residents for restraining barriers in California rivers. On the 2nd inst. the House passed the bill over the head of the Chief Executive by a vote of 220 to 60. On the 3rd the Senate followed suit by a vote of 56 to 5. So that part of the legislation desired by the miners of California is secured.

The full text of that portion of the bill making the appropriation is as follows:

For the construction of restraining barriers for the protection of the Sacramento and Feather rivers in California, two hundred and fifty thousand dollars; such restraining barriers to be constructed under the direction of the Secretary of War in accordance with the recommendations of the California Debris Commission, pursuant to the provisions of, and for the purposes set forth in, section 25 of the act of the Congress of the United States entitled "An act to create the California Debris Commission and regulate hydraulic mining in the State of California," approved March 1, 1893.

*Provided*, that the Treasurer of the United States be, and he is hereby, authorized to receive from the State of California, through the Debris Commissioner of said State, or other officer thereunto duly authorized, any and all sums of money which have been, or which may hereafter be, appropriated by said State for the purposes herein set forth. And said sums, when so received, are hereby appropriated for the purposes above named, to be expended in the manner above provided.

It will be noticed that no mention is made of De Guerre Point, or any other specific location; it will also be noticed that there is no reference to hydraulic mining *per se*. The difference is accentuated by comparison of the above (which is incorporated in the general River and Harbor bill) with the following:

A BILL TO APPROPRIATE MONEY FOR THE CONSTRUCTION OF WORKS TO IMPOUND MINING DEBRIS, AND THEREBY TO PROTECT THE NAVIGABLE STREAMS OF CALIFORNIA.

*Be it enacted by the Senate and House of Representatives of the United States of America, in Congress Assembled.*

SECTION 1. That there is hereby appropriated out of any money in the treasury not otherwise appropriated the sum of one million and thirty thousand dollars, which sum shall be immediately available and shall be expended under the direction of the Secretary of War, in accordance with the plans, specifications and recommendations of the California Debris Commission, appointed under the Act of Congress entitled, "An Act to create the California Debris Commission and regulate hydraulic mining in the State of California," approved March 1, 1893, for the purpose of constructing works for the restraining and impounding of mining debris upon the tributaries of the Sacramento and San Joaquin rivers in California and the branches of such tributaries.

SEC. 2. Whenever any such works for the restraining and impounding of mining debris shall have been constructed out of such appropriation, or shall have reached such a stage as, in the opinion of such commission, it shall be safe to use the same, it shall be lawful for such commission to make the order provided for in section 13 of said act, upon proceedings being first had and taken in accordance with the provisions of section 9, 11 and 12 of said act, but in such cases the owners of the mines affected by said orders shall not be bound by the proviso to said section 13 of said act nor by the provisions contained in section 16 thereof.

SEC. 3. The said commission shall also have the power to make the order provided for in section 13 of said act as to any mine or mines whenever it shall appear to the satisfaction of said commission that no impounding works are necessary other than the means already provided by nature to protect from material injury the navigable streams mentioned in said act and the land adjacent thereto, upon proceedings had in accordance with sections 9, 10 and 12 of said act.

The above is the original bill drafted by the Legislative Committee of the California Miners' Association and presented last January in the Senate by Senator Perkins and in the House by Representative Johnson. It was found that, as an independent measure, it could not pass, and, after considerable modification, a $250,000 appropriation, as stated, got through.

This appropriation is doubly valuable, as it unlocks the appropriation of an equal amount for the same purpose made by the State in '93, contingent upon such congressional action as has now been taken. The appropriation will be available on the first of next month, and as preliminary surveys have already been made, and the location of the dams practically decided upon by the present U. S. Debris Commission, who will have entire charge, the work can begin early in the last half of this calendar year. It is to be borne in mind that this work is largely experimental and that in no way is there any change in the present legal requirements regarding hydraulic mining. The efforts of the miners secured the appropriation, and its benefits will be more largely shared by valley residents.

The appropriation is made under the provisions of section 25 of the Caminetti act—just as the California Miners' Association has always asked it. Under section 25 of the Caminetti act, the reports of Col. Mendell and the Biggs' Commission are made the basis of operations. These reports recommend various places in the foothills and canyons along the tributaries of the Sacramento and Feather rivers, including the branches of the Bear, Yuba and American, for dam sites. The California Debris Commission is left free to select the site, or sites, for the construction of the restraining barriers provided for.

The appropriation is unconditional and is in no wise dependent upon the California appropriation. California, however, in order to keep faith with the General Government, must see to it that the contingent $250,000 appropriated three years ago is added to the Federal appropriation.

But two points now remain to be overcome: First, to demonstrate the efficiency of restraining works; second, to secure such amendment to the Caminetti act as will enable the miners to use the Government works, as originally contemplated. Section 16 of the Caminetti act and the proviso to section 13 preclude any power of the miner to use any works other than those constructed by himself.

The wording of the appropriation is deserving of particular attention. It is to be noted that the appropriation is made under the provisions of Section 25 of the Caminetti act. That section is appended.

SECTION 25. That said commission, in order that such material as is now or may hereafter be lodged in the tributaries of the Sacramento and San Joaquin river systems resulting from mining operations, natural erosions, or other causes, shall be prevented from injuring the said navigable rivers or such of the tributaries of either as may be navigable and the land adjacent thereto, is hereby directed and empowered, when appropriations are made therefor by law, or sufficient money is deposited for that purpose in said debris fund, to build at such points above the head of navigation in said rivers and on the main tributaries thereof, or branches of such tributaries, or at any place adjacent to the same, which in the judgment of said commission will effect said object (the same to be of such materials as will insure safety and permanency), such restraining or impounding dams and settling reservoirs, with such canals, locks, or other works adapted and required to complete same. The recommendations contained in executive document numbered two hundred and sixty-seven, Fifty-first Congress, second session, and executive document numbered ninety-eight, Forty-seventh Congress, first session, as far as they refer to impounding dams, or other restraining works, are hereby adopted, and the same are directed to be made the basis of operations.

The appropriation is to be used in compliance with the provisions of the above section, and is solely for the purpose of constructing restraining barriers against what has been or may become in need of such restraint. As regards location, it needs only to be said that several years ago the U. S. Debris Commission made two reports recommending the building of a restraining dam or barrier at De Guerre point. Since that time the entire personnel of the commission has changed, and the views held by the commission as formerly constituted are considerably modified. Since then, also, the channel of the river has changed, and those now in charge are convinced that it would be unwise to build any restraining barrier at that point. It is believed that the preliminary work under the provisions of the appropriation when available, in about three weeks time, will be on the Yuba river, between the city of Marysville and the foothills.

## Cost of Classification of Mineral Lands.

Speaker Reed, as a part of his reason for his refusal to permit the Mineral Lands Classification bill to become a law, stated that the cost of the classification would be a million dollars. The statement is not true nor even approximately true. It certainly is not believed by the railroad or Mr. Mills would not have made the proposition to the Miners' Association to make the classification at the joint expense of the railroad and the association. As a fact the amount is a most unreasonable estimate. Under the terms of the bill practically all of the indisputably agricultural land would be so classified without any field inspection, and at little or no cost. In Butte, Yuba, Sierra, Nevada, Placer and El Dorado counties the areas of unpatented lands that would require examination and classification by sections are not near as large as generally believed. The information available for determining their character, which would undoubtedly be used to direct the field examination is extensive and reliable. The United States Geological Survey has been made over the entire region and the maps published. Though these maps do not show the township and section lines, they are topographically so accurate that these lines can be platted onto the maps. The State Mining Bureau has published maps of portions of Placer and Nevada counties that are also utilizable. The California Miners' Association, at an expense of nearly $1,200, has also secured accurate maps of almost all the region in dispute. The location of the mineral belts has become well known, and the evidences of their existence and possibilities of value are comprehensible on a rapid examination with the aid of the data noted. It is safe to say that the entire cost of the classification of the unpatented lands in these counties would not exceed $20,000. In Siskiyou, Trinity and Shasta counties the areas requiring classification cover much more territory than in the six counties already referred to; but a much larger proportion of that area is indisputably non-mineral in character and can be classified without field examination. The cost of the entire classification in this section is safely estimated as being within $20,000. Estimating for the southern group of counties—Kern, Los Angeles, San Bernardino, Riverside and San Diego—as much as for the other two groups combined, $40,000, the total cost of the classification would not be more than $80,000, and there are many reasons for believing that the cost would be very much less. This sum would be but a fraction of what would come into the national treasury from the sale of these lands as mineral patents are obtained for them. The Government receives $2.50 an acre for placer lands and $5 an acre for quartz.

This paper never has any desire to hold post mortems. The Mineral Land bill was cleverly smothered, and those who did it doubtless got or expect their reward; but it is in order to note that Speaker Reed's plea of cost was as fallacious as his still more specious statement that he believed it was a "railroad measure" and therefore opposed it. That is so manifestly absurd as to need no reply. Meanwhile, by the time this article gets to the bulk of its readers Congress will have adjourned, and nothing can be done this session. At the second session of the 54th Congress it may be possible to get the bill through. The thanks of the miners of California are due to the men who tried to secure a measure of justice at the hands of Congress.

It might be worth while this summer to dig a little into the patents that are issued already to the railroad company, the more so as the company seems to have made a practice of holding back some of its patents from record with the county recorders. An action has just been commenced in Placer county by the Central Pacific itself to quiet title to section 21 of T 15 N, R 12 E, against a miner who claims a quartz ledge on it. This section was patented to the Central Pacific some ten years since, but the patent is not on record there. The section is said to be well known valuable mineral land. How much similar land the same patents may take no one knows there. An examination of the recorded patents shows that thousands of acres of mineral land are patented to the railroad in that county.

## Concentrates.

THE Pueblo, Col., Mining Exchange has resumed calls.

THERE are 2,600 men on the payrolls at Anaconda, Montana.

WORK is resumed at the North American mine, Gibsonville.

SEVERAL California mining men are returning from South Africa.

THE Los Angeles Mining and Stock Exchange opened for business May 26th.

THE monthly profits of the Utica mine, Calaveras Co., are stated to be $150,000.

AT the Plumas Eureka, Johnsville, twenty stamps are dropping. Sixty men are now employed.

IT is estimated that there are now 18,000 miners at work in this State—an increase of 4,000 over '94.

THE value of the output for the Kootenai country for 1896 is estimated at from $5,000,000 to $10,000,000.

A RUSSIAN COMPANY has obtained a Government grant to work for gold in Corea for twenty-five years.

A CLOUDBURST at Empire, Nevada, last week, carried away about 1000 tons of tailings from below the Morgan mill.

W. H. MARTIN now has charge of the Mayflower mine, Nevada Co., which has reverted to its original owners.

TWO MEN from the War Eagle won the drilling contest at Rossland, B. C., last week—31¼ inches in fifteen minutes.

THE San Francisco Mint will be closed on both crude and refined gold from June 13th to July 6th for the annual cleanup.

FEELING the need of a vacation, the editor of the Bellevue, Idaho, *Herald* has suspended publication for two months to go fishing.

IN May the coinage at the U. S. Mint in this city aggregated $2,266,990; for the first five months of this year it aggregated $9,102,490.

THE Anaconda Company is now producing almost as much copper as the whole State of Michigan, more than Spain and more than Chile.

THE State Mining Bureau has received a bronze medal and award for its handsome exhibit at the World's Columbian Exposition at Chicago in '93.

THE miners of Belt, Montana, propose to raise $5,000 to send orators East to educate the people and give a current presentation of the silver cause.

POSTMASTER ROSE of Cripple Creek, Col., recently grew tired of seeing mail matter accumulate, and accordingly burned four wagonloads of it.

IN London it is thought that a solution of the labor problem in the South African gold mines can be found in the importation of 10,000 Chinese to the Rand.

TWO NUGGETS are on exhibition in Globe, Ariz., weighing six and one-fourth pounds, and said to be almost pure silver. They were found in Richmond Basin.

ABOUT 1200 miners are at Cook's Inlet, Alaska, waiting for the breaking up of the ice. So far the restaurants and saloon men are the only ones who have a paying claim.

SUPT. ADAMS of the Carson, Nev., Mint has received instructions from Washington to reopen the Mint to receive bullion and to resume operations in the refinery.

THE DeLamar, Idaho, Mining Company, limited, in its report for April, shows the total value of the product to have been $62,730, and the profit for the month $25,275.

AN international exhibition of machinery, mining appliances and metallurgical processes will be held at Brisbane, Queensland, Australia, during June, July and August, 1897.

A NEW YORK financial journal puffs a mining company reorganized in Sierra County which "owns three full claims of 3000 feet by 600 feet each," with "veins rich in value."

A SECOND EDITION of two valuable treatises, "Mine Timbering," by W. H. Storms, and "The Cyanide Process," by A. Schiedel, has been issued by the State Mining Bureau.

THE renewed interest in the mining industry is a Godsend to many a California rancher, who finds his best cash market among the miners, and who shares directly in the benefit.

THE sales on regular call at the San Francisco Stock Exchange last month were 818,610 shares; in May, '95, 274,030 shares. The sales in May, '96, were the largest for many years.

IT is understood in Salt Lake, Utah, that the Centennial-Eureka sale is "a go," and that this week the whole property will be turned over to its English purchasers on a $3,000,000 basis.

The *Searchlight* reports that the Dyson Consolidated Mining Company, owners of the "white or unknown metal" claims in Modoc county, have bonded them to W. W. Robinson of Redding, for $21,000.

AT Pike City, Sierra Co., the Alaska mine is to be reopened and worked on a larger scale. R. A. Paine will have charge. The stamp mill which recently burned down will be replaced by a new and larger one.

IN the General Deficiency Appropriation bill, which passed Congress this week, was an item of $45,000 for the construction of sampling works for assaying imported silver-lead ores at the points previously reported.

THE scheme to run a tunnel through the Rocky mountains forty-eight miles from Colorado City to Cripple Creek is again revived, which would seem to indicate that Brick Pomeroy, who passed away last week, died too soon.

A CLOUD burst over the Red Boy mining camp at Baker City, Or., on the 2nd, wrecking the miners' boarding-house. The office building and mine headquarters were moved from their foundations. The mill and mine were not within range of the flood.

A HELENA, Montana, smelting company essayed to restrain a placer miner from working above them, claiming that he muddied the water so that they could not use it. The case was decided against them, and the miner then agreed to impound his tailings.

THE President vetoed the River and Harbor bill on May 29th. On the 2nd inst. the House passed the bill over his head by a vote of 220 to 60. On the 3rd the Senate did likewise by a vote of 56 to 5. This insures the $250,000 appropriation asked for by the miners of California.

AT Union Square Hall in this city last Wednesday evening Prof. Harold Fairbanks of the University of California, for many years connected with the State Mining Bureau, delivered an interesting and instructive lecture on "The Mother Lode" before an audience that filled the hall.

THE Plumas *Independent* says Thompson, Hosselkus and Hardgrave have received from Mrs. L. Wegener payment for the Lucky S. mine. This property has been under lease to Mrs. Wegener with the privilege of buying for more than a year, and the lady has spent over $30,000 in development and other work. The sum paid is stated to have been $9000. The new owner will, it is understood, proceed to increase the milling facilities and push ahead the tunnel.

SILVER REEF, UTAH, which came into prominence twenty years ago as the first place in the world where silver was found in sand, and where petrified wood assayed way up in the hundreds, shows signs of new life, and the old dumps are expected to turn out considerable gold values by the cyanide process.

THE local paper of Tallapoosa, Ga., has the following advertisement: "A few good men can secure steady employment at the Royal mines. Wages from 80 cents to $1.25 per day. Apply at mines. A. C. Theis, Supt.," and devotes an editorial thereon to the great "boom" in gold mining in that section.

BUTTE, MONTANA, advices are to the effect that the Rothschilds have finally acquired a controlling interest in the Anaconda Co. The syndicate they represent recently secured a quarter interest in the property on a basis of $30,000,000, but the present purchase is on a basis of $45,000,000 for the whole property.

THE Cleveland G. & S. M. Co. started up their mill last week. This company owns a number of claims about forty miles south of Austin, Nev. So far the ore averages $15 gold and $9 silver per ton. The mill consists of a crusher and a 6-foot vanner. The mill was built by O. H. Packer, the superintendent.

AN Ottawa, Ontario, dispatch of the 4th says: "The mining properties in the Kootenay district, British Columbia, known as Le Roi, War Eagle and Iron Mask mines, have been sold to capitalists in London, England. The Le Roi mine brought $5,000,000, the War Eagle $2,000,000 and the Iron Mask $1,000,000."

UTAH furnishes an example of how modern methods make profitable the working of lean ore in the case of the Geyser Company, Camp Floyd district, where the average value of the ore milled during the month of April was but $3.92 per ton. The entire cost of mining and milling was $1.97 per ton, leaving a profit of $1.95 per ton.

THE Court of Appeals of Colorado holds that, where one to whom an interest in the lease of a mine is assigned agrees to pay all costs and assessments on his own interest and that of his assignor, he is not liable for a deficiency of receipts for a certain month and incurs no liability if, during the whole period of the lease, there are funds available for expenses. Shaw v. Horner, 42 Pacific Reporter, 689.

W. E. VAN SLYKE, A. S. Omer, M. E. Miller, F. Shaffer and W. W. McCoy have executed a deed to a group of mines in the Ibex mining district in San Bernardino county, the consideration being $225,000. The deed runs to Eugene Harbeck, "but," says a southern California paper, "the real party in interest is the Lord Mayor of London." He is probably acting for the Prince of Wales or Chauncey Depew.

WHETHER from a desire to play with his captives, a wish to impress them with his power, or an honest effort at clemency, President Kruger of the South African Republic has acted very singularly with the political prisoners. News now comes that John Hays Hammond and his fellow-sufferers, who were first condemned to death, subsequently commuted to fifteen years' imprisonment, then fine, are to be released from custody.

AT Frisco, Utah, the Horn Silver mine and mill closed down on the 1st, owing to a contemplated reduction of 25 cents per shift in miners' wages. Miners who had been receiving $2.75 for ten hours' work were notified that the pay in future would be $2.50 for eight hours. Laborers' wages remain $2.25, the same as formerly for ten hours. The men operating the drills were to receive the same for eight hours as they formerly did for ten hours—$2.75.

DUST from dry tailings annoy residents adjacent to the Johannesburg, South Africa, mines. Some two or three from the South African capital can organize an anti-debris association there and make a good thing of it in the way of a profitable job. Now that some of the Sacramento valley agitators are denied further support by the county boards of supervisors, they could probably find profit and notoriety in kicking up a row among the Boers.

THE South African *Mining Journal* of May 2 says that on the Robinson Deep the two shafts are now nearly 1600 feet deep—several hundred feet deeper than any others on the Rand—and progress continues to be made. Difficulty has been encountered owing to the scarcity of skilled native miners, for the whole of the sinking has been done by hand drilling. An average of 65 feet a month in each shaft has been maintained during the two years the work has been in progress.

THE Merced Gold Mining Company at Coulterville, Mariposa Co., has been accused of being un-American and employing only Cornishmen. The superintendent has prepared a list, showing that about three-fifths of the company's employes are native-born Americans. In the Transvaal the native-born population complain that the English companies will give them no work, and now a disgusted English miner writes to a London paper that the same concerns which are spending English money will not employ English miners on account of the "Yankee bosses" who favor their own countrymen.

SAYS the Stockton *Independent*: This is a truth that cannot be too often repeated to impress on Californians, that it is idle to seek wealth in distant or foreign regions when there is such a vast amount of undeveloped wealth in this State. All that is required to develop it is knowledge of mining and energy and persistency in seeking it. When a good deposit is discovered there is no lack of capital for development, and many hundreds of millions will continue to reward those who have the intelligence to seek and the perseverance to continue the search in the gold-laden Sierra, not a tithe of the wealth of which is yet known.

GEO. TURNER, manager of the Le Roi mine, Trail Creek, B. C., says he is preparing to add a forty-drill compressor and a 250 H. P. hoist to the machinery of the mine, and will then be able to take out about 500 tons of ore a day. The new engines will be in position by November 1st. "Heretofore we have been working with a ten-drill compressor and a 50 H. P. hoist, getting out about 100 tons a day. I recently took an average on all the ore shipped by the mine so far, and it came to $36.77 per ton, not including 3 ounces of silver and 3 per cent copper. The cost of hauling to the smelter amounts to $2 per ton, and it costs $9 to have it smelted. For some months past the monthly payment of dividends has alternated between 5 and 10 cents a share. In round figures the dividends have been $500,000 for the past year."

REGARDING the Butte Co. properties of the English syndicate the London *Mining Journal* of May 23rd reports: "An extraordinary general meeting of the shareholders in the Golden Gate of California (Limited) was held on Wednesday at Winchester House, E. C., Mr. W. Ashton-Ellis presiding, for the purpose of considering resolutions for the reconstruction of the company. The chairman, in moving the resolutions, stated that it was very encouraging to the directors, after having experienced such troublous times, to find that they had a very rich property in the Rock river mines, for which they required additional capital to complete the purchase. On Monday they received the following cable from their consulting engineer (Mr. J. B. Low) and the general manager (Mr. G. H. Evans): 'The character of the ore we expect to strike will be so remarkably rich that it will be most advantageous for shipment. Mill will not be required. Ore will be carefully assorted by hand when prepared for shipment to San Francisco. In our present position it will be best to be all ready to complete the purchase July 1st. In the meantime you must push on developments.' The capital of the new company would be £80,000 in 80,000 £1 shares credited with 17s paid up; 1s would be paid on application and 6d on allotment, and the balance as and when required. However, it was not anticipated that the balance would be wanted. Mr. Pechey seconded the resolutions, and they were carried unanimously. A vote of thanks to the chairman and directors concluded the meeting."

WORK is resumed on the Muscovite Mica Mining Company's mine, fifteen miles from Vollner, Idaho, after a suspension of several years following upon an abortive sale of the property to London capitalists, and production will now be pushed from the greatest mica mine west of North Carolina. The mica occurs in blocks of various sizes, enclosed in a 10-foot ledge of feldspar, their weight being from five to 500 pounds each. About 3,000 feet of development work has been done, consisting of a shaft 160 feet deep and four tunnels, of which the three upper ones average 800 feet in length and the lowest, forty feet below the bottom of the shaft, is in 200 feet and will now be driven farther. The mica is split and cut into marketable sizes and shapes at the mine. The smallest sheets, cut in merchantable sizes, sell for 30 cents a pound, the largest from $20 to $30, and the average about $10.

CONSIDERABLE inquiry is received regarding the Rigaud gold process, recently noticed in these columns. The *Credit National* of Paris has issued a special illustrated number treating of the new process, which contains little more than that previously reported herein, except sundry extravagant statements which will hardly be accepted by California miners. Among other things it is declared that the tailings dumps of the world contain gold worth $5,400,000,000, and that the Total Gold Extraction Company can take out all this gold in all these dumps at a profit of one-half the amount. It is also claimed that at the works at Tancarville, France, the company can "fairly count in its first year upon an income of $8,000,000." The whole thing looks like a big scheme to sell stock, but the author of the statement should have had a little more knowledge of metallurgy and of existing facts before preparing the cleverly worded prospectus.

DISCUSSING Siskiyou Co. mines the Yreka *Journal* reports that the French Creek mine, near Etna has closed down. The Espey-Hunter mine at Hawkinsville, will be opened up this week. Hobart & Co., Hull Gulch, Scott Valley, had occasion to move the first twenty boxes of their sluice way lately to work in another place, that cleaned up about $6,000, with 300 boxes not touched, seventy of which show amalgam floated down, with the balance no doubt containing fine gold carried off by the water. The hydraulic miners at Oro Fino expect to be able to keep their giants at work until after the 4th of July this year. The warm weather of the past few days is melting snow rapidly. Two of the Distlehorst dredgers are now in the Klamath river, and the third will be launched in a few days, to begin the work of mining in the river bed by dredging, above Oak Bar. At the Columbia quartz mine, between Oak Bar and Scott Bar, forty men are employed.

THE eight-hour Utah mining law went into effect in that State yesterday. It makes it a misdemeanor for a mine owner or smelter to permit any employe to work longer than eight hours a day. The practical workings of the new statute is of interest to the miners there. Manager O. B. Hardy of the Bingham Copper Company says: "There are miners whom I know who can do as much work in eight hours as in ten, and there are hands who could not do the work of a miner's day if you allowed them twelve hours. The way I feel about it is that, if a miner can do his work in eight hours, let him do it. If, on the other hand, a man cannot do it in that time, let the foreman fire him and employ one who can." A Salt Lake attorney says that there is nothing in the law to prevent a miner dictating his own hours and working as many in excess of the statutory provision as he liked. This may enable the miner and mine owner to arrive at harmonious conclusions.

THE Simmer & Jack, South Africa, directors send the following summary of operations for March: Quartz milled (100 heads), 13,145 tons of 2000 lbs., yielding 5,491.97 ozs. smelted gold, taken at 72s per oz.—£19,771 1s 10d; chlorination, 652.05 ozs. from concentrates—£2608 4s; tailings treated, 8215 tons, and 81 tons concentrates, yielding 2492.64 ozs. smelted gold—£7477 18s 5d; total value, £29,857 4s 3d. Cost, £12,373 5s 2d: Mining and hauling, 12s 4.01d per ton; transport, 6.16d; milling, 4s 4.32d—17s 2.49d per ton; general charges, 1s 7.42d—18s 9.91d; expended on mine development, 4s 8.79d per ton—£3110 10s 9d; total per ton, 23s 6.70d; cost of treating concentrates, £495 10s 9d; cost of producing concentrates, £375 3s 11d; cost of treating tailings, £2036 11s 8d—£6017 17s 1d; total cost, £18,391 2s 3d. Profit for month, £11,466 2s. Capital Account: Expended on plant and buildings, new shafts, etc., £45,853 18s 6d. Mine Development: 1945½ feet sunk and driven, developing approximately 38,910 tons of ore.

TWO STRONG APPEALS were made to Speaker Reed this week in favor of the Mineral Land bill. The first reads as follows: San Francisco, June 2, 1896.—Thomas B. Reed, Speaker House of Representatives, Washington, D. C.: The miners of California appeal to you to afford a California Congressman recognition on the Mineral Lands bill. The measure is just and will afford relief to thousands of California's citizens. Well knowing your thorough knowledge of parliamentary law, we firmly believe you will find a way to give to California the long-sought-for benefit. The people of this State are unanimously in favor of the bill; and if you desire, we can get all of the largest and most influential commercial and financial organizations of California to join in the appeal to allow this bill to pass. It was signed by Pres't Neff and Sec'y Sonntag of the California Miners' Association. On the 3rd a second telegram was sent as follows: San Francisco, June 3, 1896.—Thomas B. Reed, House of Representatives, Washington, D. C.: California is deeply and vitally interested in House bill 5819, for examination and classification of certain lands in California and Oregon. The bill affects California and Oregon only. It is now pending in the House for concurrence in Senate amendments. California would be grateful for any assistance you might render. The failure of the measure to pass at the present session would be a bitter disappointment to California, while the passage of the same would be hailed with joy throughout the State. This was signed by Attorney-General Fitzgerald, Secretary of State Brown, Controller Colgan, Hugh Craig, president of the Chamber of Commerce, A. A. Watkins, president of the San Francisco Board of Trade, and George Stone, president of the Union League. "We have done all in our power, Senator Ford and I," said Secretary Sonntag to a reporter, "to get the Mineral Lands bill off of the calendar. Our reason for getting the signatures of the State officers was to show Speaker Reed how general is the feeling of the people of California in favor of the passage of the measure. We would have liked to have had the signature of the Governor, but he is in the Yosemite and could not be reached. The only answer we want from Mr. Reed is for him to say to some member of the California delegation, 'I'll recognize you to-morrow.' We only ask these few words. If the bill should not pass at this session we will make a great effort to have it become a law at the next meeting of Congress; but, meanwhile, thousands of acres of mineral lands may be gobbled up."

## The Assay by Prospectors of Auriferous Ores and Gravels by Means of Amalgamation and the Blowpipe.*

BY WM. H MERRITT.

At the Pittsburg meeting last February Mr. Merritt of Toronto, Canada, discussing the subject named in the caption of this article, said, regarding the fired testing of gold ores, that, after sampling the ore, he treats two pounds. the one-thousandth part of a ton being a convenient quantity to operate upon, passing ore through a forty or sixty-mesh seive, generally the latter; but if it be known that the ore is to be treated in a mill using a screen with the former mesh, then the use of that size will give a fairer test.

We use an ounce of mercury, and I find (as stated by Louis) that the results are better when sodium amalgam is used, as the mercury does not flour so much, and also that a little sodium helps immensely to gather the very fine globules of quicksilver toward the end of the panning. After panning, the mercury is weighed to see if it all has been recovered. If there is a loss, the pulp is repanned, or a pro-rata loss of gold is allowed for. Instead of grinding the pulp after the mercury has been mixed with it, I use a pestle made of soft wood, for I consider that thorough mixing (say for an hour) will give as intimate a contact as is obtained in the stamp mill, and that (as the test is really to determine what we may expect from the mill) this result is no more than we wish for. Fine grinding with the mercury would probably give a higher result. This it may be desired to ascertain by subsequent investigation, but in the first instance we seek the result we may expect from the stamp mill. After panning and getting first the mercury and afterwards the concentrates, and estimating the percentage of concentrates in the ton of ore, we follow a rude method, which is practically useful. In operating upon 2 pounds of pulp, every grain of gold or bullion obtained will represent approximately 2 ounces to the ton of ore (more precisely, 2.08 ounces Troy of gold or bullion in 2000 pounds avoirdupois of ore). An excellent little balance with sliding weight, capable of weighing from 0.1 up to 5 grains, can be bought for $3. As every grain of gold obtained represents practically 2 ounces per ton, it will be seen that a gold ore can be determined running as low in free gold as $3.60 per ton (the bullion being estimated at $18 an ounce) by means of this $3 balance. Indeed, it is quite possible to adjust the weight half-way between two divisions and get a result below $2, as we have done in our testing. Again, in the matter of a retort for retorting the small quantity of mercury, we find that a small sheet of Russia iron can be worked by a tinsmith, for a few cents, into a deep cup-shaped retort, with a smooth rounded bottom and corrugated sides. If necessary, this can be unbent and flattened, should any difficulty be found in getting out the gold, which seldom occurs.

To avoid the fumes, or to save the mercury, a hollowed-out potato answers the purpose of a cover and condenser. The sponge of bullion is preferably taken out of the retort, mixed with lead and fused by blowpipe on charcoal or in a capsule, flux being added for refining after the first fusion. Cupellation is done in a clay pipe. A good idea of the bullion will be obtained by the color of the button, but to be exact it can be parted in the usual manner and both gold and silver estimated. The amalgamation can be done in a miner's pan (kept for that purpose); therefore the whole outfit, balance included, only costs a few dollars, and is within the limit of financial possibility of all prospectors. The cheapness and portability of the outfit is also not objectionable to the mining engineer in the field. We generally content ourselves with testing the concentrates for gold and silver by the blowpipe, I may say, qualitatively, without measuring the bead, going on the principle that any gold bead which is visible to the naked eye, or a fair-sized silver bead, are evidences that the concentrates are worth a more careful assay. Gold ores which we have tested in our prospectors' classes have yielded results from $115 free gold per ton, with $689 concentrates (or $8 in concentrates per ton of ore), down to $3 free gold per ton and nothing in concentrates. One ore was determined down to $1.50 per ton, free gold. Some samples have proved to contain nothing, but we naturally avoid using them for class instruction. A sample of alluvial sand from this province, treated in the manner above described, was proved to carry $2 per ton in free gold. As might be expected, its concentrates carried nothing.

*Cost of Apparatus.*—The *panning* outfit catalogued below, including sufficient supplies of reagents, etc., for any ordinary prospecting trip, will cost about $7.50: Glass-stoppered bottle, containing strong nitric acid. (This can be carried in a "patent lightest-weight liquid-mailing case.") Two gold-pans; one to be used for mercury only. Mercury, about 1 pound. "Travellers' letter and parcel-balance" hand-scale, weighing 0.25 to 12 ounces, for weighing mercury and pulp; cost, 30 cents. Balance, hand-scale with sliding weight, very sensitive, from 0.1 to 5 grains; cost, $3. Small Russia sheet-iron retort, and sheet of Russia iron 1 foot square, (with hole for retort in the center), for supporting the retort. Small porcelain dish or thimble. Iron mortar and pestle; cost, 90 cents. Brass wire 60-mesh sieve; cost, 50 cents. A little sodium carried in naptha, in a wide-mouthed bottle, in a "patent lightest weight liquid-mailing case." Wooden pestle. Sheet or shot-lead (pure, if possible). Borax. Soda. Blowpipe; cost, 25 cents. Bone-ash. Clay pipe for cupelling. Charcoal. Candles.

For *quantitative* determination of value of concentrates by measurement, a sufficient outfit, including the scale, can be obtained for $5, if the prospector makes his own little anvil, pestle and guard and pincers, and gets a small cheap hammer. He will need in addition (included in the $5) only a blowpipe furnace, clay crucibles and capsules, a spirit lamp and some litharge.

For *qualitative* work, a prospector's simple blowpipe outfit might comprise: Knife; magnifying-glass; blowpipe; charcoal; candle; old scissors; pincers; steel anvil, ½ by 1½ by 2 inches; pestle and guard; small hammer; magnet; borax; soda; litharge; bone-ash; clay pipe for cupel; round-headed bolt for making cupels. To which may be added platinum wire, spirit lamp, microcosmic salt, cobalt nitrate, three-cornered file and glass tubing. The total cost need not greatly exceed $1.

Therefore for the entire panning, qualitative and quantitative field outfit for purposes above indicated, the cost need not exceed $14, and with it the prospector, or indeed the mining engineer, can with practice obtain in most cases valuable information in the field concerning the ores of the precious metals.

*Weight of Apparatus.*—The weight of complete outfit, including the panning, qualitative and quantitative outfits (avoiding duplications in above lists) may be about:

| | Pounds. | Ounces. |
|---|---|---|
| Two pans | 3 | 12 |
| Mortar and pestle | 11 | |

*Condensed from the report in the transactions of the Institute of American Mining Engineers.

## Manufacture, Use and Abuse of Dynamite.

H. A. Lee, Commissioner of Mines of the State of Colorado, has the following to say on the above subject:

*The Dangers of Dynamite Manufacture.*—Under the most favorable conditions the manufacture of dynamite is a hazardous business, safety being entirely dependent upon the purity of materials used and the skill and care of the workmen employed. In the manufacture of explosives, as in all lines backed by American ideas and energy, the American product stands pre-eminent. Although the first plant was established in this country only a little over twenty years ago, the art has to-day reached that point of perfection, brought feats of engineering within the range of possibility and exerted an influence upon modern civilization, which entitles it to take rank with the application of steam power.

The aim of the various powder companies is to supply a product which can be transported and handled with safety, which will give uniform results in blasting, keep in good condition when properly stored, and, as far as possible, neutralize all poisonous fumes when exploded. The explosives used almost universally throughout Colorado are compounds having nitro-glycerine for a base, commonly called by the miner "30 per cent powder" or "60 per cent powder," according to percentage of nitro-glycerine in the mixture.

The strength of the American nitro powder is not, as is generally supposed, wholly dependent for force upon the amount of nitro-glycerine present in the mixture. The compound is composed of various elements which in manufacture not only absorb the desired amount of nitro-glycerine, but are in themselves an explosive. In blasting, the exploder or cap, which is charged with fulminate of mercury, explodes the nitro-glycerine and the nitro-glycerine, in turn, the remainder of the mixture. A line of experiments, conducted by experts, shows that the force exerted by this combination exceeds that of the sum of the three exploded separately.

The American dynamite of to-day is not an accident, but is the result of a long line of careful experiments, conducted by eminent chemists, and demonstrated by practical tests. These tests, aided by great advances in the art of manufacturing, have demonstrated that the products can be handled with greater impunity than many other things common to transportation by common carriers. They have also demonstrated that the safety of the compound is dependent upon purity of materials used and care in mixing. During the past few years competition among various powder companies has been so keen and bitter that gradually but steadily the cost of dynamite to the consumer has been reduced. It is a dangerous contest and a rivalry in which, sooner or later, if continued, safety will be sacrificed. To be more explicit upon this point—skilled labor commands a certain price, likewise chemically pure nitro-glycerine, the two being the most expensive parts in the compound of dynamite; combined, the product is a safe mixture. Unskilled labor and impure nitro-glycerine can be had for less money, but the product of this combination is a mixture subject to decomposition. Decomposition in such a compound is practically explosion. Decomposition may not set in for some time, and the great danger of the competition, in the manufacture and sale of dynamite, is that of forcing some of the competitors to use impure or cheaper materials and labor, in order to meet a lower price, and take chances upon decomposition not commencing before the stock thus manufactured is disposed of. This danger point may not as yet have been reached. The older powder companies have much invested and a reputation to maintain; the newer companies have much invested and a reputation to make. From the standpoint of safety, however, the bottom price is very little below the market price of to-day.

*The Storage and Age of Powder.*—Powder should be stored in a dry, cool and well-ventilated magazine built for that purpose. A brick or stone magazine is preferable to a frame, both on account of being affected less by sudden changes in temperature and freed from any danger of bullets from careless marksmen. When built of wood the frame, or studding, should be covered inside and out with boards and so set that the air can circulate all around, and the inner boards be but little affected by the heat of the hot sun.

Caps should not be stored with powder.

Regarding the age of powder—when powder has had proper care in manufacture and storage, decomposition will not set in. If there is no decomposition there is no chemical change, and under these circumstances powder ten years old or older is just as good and safe to handle as powder ten days old.

One of the main sources of accident is from thawing powder, and the only safe plan is the use of heat from hot water. The powder should not be dipped in the water, but placed in a water-tight vessel and the vessel set in hot water, or a regular powder warmer should be made. These vessels can be obtained from any of the mechanical firms or from the powder companies, at nominal cost. Do not place powder under or on a stove, or in the oven. Do not lay on boiler wall or on back plate of a boiler. Do not heat around a blacksmith forge, or over a burning candle. Do not lay on hot sand, or, in short, do not thaw powder with dry heat. Do not consider these precautions unnecessary, or reason that because you have done so many times there is no danger. An explosion is usually fatal, and numberless escapes in no manner reduce the explosive force.

*Freezing Temperatures.*—Powder freezes at from 40° to 44° F., explodes when confined, at from 320° to to 360° F. From a quick application of dry heat, powder is liable to explode at 120° F. A stick of powder heated to 120° F. can be held in the hand with little inconvenience, and this degree of heat is soon reached when placed under or about a stove.

That frozen dynamite is liable to explode from heat quickly applied has been demonstrated many times, and to ignorance, non-appreciation or carelessness of this fact, most accidents are due. If you have heated powder above a stove for years without harm, consider yourself fortunate and stop it. If the warning of those who make the powder has no effect, let the accidents constantly occurring from this cause convince you. If you cannot procure a powder-warmer, take a five-pound lard bucket, fill it with powder, and set in warm water. If you have no warm water, put some sharp rocks in the bottom of a larger vessel to keep smaller vessel off the bottom, surround the inner vessel with water and set two lighted "snuffs" about an inch long under the big can, throw an ore sack over the whole, and in a short time the powder is in good condition for use and no risk has been incurred. With slow heat thus applied, dynamite may be heated to temperature of boiling water with safety. Do not use frozen powder to load a hole. It is unfit for use. If it explodes at all it will do poor work. If it does not seemingly burn or explode, it may be smouldering or decomposing, and the dropping in of a spoon, a drill or the stroke of a pick or hammer may be sufficient to explode what is left.

*Do Not Hurry Back to a Shot.*—Constant care in preparing charge and loading will avoid "missed holes. Next to warming powder with quick, dry heat, "picking out a shot" is the cause of the most fatal accidents. If a hole "misses," do not be in a hurry to return, and especially if the hole was tamped close. More accidents are caused from supposed missed holes than from actual. A small, sharp rock may be tamped into a piece of fuse so that the fire will not pass that point for hours; this is often mistaken for a "missed hole." The hole is picked out, this particular rock removed and an explosion follows. To fully demonstrate this, put some V-shaped clamps on a piece of fuse and see how long it will take to burn by certain points. Long after the fuse is supposed to be out, loosen the clamps and see how quickly it will "spit" at the other end. Some holes do miss fire and have to be picked out. In these great care should be exercised to clean down not nearer than 5 inches from cap, then reload with another charge, and, instead of using a small piece of powder, use plenty. A heavy charge on top may

destroy the effectiveness of the lower charge, but it will explode and get rid of a bad job. If the "collar" of the hole is simply blown off and the lower charge has not broken to bottom of hole, do not drop in a drill or spoon to see "how much hole is left"; leave it alone as long as possible. The lower powder may have frozen and all may not have been consumed.

Caps are charged with fulminate of mercury—one of the most violent explosives and one of the most unstable, chemically—and may explode from the slightest jar or least amount of friction. The caps at all times should be stored well away from the powder and at no time in or round a miner's pocket.

Powder should under no circumstances be stored underground. Poor ventilation with damp air will produce decomposition, and decomposition explosion. There is practically no danger in transporting powder in cases, and especially when frozen. Even well-thawed powder will not explode from any of the jars occasioned by a wagon haul or pack train. A case dropped several hundred feet upon a rock might explode, but separate sticks would simply break out of the wrapper and no explosion follow.

Powder will burn in the open air and not explode, providing the gases generated in the adjoining powder from the heat of combustion have room to escape. For example, place two boxes of powder side by side, open one and ignite, and leave the other box closed. The burning box will not explode, but the heat will explode the closed box.

# Scientific Progress.

IF a couple of hundred coins are placed upon a tray and tossed on the table repeatedly, it is plain that any number of heads from none to 200 may turn up after each throw. If there were no trick in the business, none and 200 would very rarely appear. Most frequently the difference between heads and tails would be more or less even. Now, supposing we were to take a piece of paper ruled into 200 vertical columns, and to write the numbers from nothing to 200 in order along the foot of the columns. Then suppose we sat down and tossed the tray of 200 coins a few thousand times, at each toss counting the number of heads and placing a black mark in the proper column, we should find that the middle columns would soon increase in height, while the lateral columns would increase much more slowly. After a sufficient number of experiments, providing that the tossing was fair, the top of the columns would form a curve, rising regularly from the nothing to the hundred column, and filling regularly up to the two hundred. Such a curve would be nearly what a mathematician like Prof. Pearson would call the normal curve of frequency. Supposing, however, that when the operator was not looking, after each throw some one were to turn around half a dozen or so of the tails to heads, it will readily be understood that the resulting curve would not be symmetrical, but would bulge out on one side of the middle line. A large number of other disturbing causes would alter the curve in a definite fashion.

THE following from the current issue of *Machinery*, will doubtless elicit discussion and dissent: "Mining engineers, although fewer than formerly, have a strong impression, and in some cases a belief, that iron and steel crystallize under vibration. That nothing of the kind does occur is, of course, known to metallurgists, physicists, and those members of the engineering profession who have been favored with opportunities for investigating the causes of failure of material which has been subjected to stresses alternating from tension to compression, or of either kind frequently repeated. Ore stamp stems, piston rods, rock drills, channelling machines, and drop hammers, cam shafts for bolt headers, ore and rock crushers, all break after being in service a short time, their length of life depending on the amount of work they are called upon to perform. The repeated alternation of stress and release seems to exhaust their life at their weakest point, and they break off suddenly with a coarse granular fracture, the appearance of which has given rise to the belief that crystallization has taken place. There is no reason why crystallization should occur, and it is not known that the cause of failure is that the elastic limit of the metal has been repeatedly exceeded in the strain of the metal."

THE new chemistry of high temperatures is likened by Prof. Dewar to the solvent power of water. In its solid state this has little potency as a solvent; in its liquid form it has greater powers of solution than any other liquid, and its solvency is increased by heat. So with minerals and metals. As a solid a metal is relatively inert, but under the enormous heat of the electric furnace, metals heretofore unmanageable combine with minerals or chemical elements forming compounds which heretofore have been mainly hypothetical.

THE Roentgen rays of sunlight should be sought, Prof. Lodge recommends, from the tops of high mountains, because the atmosphere is equivalent to two feet of mercury, and must entirely screen these rays from lower levels. Alpine tourists have often reported an unaccountable fogging of plates. A medical paper reports action of the X-rays on the skin, long experimenting producing an effect resembling sunburn.

THE constituents of helium are being sought by Prof. Ramsey, evidence that it is a mixture being quite strong. The density of the gas from cleveite is 2.2, from samarskite 2.12, from broggerite 2.18, and from fergusonite 2.14; while considerable spectroscopic differences have been observed, and a difference in color is perceptile to the unaided eye.

A NON-POISONOUS MATCH has been devised by a French chemist, potassium, permanganate and amyl acetate being among the inoffensive ingredients. The matches are made easily and without danger, ignite readily, are not liable to explosion when stored in quantity and have an ordor said to be positively agreeable.

# Mechanical Progress.

### Depth of Lake Superior Mines and Mining Costs.

John Birkinbine says:

As illustrating the depths reached by some of the mining operations of Lake Superior, and the relations which the mouth and bottom of various shafts bear to the level of the ocean and that of Lake Superior, it may be stated that in the copper region the work has been carried to a depth of nearly one mile from the surface, and those interested in these exploitations anticipate no unsurmountable difficulties in reaching depths of 10,000 feet. The surface at these mines approximates 650 feet above Lake Superior, or 1250 feet above sea level, but the vertical shafts of the Tamarack, Calumet and Hecla, the slopes of the Quincy and other mines extend far below the water level of Lake Superior and of the ocean, and the Silver Islet workings were carried from a few feet above the lake level to below ocean level.

The iron mines are located from 550 to 1200 feet above lake level; and, although a number have been exploited to or below lake level, but a few have been carried to depths below ocean level. The high temperatures experienced in the Comstock lode and other deep workings in the Western States is not apparent in the Lake Superior mines, which have penetrated the earth for great distances. The increase in temperature is not great, and at 1500 feet the mine water becomes saline, but as greater depths are reached more objectionable characteristics are noticed, the water becoming so acrid as to destroy books and clothing and affect the skin.

In some of the iron ore mines ore is dug from 500 to 700 feet below the surface and delivered on cars for shipment for less than 70 cents per ton. This includes wages of miners, cost of light, explosives, timbering, etc., surface and machinery attendance, repairs and all charges except royalty, general administration and interest on investment. During the business depression which has characterized the past two years, millions of tons of iron ore have been mined in the Lake Superior region, shipped by railroad from fifteen to ninety miles to ore docks, transferred to vessels, and carried from 600 to 1000 miles unloaded and delivered on cars at lower lake ports from $2 to $3 per ton. Although little if any profit (after paying royalties or interest) resulted from these low prices, the possibility of accomplishing the above result is a tribute to the skill in mining, transporting and handling large quantities of ore.

### The Best Ore Mining Record.

The marvelous record made by General Manager Florada at the Lone Jack mine last season, when he stripped and opened this mine and shipped therefrom 400,000 tons of good merchantable ore inside of a space of six months, is without parallel in the annals of iron mining, and probably never will be equalled, and affords an instance of the ease and celerity with which the Mesabi ores can be handled in the early stages of the development of the open pit mine. At the Chandler mine, the finest underground mine in Minnesota, before a like amount was hoisted to the surface, patient and scientific mining work had to be undertaken which extended over a period of nearly eighteen months, aided by costly pumping and hoisting machinery. At the Lone Jack the entire work was performed by three steam shovels and a little powder. However, it is only a question of time when the present steam-shovel mines will all be worked on the underground plan, and at increased cost.—American Manufacturer.

AN important improvement is expected to follow the introduction of 400-foot ore carriers on the great lakes. The immense open holds of these big vessels offer special opportunities for the development of a machine for trimming the ore after it is dumped into the vessel from above-pockets in shipping docks at the upper lake ports. The labor cost of about 3 cents a ton which is paid for trimming is an important item, and then, too, there has been more or less trouble of late with this kind of labor. At least two of the shipbuilding companies are trying to work out the details of a machine for trimming ore, to be located permanently in the vessel's hold, and it is quite probable that such a machine will be ready for use before the coming season is at an end.—Marine Review.

A NEW cage for incline shafts is in successful operation at the Original mine and is attracting considerable attention among those interested in mining machinery. The cage is protected on three sides by steel plates so that there is absolutely no danger of the men on it being jammed against the wall plates. It is considered a great improvement over the skip, much safer, has more carrying capacity, is lighter and it is claimed can be constructed and operated at less expense than the skip.—Butte Miner.

THE report of the Chicago City Railway Co. (see *Street Railway Review*, Feb. 15, '96, p. 807) shows cost of operating per car mile as follows:

| | 1894. | 1895. |
|---|---|---|
| Cable lines | $0 09972 | $0 10240 |
| Electric lines | 0 16904 | 0 14776 |

Report of North Chicago Street Railway Co. for 1895 (see same):

| | Earnings. | Expense. | Expense to Earnings. |
|---|---|---|---|
| Cable lines | $1,632,797 | $651,942 | 40 per cent |
| Electric lines | 670,284 | 303,136 | 45 per cent |

# Electrical Progress.

### An Electric Mine Plant at Silverton, Colorado.

A few months ago in these columns was described the power-transmission plant installed at the Silver Lake mines of E. G. Stoiber at Silverton, Colo., which has resulted in economy so noticeable that an increase in the plant is now being made, to provide for an extension of the system in the mines and to reinforce the water power, which is not sufficient to furnish all the power required throughout the year. Two cross-compound Corliss engines, with cylinders 24x46x48 inches, each engine of 850 I. H. P., are now being set up, together with water-tube boilers, mechanical stokers, coal and ash conveyors, feed-water heaters, separators, water meter, coal weighers—the whole making what will be the most thoroughly modern steam plant in the State. The difference between the cost of coal at the power house and its cost at the mine, which is at greater elevation by some 2500 feet, is such that the saving effected, even when steam power is used for generating purposes, will insure an ample return on the investment, while the economy induced by the use of the water power is considerably greater. Mr. Stoiber, therefore, feels that in adopting electricity for the operation of his mines he has more than considerably diminished the cost of working them. The additional plant will consist of two 150 K. W. general electric generators, one 100 H. P. motor for the mill, one 15 H. P. motor to drive a pump and two 10 H. P. for blowers, forges and miscellaneous machinery, and to eventually utilize to the full the capacity of the steam and water power plants additional and larger generators will be set up. Although the entire output of electrical energy is to be used in the operation of a single mining property, it will be when completed the largest electric power plant in the State of Colorado.

THE '96 model alternating current fan motor of the General Electric Company, herewith illustrated, is a new device embodying many improvements dictated by careful observation of the performances of the fan motors of previous years. Of these improvements, perhaps, the most important is the universality of direction which can be given to the draft caused by the revolving blades, the motor field frame being provided with trunnions resting on a yoke, the current of air may be directed at almost any angle in a vertical plane. While the yoke is so set in the base that the motor may be moved through a complete circle horizontally and the current be directed toward any point as desired, the yoke may also be removed from the base and inserted in a wall bracket. The design of the motor is both simple and ingenious. The field is a ring built up of thin iron punchings, with inwardly projecting teeth carrying the field wiring. The armature is a cylinder of iron laminations, with small bare copper rods running through the

iron and terminating in copper discs fastened at the end of the core. There are neither brushes nor commutators, and this small fan motor embodies principles similar to those involved in the large General Electric induction motors. To reduce the friction of the starting and running current, the fan is provided with smooth-running bearings, with hardened steel cones and balls. The complete device is artistic in design and handsomely finished. The diameter of the fan is twelve inches and the speed 1800 revolutions per minute.

# Practical Information.

### Mining Case Decided.

Eicke et al., plaintiffs, vs. Reed et al., defendants.

This action is brought by the plaintiffs under the mistaken belief that a laborer is entitled to a lien upon a mining claim for labor performed therein at the instance of a lessee after the owner of the mine has posted in a conspicuous place thereon a notice that he will not be responsible for such labor.

The attorney for plaintiff admits that such a notice is operative as to all new employments entered into after the notice was posted but insists that it does not apply in a case where the labor was commenced, say a month before the notice was posted.

But it was held in the case of Calenberg vs. Hamilton on the authority of a decision by Chief Justice Beatty that an employment from month to month as long as mutually agreeable is in effect a new employment for each separate month and that the conditions at the beginning of any new month are to operate as to the rights of the parties for that month. It follows that the lien is not operative after the end of the month within which it is posted and that the court has no authority to allow a lien for a longer period.

I find by inquiry that this is the rule followed in the neighboring mining counties of Amador, El Dorado, Nevada, Sierra and others and is undoubtedly correct.

The end and aim of the law should be in all cases, actual and abstract, justice, and this is usually obtained by the construction above suggested. It is perhaps true that sometimes it works a hardship on one side or the other; but this is an infirmity growing out of the weakness of human statutes.

The fairest course is the best in this as in all other relations in life, and this course is best attained by rigidly holding the mine for the debts created against it, unless the mine owner by public notice gives warning that the mine is not liable.

But whether it is the best course or not, it is clearly the law and the court has no choice but to follow it.

Let findings be prepared awarding the plaintiff Eicke a lien in accordance with the views above expressed and awarding to the other plaintiffs money judgments for their claims.

J. E. PREWETT, Judge.

—Placer Herald.

A TREE is a composite being, a kind of community by itself. The leaves and limbs are all the time striving with each other to see which shall have the most room and the most sunshine. Each strives for all he can get. While some perish in the attempt, or meet with only very indifferent success, the strongest of the strongest buds survive. Each leaf helps to sustain the limb which carries it, and each limb furnishes some nourishment to the common trunk for the common welfare. The tax is always adjusted according to the ability of each to contribute. As the limbs of a tree are constantly striving for the mastery, so each bush and tree in grove or forest is striving with others for the mastery. The weakest succumb to the strongest; some perish early, some lead a feeble existence for many years, while even the strongest are more or less injured. With plenty of room the trunk will be short, the branches many and widespread; where crowded, the lower limbs perish for want of light. Dead limbs fall to the ground to protect and enrich it for nourishing the surviving limbs and trunk. The scars heal over, more limbs perish as new ones creep upward, and thus we find tall, clean trunks in a dense forest.

MR. MINER wants to know how the contents of logs are computed according to Doyle's rule. Here it is: From the diameter in inches subtract four. Square one-fourth of the remainder and multiply the product by the length in feet. Thus: take a log 24 inches diameter, 12 feet long; 24—4=20; ¼ of 20=5; 5×5=25, which, multiplied by 12 (the length in feet), equals 300 feet. Another way to obtain the same results, and by some considered a much simpler method, is as follows: From the diameter in inches deduct four. Square the remainder. This gives the contents of a 12-foot log. Then increase or diminish in proportion for other lengths. Thus, for 18 feet add one-eighth; for 20 feet add one-fourth of itself. For a 14-foot log subtract one-eighth; for 12-foot one-fourth of itself. For example, take a log 24 inches in diameter, 12 feet long, as in the foregoing illustration; 24—4=20, and 20×20=400; one-fourth of 400=100, and 400—100=300—the same result as the other. The first method is Doyle's rule, but both will work the same as to results. — Corwin in the Wood Worker.

MICROSCOPIC investigation has proved that the pores of wood invite the passage of moisture in the direction of the timber's growth, but repel it in the opposite direction. This accounts for the phenomenon which has so often been noticed, and which puzzles a great many people, namely, why two pieces of timber sawn from the same section of a tree sometimes appear to possess very variable degrees of durability. If the wood, say of a gate post is placed right end up the moisture in the soil will affect it, but the rain falling on the top will do little harm; if, on the other hand, the butt end of a tree is put uppermost, the top of the post will decay, because the moisture of the atmosphere will penetrate the pores of the wood more rapidly in this position. Many people have noticed that the staves in a wooden tub appear to absorb moisture irregularly, some getting quite sodden while others are comparatively dry and almost impervious to moisture. In this case the dry staves are in the position in which the tree grew, while the saturated ones are reversed.

THE largest blast ever made on the Marquette, Mich., iron range was fired recently in the Winthrop open pit. The amount of ore brought down from the east side of the pit is estimated at from 10,000 to 13,000 tons. Previous to the blast proper 300 pounds of giant powder were exploded to loosen the ground. This did its work splendidly. Some of the cracks in the ore were two inches in width, while there were many smaller ones. Immediately back of the larger crack, about 40 feet from the end of the hanging, a large hole, 35 feet in depth, had been drilled. Over half a ton of black powder was put into this hole. When the blast went off the ore ahead and 40 feet on either side the hole tumbled over into the huge pit. The Winthrop open pit is a mammoth affair. It is about 150 feet in depth and is over 500 feet long by 400 feet wide. The entire east side is in solid ore, as is also a portion of the south side. The bottom is also in ore, and the deposit can only be conjectured.

THE authorities in Colorado have been examining the forest regions of the State to determine to what extent they hold back the snow from melting in the spring. It is found that the forests retard the melting of the snows, and so cause the waters to flow down gradually over a much longer period of time than is the case where the trees are cut away. They thus have a tendency to prevent floods in the spring and droughts in the summer. Some time we of California will awake to a realization of the fact.

## Notes of Travel.

NUMBER I.

By Our Traveling Correspondent.

Ione, Amador county, was the first place of importance reached in the mining districts after leaving Stockton. It has 900 inhabitants. It is not a mining town, although some fine prospects exist near by. The coal and iron mine, known as "No. 3," is three miles northwest. The Preston School of Industry, one mile from Ione, on the Plymouth road, is superintended by E. C. Bank, and has the most efficient corps of officers, teachers and servants I ever met in any similar institution. Over 200 (supposed) criminal youths are (I won't say confined) retained here, without a weapon, whip, or even a strong lock, by a staff of about thirty-four teachers and servants.

Drytown has increased but slightly since the census year. The interest, however, in prospective mining has increased perceptibly. The Phœnix Reduction Works of Barney & Voorheis, located at this place, are running to their full capacity. The La Jolla gold quartz mine, within the limits of Drytown, is owned and superintended by John M. Wilson, who will soon be working a full force. The Loyal Lead mine, quoted as being located near Plymouth, is one mile east of Drytown. The Pocahontas mine is about three-quarters of a mile east of Drytown, on the mother lode, and shows considerable promise. It is owned by A. McWayne et al. The character of this location is gold bearing quartz and sulphurets. Sufficient prospecting has been done upon this mine to warrant an outlay for deeper development. It is patented. All of the working mines in and around Amador City and Sutter Creek, including the mills and chlorination works, are running full forces of men. The Keystone at Amador City has 110 men on the payroll. John R. Tregloan, superintendent of several mines at this place, has introduced a complete telephone service throughout one of the mines under his management, so that from his office or residence he can communicate with every level in his mine, and any portion of his mill or works—the first of record, so far as I know, of a telephone service underground throughout a mine.

Jackson, the county seat of Amador county, shows improvement in many ways since my last visit. The larger corporations, such as the Kennedy Mill & Mining Co. and the Zeile Mining Co., are running full forces of men; but anything like detailed information from these companies is out of the question. It is self-evident, however, that the output of ore both in quantity and quality from these mines is satisfying their managers.

Union Consolidated Gold Mining Company, originally called the Clinton Consolidated, is seven miles from Jackson in the direction of Volcano. Benjamin Bibo is the resident superintendent. Their improvements consist of extensive hoisting works, run by both steam and water power; a head of 280 feet for their water power gives them ample force for their hoisting works over their principal shaft, down 330 feet. They are working thirty-five men; expect to have sixty men at work by July 1st, when their new thirty-stamp mill will be in operation. The property of this corporation consists of 800 acres, covered by U. S. patent. They have good machinery for operating their mine, which from all appearances will prove a paying property. Besides the main shaft they are running a tunnel, which will be, when completed, 1500 feet in length; now within 100 feet of the shaft. This tunnel taps the mine at the 200-foot level; another tunnel has been started to reach still lower levels. I am informed by the superintendent that the rock thus far extracted prospects from $13 to $53 per ton.

West Point, Calaveras county, has more apparent activity in a mining way at the present writing than any village of 800 inhabitants in the State. A telephone and telegraph company has just been organized, to be in operation within sixty days. Some of the working mines are: The Machu Gold Mine & Mining Company of Denver, Col., located adjoining the town of West Point; A. B. Twombly of New York is president; H. Collbran, president of the Midland Railroad, is vice-president; L. R. Ford of Denver, Col., is secretary; John T. Grayson, Stanford, Conn., and A. T. Rowe of Denver constitute the directors, J. M. Martin of Salt Lake City is the general manager and S. T. Godbe mining engineer. The capital stock of this corporation is $1,000,000. This property consists of 180 acres of mining ground covered by U. S. patent. In addition, they have lately acquired by purchase of what is known as the Smith property adjoining, for which they paid $13,000; this will give the company about 4500 feet on the lode. The trend or dip of the ore chutes are to the southwest; general strike of the fissure north and south, in a granite formation, varying from 50 to 100 feet wide; the ore chutes occurring at intervals of from 100 to 200 feet apart. Through a shaft down 160 feet on the lead they have developed an ore body that averages 20 feet in thickness, as far as penetrated, that will mill some $5 per ton. The superintendent informs me that the whole formation for 100 feet wide has been so completely impregnated with the gold solution that at least $4 per ton can be extracted from the whole mass. Working thirty men; extracting about ten tons of ore per day, simply developing work coming out of their shaft. The improvements consist of 60 feet of shaft on the lead; double cylinder hoist, 60-horse steam power. A gallows spring 65 feet high has been erected in anticipation of putting up a rock-breaker. A 20-stamp mill is to be erected on this plant within sixty days. The rock, I am informed, averages $15 per ton; sulphurets run up to $260 per ton.

The Blazing Star mine is located 1½ miles southeast of West Point. It is owned and managed by W. E. Foster. The owner has applied for a U. S. patent for an area of 600 feet by 1200 feet; he has also obtained by purchase parts of two other claims adjoining. The ore body of the mine runs north and south and pitches west; granite is the formation; the ore body averages 4 feet wide; it is of a rebellious character; the ore is assorted and the refractory part sent to Selby & Co. at Vallejo Junction for treatment. Of the free milling ore that they assort, Mr. Foster informs me, will pay from $20 to $40 per ton, and is crushed by a 5-stamp mill on the plant. The portion sent to Selby & Co. pays from $100 to $350 per ton.

The Soap Root mine, located one mile east of West Point, is owned by parties residing in San Francisco; Captain J. W. Summerville is superintendent. At present twenty men are employed. This mine has a steam hoist; shaft down one hundred feet. They have a ledge of blue granite formation, about four feet wide. It runs north and south, pitches west, but now nearly vertical. The ore of this mine is of a rebellious character, which they have reduced at the Scorpion Chlorination Works adjoining their mine. The Scorpion mine was idle when I visited it, but it will be started up early in June. The Soap Root only recently started up; they have about twenty tons of ore on the dump, said to assay $250 per ton. Rumor has it that this will prove to be a good paying property. Other mines working a few men each are:

Hurley gold mine employing twelve men.

St. Louis mine, working three men; they have developed a ledge four feet thick that prospects from $5 to $10 per ton.

Lone Star gold mine, character gold quartz, is located two and one-half miles northwest of West Point; owned by the Hurley Mining Co., M. Hurley, president and superintendent; residence Palace Hotel, San Francisco; have four men at work.

Lockwood Gold Mining Co., located near West Point, have two men at work. They will soon start up with a full force under the supervision of an English syndicate; said to be a good property. There are at least a dozen other prospective mines in this district that I did not visit.

The North Star mine, located in Happy Valley, one mile east of Mokelumne Hill, on West Point road, is a curio, both in character and the method of working it. It is a cement gravel mine. It has been worked in various ways in the past, by hydraulic, sluice, rocker and by slacking in the sun and then washing. But all this has changed. Now it has a 10-stamp mill to crush the cement gravel formation. This property was formerly operated by the Crescent Mill and Mining Company, H. B. Harvey president, and for some eight months development work only was performed under the superintendency of W. W. Cook. This mine with all its equipments was recently purchased by Mr. P. L. Shuman, of Chicago, who is at present managing its affairs. This property consists of 110 acres of mining ground, covered by a U. S. patent. The mine has connected with it 3,500 feet of bed-rock flume, six air shafts from 61 to 235 feet deep; also, two tunnels, one in 620 feet, the other 530 feet, opening up two channels, one 61 feet above the other and all in gold-bearing gravel. Water is taken from the Mokelumne ditch with a fall of 210 feet. Fully 30 inches of water is obtainable here the year round. This force of water runs the mill of 10 stamps, the hoist and air compressor, and gives them free water for the mill and power for draining the mine. The drainage is accomplished by a siphon-shaped pipe, so placed that after descending to a sump in the lowest part of the mine it is turned upward and lifts all the seepage some 12 feet and passes it out into the flume in the tunnel without apparent cost or trouble. There are 15 men employed at this writing, but this force will be increased to 30 men, when Mr. Shuman said he will be able to dispose of about 100 tons of gravel daily. The gravel averages about $4 per cubic yard, of 3,000 pounds. His mill has been overhauled and rebuilt, a new ore bin of 100 tons capacity has been placed in position, hoist and elevator for cars, where the gravel is dumped on the grizzly. Hendy ore feeders and silver plates have been added. A new blacksmith shop is in course of construction, also an air compressor and power drills are to be placed in position within 30 days. Altogether this will be, when completed, the best equipped gravel mine in this (Calaveras) county. The cost of extracting and reducing the material is reduced to the lowest possible figure. Mr. Shuman is in charge personally, and W. W. Cook is acting in the capacity of superintendent. This mine is not for sale; the foregoing points are given publicity to answer the inquries of Mr. Shuman's friends.

More next week from Mokelumne Hill, San Andreas and Angels. L. P. Mc.

## Recent California Mining Incorporations.

Woodsides' Con. G. M. Co.; capital stock, $400,000; $204,000 subscribed. S. J. Bakke, Belfast, Ireland; J. C. Jens, T. Frouch, A. Woodside, G. Gall, W. J. Woodside, J. M. Porter, H. E. Zimmerman, O. Seipert.

Bankers' Group Gold Mines; capital stock, $1,000,000; $2500 subscribed. W. McCracken, J. M. Logan, H. Z. Burkhart, B. R. Keith, P. T. M. Wate.

Florence G. M. Co., Amador; capital stock, $200,000; subscribed $100.000. C. H. Morey, J. W. Freidman, J. O. Yardley, C. E. Williams, Stockton, and J. Isaacs, San Francisco.

Colorado Development Company, San Francisco; capital stock, $100,000; subscribed, $90,000. G. Stone, P. Tautphaus, A. Gerberding, S. K. Thornton, T. J. Parsons, C. Stepp, F. Boeckmann.

Saulsby Con. G. M. Co., San Francisco; capital stock $875,000; subscribed $250. E. W. Hebbard, C. Hebbard, A. Lundberg, M. C. Hebbard.

California Bar M. Co., Oakland; capital stock $50,000; subscribed $50. E. Price, W. P. Prindle, G. P. and W. R. Berry, Oakland, G. E. Price, San Francisco.

## Coast Industrial Notes.

—Coalinga, Fresno county, has begun shipping oil.

—The State's rock-crushing plant at Folsom will be formally opened to-day.

—Electric power brought thirty miles from the San Joaquin river prints the Fresno *Republican*.

—F. Weitman of this city has a contract to cover the roof of the Guatamalan capital with aluminum.

—Mendocino county tan bark has fallen in price from $15.50 to $14 per cord, delivered at San Francisco.

—Rapid progress is making in the construction of the railroad from Corral Hollow, Alameda county, to Stockton.

—San Francisco merchants propose to sell Japan some goods and will establish an agent in Yokohama for that purpose.

—An electric road to cost $175,000 is projected from Redlands to the top of San Bernardino range north of that town.

—The Travertine Company, Bridgeport, Mono Co., has shipped machinery for the quarry. The company has on hand several large orders.

—Shipments of lumber from Coos bay, Or., during 1895 footed up 29,853,983 feet of lumber and 3,162,900 lath, against 22,535,694 feet of lumber and 3,028,700 lath during 1894.

—Telephone lines are reaching out from the bay to every part of the State. Amador and Calaveras are now covered with several lines, and as far north as Trinity the long distance service is available.

—The Japanese Steamship Company, with a line of steamers from Yokohama to Honolulu, have chosen Portland, Or., as their American port. They will there connect with the coast steamship lines for this city.

—The United States Minister to Corea reports that a concession to build, operate and maintain a railroad between Seoul, the capital, and Chemulpo, its seaport, has been granted to an American syndicate.

—The United States Consul in Honduras reports that the Congress of Honduras has passed an act granting to New York capitalists a concession for building an interoceanic railroad from Puerto Cortes to Amapala.

—Ladue & Harper of Sixty-Mile, Alaska, will put in a sawmill at Circle City, also an electric light plant. Lumber at Circle City, which is within the Arctic Circle, is worth $100 for rough and $130 per 1000 feet for dressed.

—The Senate committee on the Nicaragua canal last Wednesday authorized the chairman, Senator Morgan, to report favorably a bill similar to that which has been reported in the House for the construction of the Nicaragua canal.

—Youngren & Walker have located a water right on the Tuolumne river near Sonora, and are credited with intention to build a canal and generate electricity for light and power for the Blue Gulch, Mammoth, Eagle and other mines in that vicinity.

—W. A. Nygh, agent for London capitalists, has bought the property of the Spilman Suburban Water Works at Los Angeles for $225,000. To complete the project will take nearly $2,000,000 more, and includes an 1100-foot tunnel below the bed of the Los Angeles river.

—Los Angeles reports an advance in the price of oil from $1.15 to $1.25 f. o. b. a barrel. There has been an increased consumption since January. The Southern California Railroad and other large consumers are using more than formerly. Twenty new wells are being bored.

—The flax crop at Hollister, San Benito Co., is valued at $30,000—the product of 1400 acres. Oakland men want a grant of five acres upon which to erect buildings and prepare the flax for market. The company will contract for the cutting and cleaning of each man's crop and give $2.50 a ton for the straw.

—There will be a decrease in the production of hops in Washington and Oregon this year. Over-production has brought the price down to an unprofitable figure, and in the last year insect pests have caused great loss to the growers. A great many hop fields in various parts of the two States have been plowed up.

—The House Committee on Commerce has reported favorably on a bill looking to the construction of a cable from San Francisco to Japan via Honolulu. The estimated cost is $7,500,000, a subsidy of $100,000 for eighty years to be paid by the government. The Pacific Cable Company, capital stock $10,000,000, is behind the enterprise.

—The Utah & California road attracts renewed attention, the idea being to push on from Milford, Utah, through Lincoln county, Nev., close to Las Vegas, cross the Atlantic & Pacific near Ludlow, cross the Southern Pacific at Banning, go through the San Bernardino range via the Morongo pass and thence to Los Angeles.

—Lieut. Miley has mounted a fifty-ton rifle at Fort Winfield Scott in this harbor, the second modern rifle to be added to the heavy artillery on this coast. The gun has a bore of twelve inches, shoots a projectile weighing 1000 pounds and requires a charge of 450 pounds of powder at each shot. The estimated "life" of the gun is one hundred shots.

—The Skamokawa, Wash., mill is turning out the largest timber ever cut at any mill on the Columbia river, cargo of the schooner Louis, consigned to parties in Shanghai, China. The list includes one stick 111 feet long, 24x24 inches, and there are eight 100-foot timbers that square from 24x24 to 18x18 inches. There are also a number of heavy timbers running from 70 to 90 feet in length. She also carries four spars 100 feet long, 24 inches through the center. The bark Big Bonanza, also loading for Shanghai, will take about the same number of heavy timbers as the Louis.

—H. R. Robertson, whose timber raft was illustrated and described in this paper last August, is building another cigar-shaped lumber raft at Stella, Wash., on the lower Columbia, which will contain 300 M feet, exclusive of 300 ships' spars 100 feet long and from 18 to 32 inches in diameter. He expects to have his raft ready for towing to this city on the 15th prox.

—The California State Pharmaceutical Society has decided to establish a laboratory in San Francisco for the manufacture of many medicines that they now purchase in the East. Large Eastern firms sell to California druggists prepared articles, such as liniments, cough mixtures, etc., to the value of several hundreds of thousands of dollars annually. It is stated that the formula of the different patented medicines are well known to all druggists, and can be as easily and as perfectly made here as elsewhere and at one-half the cost.

## Personal.

CAPT. A. H. WARD, of Pinon Blanco, Mariposa Co., is at Alameda.

I. T. PETERSON has been appointed State mine inspector of Idaho.

COL. GRAYSON, of New York, is in Calaveras Co., with a view to mining investments.

J. H. TIBBITTS is reported to be on his way back from Matabeleland, South Africa.

E. B. HENDRIE, pres't Hendrie & Bolthoff Mfg. Co. of Denver, Col., is visiting San Francisco.

CAPT. THOS. COUCH, who is now in Europe, expects to return to Mariposa county about September 15th.

ALEX. HILL, general manager Mountain Mines Co., Ltd., Keswick, Shasta Co., has returned from Butte, Montana.

PRINCE CHILKOVE, Russian Minister of Ways and Communications, will visit San Francisco next August.

A CABLEGRAM from Pretoria says the leaders of the Johannesburg Reform Committee, including John Hays Hammond, "will be released in a few days."

MRS. JOHN HAYS HAMMOND is very ill and her attending physicians have abandoned all hope of her recovery. Her condition is due almost entirely to anxiety and suspense incident to her husband's imprisonment.

A LETTER received at Prescott, Arizona, from South Africa confirms the telegraphic news of the killing of H. N. Palmer and W. H. Johnson near Buluwayo. They were on the way to the mines thirty miles from Buluwayo, when the party was attacked and massacred. Palmer went to South Africa at Hammond's request to take charge of mines for Cecil Rhodes near Buluwayo.

## Commercial Paragraphs.

A ROPP straight-line furnace is to be erected at the Hanauer, Utah, smelter.

THE Fulton Engineering & Ship Building Works is sending machinery for the new Hawaiian steamer Jas. McGee.

IN addition to a good local and coast business, the Denver Fire Clay Company of Denver, Col., report an increased export trade with British Columbia and Mexico.

KNIGHT & Co., of Sutter Creek, are building a 100-horse water power plant for Indian Diggins. This week they shipped a 50 H. P. wheel for an electric light plant at Fort Jones and a 100 H. P. air compressor for the Shawmut mine, Chinese Camp, Tuolumne county.

THE Colorado Iron Works Company of Denver are making one carload of steel jackets for the new copper furnaces of the Guggenheim Smelting Company at Aguas Calientas, Mexico. They have also recently made and shipped two silver-lead furnaces for the same company.

JOSEPH J. PAYNE, inventor of the Payne gold saving riffle, made a public test of his riffle plates recently at Denver, Col., on Cherry creek at the Broadway bridge. The cleanup showed forty cents per cubic yard and it is stated not a color could be found in the tailings.

MANAGER GRAHAM of the Vulcan Iron Works is fast getting matters in shape for increased activity. Since the recent disastrous fire he has occupied the N. W. corner 1st & Mission as business headquarters. The company has just issued Catalogue "B," a handsomely illustrated description of the Vulcan Ropeway, a detailed account of its operation at Empire, Nevada, recently appearing in this paper. The matter in the catalogue is all new. It will be sent to any address upon request.

THE Pelton Water Wheel Co. has been awarded the contract for the hydraulic work of the new power station of the Central California Electric Co., located near Newcastle, Placer county. The plant consists of two pair of 48-inch Pelton wheels mounted on a cast iron base and direct connected to Westinghouse generators, the wheels having a capacity of 1200 H. P. running under 420 feet head at 400 revolutions. The power thus produced is to be transmitted to Sacramento, a distance of twenty-eight miles, and used for light and general power purposes. This company has large water resources and proposes later on to greatly increase the present plant. It has already a station with which it is supplying Penryn, Rocklin and other surrounding towns with light.

AT the Risdon Iron Works, Howard & Beale streets, this city, T. J. Barbour is superintending the construction of what will be the largest mining hoist of that character in the country. It is understood to be for the Anaconda, Montana, Co.; there are two 30x72 hoisting engines, direct acting Corliss, and will handle a load of twenty tons from a depth of 4,000 feet at an average speed of forty-seven feet per second. The cage is a 4-deck affair. The whole hoist will weigh 275 tons; the shaft is eighteen inches diameter and twenty-seven and a half feet long; seven double cylinder engines will operate the hoist. The whole thing will be ready for shipment about August 1st. The Risdon Iron Works is also building a 20-drill cross-compound Corliss compressor with the new Risdon ring inlet valves for the Boston & Montana Co., who will use it at the Leonard shaft at Butte, Montana. The Risdon Iron Works is also building two new furnaces for the Mountain Mines Co., at Keswick, Shasta Co.

DOUBLE PIPE AIR COMPRESSOR.

This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to us at 306 Pine St., San Francisco, Cal. We could save you money though in cost of foundations, as our Compressors are half the size of other makes.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will have inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S. F.

# Mining Summary.

## CALIFORNIA.

### Amador.

*Record*: The Good Hope mine is operating on a small scale, three or four men being employed, working one shift per day.

*Record*: The Bellwether Gold Mining Company, principal place of business Des Moines, Iowa, capital $1,000,000, in one million shares at $1 each, proposes to operate near Jackson. The limit of indebtedness is placed at $600,000, and the articles provide that the private property of stockholders shall be exempt from liability for corporate debts. The term of existence is 20 years. The amount of capital actually subscribed is not given. It is reported that active operations are to commence next month. George Adams, the superintendent, and Mr. Knapp have arrived to start operations.

The Red Hill Mining and Milling Company has incorporated; principal place of business, Jackson; term, 50 years; amount of capital stock, $500,000; C. B. Zeek, 20,050 shares; E. V. Zumbiel, 1500 shares; M. S. Matson, 10,000 shares; C. E. Brown, 5000 shares; E. Ginnocchio, 50 shares. The intention is to develop the mining claims formerly owned by M. S. Matson and others near Butte basin.

### Butte.

A vertical shaft is being sunk at the old Miocene mine. Work is resumed at the Pershbacker and at the Princess, near Marysville. The Cascade Mining Co. has incorporated at Chico to work a claim on Butte creek, near the Savercool mine.

The Denver mine, near Enterprise, has twenty men at work. Work has been resumed on the Golden Queen mine at Forbestown.

### Calaveras.

At the Gwin mine they have struck the foot of the old drift, and have 300 tons of milling ore on the dump. They are also taking out old iron pipe, old picks and rotten wood. A survey has been made for a 40-stamp mill just below the present shaft. There is considerable free gold to be seen in the quartz. The ledge is thought to be from 15 to 20 feet wide; 12 to 14 feet has been opened up east and west with neither foot nor hanging wall as yet. The president, Mr. Belshaw, and superintendent, F. F. Thomas, are elated over the outlook of the Gwin mine being restored ere long to its bonanza times.

### El Dorado.

Placerville, Cal., June 3, '96.

(Special Correspondence).— The Reservoir Gold Mining Co., are reopening old tunnels and running new drifts two and a half miles northeast of town. A 10-stamp mill is in course of construction. This is a gravel property, worked under bond by J. W. Knowlton of Bridgeport, Conn., and W. C. Root of Idaho.

The Blanchard Mining Co., four miles south of town are placing a 20-horse power engine and a 60-horse power boiler, and preparing to erect a 10-stamp mill.

The Kipp brothers are said to have discovered a good ledge on the extension of the Boulder mine sixteen miles southwest of Placerville.

An option on the Newton Mining and Milling Company's property four miles east of town has been given to D. H. Jackson. This is both a gravel and quartz mine; it has a 10-stamp mill. Drifting and tunnel work is in active operation.

M. Starbuck is operating a gravel plant in Green Valley district twenty miles west of here with good success.

In the new tunnel being run on the Blue Gouge by Mackey, Head and Flood, another good ledge was struck yesterday. The ore assays an average of $8 in free gold. The ledge is not yet cut and it is not known how large it will prove. This is the sixth in the series of ledges cut by the new tunnel.

The International Gold Syndicate, Limited, of London has secured a lease and option of purchase from J. J. Crawford of the Richmond mine fifteen miles south of Placerville on the east vein of the mother lode. It has a 15-stamp mill. A shaft already begun will be carried to a depth of 600 feet; new hoist, rock breaker and concentrators will be added at once. The syndicate will expend $50,000 in prospecting this property.

Work on the copper plant recently bonded by A. E. Head and Jos. Clark, is progressing rapidly. The old 160-foot tunnel has been put in working order and will be crowded forward.

Considerable prospecting and some development work is being done in the Grizzly Flats section. This portion of the county twenty-five miles east is regaining its old time popularity for rich quartz lodes.

About Greenwood and the Taylor mine sections properties are receiving continued attention. These are in the vicinity of Georgetown, sixteen miles north of Placerville and reached by good wagon roads and excellent stage service.

The Grand Victory people six miles south have made new discoveries of ore bodies in their sinking and crosscutting from the 100-foot level.

### Kern.

Miners at Piute Mountain, in the eastern part of the county, report a 34-foot ledge of gold-bearing quartz near the Bright Star mine, which it is said will average $25 per ton. It is twenty-five miles from Caliente.

### Mariposa.

Coulterville, June 3, '96.

(Special Correspondence).—William Johns, the general manager of the Sierra Buttes Company, Limited, has just been visiting the Tendron mine at Whitlocks, six miles from Mariposa. The mine, which is under the superintendency of A. G. Briggs, is worked economically and well. Twenty head of stamps are constantly running, but the expense of steam power is excessive, and, as timber is disappearing, it is on the increase. Steps are likely to be taken for the introduction of electrical power from the Merced river, only a few miles distant. Sinking is going on steadily at the Tendron; but until cheaper power is available, the position of the mine can scarcely be regarded as satisfactory.

Curiosity has been aroused by a paragraph in the MINING AND SCIENTIFIC PRESS stating that Whitelaw Reid, son-in-law of D. O. Mills, and proprietor of the New York *Tribune*, had purchased a controlling interest in a mine three miles from Coulterville. The Virginia mine, now operated by Prof. Clarence King and Paul Blackmar, is just that distance away, but Mr. Blackmar stated a few days ago that he knew nothing of the transaction. Prof. King was instrumental as an expert in introducing Whitelaw Reid to the Washington coal property, in which he is so largely interested, and it is possible that he may have induced Mr. Reid to turn his attention to this section of the mother lode. At any rate, Prof. King is now in New York and Paul Blackmar left Merced to join him in the end of last week.

At the Virginia mine work is going on rapidly and everything on the surface is in ship-shape order. The old shaft and tunnel are being cleaned out and retimbered—a work of great difficulty from the nature of the ground. Until the tunnel and shaft are opened out there will be nothing of interest to report.

Recent discussions of the Merced Gold Mining Company and its affairs, which have been receiving considerable newspaper attention, have not affected the actual work that is going on at the properties themselves. The 40-stamp mill is running night and day. The ore being crushed appears to be mostly samples taken in 100-ton parcels from different levels of the company's various mines.

A. Wartenweiler, the managing owner, is at present visiting his Red Banks property, eight miles distant on the north bank of the Merced river. Mr. Wartenweiler has cut down his working force at the Red Banks to as few men as possible until the snow water runs out of the Merced river. As soon as the river reaches its fall level, a dam will be constructed in the same place where an attempt was made last summer. At that time a very unexpected cloudburst in the Yosemite valley brought down the Merced river and carried away a dam there in course of construction.

The Tyro with its 10-stamp mill is working full time. Jos. Buttgenbach, the president of the San Francisco Gold Mining Company, which owns it, is now visiting the property and expresses himself as well pleased.

Chas. E. Stuart of Piqua, Ohio, has returned to Hornitos and is starting up the Dorse (or Brooks) mine on a considerable scale. Mr. Stuart, who held a bond over it, has had a force of men working with Burleigh drills on this property for some time past. He is apparently satisfied with the prospecting he has done.

Some interest has been shown during the week in a prospecting claim about two miles southwest of Coulterville. It is known as the Alline, and is situated to the south of the Merced Gold Mining Company's Melvina mine. The owners are Sam DeBow, Dave Forbes and Louis James. The claim is on a well-defined quartz vein which crops out on a steep mountain side that forms the north bank of Maxwell's creek. It is apparently a true vein and not a bunch of quartz. It prospects well and the rock shows considerable gold in places. The owners have not the means to work it to any great extent, and there is some talk of making a stock company for prospecting purposes.

It is stated on apparently good authority that a twenty-stamp mill is shortly to be erected at Mount Ophir on the Mariposa grant. At the present time the prospectors on that property have no means of crushing their ore; and as they are for the most part men who cannot afford to lie out of their money, there is considerable complaint.

### Nevada.

The *Union* says the Lone Ridge mine at Blue Tent is to be started up by Superintendent Treadwell.

*Tidings*: The Champion Mining Company are arranging to add ten stamps to the twenty which have recently been erected in their new mill. This will give them a capacity of sixty stamps, and there is room for ten additional stamps, which may be put in later. The new machinery, weighing thirty-five tons, is now at the depot.

### Placer.

The *Sentinel* reports that 1,184,725 pounds of sulphurets have been received at Colfax for shipment since January 1st. During the same period 852 cars of freight have been received and distributed at Colfax.

### Plumas.

The mills of Standart & McGill and of the Hibernia Company, near Greenville, are dropping their stamps on good rock.

*National-Bulletin*: M. H. Day has placed upon record two deeds from L. P. Drexler, conveying the Sunnyside and Day mines to Mr. Loring of Boston. A corporation has been formed to work the mines. J. F. Cummings will superintend the work. The channel of the Sunnyside will be opened by a lower tunnel so that the gravel can be extracted on a large scale. Thus far the bottom of the channel has never been reached, the explorations having been on the rim only. Even here very rich gravel has been taken out, some of the nuggets ranging from $20 to $60.

### San Bernardino.

T. N. Stebbins of Calico filed a petition in insolvency Tuesday, the liabilities embracing debts due for materials, supplies and borrowed money—aggregating $20,442. Assets consist of over one hundred mining claims, most of them being located in Calico district—valued at $35,000. The *Sun* says that the failure resulted from the depression in the price of silver, which not only reduced his income, but almost entirely removed opportunities for the sale of silver mining properties.

### Shasta.

J. W. Parmelee, owner of the Minnesota mine near Copley, will secure control of the mill and machinery of the Parmelee Ore Concentrating Company.

*Democrat*: The Gold Group Mining Company, which is negotiating the purchase of the Shasta County Mining and Developing Co.'s property near Iron Mountain, will no doubt in a few days become in possession of the property and begin development work. The affairs of the Shasta Development Company are being straightened out so that a transfer can be made. The Hopper process for reducing the ores will be put in on the mine.

*Democrat*: Work has commenced in the Iron Mountain Co.'s new ditch. Fifteen miles of flume will also be built. It will take over a year to complete the ditch and flume and get the new works in operation. The smelter is now working smoothly and is a complete success.

The smelter for Clear Creek is a go. We can state on authority that in less than four months time the smelter will be in operation. The new plant has been ordered and will arrive here some time next week. It will be located near the bridge across Clear Creek on the Igo road. This will mean a boom for western Shasta.

The Little Maud mine, near Iron Mountain, owned by D. N. Haskell & Co, is looking up nicely. Last week two splendid bodies of paying ore were opened up on the upper level in the east and west drifts. The company has just contracted with the Review smelter people to work another hundred tons of ore and have begun to ship. The ore averages $20 per ton.

E. A. Zoellen has just completed a survey of a ditch eight miles in length, from Brandy creek to the Dobelin mine, in Muletown district, which has recently been purchased by a Colorado syndicate. The ditch will carry water to work the extensive gravel mine at the Dobelin place. The new company will do extensive development work this summer.

Work on the E. P. Conner mine, on Salt creek, is progressing rapidly. The arrastra is working right along on $10 ore.

### Sierra.

*Messenger*: There are seventy-five men employed at the Thistle shaft. Everything is looking bright.

The Gould & Spencer mine at Hopkins Creek is working ten men, with the expectations of a big cleanup.

The North American and Bunker Hill mines are being sold to a large company of capitalists, of which Major McLaughlin of Oroville is a party. Upon the completion of the sale, development work on a large scale will be commenced and pushed forward vigorously during the summer months.

Squire's mine near Gibsonville will soon be in operation again.

The Schofield boys are hydraulicking at the North American mine, and about six men are employed at present.

Thomas Rugg and others will operate this summer on Cleghorn bar, on a branch of the Feather river. They intend putting in machinery, with a view to sinking upon the bar.

Overstreet and others, owners of the Hawkeye mine, are at present employing twelve men.

At the Claybank mine near La Porte work is being vigorously prosecuted.

*Enterprise*: The Mammoth Springs Q. M. Co., owning the ground beyond the Bald Mountain Extension claim, expect to strike good paying gravel soon. The main tunnel is in near 2,000 feet and in good working order. D. Devers of ForestCity is superintendent.

### Siskiyou.

About 300 acres rich placer ground at Happy Camp has been bought from the Siskiyou Mining Corporation by A. Doolittle. There are several miles of ditches belonging to the property, one being the Lone Pine ditch, taking water from Indian creek, and another the South Fork ditch, which carries water for a distance of eighteen miles. Negotiations in progress for the placer property of Capt. Doolittle, to a New York syndicate if they fall through, will result in work being resumed this season. He purposes to secure water and operate the mine himself if the New York company does not purchase it. The property comprises over 200 acres of gravel. Placer mining at Happy Camp has received a fresh impetus and the renewed activity will increase the gold output of Siskiyou county to an appreciable extent.

### Trinity.

McLain Bros. have the contract to build 9,000 feet of tunnel and eleven miles of flume for the La Grande Mining Company on the grounds near Weaverville. The tunnel will be through almost solid rock. The tunnel and flume are for the purpose of conveying water for power purposes. Work will begin immediately and a large force of men employed. It will take two years to complete the job.

### Tuolumne.

The King Solomon, Coarse Gold and War Eagle mines, in Tuolume county, are reported sold to an English syndicate for $150,000.

*Independent*: The Dead Horse has struck very rich ore in the 1400-foot level.

## NEVADA.

### HUMBOLDT COUNTY.

Derby & Co.'s 5-stamp mill is crushing ore from the Badger mine.

### STOREY COUNTY.

*Appeal*: Peck Bros., who have been running tailings from the Morgan and Mexican mills for some time past, have been making money. The amount of bullion produced has always been a matter of guess work, but these are the figures: Out of 11,569 tons worked in three months from January 1, 1896, $42,238.13 was netted. Of this amount they have paid into the county treasury a bullion tax amounting to $330.40.

## OREGON.

### BAKER COUNTY.

T. W. McCoy has bought from Bradbury Bros., the Perry mine, an extension of the Rachael, for $11,500, of which $1,500 is cash.

In the Bohemia mining district sixty men are building a wagon road to the Annie mine, owned by a Chicago syndicate, under the management of P. J. Jennings. This company, it is said, will erect chlorination works at the mine this season and a 20-stamp mill. The 10-stamp mill at the Champion is running on full time. It is thought that the district will not be free from snow until June 20th. The snow now is about 15 feet deep at the Annie and Music claims.

### DOUGLAS COUNTY.

The Pacific Mining & Smelting Co. of Elk Head has been actively at work for four months, says the *Journal*, developing the old Todd quicksilver mine, about eight miles from Yoncalla, the nearest railroad point. A 250-foot upraise from the end of a 275-foot tunnel has been made, and the tunnel extended 130 feet beyond the upraise, uncovering a 20-foot body of excellent ore.

### LINN COUNTY.

At the Lawler mines on the Santiam river the 20-stamp mill is running. At Quartzville seventy-five men are employed by the company.

## WASHINGTON.

At Marcus the Drummond claim on Sand creek is claimed to be one of the best strikes on the reservation. The surface shows a ledge 20x30 feet of solid iron capping. Rock Cut is twenty miles from Marcus, on the Kettle river.

To illustrate the activity in the State of Washington in the mining incorporation industry, the following list is appended of new mining companies filing articles of incorporation at Olympia, the State capital, for the week ending May 30: Ontario Gold Mining Company, Spokane; capital, $1,000,000; M. T. Hartson, C. W. Ide, Smith Ely. Jo Jo Gold Mining Company, Spokane; capital, $500,000; G. N. Taylor, C. Mills et al. Frisco Mining Company, Spokane; capital, $500,000; J. Currie, L. L. Westfall et al. Novelty Gold Mining Company, Spokane; $1,000,000; P. Larsen, M. R. Galusha. Comet Mining Company, Everett; $500,000; W. Bennison, J. W. Cover. White Bear G. M. Co., Spokane; $500,000; J. Cole, C. P. Oudin, F. J. Kilner. Diamond Dust Con. G. M. Co., Spokane; $1,000,000; H. L. Rodgers, F. P. Smith. Mustaher G. M. Co., Spokane; $600,000; A. G. Ansell, O. O. Peck, A. B. Clark. Interstate Mining Co., Spokane; $750,000; I. Smith, W. H. Marshall. Mabel G. M. Co., Spokane; $1,000,000; F. F. Leland, C. D. Crites. Centennial M. and S. Co., Spokane; $300,000; S. Glasgow, E. J. Cady. Bluebird Mining Co., Spokane; $600,000; E. Vousquet, J. Fountain. United States G. M. Co., Spokane; $600,000; J. D. Hinkle, D. R. Evans. Lilly May G. M. Co., Spokane; $1,000,000; J. Raymond, W. J. Harris, G. Turner. Electric M. and M. Co., Spokane; $600,000; W. D. Nixon, L. B. Stutz. Queen Ann M. and M. Co., Davenport; $700,000; A. L. Tinsley, A. C. Shaw. Wonderful Group M. Co., Spokane; $1,000,000; W. W. D. Turner, G. Turner.

## BRITISH COLUMBIA.

The Skylark and Denver claims at Greenwood city have been bought by the Lexington Co. of Butte, Montana, for $20,000, one half cash.

Ashcroft *Journal*, May 30th: The reports this week from the Horsefly are that the Horsefly Hydraulic Gold Mining Co. has been working for the past several weeks and seems to be doing good work. There is no news as yet when a washup is contemplated. At the Horsefly Gold Mining Co.'s camp it is reported that the mine will be ready to begin piping about July 4th, work so far having gone on satisfactorily. There are many idle men at that point and twenty-five were let out some days ago, as the ditch work is well along.

## IDAHO.

Pierce, Idaho, May 23rd, '96.

(Special Correspondence).—Owing to the late inclement weather, placer mining has been materially retarded and the output will be considerably reduced this season. But recent new discoveries in quartz will more than offset the deficiency. The development on the Idaho still progresses favorably and the mill will start up in a few days. The Bond is also producing some rich ore. The owners are now sinking on the vein. The Caledonia Gold Mining Co., recently organized to operate in Pierce mining district on the Caledonia group, formerly owned by A. Walker and J. B. Williams, will soon commence active work. At present there is a large body of low-grade ore in sight, and if development work shows up as well as it is expected it will a large mill will be built to handle the ore, which is free milling. At present it is practically a prospect, but the amount of ore exposed on the surface justifies and entitles the Caledonia to the name of a mine. Recent discoveries are quite numerous, amongst the most important being the G. A. R., owned by J. Rankins & A. S. Warren; also the Calumet & Hecla claims, owned by Thomas Keily of Kendrick and A. Walker. Some ore is exposed on those claims that runs $200 to the ton, but the vein is small as yet. The Climax group is another important prospect destined to be a producer before the snow flies. This property is situated on a high divide and will be very easily opened by tunnel, and the ore requires no glass to see free gold in it. The Golden Reward is idle at present owing to a slide in the mountain caving in the tunnel. A deal is pending on the Climax and Golden Reward group, and if consummated will fall into the hands of Eastern men. Mr. Sullivan, representing the Anaconda Co., was in here last fall, and was surprised at the good indications for the making of a big mining camp

quartz, and he intends returning here as soon as it is possible to get over the roads, which at present are almost impassable. Men hunting for work would do well to avoid this camp for the present, as the supply of miners is fully equal to the demand, and until later in the season very few additional men will be needed.

The contract for the construction of the Tiger & Poorman concentrator, recently destroyed by fire, has been awarded. The insurance companies have been settled with for $75,000. The two companies have been consolidated and will have one concentrator with a daily capacity of 350 tons. The concentrator will be completed in four months and it is expected that the mines will then clear $25,000 per month.

*Headache*, May 29th: It is understood that the DeLamar Mining Company made the union a proposition last Tuesday to increase the carmen's wages 25 cents per day and to grant all employes the privilege of boarding where they choose. The proposition was rejected by the union, and everything continues quiet.

A dispatch dated Boise, June 3d, says: "The DeLamar miners dropped their demands for a written agreement that none of the strikers be discharged, and work has been resumed."

Wallace reports that the Standard mill is closed down on account of the caving in of the tunnel of the mine at Burke. There has been a number of caves in the tunnel, until it is completely blocked, and will have to be retimbered in part before it is used again. This trouble does not affect work on the new or Campbell tunnel where thirty men are employed.

Operations at the Red Cloud mines were resumed this week.

### UTAH.

*Tribune*, May 28: At the Hanauer smelter yesterday a notice was posted informing the employes that on and after June 1st the eight-hour law would be enforced. At the same time it was decided to make an advance of 10 per cent, which will leave the scale at from 18 cents and a fraction to 25 cents an hour. This, said an officer of the company in discussing it, is virtually a return to the wages that prevailed prior to the slump in the metal market in 1893, and which was followed by a reduction of 10 per cent. According to the new scale, a man working eight hours at 18 cents an hour would receive at the rate of $1.44 a day, and at 25 cents an hour $2 a day. Mr. T. R. Jones of the Germania was visited and said the same scale would be put into effect at that plant on June 1st.

At Tintic the Eureka Hill mill shut down on the first to put in forty additional stamps, which will give the mill 100 stamps. This will occupy about a month.

### MONTANA.

*Miner:* The new camp of Quigley continues to boom. Men are coming in daily and the camp now has a population of over 600. The Golden Scepter Co. is now engaged in an expenditure of nearly $500,000, as follows: A mill of 100 stamps capacity, which is to cost $150,000; an electric railway eight miles in length, to cost $40,000; a flume four miles in length, size 9x6 feet, to cost $30,000; hoisting works and accessories at the mine, to cost $50,000; $30,000 more necessary for the carrying on of detail work, and a late expenditure of $35,000.

The April payroll amounted to $40,000 and it is thought that $60,000 will be expended for labor alone in May. The estimated number of men now at work for the Golden Scepter Co. is 500, divided as follows: Laborers, graders and excavators, 100; rock men, 30; flume men, 50; miners, 55; railroad, 50; masons, carpenters and bricklayers, 50; lumbermen, 50; teamsters, 75; civil engineers, foremen, etc., 25.

The mines in that vicinity are also showing up well. Several prospectors have uncovered good ledges which assay high. When the mill is complete and the mines are working Quigley will be a great camp

A Helena dispatch of May 30 says the hoist house and a portion of one of the shafts of the Poorman mine have been destroyed by fire. Several men were in the mine at the time but made their escape through one of the other shafts. The fire caught from a spark from the furnance. The damage will amount to several thousand dollars. The house will be immediately rebuilt and the shaft repaired.

### SOUTH DAKOTA.

COST OF STAMP-MILLING IN THE BLACK HILLS, SOUTH DAKOTA.

*The Homestake Mill.*

The Homestake will soon have 800 stamps dropping day and night. The discovery at a depth of 900 feet that there was a vein of $8 to $10 ore has caused the company to determine to spend $500,000 in improvements this year. These will consist in the addition of 300 stamps, the sinking of a new shaft 3000 feet and the erection of a steel bridge or tramway across a gulch 1500 feet wide. A new mining company, the Golden Reward, embraces the original Golden Reward and fifteen other mining companies, all of which possessed valuable properties. The ores are of a refractory character, but run from $25 to $50 per ton. Harris Franklin has erected, about a mile below Deadwood, what is claimed to be the largest chlorination plant in the world. It treats 225 tons ore daily and is kept in constant operation. Below the works is a large smelter which is doing a big business. Five additional furnaces are now being added to the smelter. A cyanide mill of large dimensions is also in full operation in the same locality.

### COLORADO.

D. Moffat of Denver and D. R. C. Brown of Aspen are now owners of the property of the Aspen Deep Mining and Drainage Company, having paid $75,000. It is stated that they will clear the Deep shaft of water and start it up again, giving employment to 100 men.

At Florence the new mill is completed. The crushing mill, 50x100 is under way. The building is 100x200 feet in size, of stone, brick and steel. It will contain the roasters which the company will build in connection with the new 250-ton plant.

### ARIZONA.

Payson, Ariz., May 29, '96.

(Special Correspondence.)—The Golden Wonder has two shifts at work sinking on $50 ore. This mine has more work done on it than any other in the camp and has put thousands of dollars into its lucky owners' pockets, and, unless all indications fail, will make them rich.

Collom & McGraw are taking out rich ore from their Pay Rock mine. This mine is an extension of the Golden Wonder.

Colcord, Duff & Lee have struck some nice ore on the old Tonto Chief. The group of copper claims belonging to Hamilton, Sprague & Coleman were bonded on the 25th inst. to Colorado parties for $20,000, work to commence within thirty days. The ore on this property is very rich, assaying from 30 to 65 per cent copper, 15 ounces in silver and $7 in gold.

J. I. Coleman's mill is kept busy on custom ore. He intends putting in a concentrator in the near future.

Phœnix parties are thinking of putting in a custom smelter here, which, I am satisfied from the immense amount of ore in sight, would be a handsome paying institution for many years, if properly handled.

New machinery is to be placed at the Crowned King mine, but there will be no shut-down.

Seventy-five men, known as "pot-pullers," at the United Verde mines, who were receiving $2.50 a day each, went on a strike for $3 a day and eight hours' work.

The *Courier* reports that the Last Chance mine and mill is being successfully operated a few miles west of Prescott; fifteen men are employed and the mill will soon run twenty-four hours a day instead of twelve, as at present.

Dr. Theo. B. Comstock left this afternoon for Kingman and Chloride, taking with him Mr. R. J. Ferguson, who has been engineer at the University and School of Mines for five years past. The Elkhart mine at Chloride will be equipped with steam hoist and buildings and vigorously worked by the Prescott Development Syndicate, Mr. Ferguson being left in immediate charge at the mine. Dr. Comstock will return the last of the month to Prescott.—Prescott Journal-Miner, May 27.

Senator Tabor is locally credited with intention to reopen the Vulture mine "and put several hundred men to work."

Among the improvements soon to be added to the works of the United Globe mines are a 100-ton furnace and a cable tramway to connect the Buffalo mine and smelter. The company has been making some phenomenal smelting records of late; and when the 100-ton furnace is put in operation, their output of copper will be largely increased.

The underground miners of the Tombstone Mining and Milling Company, who had been on a strike for a raise of wages from $2.50 to $3 per day, won their fight and returned to work on Monday last. The *Prospector* says: The company will prosecute work as heretofore at the mine, while at the cyanide mill success and most flattering encouragement is assured. With the completion of the last mammoth tank, pipe connections, etc., the total capacity of the three tanks amounts to ninety tons.

### LOWER CALIFORNIA.

*Lower Californian*: In the Jacalitos district the Recompensa mill is finished. The mine is down 125 feet and has a four-foot ledge rich in sulphurets.

The Piedad mine is running night and day and two satisfactory cleanups were made, the ore averaging over $20 per ton. They are now stoping at the seventy-foot level and are in ten feet of ore.

At the Agua Dulce they are waiting for the stamps to complete the mill and are sinking on the mine.

### MEXICO.

The experts who are examining the Minas Prietas properties for the English syndicate, which has an option to buy them, are working very systematically, says the Nogales *Oasis*. They are taking accurate measurements of all ore bodies, stopes, drifts, etc., and have the exclusive use of the assay office at the Prietas mill for making their tests. There are four or five experts engaged in this work.

### SOUTH AFRICA.

Johannesburg *Journal*, April 25: According to the Chamber of Mines' statistics, dynamite can be landed here at 42s. 6d. per ton. At present the average price, as seen in the statement of stores consumed, appearing elsewhere, is £5. From the best evidence obtainable, the annual sale of this explosive in the Transvaal is now about 175,000 cases, which is employed exclusively for mining. At £5 per case the value of this quantity is £875,000. At 45s per case, the price at which it would be sold under free competition, the value is £480,000, making in round figures a tax of £400,000 upon the mining industry. Some of the details of the tax are as follows:

*Robinson Gold Mining Company.*

| | |
|---|---|
| 1,350 cases cost | £10,681 |
| 1,350 cases at 15s | 9,787 |
| Annual tax | £10,893 |

*Simmer and Jack Gold Mining Company.*

| | |
|---|---|
| 6,420 cases cost | £33,153 |
| 6,420 cases at 15s. | 11,444 |
| Annual tax | £18,708 |

*Meyer and Charlton Gold Mining Company.*

| | |
|---|---|
| 1,215 cases cost | £6,91 |
| 1,215 cases at 15s. | 2,734 |
| Annual tax | £3,757 |

It is, of course, impossible to apportion this tax between producing and non-producing mines. In 1895 the tonnage milled was 3,456,575 tons. If the tax were paid by the milling companies alone it would amount to 2s. 4d. per ton, but on the rock actually blasted it is not easy to arrive at the cost. Thus, the Simmer and Jack has a heavy bill for dynamite, but, as the mine is to be opened up for a 280-stamp mill, a great amount of development has been done.

**Wonderful Development of the Camp Floyd Mining District.**

The Camp Floyd Mining District of Utah, distant but forty miles from Salt Lake City, is now attracting the attention of the mining world as the only Western rival of Cripple Creek, Colo. The district has had a most remarkable history. The town of Lewiston rose, flourished and passed into decay twenty-five years ago, on the very spot on which Mercur has been built within the last eighteen months. It was renowned as a silver camp in '71, and from that time until 1880 old timers tell of the many big strikes in the district, but it was not until 1890 that gold was found. Attention was then called to the MacArthur-Forrest cyanide process, and a test of the ore was made in Denver, with such elaborate results that the old mines and many new ones were put on a dividend-paying basis. The formation at Mercur is very similar to the region about Johannesburg in South Africa, except that the Camp Floyd ore bodies are larger and richer. Geologists and mineralogists differ as to the origin and formation of the ore body, some claiming three distinct gold-bearing veins, while others seem to favor the single blanket vein theory. On one point, however, all agree, that no such gold deposit has ever before been discovered. In the Mercur mine the ore bodies average $15 in gold to the ton, while some assays run into the hundred's mark. With the aid of the cyanide process this ore is mined and milled at an average cost of $2.50 to $3 per ton, leaving a profit of $12 to $12.50 per ton. On this basis the mine has, in the year just passed, paid dividends to the extent of $300,000. The adjoining properties—the Golden Gate, Marion and Geyser—are equally as rich. The vein or veins have already been traced from the cluster of mines at Mercur to Sunshine, a distance of six miles, where the Sunshine mine and mill, another large property, is located, together with numerous claims of less magnitude. If the discoveries recently made, twelve miles west of Mercur and far to the south, are uncoverings of the same vein, then there is strong evidence that the great deposit covers an area of from 100 to 150 square miles and is the greatest ore body in the world.

Mercur or the Camp Floyd Mining District is best reached by the Rio Grande Western Railway to Salt Lake City. For further particulars or for printed matter apply to F. A. WADLEIGH, General Passenger Agent, Rio Grande Western Railway, Salt Lake City. *

Manufacturers and Importers of
Assayers', Mine and Mill Supplies, Chemicals and Chemical Apparatus.
We frequently have Second-Hand Assay Balances, which we put in order and sell at reduced prices. We can now offer for sale a fine new portable balance, made by Oersterland, Freiburg, Germany. This balance, including glass case, will fold up to 6½x12x4½ inches. Beam, 7 inches long; sensible to 1-10 milligram. New movement to release pans. All parts nickel plated. Specific gravity bottle and hook pans; 3 sets removable pans, one set of horn; pincets and weights; 1 platinum gram down to 1-10 milligram. Formerly listed at $85, now offered for $56.
Oertling's Assay Scale, No. 10, in glass case; powers, 10 grains down to 1-100 grain and riders, with weights; price, $60, offered for $40.
Oertling's Pulp Scale, No. 1, in case; power, 500 grains to 1-50 grain; without weights; price, $40, offered for $30.
German Assay Scale, not in case; steel bearings, 10-inch open beam, index pointing below; mounted so as always to be level; pans suspended by three platinum wires and hook; all packs in drawer 12½x6¾x2 inches; without weights; price $35, offered for $23.
German Scale; agate bearings for center knife; all packs in drawer 12½x6½x2½; price $30, offered for $22
German Chemical Scale, in glass case, with two folding doors in front and one at each end; long open beam with 8-inch radius; center knife rests upon agate; pans suspended by platinum wire chain and jewelled hooks; rider movement; beam graduated into 100 parts. This is a new scale left on sale; price $70, offered for $30.
German Assay balance cat No. Z; solid beam, 8 in. long, index pointing upwards; pans suspended by platinum wires and hooks; in glass case with sliding door; price $40, offered for $30.

## The General Gold Extracting Co., Ltd.,
PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

Prompt returns.
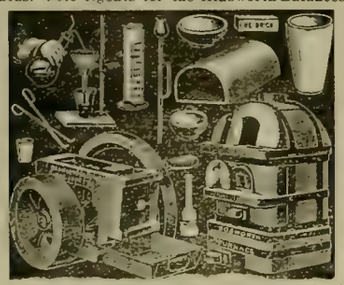
STATE ORE SAMPLING COMPANY, Denver, Colo.

## PAYNE'S
PATENTED
## GOLD SAVING RIFFLE.



This Riffle is just what placer miners want whether they are working large or small claims, as it is the only riffle ever invented that holds the mercury entirely exposed to the material, no matter what force of water is used. A large number of these Riffles have been sold, and are now in use in Colorado, Montana, New Mexico and elsewhere, and the first complaint has yet to be made against them. Many testimonials have been received from parties who have used and are now using them, giving them the highest praise. Are made of chilled cast iron, cheaper and more durable than any other process. Agents wanted. County and State rights for sale. These Riffles are manufactured at Denver only. Address all orders and communications to

**JOSEPH J. PAYNE, Sole Owner,**
1647 Champa Street, DENVER, COLORADO.

OFFICE: McPHEE BUILDING, DENVER, COLORADO.

**MILLS BUILT WITH GUARANTEE OF SUCCESSFUL OPERATION.**

## KENDALL GOLD AND SILVER
**EXTRACTION CO.**

The Kendall Process is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.
*The Kendall system is covered by patents which this company will defend.*
The American Cyanide Gold and Silver Recovery Co., organized in Denver more than a year ago to introduce and operate the Kendall Process in several States, have closed contracts with some ten mines for the use of this process after exhaustive comparative tests with the ordinary plain cyanide method.
Capt. De Lamar has adopted the process at his Nevada mines, where a 250-ton plant is being completed. He writes that he is saving 95 per cent of his gold values, and regards the Kendall Process as the cheapest and best he is aware of for the treatment of gold ores.
*All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.*
Owners of mines and reduction works can obtain full information on application to

# Great Reduction in Light!

# IMPERIAL Automatic Gas Machine

**Produces a Beautiful Light.**

The difference between the brilliancy of light produced from gasoline gas and from coal gas is 3 to 1. The gasoline light is clear and soft, rests the eyes and brings comfort to the home.

The latest and most perfect Automatic Gas Machine now in use, particularly for illuminating private dwellings in the country, as well as residences in the suburbs of a city or town, public institutions, asylums, hotels, etc. The light is steady, soft, bright and pleasant to the eyes and can be furnished at an expense of but eighty cents per 1000 feet of gas. It is much safer than coal oil lamps, which are so dangerous to have in the house on account of an explosion.

These Gas Machines are perfectly safe, and free from any danger whatsoever. Every modern house built for gas should have one of these machines. No public institution should be without one. I have no hesitancy in saying that there is no other gas machine in the market that can compete with mine as to prices, and they surpass as to perfection in all its requirements.

For supplying gas for gas stoves for cooking or heating these gas machines have no equal. Address

IMPROVED PORTABLE HOISTING ENGINES.

**Improved Self-Contained Three or Five Stamp Mill,**

Saves bill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.

FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.

SECOND: The saving in millwright and mechanics' labor in framing and erecting.

THIRD: The large amount of space saved.

FOURTH: The great saving of freight,

THE POOR MAN'S MILL AND ENGINE:

## THE . . . . . DANIEL BEST CRUDE OIL . . ENGINE. . . . .

CAPACITY, 2 to 200 HORSE POWER.

**The Cheapest Power Known; Invaluable Where Fuel is Scarce.**

The most economical motive power ever invented, costing but 10 cents per H. P. per ten hours' run, using crude oil. Cheap, safe, reliable and clean. Strong and simple to operate. Requires no engineer, and when you stop, all expenses cease, and no fire is left to endanger your building. Send for Illustrated Catalogue with full particulars, and mention the MINING AND SCIENTIFIC PRESS.

## THE KINKEAD QUARTZ MILL.

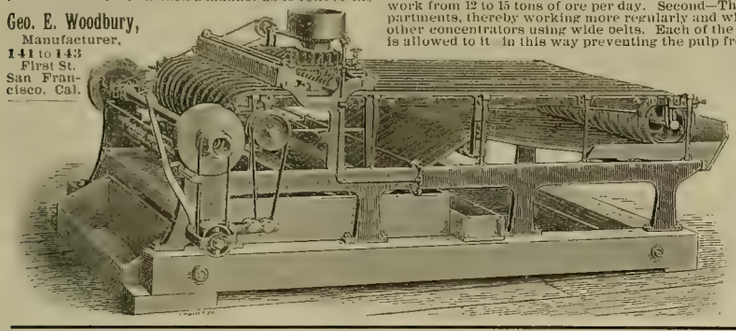
**The Kinkead Quartz Mill** will do the work of five stamps with less than half the power, and can be built and put into operation for less than half the cost of stamps. The only wear is the shoe and die, which is less than that of one stamp. The cheapness in first cost and operation of this mill makes it possible to work with profit ores so low in value that they have heretofore been treated as waste. Each mill will crush 10 tons in 24 hours through a 40-mesh screen.

It requires only a 2-horse power Daniel Best Crude Oil Engine, to operate this Mill and one concentrator. Engine and Mill can be set up and running in 48 hours.

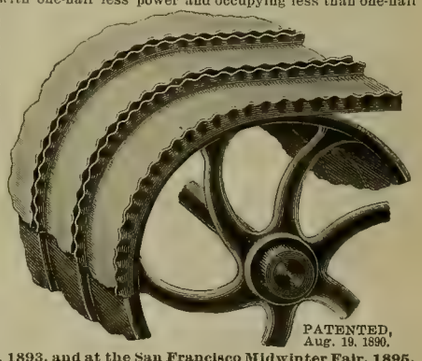
**Price of Mill $1,000, f. o. b. San Francisco,** including Self-Feeder, Ore Hopper, Frame and Foundation Timbers all framed, and one Silver Copper Plate. Weight, 2½ tons; heaviest piece, 1350 pounds.

One ordinary mortar for a 5-stamp battery will weigh more than our whole Mill. This Mill can be made in 300 lb. sections, if desired, at extra cost. Send for Catalogue.

**Interior of Four Kinkead Quartz Mill Plant at Virginia City, Nevada, Equal to Twenty Stamps, Crushing Fifty Tons Quartz Daily Average.**



**Call and See Our Kinkead Quartz Mill in Operation. * * * 413 & 415 MARKET STREET, San Francisco, Cal.**



## THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

**was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891,** with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury,
Manufacturer,
141 to 143
First St.
San Francisco, Cal.

PATENTED, Aug. 19, 1890.

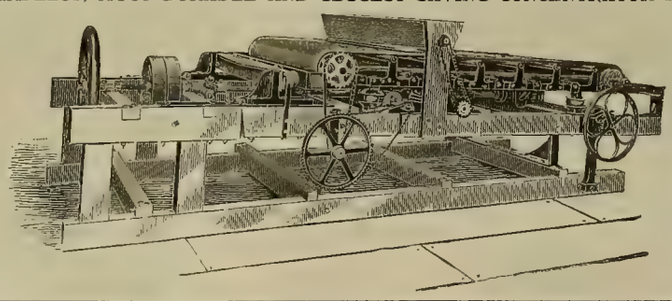
**This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1895.**

# The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. **CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE.** FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Company's works, 132 **Main Street, San Francisco.**

**Office, 116 Davis Street.**



**NINETY-FOUR AND ONE-HALF PER CENT —SAVED— ON ORES DIFFICULT TO CONCENTRATE.**

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

**PRICE.....$350 EACH**
Including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1896.

THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

# THE GUTTA PERCHA AND RUBBER M'F'G CO.

**30 and 32 FREMONT ST., SAN FRANCISCO.**

## Spadone's Concentrator Belts. Patented.

**The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.**

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

FIG. 1.

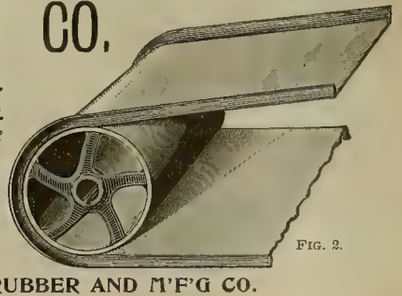


FIG. 2.

**We shall be pleased to quote you also on Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING and RUBBER PACKING. Correspondence Solicited.**

# Market Reports.

## The Markets.

SAN FRANCISCO, June 4, 1896.

Jobbers report an increasing and enlarging demand for goods, with buyers from both mining and agricultural districts well represented. As fruit, hay and grain harvesting enlarges more hands will be given employment, which will cause an increase in consumption of goods and a steady increase in the disbursement of funds. From the gold mining districts come encouraging reports. It is stated that there is a steady flow of capital to this coast for investment. Considerable of this is foreign. If silver continues to appreciate within the next few weeks more attention will be given to silver mines; but it is doubtful if the market will hold up, unless there is international bimetallism. The lumbering camps report a continued active home and export demand at firm prices. This industry is said to give employment to a larger force of men than at any time within its history.

The local money market continues easy, but a steadily increasing call is expected to rule from the agricultural districts for crop moving purposes. The banks state that the supply of funds in hand is excessive for even this time of the year. Collections are said to be fairly free. The East reports a continued ease in the money markets. New York advices are to the effect that currency steadily sets from the Central States to that place, and with a light offering of commercial and manufacturing paper the rates of interest favor borrowers. The uncertainty regarding the position of the Republican and Democratic national conventions on the silver questions has an unfavorable influence on business and finance.

**New York Silver Prices.**

NEW YORK, June 4.—Following are the closing prices for the week:

| | Silver in London. | Silver in N. Y. |
|---|---|---|
| Friday | 31 3-16 | 68¼ |

The local bullion, money and exchange quotations current are as follows:

| | |
|---|---|
| Commercial Loans, % per annum | 7@8 |
| Commercial Loans, prime | 6@8 |
| Call Loans, gilt edged | 6@7 |
| Call Loans, mixed securities | 7@8 |
| Mortgages, prime, taxes paid by lender | 6@8 |
| New York Sight Draft | 12½ |
| New York Telegraphic Transfer | 15 |
| London Bankers' 60 days | $4.88¼ |
| London Merchants | $4.88¼ |
| London Sight Bankers | $4.90 |
| Refined Silver, per oz., 1000 fine | 62⅜ |
| Mexican Dollars | 54@55c |

SILVER.—The market has made quite an advance the past week, closing strong with an improved inquiry. A New York exchange states from an authoritative source that the French Government is buying anywhere from 1,000,000 to 2,000,000 ounces of silver each month for coinage purposes. It is stated, also, that this coinage is not only for the French Government, but for many other Governments for which France coins money.

A leading dealer in silver says: "There is a steady demand for silver for export to London. From London it goes at present to France for coinage and to Germany and Russia. We find there is an unusually strong desire for gold and silver in European countries. We presume the silver is wanted entirely for coinage. The gold is in part probably being hoarded." Much change is taking place in the production of both gold and silver by the new electric process. Electricity is working wonders in reducing the cost of production of both metals.

Russia will unquestionably absorb large quantities of silver, so as to provide subsidiary coins to replace the small denominations of paper currency that is being retired. Referring to this the New York *Journal of Commerce* says: "The paper will be taken for gold in the new coinage, ruble for ruble, and the State Bank will receive 750,000,000 in the new gold piece for the purpose. The silver ruble will be compulsory, if required, between private persons only up to 50 rubles, while the exchequer will receive it to any amount. Only in the payment of customs duties silver coinage will not be received above 1 ruble until further notice. This important revolution in the monetary system of Russia is considered imminent."

The last steamer for Japan and China took out 217,000 ounces of silver bullion.

MEXICAN DOLLARS.—The demand is light, but the market is strong, in sympathy with an advance in silver. The last steamer took out 35,000 dollars. The market is quoted at 54¼@55c.

COPPER.—The market has held quite strong. While there has not been any advance in our market, yet buyers are not able to secure any concessions. James Lewis & Sons write from Liverpool: "The market has developed considerable activity, and not only consumers, but also the public, appear at last to be realizing the exceptionally strong position of this metal, the consumption of which is greatly exceeding the production—large though the increase of the latter in the United States be. This American increase of production appears to have reached its maximum for the present. For refined copper there has been a good demand, and there is more inquiry for manufactured for both India and elsewhere. High conductivity copper continues in request, and a contract has been placed for a French Pacific cable, which will absorb about 900 tons of wire. A considerable quantity of American electrolytic copper sold to the Continent has been repurchased by the original vendors. The increased consumption of England, Germany and France is at the rate of 52,763 tons per annum."

The market is quoted as follows:

| | |
|---|---|
| Bolt | ¼ & 5-16, 20c; ⅜ and larger, 17c |
| Lake Superior Sheathing | 20 |
| Ingot, jobbing | 13 |
| Ingot, wholesale | 12 |
| Sheet copper | 17 |

QUICKSILVER.—There is a continued good export demand. The last steamer for Mexico took out 150 flasks.

The market is quoted as follows:

| | |
|---|---|
| Home trade, per flask | 39 00 |
| Distant points up north | 38 00 |
| West coast of Mexico, for export | 34 00 |

ANTIMONY.—The market is quiet but steady at 8@9c cents in a jobbing way. New York mail advices quote 7⅞@7¾c for Cookson's, 6⅝@6¾c for Hallett's and 6½@6¾c for Japanese, from store.

TIN.—The advance in silver, with still higher figures looked for, is causing a stronger market at the East and abroad.

The market is quoted as follows:

| | |
|---|---|
| Pig, per lb | 14½c |
| Plate, I C coke, heavy, per box | $4 25 |
| " " " light, " | 4 10 |

POWDER.—An advance of 25 cents per keg has been made by leading manufacturers at the East. This will help California manufacturers to place their make at some points now monopolized by the East. Our market is firm at quotations.

The market is quoted as follows:

| | |
|---|---|
| Hercules, No. 1, per pound | 11½c |
| " No. 2, " " | 8½c |

BORAX.—The market is quoted as follows

| | |
|---|---|
| Refined, in car lots | 6½ |
| Refined, in sacks | 5¾ |
| Powdered, in car lots | 6¼ |
| Concentrated, " | 5¾ |

LEAD.—The market is steady both here and at the East.

| | | | |
|---|---|---|---|
| Pig | 3 75 | @ | 4 00 |
| Bar | — | @ | 4 15 |
| Sheet | — | @ | 5 50 |
| Pipe | — | @ | 4 75 |

SHOT.—The market is quoted as follows:

| | |
|---|---|
| Drop, sizes smaller than B, per bag of 25 lbs | $1 40 |
| Drop, B and larger sizes, " " | 1 65 |
| Buck, Balls and Chilled, do, " " | 1 65 |

IRON.—The market is essentially unchanged. The consumption continues large, but the offerings are free. The East reports slightly more life, but the demand is not large. Some cutting is reported.

Our market is quoted as follows:

| | To Arrive. | Spot. |
|---|---|---|
| **AMERICAN.** | | |
| Sloss | $21 00 | $23 50 |
| Thomas | 22 00 | 23 50 |
| Salisbury | 30 00 | 33 00 |
| **ENGLISH.** | | |
| Barrow | $21 00 | $23 50 |
| Gartsherrie | 21 50 | 23 50 |

COAL.—The market is reported as follows in the private circular of I. Steuart, which embraces the main features of what is reported by other brokers: "The receipts of coal at this port thus far this year are 542,100 tons, against 563,300 tons during the same time in 1895. Notwithstanding the continuance of the strike at the Australian coal mines of the Newcastle district, prices of coal have not as yet been affected in this market, owing principally to the fact of English anthracite and bituminous coal (chiefly the former) being offered for shipment at low prices, and abundant supplies from British Columbia being always obtainable at reasonable rates, assures this market against any scarcity of coal."

| Spruce | 26 00 | @ | 31 00 |

## Mining Share Market.

SAN FRANCISCO, June 4, 1896.

The market has been spasmodically active, with only slight fluctuations in prices. The small moves, up and down, have not been of sufficient moment to induce much outside trading, but they have been attractive to professional traders. So far as we are able to learn the impression prevails that the market value of the shares of both Chollar and Hale & Norcross has been kept up by main force, so as to keep the market from breaking before a sufficient number of shares have been unloaded. It is also the belief that for fully two weeks outside dealers have sold considerably more than they have bought, owing to the top-heavy character of the market and points put out that a "big break" is coming. At this writing the better informed dealers are giving more attention to the shares of the mines north of Chollar and Hale & Norcross, particularly those of the north end. What has brought about this change in sentimental dealing it is hard to say, unless it be that the manipulator for the pool has caused it so as to give better support to the shares he wishes to unload. Of necessity good news from the mines must be forthcoming, or else the movement will fail. A short time ago the street was full of an upmove in the Gold Hill shares, but which has not been realized, for the thing only strengthened in sympathy with the shares of the middle mines. This failure has caused quite a general selling by outsiders, which has admitted of better concentration by the Mills-Morrow crowd, and as the work in several of the mines is growing in interest an upmove is liable to be started there any day. At this writing it looks as if the market will advance along the entire line. How much of an advance will take place it is hard for an outsider to say, for the price of some of the shares is even now higher than the ore developed warrants; but, perhaps, it is the prospects that make the gamble now, and if so, there ought to be some radical changes as the work progresses.

During the past week several brokers visited Virginia City to personally inspect the work on the Brunswick lode and also see and learn what is going on elsewhere up there. Among them was Mr. Coffin, of Coffin & Sanderson, who is reported to be one of the most conservative brokers in the Board, and to find him somewhat bullish on the situation at the mines has caused surprise and make many believe that the outlook is far from discouraging, so far as the present work in the mines is concerned. This bullish feeling is enjoyed by the other brokers who went up, besides which private advices are more than confirmatory of the favorable situation. The visitors were not taken through the long crossdrift run from the Comstock lode to the east three or four years ago. It may be that what was then found induced the purchase of the ground on the Brunswick lode.

Official and private news from the mines on the Comstock lode is of increasing interest, yet it all points to time before the results can be accurately ascertained. Considerable dead work is nearing completion. With this finished, better ventilation and also manescapes will have been secured, which are an absolute necessity before active exploiting can be successfully inaugurated on the Comstock lode. From the Alta group the news is practically unchanged. From the Gold Hill group information is at hand stating that work has been resumed in Overman. Seg. Belcher and Belcher are still extracting and raising fair grade ore. It assays around $27 a ton. From what level it is taken, or whether any exploring work is being done, official letters are as dumb as an oyster. The Crown Point letter reports that connection has been made between the 600 and 700 foot levels and that in the upraise from the latter level $8 to $12 gold ore had been run into. This ore will pay to extract and mill. This dead work has been under way for some time so as to allow work to the west, owing to the ore found above having a decided western dip below the 600-foot level. The superintendent, in his annual report, writes quite encouragingly of the prospects there. On the 1100-foot level they are in ore assaying from $7 to $11 a ton, mostly gold. No work is being done in Kentuck, but some is reported in Yellow Jacket. In Confidence they are raising to the surface from the 600-foot level above the 200-foot level so as to get ventilation to expedite the work. After this is done they may (perhaps) find the lost ore found on the 200-foot level in Challenge and Confidence. The joint crossdrift run west by Con. Imperial, Challenge and Confidence is being pushed slowly ahead. The formation is favorable. In Alpha they are still fooling on and around the 500-foot level to the west. No report is had from Bullion outside of the work in the long west crossdrift. Potosi reports more or less dead work with no material change in the formation of the material encountered. The Chollar letter reports the shipment of $10,857 in bullion. There is some repair work under way in the main incline. In Hale & Norcross work is being pushed to strike the ten feet of good ore found in Savage. The milling returns of this company speak well for the management in the interest of shareholders. The Savage letter reports the raising of 110 carloads of ore assaying, as per car sample, $63.84 to the ton. The letter also says that 260 tons of ore had been milled which gave an average battery assay of $37.69 to the ton. Seeing that the company raised for the four weeks ending May 25th 271 carloads of ore, which gave an average assay as per car sample of $63.21, the battery assay is exceedingly small, provided it is the same ore. Work is still under way in the Gould & Curry long west crossdrift. Report is current that they have struck ore to the west in Best & Belcher, but particulars are not obtainable. Con. Virginia continues to raise and mill ore, which more than pays for the work that is being done on the different levels. The work on the 1000-foot level was, at last advices, in good formation. In both Ophir and Mexican, work on the 1000-foot levels is being pushed to the west. The work on the Central tunnel level is also being pushed westward. In Union and Sierra Nevada the work is the same as heretofore reported. In Utah they have started a west crossdrift.

Attention continues to be centered on the work under way on the Brunswick lode. The news from this lode is made the pivot on which to turn the share market. Private advices are of a more encouraging character than is official information. The latter, while quite conservative, gives encouragement to the belief that within the next few weeks considerable activity can be looked for in the shares of the mines on this lode. In Occidental they are running for the downward continuation of the ore found above. In Chollar they will crosscut at several places the ore found on the 200-foot level. They will also sink an incline winze, probably on the ore, from that level to the 300-foot level. In Hale & Norcross and also Savage they will soon begin running for the ore on the 300-foot level. In Gould & Curry work is being pushed ahead. So far nothing has been found on the lode to create an undue excitement. Further work is necessary to show the extent and value of what has been found. This makes the shares a gamble for something good or else for nothing of much if any legitimate value.

From the Bodie district the news is unimportant, being essentially the same as heretofore made public.

The market opened this morning dull and barely steady. After the regular Call, under the lead of Ophir, the north end shares did better, closing slightly higher at noon. At the 2:30 session this afternoon the market was quite active, with more trading, chiefly in the north end shares. Ophir sold up to $2.05 and Andes to 52c. Con. Virginia, Best & Belcher, Mexican, Union and Sierra Nevada sold slightly higher. The middle shares were firmer, but no higher. The Gold Hill shares were stronger under a better demand. The strength in Ophir is due to a reported improvement in the mine towards Andes.

The following illustrates the changes of the week:

| MINES. | May 28. | June 4. |
|---|---|---|
| Alpha | $ 27 | .... |
| Alta Consolidated | .... | $ 19 |
| Andes | 38 | 52 |
| Belcher | 79 | 76 |

## Recently Declared Mining Dividends.

THE Cariboo mine, B. C., paid a dividend of $16,000 May 16th.

THE Elkton Con., Montana, paid a dividend of $10,000 on May 25th.

THE Big Six mine, Lake county, Col., paid a $2,500 dividend May 20th.

THE Slocan Star mine, British Columbia, paid a dividend of $100,000 May 15th.

THE Ontario mine, Utah, has paid a dividend of 10c per share, $15,000, on the 1st.

THE Isabella, Colorado, paid a $22,000 dividend May 25th, an aggregate of $90,000 this year.

THE Centennial-Eureka mine of Utah paid $30,000 on the 15th ult.; this is $180,000 in '96 and a total of $1,680,000.

NEXT Wednesday the Ætna Q. M. Co., Napa Co., will pay its sixth dividend: one of ten cents per share. On the 16th the Napa Con. Q. M. Co. will pay its regular quarterly dividend of ten cents per share and an extra dividend of the same size.

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR THE WEEK ENDING MAY 19, 1896.

560,834—SHELF BRACKET—T. M. and R. J Anderson, New Whatcom, Wash.
560,844—RECORDING COINS—P. E. Daniels, Oakland, Cal.
560,849—CAR FENDER—M. Fernandez, Los Angeles, Cal.
561,005—BED AND SOFA—T. Langdon, Los Angeles, Cal.
561,007—BICYCLE BRAKE—J. W. Little, S. F.
561,008—MEAT HOLDER—C. P. Loughridge, Nevada City, Cal.
560,911—GAS BURNER—P. Meyer, Alameda, Cal.
561,025—WASHSTAND—R. R. Parrish, Portland, Or.
561,026—LAVATORY—R. R. Parrish, Portland, Or.
561,027—LAVATORY—R. R. Parrish, Portland, Or.
560,749—FAUCET—B. Pearson, Redlands, Cal.
561 063—TYPE MACHINE—V. J. A. Rey, S. F.
560,950—WIDOW POCKET—J. M. Thorpe, San Jose, Cal.
560,883—TIRE ARMOR—D. A. Zan, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WINDOW POCKET AND COVER.—Joseph M. Thorpe, San Jose, Cal. No. 560,950. Dated May 26, 1896. This invention relates to improvements in the sash pockets which are formed in window stiles and the covers therefor, and the method of securing the same in place. It consists of a pocketed window stile and a pocket piece formed in the same board, the stile opening being formed with ends diverging from one side toward the other, said ends and the ends of the cover being formed by V-shaped cuts made from opposite sides and intersecting each other on lines intermediate between the opposite sides of the board, whereby tongues and grooves are formed upon the diverging ends and longitudinal vertical channels cut through the board, whereby the cover is separated and is movable edgewise, to disengage the tongues and grooves when moved in one direction and engage and lock them when moved in the opposite direction. The cover is locked in place by means of a parting bead, which fits in the channel in contact with the longest edge of the cover and when removed allows the cover to be taken out.

BICYCLE BRAKE.—John W. Little, San Francisco, Cal. No. 561,007. Dated May 26, 1896. This invention relates to a brake which is especially adapted for use upon bicycles. It consists of a fulcrumed brake-shoe, situated above the wheel, having a flexible connecting strap extending from the rear end of its leather upwardly over guiding pulleys, thence into the end of the hollow handle-bar, where it is connected with a non-rotable disk. The handle is turnable upon the end of the bar and the two are screw-threaded, so that when the handle is turned in one direction the disk will be drawn outwardly, and, acting through the connection, will apply the brake. When turned in the opposite direction, the brake will be released by the action of a spring suitably placed with relation to it.

**"HISTORY OF CRIPPLE CREEK."**

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address. *Illustrated Weekly*, Denver, Colo.

## Assessment Notice.

OCCIDENTAL CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 2d day of June, 1896, an assessment (No. 23) of fifteen cents (15c) per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of July, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before will be sold on TUESDAY, the 28th day of July, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

## DELINQUENT SALE NOTICE.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the Tenth (10th) day of February, 1896, the several amounts set opposite the names of the respective shareholders as follows:

| Names. | No. Cert. | No. Shares. | Amt. |
|---|---|---|---|
| Chas. A. Moore | 102 | 7,222 | 361 10 |
| Chas. A. Moore, Trustee | 103 | 7,222 | 361 10 |
| Percy P. Moore | 117 | 6,000 | 300 00 |
| Percy P. Moore | 118 | 7,222 | 361 10 |
| Percy P. Moore, Trustee | 130 | 468 | 23 40 |
| E. C. Godfrey, Trustee | 160 | 6,667 | 333 35 |
| N. L. Bell, Trustee | 128 | 250 | 12 50 |
| A. U. Rugg | 16 | 1,000 | 50 00 |
| A. U. Rugg | 67 | 1,000 | 50 00 |
| Louise V. Rugg, Trustee | 149 | 5,000 | 250 00 |
| Louise V. Rugg, Trustee | 150 | 5,000 | 250 00 |
| Louise V. Rugg, Trustee | 151 | 5,000 | 250 00 |
| Louise V. Rugg, Trustee | 152 | 5,000 | 250 00 |
| Louise V. Rugg, Trustee | 155 | 1,000 | 50 00 |
| Louise V. Rugg, Trustee | 156 | 1,000 | 50 00 |
| Louise V. Rugg, Trustee | 157 | 500 | 25 00 |
| Louise V. Rugg, Trustee | 158 | 2,500 | 125 00 |
| Louise V. Rugg, Trustee | 159 | 2,500 | 125 00 |
| W. B. Rugg | 109 | 5,000 | 250 00 |
| G. H. Ripley, Trustee | 120 | 400 | 20 00 |
| G. H. Ripley, Trustee | 121 | 200 | 10 00 |
| E. C. Godfrey, Trustee | 141 | 1,667 | 83 35 |
| E. C. Godfrey, Trustee | 142 | 3,000 | 150 00 |
| E. C. Godfrey | 133 | 3,195 | 159 75 |
| E. C. Godfrey | 134 | 4,000 | 200 00 |

And in accordance with law, and an order from the Board of Directors, made on the 10th day of February, 1896, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Nos. 37 and 38 Crocker Building, San Francisco, California, on FRIDAY, the 10th day of April, 1896, at the hour of 2 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

E. C. GODFREY, Secretary.

Office, 37 and 38 Crocker Building, San Francisco, California.

**POSTPONEMENT NOTICE.**

By resolution of the Board of Directors of the Gold Bar Consolidated Mining Co., the day of sale for the above delinquent stock was postponed until SATURDAY, May 9, 1896, at the hour of 2 P. M., at the office of the Company, Room 38 Crocker Building, San Francisco, Cal.

E. C. GODFREY, Secretary.

**POSTPONEMENT NOTICE.**

By resolution of the Board of Directors of the Gold Bar Consolidated Mining Co., the day of sale for the above delinquent stock was postponed until MONDAY, June 8, 1896, at the same hour and place.

E. C. GODFREY, Secretary.

Office, No. 38 Crocker Building, San Francisco.

## WANTED.

For free milling and smelting property (gold) near Prescott, Arizona, competent mine superintendent who can make his own assays and run his own levels. Must have gilt-edged references; developed property. Address,

**L. A. DAVIES,**

**189 La Salle Street..... CHICAGO, ILL.**

WANTED.—A young man with literary ability, having had practical experience in mining and metallurgy, for the editorial staff of a first-class trade paper. Applications will not be noticed unless stating full particulars as to experience, compensation, references, etc. Address "Charter," P. O. Box 2718, New York, N. Y.

**An Experienced Millman**

Desires position in mill; understands concentrators; has had 8 years' experience. Address Amalgamator, care MINING AND SCIENTIFIC PRESS.

## GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 66, Placerville, Cal.

# VICTOR Amalgamator.

(PATENTED.)

**FOR MILL OR PLACER USE.**

**GREATEST**

## Gold-Saving Machine

**Ever Invented.**

**The Following Speaks for Itself:**

TO THE VICTOR AMALGAMATOR CO.,
703 SOUTH MAIN ST., LOS ANGELES, CAL.

*Dear Sirs:*—Referring to the run made by me of fifty tons of the black sands near Santa Monica with the Victor Amalgamator, I have to say that the results were quite satisfactory, considering the crude arrangements employed in feeding the machine.

During the run, in all the panning (of over one hundred) I never missed finding gold before passing through the machine, and after passing the machine I found only two colors in panning after going through; in other words, only two colors were found in the tailings after panning over 120 pans.

Of the many methods that have been tried for saving the gold from the sea sands on this coast for the last twenty-five years, none have given as satisfactory results as the Victor.

I have no hesitation in saying that the machine, properly handled, will save a larger percentage of gold contained in the sea sands than any other process in my experience of over thirty years.

The machine is equally well adapted to saving the free gold from mill tailings, when it is too fine to amalgamate on ordinary plates. In milling talcy ores, I know of no other process so well adapted to saving gold as the Victor Amalgamator.

The above run showed the capacity of the machine (small size) to be about twenty-five tons per day. Respectfully, GEO. O. KILBOURNE.

For catalogue and full particulars, address

**VICTOR AMALGAMATOR CO.,**

**703 South Main Street, LOS ANGELES, CAL.**

TO THE STOCKHOLDERS OF THE SOUTH PALOMA GOLD MINING COMPANY, LIMITED:

Notice is hereby given that by resolution of the Board of Directors of the corporation, adopted on the 21st day of March, 1896, a meeting of the stockholders of the corporation was called for the purpose of increasing the capital stock to the amount of two hundred thousand dollars, to be divided into one hundred thousand shares of the par value of two dollars per share, and of determining the disposition to be made of the increased capital stock; and it was resolved that such meeting shall take place at the principal place of business of the corporation, being the same building where the Board of Directors usually meet, to wit: No. 212 Sansome street, room 17, in the City and County of San Francisco, on WEDNESDAY, the 10th day of June, A. D., 1896, at 11 o'clock in the forenoon of that day.

Dated San Francisco, 2nd of April, 1896.

# FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

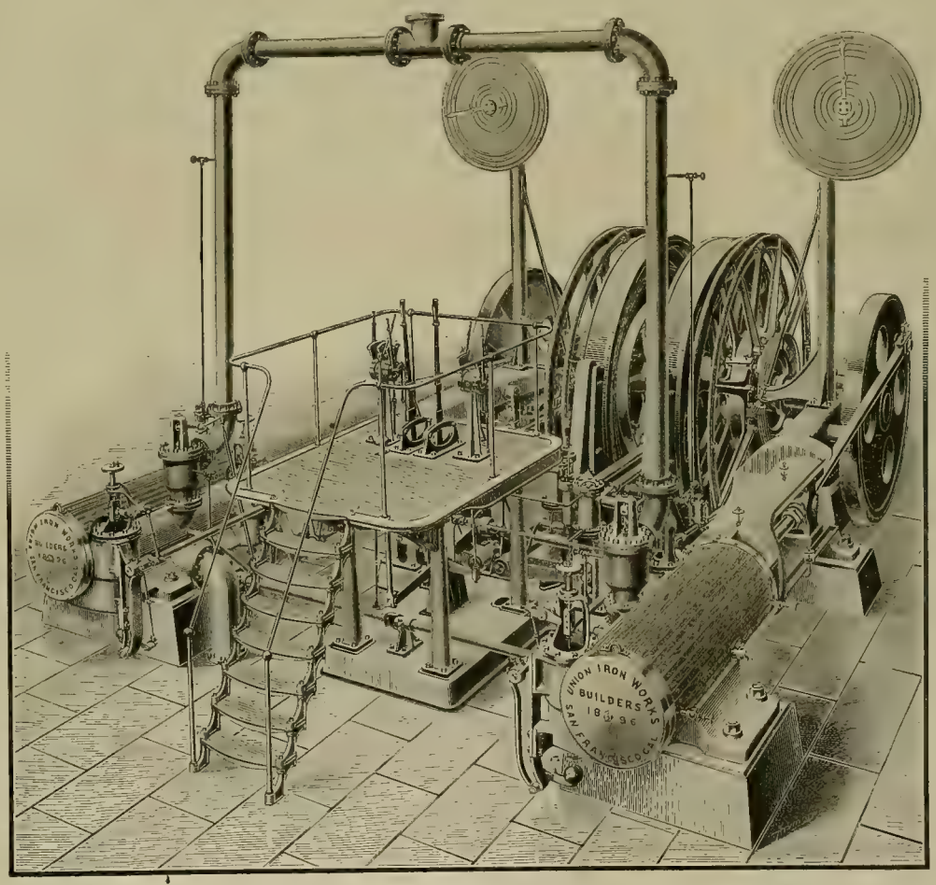
## The Silver Situation.

In its advocacy of silver, this journal notes a narrowness of view on the part of some of its Eastern contemporaries. The parrot cry of "sound money," being devoid of argument, deserves no reply. But many who honestly seem desirous to discuss the question with the impartial earnestness that its importance demands appear to be confused as to the place this whole silver question occupies.

Papers published on the Atlantic slope, and people writing from there, seem to honestly believe that this whole effort for the remonetization of silver is a petty conspiracy on the part of the owners of silver mines for personal gain.



The mistake these people make is a natural one to those who approach the subject with prejudiced minds. They think the question is an industrial one, when it is purely a financial one; it is not simply a matter of concern to a few small producers; it is not a subject of personal, class feeling, like the manufacture of carpets, the production of cotton goods or the dairy interests of some State. It is of wider scope. The man who owns a corn field in Nebraska; the owners of a blanket factory in Ohio; the producers of muslin and calico in Rhode Island; the shoe manufacturers of Massachusetts; the pork packers of Chicago; the railroad bondholders of the country—these and a thousand other industries are more interested in the remonetization of silver than the few scattered silver miners of this west half of America. To all those enumerated or suggested, it means loss or gain; to the miner it means merely a choice of work. If the country refuses to care for silver, he can and will produce gold; he is the most independent one of the whole lot.

The selfish, narrow view of this subject taken by Eastern critics is the saddest part of the whole matter. The lofty assumption of superiority is irritating, the arrogating of all the wisdom and common sense is of course amusing, but the arguments made in ignorance or defiance of the plain facts must be a matter of regret to those who hope for the country's general prosperity. If those papers and people who talk so glibly of "silver barons" and "sound money," of "free silver cranks" and "the necessary gold standard," yet deplore the shrinkage of values and the general stagnation of business, would permit their sober senses to sway their sentiments, they would probably realize that the question is not an industrial one like the tariff, but a financial one, of equal importance and underlying the success or failure of all industrial schemes.

The silver mine owners of the United States produce annually one-half of one per cent of all commodities in the United States. They are interested in this matter of the remonetization of silver together with their fellow-citizens in the proportion of 1 to 200; no more. Were silver restored, they could buy no more wheat or machinery or pork or land than now, for all would advance together. Their profits would be commensurate with that of the rest of the producers of the country in the proportion of 1 to 200.

Three years ago the people who are the most stubborn now in talking round the circle on this subject scared the country into a panic that has cost twice as much as the Civil War. Now, at the beginning of a national campaign they are again trying to stampede the herd.

The logic of the situation is against the monometallists. Neither sophistry nor terrorizing; neither falsehood, ridicule nor defiance can face down the one unanswerable fact that the population is increasing, that the needs of the country require more currency of a value attained only by use of the precious metals, and that in this regard the interests of consolidated banking interests are opposite to those of nearly the whole people. So long as nearly the whole people can be fooled with side shows they will be denied their rights. Some new issue every election is as necessary to the success of the monometallists as an alibi in the successful defense of a criminal. Sooner or later the people in whose hands lie our national destinies will realize the truth, will see that this silver problem is not an industrial question, involving only the fortunes of a few miners, but a great financial Government problem, affecting alike the fortunes of every resident of the nation everywhere. When they do, whether this year or next year or the year after, silver will be remonetized, and the country resume its old-time prosperity. We of California can stand this present stagnation probably better than any one else. The California gold miner is to-day engaged in the most prosperous occupation on earth; but he realizes that, as in the human body, no part can be diseased without injury to all others; so in our national prosperity, the country cannot enjoy as a whole the fullest measure of financial prosperity while the natural ally of gold is in its present plight. Hence the California miner is an advocate of silver.

20 x 60 INCH HOIST FOR CRESTON MINE, SONORA, MEX.

## Double Reel Direct Acting Hoisting Engines.

This week's mechanical illustration is of a large hoist built for the Creston mine at Prietas, Sonora, Mexico, and now being put in place there by the Union Iron Works of this city. It is for a three-compartment shaft, which is to be sunk to a depth of 2100 feet. The cut illustrates the pair of double reel direct acting hoisting engines, cylinders 20 x 60 inches, showing the reels, designed for flat wire rope, steam-actuated brakes and band friction clutches. The engines are of the ordinary girder frame pattern, and the reversing gear has a cut-off for working the steam expansively through any portion of the stroke; the engines are connected by a crank-shaft; the reels are brought into action independently of each other by means of band friction clutches, operated by steam. The brake wheels are provided with steam-actuated brakes and the crank discs with foot brakes, thus giving perfect control of the load and insuring most rapid work with absolute safety.

An elevated platform is placed between the engines, upon which are mounted all the levers, as shown in the engraving, which gives the engineer full view of the mouth of the shaft, the reels, indicators, etc., and allows all parts to be placed above the floor and within easy reach in case of repairs when necessary.

The indicators are of the spiral disc pattern, provided with adjustable tabs, to show the position of the ascending or descending cages in the shaft.

MECHANICAL PROGRESS.—Acetylene, the New Light, 483. Tin Smelting in Singapore; Patents Issued by Foreign Countries; Development of Business of Making Steel Tubing in England; To Work Steel in a New Way, 484.

PRACTICAL INFORMATION.—Rope and Belt Transmission of Power; An Exposition of Fraud; Procuring Water; An Arctic Exploration; Census of London, 484.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 486-7-8.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 498.

MISCELLANEOUS.—Concentrates, 479. The World's Greatest Gold Lode, 480. Mining an Early Pursuit; California Summer Scenery; Queer Reason for a Strike Reported from England, 481. The American Steel Pool and Welsh Tin Plate Makers; Practical Experience with the Patio Process, 482. Gold in Ecuador; Recent California Mining Incorporations; Recently Declared Mining Dividends; Should Be Partial to This Paper, 483. Mines and Miners, 484. Coast Industrial Notes; Personal, 489. Commercial Paragraphs; Patents; The Denver Engineering Works Co., 490.

## A Great Gold Field.

There is every indication that the Pacific coast will soon lead all the auriferous regions of the world in gold production. Large as is our present yield of the yellow metal, it is only the beginning. We have but commenced the development of the gold-bearing quartz veins of the country. There yet remain in our great gold fields extensive regions that are wholly unexplored. The vast majority of the gold-bearing veins of the country await the developing pick and drill of the miner. Nowhere else on earth can there be found a greater field for the industry of gold mining than here in this west half of America. We have hundreds of thousands of square miles of gold-producing territory. A man may mount a horse and ride for days, weeks and months, and at the end of a year he will not have been able to visit a tenth part of the localities in which gold is to be found.

For various reasons, so well known that no particular explanation need here be made, the work of developing the auriferous wealth of this region has long proceeded very slowly. At times it has lagged for years and almost come to a stop, so far as regards the opening of new mines. Meantime the attention of the great capitalists of European countries was attracted to gold fields in distant parts of the world, where there was a greater display of activity, rich developments and new and exciting discoveries. The eyes of the whole mining world turned toward South Africa and West Australia. There are some good mines in those far-away countries, and beginning by putting upon the markets of London and Paris the shares of mines that were paying, a great boom was presently worked up. Then, when the masses came in, all wild to become purchasers, there were put out at big prices all manner of wild-cat trash—mere mines on paper. But speculation went on all the same, and stocks that represented nothing more valuable than stretches of sandy veldt were as eagerly snapped up as though they had been shares in dividend-paying mines.

It was a long boom and a profitable one to the insiders who worked it. It began in the latter part of 1894 and held until the end of September, 1895. By that time everything was boomed to such a height that the majority of the professionals decided to go on the other tack. As soon as these professionals became bears they refused to grant the usual carrying-over facilities and thus knocked out all who were unable to pay for their purchases. Then came knock-down auction sales of stocks, several failures, a steady tumble in prices, and the great boom was a hopeless slump. However, hundreds held on with bull-dog tenacity, and are still holding on. The French in Paris thought they were very careful buyers. Mistrusting the English, they would take nothing but dividend payers, but in the boom they, many of them, lost their heads and paid the big prices that all paying mines reached during the excitement. All these Frenchmen will lose, as during the life of the mines they will only get back in dividends a part of the money they paid out for shares.

Both the English and the French doubtless now have all the South African and Australian stocks for which they have any hankering. They undoubtedly had in the cement reefs of the Rand a great gold deposit and one that will still produce a great deal of the yellow metal, but, if reports from there are to be believed, the Johannesburg mines have seen their best days; they are now on the decline—are slowly petering. The hopes of the people are now in the "deeps"—next they may be in the "dumps."

The reported outlook in the "deeps" is not good. The ore is of low grade and they must go down 4000 to 5000 feet to get it. The ore of the "deeps," or lowest workings, yields only $4 to $5 a ton, which with the old cheap labor and all else favorable could hardly be made to pay. The Robinson Mining Company, the largest producer in the Rand, under the management of Captain Thomas Mein, formerly of California, has brought the cost of working ore down to $4.58 a ton, which is considered to be the lowest possible figure. This looks bad for the "deeps." There is not likely soon to be seen any increase of production at the mines of the Rand. Few new properties are being opened up, and all the old accumulations of tailings are being worked, therefore the hopes of the people for an increased output are centered in the deep levels.

In the South African mines they long enjoyed a great advantage in the low rate of wages at which native miners could be procured. This made it possible to work the low-grade ores at a good profit. But the natives have gradually had their eyes opened in regard to the value of their labor to the whites. Where they were at one time paid but $6 a month, they now demand and get $16. Even at this rate, the number procurable is insufficient. The labor trouble began before the late political trouble, but since then the wars and war talk has scattered and demoralized the workers—filled their heads with notions of fighting. Native labor is very unreliable. Even when the notion takes them to work, the Kaffirs remain at the mines but a short time; as soon as they get a little money ahead they are off and away. There is no way of compelling the natives to work. All that can be done is to put before them inducements, and then await their notions and motions. The Portuguese Government have added to the labor trouble by demanding $5 for a passport for every native leaving their territory. This prevents hundreds from even thinking of going to the mines. The high price charged in the Rand for explosives, owing to the monopoly granted by the Boer Government, also adds greatly to the difficulty of the problem of how to get any profit out of the low-grade ores that are ahead.

It was at one time widely and wildly heralded that in Mashonaland—Rhodesia—the "gold mines of King Solomon" had been found, and many persons had visions of gold by the ton. During the big boom stocks in mines in that region were run up to a big price. The gold deposits of Mashonaland are quartz veins, not beds of auriferous conglomerate, as are those of the Rand. It seems that the ancient miners made a pretty clean sweep of the gold in both the quartz veins and the placers in Mashonaland. Little gold is coming from that section.

It now seems that the predictions and promises of the South African boomers will not be verified. The thousands who have lost can have no hope of ever getting even. For them to come out even it would be necessary for the mines to prove to be all that was reported of them during the height of the boom. The hopes of many of these people are in the "deeps," in the shares of the trust companies holding the stock in the deep-level companies, as the Consolidated Goldfields, Barnato Consolidated, Barnato Bank, and the like.

The tide of mining speculation and development is likely soon to set in this direction. The present outlook in South Africa is not such as will be likely to induce European capitalists to make further investments in that country. Already a vast deal of European money is being put into mines in this country. Although American stocks cut no figure in the markets of London, Paris or Berlin, many English, French and German capitalists own big and rich mines on this coast. These men are not buying mines for the purpose of making money by selling stock. They look to the mines themselves for their money. Their profits are derived from the precious metals they dig out of the ground. Many fine paying mining properties in different sections of this country are owned by foreign capitalists. Little is heard of them in the markets of the world, for they are not peddling their stocks; nevertheless their success is not without effect. More and more money is coming here each year for investment in mines. The men who are now coming here want mines, not stock. As there are always plenty of mining properties of merit that can be bought at fair prices, these men have only to exercise a little ordinary sagacity in order to secure paying mines.

While there are opportunities in every far western State for the acquirement of good mining properties, California is probably the most attractive field for the capitalist, either home or foreign, because of the climate and the unrivaled facilities it affords for mining.

For hundreds of miles along the western base of the Sierra Nevada mountains are gold-bearing veins and placers awaiting development that will yield a profitable return to the energy and money of the capitalist. The hundreds of millions gathered from the gravel on the surface and the other hundreds of millions that have rewarded those who have delved in the quartz mines is good evidence of this. There, along the mountain range, will be found a delightful climate and all the facilities of accessibility, cheap electrical and water power, abundance of lumber and timber and every concomitant required to make the business of mining both pleasant and profitable. Notwithstanding the vast amount of treasure California has given to the world, much more undoubtedly remains in the ground than has ever been taken out. The gold-bearing veins are practically without limit. Besides the veins of the great mother-lode belt, there are other systems of veins throughout the whole length of the State. There are even yet immense deposits of auriferous gravel lying unworked in the old dead-river channels and the deep placers. In forty-five years the mere surface gold of the country has not been exhausted.

They have no mines in the Rand at all comparable in richness to the veins of the mother lode of California. Had the same amount of machinery been erected on the mother lode, and as much development work been done as in the Rand mines the yield of gold obtained would undoubtedly have been far greater from the South African bonanza. Indeed mines that prospect better and will pay better than the "deeps" of the Rand can be found by scores in every Pacific coast State.

As regards a gravel deposit such as that of the Rand, there can only be a certain amount of pay ground and when that is worked out the mine is gone—it is dead. It is very different in the case of a quartz mine. In the latter there is always the chance of finding a parallel vein that does not come to the surface. This may prove better than the original vein. Then in the ground adjoining the main vein will most likely be found paying streaks and feeders. For years they have been working on such outside streaks on the Comstock in Nevada, and large and rich ones are still being discovered.

Gold mining is now about the only industry that pays and a paying gold mine is a good piece of property to tie to. This is beginning to be more and more understood. A man with a paying mine on say the California mother lode may consider himself fixed for life. That great lode has been worked at so many different points, has been so well tested and has yielded so many hundreds of millions in gold that no one need have any fear of it "petering." In its longitudinal dimensions the great fissure is co-extensive with the Sierra Nevada range. It is no gash vein in the surface rocks, but is a great fissure that reaches down into the fiery depths; is as deep-seated and permanent as the mountain range itself. The very rich ore obtained in the deep shafts of several leading mines on the mother lodge shows that there is no decrease of pay in depth.

In Australia gold-bearing veins are now being profitably worked to a depth of 3000 feet—in one mine to the great depth of 3300 feet—and it is there said that "mining can be carried down to 3000 feet as economically as at 600 or 700 feet from the surface." The Victorians are firm believers in the existence of gold at deep levels. When, at a depth of about 2150 feet the last payable reef at Bendigo appeared to be worked out, the miners instead of abandoning their work, determined upon going deeper, with the result that payable quartz was found at a depth of 2800 feet, and in exactly the same formation as that met with in the higher levels. On the Comstock it was found that men could work as comfortably at a depth of 3350 feet as at 1000 feet. The ventilation was good and the heat less than at some points above. The Tamarack copper mine in Michigan has reached the great depth of 4020 feet without difficulty. Evidently even the deepest of the California gold mines have long lives before them. Thus far no limit has been found as regards the depth to which mining work may be carried.

## Concentrates.

COMPARISON is constantly and cordially invited.

EVERY miners' union in the State of Montana will hold an anniversary celebration to-day.

MANAGER CRANE of the Monte Cristo, Wash., mine has been instructed to buy a $10,000 seven drill compressor and boiler.

THE law under which American mining machinery went into Canada free of duty expired by limitation on the 6th prox.

THE cinnabar claims near Wadsworth, Nev., have been bonded, and Humboldt county expects to add quicksilver to its list of productions.

ANY errors or omissions in the list of mines now being published will be gladly corrected upon notification. Absolute accuracy is not claimed.

THE Planet-Saturn, Arizona, Mining Co. talk of putting in a roaster and cyanide plant of 75 tons daily capacity. They are sinking to a depth of 500 feet.

AT the Gwin mine, Calaveras county, the shaft is down 1250 feet and is in $8 ore. It is expected the new 40-stamp mill will be ready November 1st.

'TIS figured that about thirty mills in this country are now using the MacArthur-Forrest process, treating about that many thousand tons of ore monthly.

INDIAN AGENT NEUMAN has stopped the staking off of townsites on the Colville reservation, but says he will not interfere with miners or mine improvements.

SECRETARY SMITH last Saturday approved as a basis for a patent list thirty of the selections by the Central Pacific Railroad Company, in the Redding district.

AT the Broken Hill Proprietary, Australia, the yield for the week ending May 21 was 7536 tons of ore, producing 431 tons of lead, containing 145,865 ounces silver.

RANDSBURG, Kern Co., is reported full of tenderfoot prospectors, many of whom have "claims overlapping each other, three or four deep on the same piece of ground." "Some have located twenty to forty claims apiece."

ASSESSMENT WORK can be done quicker, easier and with more effect now than later in the year. Any one who has any kind of a gold claim cannot afford to jeopardize his chances this year by neglecting this important requirement.

THE Land Department has made another singular ruling that the sale of mine improvements in place is evidence of abandonment of the mine. On a test case, however, the Department could probably reverse itself as it has done before.

QUESTIONS sent in cannot always be given immediate answer. It is easier, usually, to ask a question than to correctly and satisfactorily answer it, and what may sometimes seem easy often takes considerable time and research for reply.

CALIFORNIA'S gold production in '95 was twenty-six times the value of its silver production for that year. Recognizing, however, that the silver question is not an industrial but a financial problem, California favors the remonetization of silver.

AT San Diego on the 5th Judge Pierce granted a temporary injunction in the case of the Golden Cross Mining and Milling Company vs. the trustees, at Hedges, and appointed W. W. Stewart of that city as receiver, fixing the required bond at $25,000.

A NEW mint at Nanking, China, is to have a capacity of 100,000 silver and 1,000,000 copper coins per day. It is proposed to coin silver dollars of a value equal to Mexican dollars. Previous attempts to supplant the latter coins in the Chinese circulation have failed.

A THIRD edition of "Aaron's Assaying," Part I, is now being printed and will be issued July 1st. It is enlarged and improved in accordance with the notes of the late author, and is believed to be in every way worthy of the same cordial reception given the original work.

THE $45,000 in the General Deficiency bill passed by the Senate this week and now a law is for the building and equipment of works for the sampling and assaying of silver and other ores imported, the works to be built at El Paso, Texas, Northport, Wash., and Bonner's Ferry, Idaho.

A TACOMA, Wash., Co. is building a mill "constructed with a coil spring sufficiently strong to deliver a blow equivalent to that of a thousand-pound gravity stamp, and by the use of the spring twice the number of drops per minute are made." It will be interesting to note its working test.

IN dealing with each other partners occupy positions of trust and are required to exercise the most scrupulous good faith toward each other. Nor is this requirement confined to persons who are actual copartners, but it extends to those who are negotiating for a partnership yet to be formed.

WAGON-ROAD, horseback prospectors, carelessly riding over the country, have given way to an army of men this summer who are prospecting the whole west half of America more diligently than ever such work was done before. The makings of many a good gold mine will be started this year.

CALIFORNIA-BUILT hoists are not slow, four now being put in place in Montana giving an average speed of 45 feet a second. At the Calumet and Hecla, Mich., the deepest shaft in the United States, they claim to attain a speed of 60 feet per second, which is about as fast as one wants to travel underground.

IN the U. S. Court of Appeals, Judge Gilbert last Tuesday, affirmed the ruling of the lower court in the case wherein the Altoona Q. M. Co., of Trinity county, brought suit against the Integral Q. M. Co., for ejectment of the defendant and possession of the Boston ditch, in which the plaintiff was successful.

THE *Economist* points out that western Australia mines, land companies, etc., are capitalized for £57,000,000. This is considerably in excess of the nominal amount for which all of the companies working in the Transvaal are capitalized. It thinks that the industry is being unfairly handicapped in this respect.

THE United States Debris Commission is not issuing any hydraulic permits at present for two reasons; this is not the season of the year when such permits are applied for and the appropriation is exhausted. An appropriation of $15,000 for the biennial expenses of the Commission will be available the 1st of next month.

A PARTY who is induced to part with the possession of his property through the fraud of a purchaser has the right either to rescind the contract of sale and reclaim the property, or to ratify the sale and pursue the ordinary remedy on the contract; but having elected to sue for the price, he cannot repievin the property.

THE new dredger of the Distlehorst Dredging Company, Oak Bar, Siskiyou Co., is nearly ready for work. There are three boats joined in one, making a dredger 65 feet long by 30 feet wide. There is an engine of 25-horse power; the iron dredgers weigh 1000 pounds each. It is expected to handle 1000 cubic yards of gravel every twenty-four hours, at a daily working expense of $18.

LAST Saturday was finally concluded the sale of the old Summit mine near Sutter Creek, Amador county, to the Central Eureka Gold Mining Company, for a price approximating $40,000. For nearly a quarter of a century the property has lain idle. It was sold by John Tregloan & Co. to C. W. Randall. New hoisting works have been put in and it is proposed to sink a shaft 1000 feet deep.

LONG CONTINUED OPTIONS on gold mining properties in this State are not as frequent as they used to be. A ninety-day option is now in greater favor than the old six or twelve months' option, and in a majority of cases even a three months' bond is not forthcoming unless a forfeit is put up or the party of the second part seems to mean prompt business.

IN renewing his subscription, a Nevada mining superintendent says "The West has a reputation for higher prices, but your paper at $3 a year and a certain New York publication at $5 a year shows that there is an error somewhere the subscription prices should be interchanged. Certainly no mining man anywhere can afford to be without your paper."

THE directors of the Chicago Coliseum propose to hold a permanent mining exhibit there. The idea is worth affirmative action in this State. While we in California do not need practical object lessons in education as to the mineral wealth of the State, the millions who yearly visit Chicago do, and one of the most effective ways is by appropriate exhibit there.

DUPRE states in his German patent that a solution of chromic acid in a solution of a metallic chloride or bromide, such as sodium chloride, magnesium chloride, potassium bromide, etc., dissolves gold and is without action upon the metallic oxid, and argues that such a solution can be used as a substitute for chlorine in the extraction of gold from roasted ores, and from ores which are free from sulphides.

THE De Lamar, Idaho, M. Co. silver producers, have promised their employees an advance in wages as soon as silver touches eighty cents. They in common with other silver producers are now paying all they can afford with silver at its present prices; it is only by close economy and careful management that any silver mining company in this country has been able to keep going for the last four years.

THE Bodie Con. Mining Co. will hold its annual meeting here next Monday when it is prophesied new directors will be elected and that there will be a change in the superintendency of the mine at Bodie. It is thought that the Bodie, Bulwer, Mono, Summit and Standard will be put under the management of the manager of the Standard Con. and an electric plant erected on the river about five miles below, or north of Brigeport.

THE United States Supreme Court has decided that there is no dower interest in an unpatented mining claim. In the Montana case of Mary A. Black vs. Elkhorn Mining Co., Judge Knowles of the U. S. Circuit Court at Helena made the first decision, which, while not revoking that ruling, was on review by Judge Ross of the U. S. Circuit Court of Appeals so construed, his opinion being affirmed on further appeal by the Supreme Court.

THOMPSON'S COLT, "who swam the river to get a drink," was of similar sagacity to the unequipped prospectors who went from California to northwestern Alaska in search of gold. Lured by the love of adventure more than any real hope of finding gold, many a poor fellow will suffer bitter hardship and privation before again seeing this golden State. The ultimate result may be of benefit to Alaska in securing population and developing natural resources.

A RESIDENT of Hoboken, N. J., has received a letter from Pres. Kruger through the German General Consulate at New York. The South African diplomatist declares "that emigration to the Transvaal republic, either from America, Germany or elsewhere, would not be advisable at the present time, as, on account of the well-known political troubles, commerce and industries are at a rather low ebb, and offer insufficient opportunities to make a living for newcomers."

USUALLY a local paper, in announcing a new mining development or the general prosperity of the place, winds up by warning all and sundry looking for work to stay away, saying that there are more men there now than can be supplied with work, but the Hailey, Idaho, *Times* says that last week Supt. Johnesse of the Lucky Boy mine tried to get miners, but was unable to secure the required number, even by advertising, and that that is one place where the demand exceeds the supply.

A DISPATCH of the 9th says Kuhn, Loeb & Co., bankers, have purchased for the Rothchilds 270,000 shares of the Anaconda Copper Company stock for the approximate sum of $7,500,000. This sale to the Rothschilds, in addition to the block of 30,000 shares previously purchased by them, places nearly half the stock of the company in their hands. J. B. Haggin, when seen in regard to the reported sale, said it had been consummated, but that the controlling interest in the company still remained in the hands of Americans.

WHEN exaggerated statements are made it is as easy to use superlatives as ordinary adjectives. Capt. Cowden and Mrs. Turner of Sitka, Alaska, are now reported to have discovered "a solid ledge of gold quartz 600 feet wide and over 3,000 feet long" in the N'Squashaisky Bay district, alongside of which "the great Treadwell ledge is a mere stringer." There is enough gold ore to keep "500 stamp mills going day and night for 100 years." Coming just on the eve of the great national nominating conventions this is important.

CONGRESS adjourned yesterday, and to the last Speaker Reed refused to recognize any member from California or anywhere else who wanted to move the passage of the Mineral Land bill. This is a temporary victory for the corporation, but next winter another effort will be made to secure justice. Post mortems are useless; just what killed the bill is thoroughly understood. The thanks of the California miners are due the California delegation and other members in the Senate and House who worked so hard for the passage of the bill.

ON the stage the farce, or curtain-raiser, precedes the main play. In Congress these things are reversed. This week, in the closing days just before adjournment, Congressman Hyde of Washington introduced a bill in the House for the classification of mineral lands in Washington, Pacific coast, identical in wording with the bill introduced by Representative Johnson of this State at the opening of the session, except that it applies to the State of Washington. The impossibility of any action being taken on it makes it unnecessary for Senator Mitchell of Oregon to prepare any amendment thereto.

ACCORDING to the *Silver Belt* at Globe, Arizona, a reduction of wages to $2.25 per day for all miners, car men and surface men was ordered last Saturday, whereupon all the employes struck, the miners demanding $3 per day, the discharge of all Mexican employes about the mines, and the abolishment of the monthly insurance fee, which, under pressure, was temporarily acceded to by Supt. Parnell till such time as the owners, who reside in Boston, could be apprised of the facts and determine whether they shall continue operations or close the entire plant. It is probable the mine will be closed down.

NOT since Moses smote the rock from which gushed the water in the wilderness has anything in that line been more remarkable than the report of the discovery of a flow of water on the Mojave desert. A ten-stamp mill is being built at Kane Springs, about thirty miles northeast of Mojave station. A shaft 6 feet square was sunk to obtain water for the mill. Last Tuesday the well was down 20 feet when, according to a Bakersfield account, the bottom seemed to drop out and the water came in so fast that workmen could scarcely get out in time to save themselves from a good wetting. In forty-five minutes the whole well was filled up, and the water was running over the top. This gives great abundance of water for mill work, and it can be run directly into the battery. The mill and spring are the property of O. B. Stanton.

THE Old Glory Mining and Smelting Co., 95 Milk St., Boston, Mass., may be an excellent concern, but its statements are a little strange. It claims to have several "world-beaters" in the shape of Idaho mines, publishes a statement of their value, certified to by the Idaho State geologist, and locates one mine in the same mining belt with the DeLamar. The fact that there is no State geologist in Idaho and that the mine in question is a hundred miles from the DeLamar, in a different mountain range on the other side of a valley fifty miles wide, makes it difficult to believe all that the Boston corporation claim.

BECAUSE a mine has been abandoned is no evidence of its worthlessness. It argues only that those who abandoned it did not have enough money or stick-to-it-ativeness to make it pay. Four of the biggest and best paying gold mines in the State were abandoned or allowed to lie idle for many years even after they had been worked and were profitable producers. Reference is made to the Rawhide, Tuolumne Co., the Utica, Calaveras Co., the North Star, Nevada Co., and the Kennedy, Amador Co. Times change in mining as in everything else, and gold mining in this State is just now getting on the same basis as any other legitimate business.

A REPORT lately drawn up by Dr. Lombardo on the sulphur mines of Sicily is so fearful as to be almost incredible. Dr. Lombardo says that in his province alone 5,000 children are employed in the extraction of sulphur, and that it is an established fact that they are literally "spurred" by their overseers to quicken their movements, some of the marks frequently remaining livid on the skin for as long as ten days. These brutal creatures will even burn the shins and calves of the children with their lamps to make them work faster, these burns constantly resulting in loathsome sores, which the doctor has often been required to investigate, as also the diseases to which they give rise.

CALIFORNIA has one form of gold mining as unique and distinctively her own as the giant trees, the flowers or the climate—drift mining. Countless æons of ages ago the channels of prehistoric rivers here ran rich in gold, where, capped with lava, the yellow metal is now found. Drift mining is sometimes expensive, usually slow and tries the endurance of the miner, but is nearly always profitable. In rare instances—as at the Thistle shaft, Gibsonville, Sierra Co., the gravel is reached through a shaft, but ordinarily the pay gravel is reached and the work carried on through a tunnel. Many a man has put in all his money and considerable time, only to find that when he got through the rim rock he was too high. Usually, the only thing to do in such a case is to begin over again, lower down.

DAVY CROCKETT was out hunting one day and had secured only one coon skin when he arrived at a backwoods bar very thirsty. The coon skin, or pelt, served as currency in that part of the country then, and Crockett handed over his one pelt in payment for his drink of whiskey. The bar-tender threw it behind the bar. That bar was built of logs and there were chinks between them. Crockett pulled the pelt out through one of the chinks and bought another drink. The operation was so successful that he repeated it a number of times. When he went away the bar-tender, thinking he had done a rushing business, started to count his pelts. He found only one. That is the way when a greenback draws a gold dollar out of the treasury. It goes out again and again through the chinks, returning for gold dollars, and at last the Government has just the same one pelt.

RECENTLY the bank at Weiser, Idaho, sent to the Crocker-Woolworth National Bank in this city for $500 worth of silver from the sub-treasury. The sub-treasurer said the silver must be obtained from the sub-treasury at Chicago. The sub-treasurer at that point returned the draft to Weiser and stated that "his office did not accept drafts or checks for any purpose whatever." The Idaho banker then instructed his New York correspondent to deposit $500 in cash with the sub-treasury in that city. This was done and the Weiser man was informed that the silver would be shipped from San Francisco. The banker waited for two weeks, and, as the silver did not arrive, he appealed to the assistant treasurer at Washington. This appeal finally brought the coin from St. Louis. It had taken just two months of persistent demands to force the administration to release $500 worth of silver, which the officials say the people do not want.

THE Superior Court of Placer county, Cal., sold at public auction on the 8th inst. what is known as the Irish & Byrne placer mine for $41,000. The mine is situated a mile and a half southeast of the town of Iowa Hill in that county. It lies between the Morning Star mine and what is known as the Big Dipper or Hoorman mine. The workings of these two important drift mines are close enough to the ground sold, to establish a belief that the rich channel worked in both of them, is continuous thoroughout the Irish & Byrne. The owners of the two mines were the only bidders. Columbus Waterhouse, the owner of the Hoorman mine, was the purchaser. The area of the ground sold is 115 acres, and it is estimated that it contains about 800 linear feet of the channel. The price paid amounts to something over $50 a linear foot of channel, and is a fair indication that the bidders estimate the probable gold yield at not less than $300 a linear foot.

A PRETORIA, South Africa, dispatch of the 10th inst. says: "The four leaders of the Johannesburg Reform Committee—Colonel Francis Rhodes, George Farrar, Lionel Phillips and John Hays Hammond—have offered the Government £40,000, to be used for charitable purposes, in exchange for their release. This action on their part has given rise to a slight misunderstanding, which may retard the settlement of their case a few days." A dispatch from Pretoria of the 11th says that Jno. Hays Hammond and his three companions have finally been released, upon their payment of a fine of $125,000 each and banishment from the South African Republic. Still another dispatch of the 12th confirms the news of their release, and fine, but says they are not to be banished. It is not likely, however, under the circumstances that any of them will care to remain. Since his confinement at Pretoria, Mr. Hammond has been paying his jailers $750 per month for the most ordinary necessities of existence.

THE shareholders of the Golden Feather, Butte Co., met in London on the 28th ult. The chairman in moving the adoption of the report said only poor returns had been made during the past year in consequence of the company having worked that portion of the river bed which was worked some thirty years ago by the miners of the Cape Union. They now knew that during the coming season the gravel they would work was up to the present time untouched. He believed they would have had better returns last year had the elevator been placed on bedrock. Financially, last year's work resulted in a loss of £2283. In a letter, dated May 1st, Supt. Evans reported very favorably on the outlook, and on May 27th, he cabled: "There is a favorable change in the weather; great heat now set in. The river is now rising; hope to be able to turn the river about the same as last year. We are doing all possible to expedite matters. The dry season is now upon us. Prospects of the season good. There is reason to believe returns will be satisfactory." The chairman said they had 6000 feet to 7000 feet of perfectly untrenched ground to work over, and Mr. Evans had informed them that one patch of rich gravel left by the old miners had yielded $4,800.

## The World's Greatest Gold Lode.*

To-day is in progress a more world-wide search for gold than has ever before been seen in all the ages that have passed since the history of our race began to be written. In times past there have been gold mining excitements in various countries, but they have mostly been confined to the region in which the mines are situated. Now, however, gold and gold mining seem to be that which is uppermost in the thoughts of the people of nearly all countries and nations, civilized and savage. All the world is out gold hunting. Fearless and enterprising men are at the front leading the way. The mountains and wilds of almost every known land on the face of the earth, however remote and savage, are being explored in search of the yellow metal. Neither the malaria of the tropics nor the ice of polar regions can turn back or terrify the invading armies of gold hunters. Everywhere bands of courageous and hopeful prospectors go "marching on."

The countries in which the greatest activity in gold mining is now seen are South Africa, America and Australia. The gold fields that have made most noise in the world—particularly in the leading cities of the Old World—in the last year or two are those of South Africa and West Australia. Australia, however, was only a fair second—South Africa was the grand field of European excitement until the late troubles at the Rand began. During the time of the opening of the mines of the Rand and other South African gold fields and the building up of great and flourishing mining towns times were bad and dull in the mining regions of the Pacific coast among those engaged in mining for the precious metals. Government has given silver a "black eye" and the demoralized miners who found their property wiped out and their occupation gone had not yet plucked up heart and turned their attention to mining for gold. Thus this country, which should have held the first place in the whole world in the production of gold, fell behind the new fields of South Africa, in which more activity was displayed and an almost unlimited amount of capital brought to bear. It is not because of the richness of the ores of South Africa that she has pushed a little way to the front, but because of the great number of mines opened, each of which is producing more or less gold. Along the edge of the Rand basin hoisting works and mills are planted two or three tiers deep.

Now, as it is the number of productive mines, big and little, that count in the grand total, the Pacific coast region must very soon surpass every known country in gold production. We have thousands and tens of thousands of veins of gold-bearing quartz in every State and Territory on the coast, from the borders of Mexico to the frozen regions of the Arctic, and as these are opened over thousands on thousands of square miles of fertile mineral belts, all that is now doing or ever can be done in the circumscribed area of the Rand basin will appear quite insignificant in comparison. What is wanted is a full awakening to the value of our possessions and the thorough development of the wealth of gold that lies hidden in our mountains. A start has been made in the work of opening up the gold veins of the Pacific coast region and, though it is little more than a start, already some wonderful discoveries have been made in all parts of the country, with a find of such rich mines at Cripple Creek, Colorado, that a boom has been started almost rivaling that seen in South Africa. At Mercur, Utah, another great auriferous deposit has been found that gives promise of building up a large and rich mining town. In both States there are probably lying untouched other gold belts that are equally rich—also in Idaho, Nevada, Arizona, and other sections—and to be equally productive only require the bringing to bear upon them of men and capital.

In every Pacific coast State and Territory are found veins of gold-bearing quartz that are wonderfully rich, also auriferous belts of considerable extent made up of systems of parallel veins, but the greatest field of America—indeed, of the known world, at the present time—is that of California. Just at present California may be a little behind one or two of the more famous regions of the world in gold production, but it is merely because of her long halt in the industry of mining—because of the many years during which capital was diverted from the mountain regions, when the development of mines almost ceased. The war upon the miners of California by the ranchmen of the valleys and the suspension of hydraulic mining under adverse decisions of the U. S. Circuit Court gave mining of all kinds a "black eye." With the defeat of the miners came an agricultural and horticultural boom during which no man of means thought of anything outside of speculation in ranch lands, orange groves, and irrigation schemes. Thus it happened that for a dozen years or more—nearly fifteen years—California was resting on her "ores," and her ancient honors. Men who had money left the mountains and went down into the valleys to participate in the boom in orange lands, while those who were left poor by the shutting down of the hydraulic mines eked out a subsistence by drifting in their gravel banks or by scraping over old bedrock. Here and there the old productive quartz mines in a few leading camps were at work, but little was anywhere being done for the development of new mines. Mining was under a cloud and at a discount. Groves of golden oranges for a time drove from the minds of men visions of nests of golden nuggets. The wealth of the mountain was sacrificed to the wealth of the valleys.

Recently, however, hydraulic mining, under certain conditions, has been resumed and in places a return of the prosperity of the olden days is beginning to be seen. The development of the quartz veins of the country has been commenced and already there is to be seen quite an awakening to the value of the golden stores of the mountains, so long slighted and almost ignored. At several points there is considerable activity in prospecting, resulting in the opening of new and valuable mines, but in hundreds of other places throughout the State where the indications are equally promising the lodes lie undeveloped. Also there are probably as many veins remaining to be discovered as are anywhere seen on the surface. There is no lack of mining ground in California. Within the borders of the "Golden State" alone there is room, in the quartz mines, and the hydraulic and drift diggings, for every miner of the precious metals now engaged in the industry on the Pacific coast. The great mother lode, which was formed contemporaneously with the upheaval of the Sierra Nevada range, extends in an unbroken line along the western slope for a distance of over 120 miles. It is not a single lode but a system of parallel veins forming a mineral belt in places twenty-five to thirty miles in width. Through this auriferous belt runs that which is known as the mother lode. It is the backbone of the system of parallel veins and by certain "ear-marks"—peculiar characteristics found in the wall rocks—it is traceable along nearly the whole western slope of the Sierra Nevada range. Through county after county it runs—Tuolumne, Calaveras, Amador, El Dorado, Placer, Nevada, Sierra, Plumas, Shasta, to where the Sierra Nevada and Coast ranges unite in Siskiyou, up near the Oregon line—constituting the richest, strongest and greatest single deposit of gold-bearing quartz in the known world. Along the mother lode, between Mariposa and Siskiyou, there is room for fifty such gold mining camps as that of Cripple Creek.

For years the great auriferous region has lain fallow, but the day is not distant when the whole belt along the course of the big central lode will swarm with miners. To-day in every county through which the big lode passes there is room on it and its accompanying veins for thousands of miners, while in several counties to the northward there still remains to be opened and worked, by hydraulic or other process, many rich gravel deposits with miles on miles of the channels of dead rivers under the lava-capped mountains to be opened up and drifted out. The prevailing opinion in the world at large is that the placers—the auriferous gravel deposits—of California were worked out years ago. This is a mistake. Most of the shallow diggings have for some time been exhausted, but in the big, deep gravel deposits and in the channels of the ancient rivers beneath the mountains there still remain hundreds of millions.

Experienced prospectors always expect to find large and rich veins of gold bearing quartz somewhere above rich and extensive placer diggings, the rule being the bigger and richer the placers the bigger and richer the vein or veins from which was thrown off the gold found below in gravel deposits. This being the case, nowhere in the world can there be found a more promising region in which to prospect and mine than that along the line of the mother lode, below which has been gathered more placer gold than from any other single gold field in the known world. When hundreds of millions in gold was dislodged from the croppings through weathering and erosion what must have been left behind in the veins themselves? There must lie in the lodes a still greater store of wealth than that brought to light by the chance action of the elements.

However, there is no uncertainty in regard to either the richness or permanence of the great California lode. At several points it has been sufficiently well prospected to show that it is everywhere fertile and reliable, though gold may not everywhere be found on the surface. At Grass Valley, Nevada City, Sonora, Angels, and other places, mines have been opened on the big lode that have yielded millions and are still paying as well as at first, some much better than when first opened. The fact that some of these mines have been worked from thirty to forty years and have attained a depth of over 2000 feet, without showing any indications of exhaustion, tells well for the permanence of the big vein. There is no reason why the lode may not be worked to the depth of 5000 feet, with the improved apparatus of all kinds now available.

Although the big lode is paying so richly and is so thoroughly prospected at a few old camps widely separated, there are in every county miles on miles along its course where little or nothing is being done in the way of opening mines upon it. In El Dorado and other counties to the northward great stretches along the vein are lying idle, though good prospects can be obtained at the very surface. Such claims as are located are mostly held by men who are able to do little more than the necessary assessment work; they were quite unable to procure machinery with which to do real development work. Along the range are many mines on which some work was done in the early days, and most of these lie much as when abandoned years ago.

In all the world there is no better place in which to mine than on the big mother lode gold belt of California. No richer mines can be found in any country on the face of the globe; the gold field lies in the midst of civilization; the climate is perfection; provisions of all kinds are abundant and cheap, and mining supplies can be easily and cheaply obtained. The man who runs away to South Africa, to frozen Alaska, or to the malarial camps of South America, while there is such a field for prospecting and mining here at home in the heart of California, is "wild as an Apache."

The big gold belt of California has a great advantage over South Africa, Australia, and most other gold fields of the world in its abundant supply of timber and water. Immediately along and above the lode are the inexhaustible forests of the Sierra Nevada range, from which may be cheaply obtained mining timbers and fuel. Then all along the range are creeks and rivers that rush down to the west to the great valley regions. Among the rivers may be mentioned the Feather, Yuba, American, Mokelumne, Stanislaus, Merced, San Joaquin and Kings. There are some smaller rivers and many large creeks and canyons that carry considerable volumes of water. All these rivers and creeks, on their way to the valley regions below, cut across the line of the mother lode, and as they have their sources in the high Sierras they are, in their downward course through the mountains, filled with falls and rapids, therefore an abundance of fall may be obtained on all the streams of the region for driving machinery by water power. By means of electrical transmission this power may be used in running the machinery of the mines and mills along the big lode. Indeed, electrical apparatus is already in use at some points, and much machinery is being run by power electrically transmitted. Eventually great numbers of dynamos will be strung along the rivers and creeks, and wires will convey power all about the mountains, making it available in places to which it would be impossible to carry water, for use in driving machinery. That he was unable to make water run up hill was always a matter of regret and humiliation to the miner of the early days; now, however, by the aid of electricity, we are able to lift a big water power from the bed of a river and set it going hundreds or thousands of feet above on a mountain top.

Had the great lode been made and planted to order, it could not have been more advantageously placed for cheap working. Then, with the new and powerful explosives, the machine drills and air compressors for use underground, improved winding gear for handling the rock, improved pumps for handling the water, and improved ore-reducing apparatus and concentrators, with new and cheap processes for the extraction of the precious metals from the pulverized quartz, hundreds of veins that could not be touched by the early miners may now be profitably worked. Mining ground on the mother lode will never be worth less than at present. The immense value of this greatest of all gold-bearing veins is just beginning to be understood, notwithstanding the millions on millions that have been taken out of it from mines opened on it here and there in years past, and the millions that it is still regularly yielding. Whoever now secures a paying mine on the great California mother lode may consider himself fixed for life; he will have a piece of property it will do to "tie to."

Although California has produced over $1,300,000-000 in gold, the source of this immense yield of the yellow metal up in the big gold belt along the mother lode has only here and there actually been tapped in accordance with the rules and methods of modern scientific mining. In other places, for miles on miles, where touched at all, it has merely been scratched over on the surface. Had the English a giant lode such as this of California in South Africa, Australia, or in any of their possessions, as well proved up in value as it is, both by the hundreds of millions taken from the gravel deposits below its croppings and the millions on millions that have been taken and are still being taken from the lode itself at a few points—had the English such a gold belt anywhere, it would be all town from end to end and in every part would be filled with swarms of people. The Comstock was packed with people in the bonanza days, though the productive portion of the vein was only about two miles in length; the mother lode would make fifty Comstocks. It may be thought that paying mines can only be found in the few places where the lode is now being successfully worked, but the immense amounts of gold mined in the whole tier of counties through which the big vein runs shows that it sent down to the placers about as much gold in one place as in another. At the south end Tuolumne

*Republished by general request from the issue of March 7, '96.

county has yielded about $220,000,000; Nevada county, toward the center, about $250,000,000; Sierra county, to the northward, about $200,000,000 and other counties in about the same proportion. These yields show that the great lode is alive and fertile through its whole course.

Outside of the main mineral belt of the mother lode are, in many places, independent systems of gold-bearing veins and many of these contain fine, paying mines. To the southward, in the southern counties, even in the desert regions, some wonderfully rich mines are being discovered and opened. In almost every part of California, in the mountains and foothills, gold-bearings quartz veins are found, and many of them constitute fine, paying properties.

To-day, a man may find any kind of mining he desires to engage in. Beginning with Placer county he may find big drift diggings all along up to Siskiyou, the ancient river channels beneath the lava-capped mountains, in many places, as Nevada, Sierra, Plumas and Trinity counties, being almost untouched. In Siskiyou, along the Klamath, are big hydraulic mines and also drift mines. Immense tracks of deep placer ground yet remain to be washed by hydraulic process, which is freely permitted along the Klamath. In this region are also fine paying veins of gold-bearing quartz. Many big foreign companies—French, English and German—are getting in here and buying up immense tracts of mining ground. They go for placer, drift, quartz—any kind of mines shown to be paying well.

In Siskiyou county is a region which this country should look after. It is an old lake basin which contains an auriferous conglomerate such as is found at the Rand in South Africa. The gold found in this formation is of the heavy, smooth variety, such as is obtained from the channels of the dead rivers. The deposit is very extensive. The western rim is seen to the east of the town of Yreka, and it has been traced north on that side a distance of twenty-five miles and there it enters what is known as the Cottonwood basin, in the southern part of Oregon. The conglomerate formation doubtless extends into the Cottonwood basin. The gold is found in a stratum of blue gravel which underlies the conglomerate. Parties who have examined this desposit say it is of the same character as that of the Rand. There is in this section of country a small system of lakes and it may be that the basin containing the auriferous conglomerate represents an ancient lake that was filled with lava-like material by some volcanic convulsion, the country being full of old cones and crates, or it may have been filled up by glacial action, as evidence of glacial erosion are abundant in all that region. Be this as it may, gold is gold wherever found, and here is evidently an immense [illegible] deposit that is worthy of critical examination by the best experts. We may have here at home a greater and richer golden basin than that which built up the big South African town of Johannesburg.

LEONARD LAKE IN MENDOCINO COUNTY.

CAMPING ON THE BANK OF THE SACRAMENTO RIVER.

## California Summer Scenery.

Our pictures suggest the season. One represents Leonard lake in Mendocino county, not very widely known out of its own region, but worthy to be described as the "daintiest of mountain mirrors." It belongs to the coast lake category—lakes hid among the hills and mountains of the Coast Range, with a beauty quite their own and quite distinct from the higher mountain lakes of the Sierra Nevada. Many California lakes are almost unknown to the State at large. The half dozen which the ordinary person can readily name are but a tithe of our lacustrine resources, which will come into greater prominence as the State advances in population. The joy of life beside a lake, mankind has known from the earliest times. In fact, some of the oldest relics of the race are from the prehistoric lake dwellings.

The other picture is demonstrative of the fact that California has not alone rivers of great volume, but of marked picturesqueness. Those who know only the lower stretches of our greatest rivers, where they flow sluggishly through marshes wide as the eye can reach, are prone to declare that California rivers have no beauty of bank nor of crystal flood. It is not in their debasement that our rivers are beautiful, for in such estate they are little more than deep, navigable canals; but higher up their banks are well defined, clad with delightful garb of tree and vine and shrub, and with sandy bars and shelving banks at short intervals which court the keel of the canoe and the foot of the bather. Higher still, in stretches of rocks and rapids, they tempt the most venturesome angler to the charming peril of his sport.

---

THE industry of mining for the precious and superior metals is one of the earliest pursuits established by man, and in remotest periods, as at the present time, added much to the wealth and pleasure of many nations. It was not the masses, however, that profited then, as the operatives were mostly slaves and the beneficiaries were either of noble blood or enjoyed exceptional political advantages. The most extensive ancient mining of which there is any authentic record occurred 2,500 years ago. The mines were known as the Laurium, situated near Attica, Greece, and were actively worked for about 170 years, when the operations were brought to a sudden termination by the Peloponessian war, which afforded the slaves an opportunity to rebel and cease work. During the greater portion of the period that the mines were worked, it is estimated that 15,000 slaves were employed, some 2,000 shafts sunk averaging 250 feet in depth, and a product recovered in silver and lead, calculated at the present market value of these ores, of over $340,000,000. The mines were operated under control of and by the State.

---

SOME queer reasons have been given for strikes, but the queerest is reported from England. A British trade union has refused to work with men who rode to their work on bicycles, on the ground that they have an unfair advantage in being able to work longer at the shop and get home at the same time as those who walk.—American Manufacturer.

### The American Steel Pool and Welsh Tin Plate Makers.

The news as to the American steel pool whereby the price of sheet and tin bars has been advanced $5.50 per ton, bringing up the price to $22.25 per ton, has been received with a good deal of comment by the Welsh tin plate makers, and some of their views upon the matter may not be uninteresting. They point out that American quotations for black plate have been advanced in sympathy with the advance in billets, and that this has brought forth the statement from American makers that thirty-five to forty tin plate factories will have to close, and it is further stated that $3 a ton on the price of billets is sufficient to enable Welsh makers to undersell Americans, and if the steel pool holds together long enough the Americans will tire running at a loss in the hope of better things. Before the operation of the steel pool the price of steel in Wales and America was nearly the same, but it is now estimated that the difference in the price of labor and billets will be equal to $5 a ton against the Americans. But the tariff on a full weight box of plates would be $24. Notwithstanding this, Mr. P. H. Loughman (one of the oldest tin plate makers) has expressed the opinion to the interviewers that if the steel pool should be a success it will not be ninety days until most of the American tin plate factories are closed. This gentleman, in the course of an interview, explains, what has often been asserted in Wales, that American makers are selling tin plates much under cost without knowing it. Speaking of himself, he said: "I have been in the rolling business for many years, and I know just what it costs to operate a mill. Men who have just started in the business have no knowledge of fixed expenses, and they can undersell me because I prefer to let my works stand idle rather than run at a loss. I have made practically no tin plates for nine months. I have sold as low as $3 36 a box. I was asked to deliver plates at $3.25; I declined, as I know that plates cannot be delivered from Wales for less than $3.40. When I make 6000 tons of plates a year, my fixed expenses are $6 a ton; if I do not do as much, they are more than that. By-and-by some will be sold out by the sheriff, and men of experience will buy their works at half what they cost. If the steel pool is a success, this will not take a deal of time. I bought steel billets to-day at $20." From the above showing the American tin plate trade may be said to be in desperates straits. What has been long felt in Wales is that if American plates were sold on a sound commercial basis, even with the tariff, Welsh plates would hold much of the market. One of the results of the steel pool will be to make business touch real bottom sooner. Thus its operations become a matter of paramount interest to South Wales.

The Welsh tin plate manufacturers are pointing out that Americans now claim to have ready for operation 172 mills, and sixteen more are said to be in course of construction. Seventeen new mills were completed last quarter of the total of 172 mills, thirty-four were reported to be idle, thus 138 mills were shown to be at work. This number of mills turning out the same proportion of work as is done in Welsh mills would produce at the rate of 3,874,400 boxes, or about one-half the largest number of plates imported from Wales in one year. From this showing it may be taken that Americans are able to supply themselves fully, except for plates used in the oil trade and packed exported tin goods, upon which rebate is allowed. Whilst the Americans claim to have 172 mills, they have no more than 179 tinning sets, and 2801 of these are said to have only been running from 40 to 75 per cent of their capacity. Thus it is seen that they have practically one tinning set to every mill. This is certainly a much lower proportion of sets to mills than prevails in Wales. Of course this may be explained by the production of black plates. But it may also be taken as circumstantial evidence that the make of the American mills does not average that of Welsh mills. That American plates are rapidly supplanting Welsh tin plates is clearly shown by the Board of Trade returns. The returns for the year 1895 showed that we sent to America the work of 170 mills, in January of this year the work of 117 mills, February the work of seventy-one, and March the work of eighty-nine mills. This goes far to prove that our trade with America has been largely supplanted. But the fact that thirty-four mills are idle is in itself a proof that matters are not much better in America than here, and the feeling in Wales is that at present it looks very much as if Americans, through their tariff legislation, have injured us without benefiting much by the trade which they have fostered at so much expenditure.—English Corr. American Manufacturer.

### Practical Experience With the Patio Process.

Where the climatic conditions allow of treating ores by amalgamation in the open yard the patio process by reason of the influence of the sun's heat the year round where the wages are low enough, as is generally the case in these regions, has certain advantages over amalgamation by pans for the extraction of silver alone, which may be stated thus: The quantity of pulp represented by a lot to be treated in a patio is generally between 300 and 500 tons sluiced out from the depot; such accumulated pulp at one time making a more uniform mass, both as to mixture of fineness, consistency, assay value and composition of the various characters of the ores similar to custom mills. The larger and longer contact with the air admits of oxidation of the iron in the pulp, especially where the mass would be in a dry state, not feasible in tanks as used in pan mills, the cost of wichh with the housing is excessive. The successive admixture of the materials according to the daily spoon and fire assays and according to the actual requirements of the lot in connection with the exact knowledge of quantity and values, proves more economical in itself and especially with regard to the loss of quicksilver, which could get floured only by gross carelessness. The more recent use of hyposulphites in part and in lieu of salt is a time-saver to one-fourth the former period employed in working, and the cost with the whole mass extended on a floor with cheap labor—less than divided up in pan charges of one to one and a half and two tons, kept in motion and having to be heated during most of the time required. It would take one hundred pans to treat, say, 200 tons daily, while with the patio there is no such trouble or any expense for a plant depending only on the crushing and grinding capacity. The principal advantage is the higher output of the silver contained in the pulp compared with that of the pans, dependent, however, on the character of ore. The proportion in time between one way and the other is as many days in the patio corresponding to so many hours in the pans. The dissolution and action of the chemicals in the former on the pulp may not only be regulated at will but abandoned to the influence of natural heat and just as desirable for the higher percentage of output of valuables in silver from the ore credited generally with five to ten per cent more, against which the interest means only a trifle on the capital. Where gold is associated with the silver it depends entirely on its character and previous saving as to what remains either by patio or pan process. For silver, where time and the natural heat does the work of steam and where labor is a small item all the year round, practice will be in favor of the patio compared to pans, which must be imported and put up at great cost of running partly because of the general want of fuel in those regions in high altitudes.

## Scientific Progress.

### The Modern Theory of Light.

By PROF. OLIVER J. LODGE.

We are living not in a Newtonian but at the beginning of a perhaps still greater era. Greater, not because any one man is probably greater than Newton, but because of the stupendousness of the problems now waiting to be solved. There are a dozen men of great magnitude, either now living or but recently deceased, to whom what we now know towards optical generalizations is in some measure due; and the epoch of complete development may hardly be seen by those now alive. It is proverbially rash to attempt prediction, but it seems to me that it may well take a period of fifty years for these great strides to be fully accomplished. If it does, and if progress goes on at anything like its present rate, the aspect of physical science bequeathed to the latter half of the century will indeed excite admiration, and, when the population are sufficiently educated to appreciate it, will form a worthy theme for poetry, for oratorios, and for great works of art.

To attempt to give any idea of the drift of progress in all directions, to attempt to explain the beginnings of the theories of elasticity and of matter, is not admissible. I will limit myself chiefly to giving some notion of what we have gained in knowledge concerning electricity, ether and light. Even that is far too much; I must confine myself principally to light, and only treat of the others as incidental to that.

For now well nigh a century we have had a wave theory of light; and a wave theory of light is quite certainly true. It is directly demonstrable that light consists of waves of some kind or other; and that these waves travel at a certain well-known velocity, seven times the circumference of the earth per second, taking eight minutes on the journey from the sun to the earth. This propagation in time of an undulatory disturbance necessarily involves a medium. If waves setting out from the sun exist in space eight minutes before striking our eye, there must necessarily be in space some medium in which they exist and which conveys them. Waves we cannot have unless they be waves in something.

No ordinary medium is competent to transmit waves at anything like the speed of light, hence the luminiferous medium must be a special kind of substance, and it is called the ether. The *luminiferous* ether it used to be called, because the conveyance of light was all it was then known to be capable of; but now that it is known to do a variety of other things also, the qualifying adjective may be dropped.

Wave motion in ether light certainly is; but what does one mean by the term wave? The popular notion is, I suppose, of something heaving up and down, or perhaps of something breaking on the shore in which it is possible to bathe. But if you ask a mathematician what he means by a wave, he will probably reply that the simplest wave is

$$y = a \sin (pt - n x)$$

and he might probably refuse to give any other answer.

And in refusing to give any other answer than this, or its equivalent in ordinary words, he is entirely justified; that is what is meant by the term wave, and nothing less general would be all-inclusive.

Translated into ordinary English the phrase signifies "disturbance periodic both in space and time." Anything thus doubly periodic is a wave; and all waves, whether in air as sound waves, or in ether as light waves, or on the surface of water as ocean waves, are comprehended in the definition.

What properties are essential to a medium capable of transmitting wave motion? Roughly we may say two: *elasticity* and *inertia*. Elasticity in some form, or some equivalent of it, in order to be able to store up energy and effect recoil; inertia, in order to enable the disturbed substance to overshoot the mark and oscillate beyond its place of equilibrium to and fro. Any medium possessing these two properties can transmit waves, and unless a medium possesses these properties in some form or other, or some equivalent for them, it may be said, with moderate security, to be incompetent to transmit waves. But if we make this latter statement one must be prepared to extend to the terms elasticity and inertia their very largest and broadest signification, so as to include any possible kind of restoring force, and any possible kind of persistence of motion respectively.

These matters may be illustrated in many ways, but perhaps a simple loaded lath, or spring in a vice will serve well enough. Pull aside one end, and its elasticity tends to make it recoil; let it go and its inertia causes it to overshoot its normal position; both causes together cause it to swing to and fro till its energy is exhausted. A regular series of such springs at equal intervals in space, set going at regular intervals of time one after the other, gives you at once a wave motion and appearance which the most casual observer must recognize as such. A series of pendulums will do just as well. Any wave-transmitting medium must similarly possess some form of elasticity and of inertia.

But now we proceed to ask what is this ether which, in the case of light, is thus vibrating? What corresponds to the elastic displacement and recoil of the spring or pendulum? What corresponds to the inertia whereby it overshoots its mark? Do we know these properties in the ether in any other way?

The answer, first given by Clerk Maxwell, and now reiterated and insisted on by experiments performed in every important laboratory in the world, is:

The elastic displacement corresponds to electro-static charge (roughly speaking, to electricity).

The inertia corresponds to magnetism.

This is the basis of the modern electro-magnetic theory of light. I will next illustrate electrically how this can be.

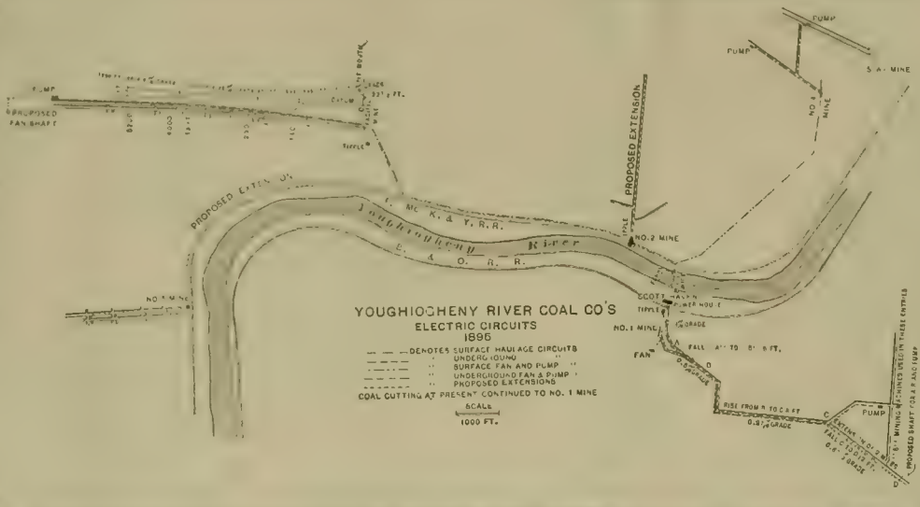
(*To be Continued.*)

A CURIOUS SUBJECT for investigation is proposed by T. L. Patterson, who contends that persons migrating from temperate lands to hot, or even from hot to temperate may become quickly and safely acclimatized by inoculation with the blood of healthy natives, the theory being that such inoculations set up in the blood of the foreigner the changes necessary to render him immune to diseases due to the climate. Blood-brotherhood, as practiced in central Africa, consists in drawing blood, from an incision in the right wrist, and smearing a little of it over a similar cut in each of the other participants. Europeans generally have evaded blood-brotherhood, so that little concerning its physiological effects is to be learned from past experience, but Stanley is said to have undergone the operation fifty times, causing Trumbull to declare that the blood of a fair proportion of all the first families in equatorial Africa now courses in Stanley's veins, and it is inferred that his endurance and success may in large measure be attributed to this exchange of blood with the natives. Britain has in this the means of working out new conquests in Africa. But to Gen. Weyler is given the grandest opportunity, for he may satisfy the demands of humanity by sparing Cuban captives as subjects of blood-brotherhood with Spanish soldiers and at the same time serve his followers and the cause of science by establishing the true way to outwit malaria and fever.

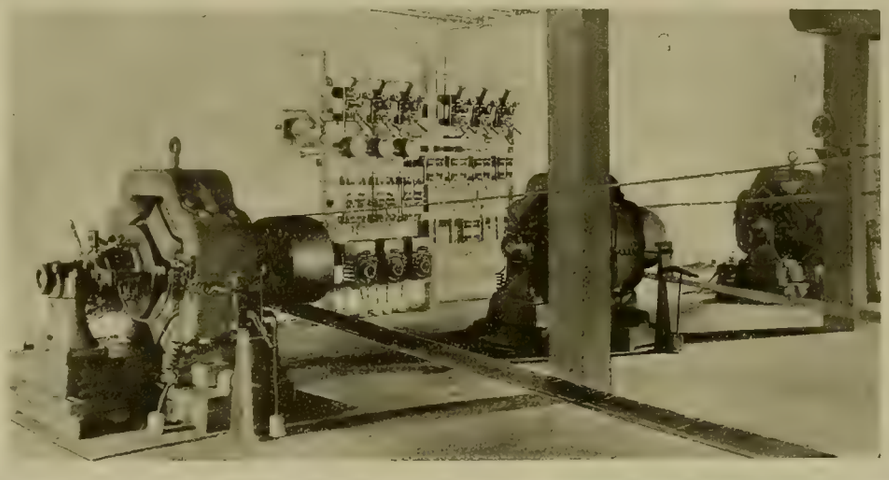
AN expert telegrapher says: "Between New York and Philadelphia, over a copper wire weighing 300 pounds to the mile, 3000 words per minute can be recorded, and with a copper wire of 850 pounds to the mile 1000 words per minute can be carried from New York to Chicago."

# Electrical Progress.

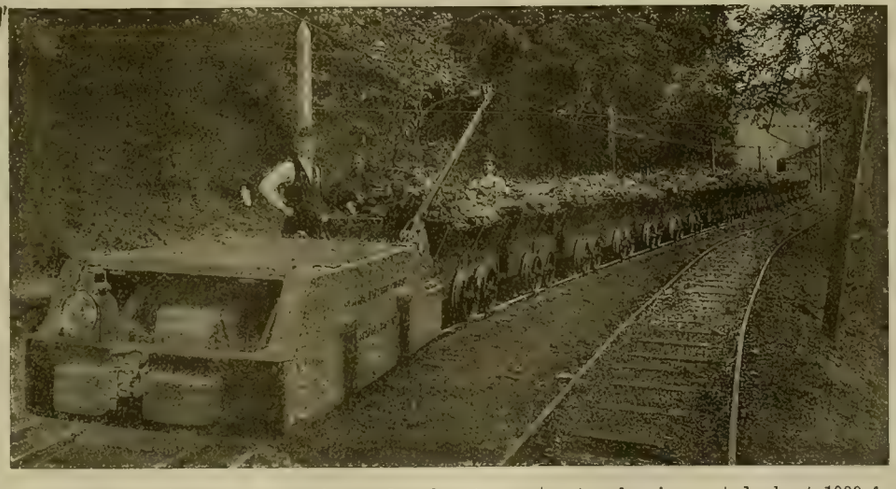
### Coal Mine Electric Plant.



One of the most interesting electrically operated coal properties in the Pennsylvania field is that of the Youghiogheny River Coal Company at Scott Haven, Pa. The mines in which the different machines, driven by electric power, are installed are scattered over a large extent of territory, the map showing the different openings.



The power house is located on the east side of the Youghiogheny river, contiguous to the line of the B. & O. R. R. It was formerly a bonded warehouse and contains not only the machinery, but also the stores and offices.



In the boiler house are three 66-inch x 18-feet tubular boilers, each containing fifty-eight four-inch tubes in diameter. Each boiler is coaled through a chute, is independent and has its own stack. Water is pumped from a well 130 feet deep, and that which is not immediately used is stored in tanks.

The engine room is 74 feet long by 54 feet wide and is separated by a brick wall from the power house. The engine installation consists of three automatic engines, each 15x16-inch, with 72-inch fly wheels running at 240 revolutions. Each engine is belted to a four-pole, 650-revolution, 100 K. W. general electric generator, wound for 500 volts and over compounded for 10% loss in the line. The engines and dynamos are erected on brick foundations. The current from the generators is carried under the floor to the switchboard over heavily insulated cables laid on porcelain insulators.

The switchboard is of the skeleton type, divided into two parts—one for the generators and one for the feeders—on a plan similar to that used in the ordinary electric railway stations. The generator board carries three automatic circuit breakers, three circular dial Weston ammeters, three main double-pole, double-throw switches and three field rheostats. The volt meter is carried on a bracket on the side. The arrangement of the switchboard is such that the plant may be run under the most economical conditions and every precaution is taken against stoppage in its operation. Two sets of circuits are run, one of which is grounded for haulage work and the other metallic for the fans, coal cutters, etc. Any machine may be run on either the metallic or the grounded circuit, and any two or all three may be run in multiple on either circuit. The feeder switchboard carries an automatic circuit breaker for each of the haulage circuits, a double-pole switch for each pump circuit, fan circuit and the coal-cutter circuit and a double-pole switch for throwing the metallic and grounded bus bars into multiple. Lightning arresters protecting the generators are placed behind the switchboard. From the power house the circuits for No. 1 mine are run on poles to the mine mouth. This mine is about 900 feet from the power house, and the circuit is used to drive fans, pumps, locomotives and coal cutters.

Mine No. 1 is provided with a triplex pump, 6½x8 inches, driven by a 7½ H. P. multipolar motor. The pump, motor and rheostat are mounted on an iron truck and may be run over the track from place to place in the mine.

The electric locomotive operated in this mine has a length of haul a little over a mile and a quarter. The grades vary from 1% against loads to .25% in their favor. The track is laid in thirty-pound rails, with a gauge of 43½ inches. The overhead construction is of the regular mining type. The pump and haulage circuits are all grounded.

In No. 4 and the Southwest mines, electricity is applied to pumping purposes only. The pumps are triplex pumps similar to those in No. 1 mine, and are driven by two multipolar slow-speed motors of 10 and 7½ H. P. respectively. These pumps are about 8000 feet away from the power house.

In the Pacific mine the haulage is effected by a locomotive, having a drawbar pull of 2500 pounds, with a length of haul of about 5000 feet underground and 800 feet in the open. This mine also contains a pump, similar in size to that in No. 1 mine, driven by a 7½ H. P. motor, located about 16,000 feet from the power house. A 30 H. P. motor fan is erected about 1000 feet beyond the pump. The installation of the electrical apparatus in No. 5 mine is not yet completed.

In the new steel tipple of No. 1 mine a 7½ H. P. motor drives a revolving screen and runs an emery wheel for sharpening bits, etc. The installation of electricity in this mine has proved of more than considerable benefit from every point of view. The two locomotives have displaced eighteen mules and their drivers.

The entire electrical apparatus used in the power house and in the mines, with the exception of the coal cutters, is of the General Electric Company's manufacture. This company has over fifty of its mining locomotives in operation in different mines in the country.

# Mechanical Progress.

### Acetylene, the New Light.

In electrical science, both ancient and modern, the present subject is the most important in its class. The value of acetylene as an agent in supplying both light and motive power was first made practical by Mr. Thomas L. Willson at Spray, North Carolina, while making some experiments with aluminum in an electrical furnace. This occurred in 1888. A mixture of burnt lime and coke dust were fused together between the poles of an electric arc. The mass, when cooled down, presented a brown crystalline compound, which was thrown away as refuse. By accident some water came in contact with the discarded slag, and immediately from this chemical affinity a gas was evolved, capable of producing a light of such intense brilliancy and power as to cast in shadow the electric arcs near by.

The elements which enter into the manufacture of acetylene are coal or coke dust, lime, water and electricity. Acetylene as a solid is known as calcium carbide. It contains in 100 parts 37.5 parts carbon and 62.5 parts calcium. One pound of carbide will generate 5.89 cubic feet of the gas; 100 pounds of calcium carbide and 56.25 pounds of water will produce 40.63 pounds of acetylene gas, in the ratio of 92.3 parts carbon and 7.7 parts hydrogen. Commercially considered, acetylene can be generated either directly from calcium carbide by being decomposed with water, or from the liquefied gas when stored in suitable receivers. The liquefied gas is manufactured commercially by decomposing the calcium carbide with water in a closed vessel and conducting the gas generated under pressure to a condenser where it liquefies and is then drawn off in tanks ready for use.

When in operation it burns with a clear white flame, odorless, as well as colorless. From burners of the same size the amount of oxygen withdrawn from the atmosphere of a room by acetylene, as compared with the ordinary city gas, is in the ratio of 1 to 6. Consequently, the new gas consumes only one-sixth as much of the oxygen in a room as coal gas, without rendering the air of the room impure to the same extent. In case of leak, it emits a pungent odor, which is easily detected. In temperature it is about the same as the electric light, and from recent tests stands at 900° Centigrade to 1400° Centigrade for the common gas light. Hence, acetylene has the advantage, as an illuminant, in throwing out much less heat than the ordinary gas light. In quality it is the most perfect light produced by human skill. In character like sunlight, since it emits the same light, proportionately, as the sun, therefore objects retain their natural color in its presence. No special knowledge is required for its use. An entire street in one of our large cities is already lighted by this gas. No main pipes are required for its distribution. A cylinder filled with the liquefied product is placed in the hollow of the lamp-post and connected by pipe with the burner. As an illuminant 1,000 cubic feet of acetylene is equivalent to 12,500 cubic feet of coal or water gas. Thus, the former (acetylene) is 12½ times as powerful as the common gas, and when burned at the rate of 5 cubic feet to the hour, is equivalent to 250 candles. As a solid in the form of carbide, it can be shipped long distances without impairment. As a gas it can be generated from carbide and applied accordingly. As a liquid, it can be utilized in the lighting of railway and streetcars, steamships and sailing craft, as well as bicycles and all other vehicles. For the isolated lighting of public and private buildings it stands unequaled.

As an example of cheapness it stands unique. At the present time it is manufactured at the low figure of $20 per ton. To quote from a reliable authority: "It is now thought that calcium carbide will eventually be produced at a cost not exceeding $5 per ton." To make the revolution most complete,

the old gas and electric light companies represented in the larger cities of the East are buying up the stock, while companies are forming everywhere, at home and abroad. Though it is chiefly as an illuminant that acetylene is heralded at the present hour, its capacity for caloric or motive power need not be overlooked. For cheapness, cleanliness and compactness it stands unexcelled by any known rival in the commercial world.

I. W. TUCKER.

413 Powell St., S. F., June 8, '96.

### Tin Smelting in Singapore.

Messrs. McKillop and Flower, at a recent meeting of the Institution of Civil Engineers, London, presented a paper giving an account of the first successful attempt of a European company to compete with the Chinese in smelting the alluvial tin ore of the Malay States, deposits of which had long formed the chief source of the metal. The works of the Straits Trading Company are situated on Pulo Brani Island, about three miles to the southwest of Singapore, and they cover an area of about eight acres. The greater part of the ore is bought in various parts of the native States and is shipped to Pulo Brani. The subsequent treatment of each parcel of ore, which is weighed on arrival, is determined by assay. The quality of the tin produced depends largely upon that of the ore smelted; and, in order to throw some part of the duty of eliminating the impurities upon the miner, the price of the ore is made to depend not only upon the amount of metallic tin it contains, but upon the nature of the impurities present, which consists chiefly of mispickel, copper pyrites and iron pyrites. Ores containing arsenic or sulphur are roasted at least once in a furnace of the "blind roaster" type, and those containing copper are allowed to stand for a considerable time between the roastings to allow the copper sulphate to drain off. The furnaces are of the ordinary reverberatory type. Their distinguishing feature is the method by which the difficulty accruing from the leakage of the molten metal has been overcome. A vault containing eight feet of water has been introduced below the bed of the furnace, and in it any tin which escapes is granulated and its further passage checked. The vault is pumped dry once a week, and the granulated metal recovered. The bed is of firebricks with ground faces, forced tightly together by screw-jacks to make the joints, and is carried by rails supported at their outer ends by the walls of the furnace and at their inner ends by a heavy iron rail placed longitudinally along the center line. The float into which the metal runs when the furnace is tapped is of wrought iron or steel lined with firebrick.

The metallurgical processes employed consist of: Smelting ore, with the production of rich slag and "ore metal;" smelting rich slag, with the production of poor slag, and "rough metal;" treatment of poor slag containing tin as prill; and refining the metallic products of the three first operations. For smelting ore the charge is made up by mixing it with about 14 per cent of culm or anthracite, about 3 per cent of refinery dross, and the time required for smelting is about eight hours. From a four-ton charge of such composition about 47 cwt. of metal, containing about 99½ per cent of tin and about 29 cwt. of rich slag, containing about 35 per cent of tin, would be obtained. Rich slag can be smelted with excess of scrap iron to produce "hard-head" and poor slag, or with culm and sufficient iron to decompose the tin silicate. A combination of these methods is also used, by which hard-head is first produced by excess of iron, and is subsequently smelted with more rich slag. The rough metal dross, containing iron oxide and tin oxide, resulting from the refining of the metal from slag, has to be worked up continuously. The rich slag is, therefore, smelted with culm and rough metal dross, producing rough metal and poor slag, or rough metal dross is used to replace hard-head in the second process. The authors urged the great need for improvement in tin smelting, perhaps the oldest and the most backward of English industries.

---

AT the close of 1895 the Scientific Library of the United States Patent Office contained records of 981,961 patents issued by foreign countries, of which 647,600 are published in full with drawings, 178,150 in abstracts and 114,000 by title only. In the twenty-five years from 1871 to 1895 inclusive, the total number of United States patents rose from 98,460 to 531,619. Of the latter number, plows claim 10,342; cultivators, 10,334; threshing, 4260; tobacco, 2362; bleaching and dyeing, 1579; chemicals, 1203; medicines, 1357; surgical appliances, 3470; dentistry, 1351; railways, 9378; electric generation, 3117; electric railways, 2019; electric lighting, 3622; electric signalling, 1934; telegraphy, 3205; telephony, 2459; hoisting conveyors, 1235; hydraulic motors, 2642; baths and closets, 3481; filters, 1326; pipe couplings, 1470; air and gas engines, 1141; projectiles, 2127; firearms, 4469; pumps, 1196; stoves and furnaces, 18,972; grinding machines, 2718; artificial stone, 1198; paper-making, 3379; typewriters, 1204; spinning, 2379; sewing machines, 6214; wood-sawing, 4404; wood-working, 5675; horology, 3746; photography, 1545; railway brakes, 3061; car couplers, 6500; bicycles, 2621; ships, 2826; electric power, 1183; elevators, 1726. During the last twenty-five years twenty-five persons have been granted more than 100 patents each, or an aggregate of 4894. Thomas A. Edison received the highest number, 711; Elihu Thomson, 394; Francis H. Richards, 343; Edward Weston, 274; Charles E. Scribner, 248; Charles Van Depoele, 244; Rudolph M. Hunter, 228; George Westinghouse, Jr., 217.

---

UNITED STATES CONSUL PARKER at Birmingham, England, has contributed to the State Department a special report on the remarkable development of business of making of steel tubing at that place, caused by the increase in the use of the bicycle. Incidentally he tells of a shrewd Yankee business transaction which has placed the British bicycle makers in a bad plight. The American manufacturers, foreseeing a great demand for wheels, not only purchased all of the stock of steel tubing on hand in England, but gave orders that engaged the output of many of the factories for a long time to come, so it happened when the "craze" struck England, the British bicycle makers found that they had been caught napping and were short of material. Immediately there was a rush to start up new steel tube plants, and so many have been projected that overproduction is feared in the end, but meanwhile there is a stringency. To show the extent of the increased export of this tubing to the United States, the consul says that while the entire export of 1894 was $85,899, that for the first quarter of this year amounts already to $231,200. Meanwhile there has been a great decrease in the exports of finished British bicycles to the United States, and their value has fallen from $478,810 in the first six months of 1893 to $90,968 for so much of the current year as has expired.

---

ALEXANDER DECK, an English steel manufacturer, proposes to work steel in a new way and force it through a hole, instead of running it through grooved rollers. He recently described his process before the Iron and Steel Institute of Great Britain and claimed it to be a success. He uses a hydraulic press. The dies through which he forces the metal are made of steel, hardened by tungsten. The container is composed of concrete layers of steel and non-conducting material. The plunger or piston which exerts the pressure is smaller than the bore of the cylinder. In front of it is placed a block, fitting loosely and previously heated almost to the temperature of the charge. Between this block and the plastic metal is a thin elastic washer, that closes the crevice when pressure is exerted. Thus the soft metal is prevented from escaping otherwise than through the hole in the die.

## Practical Information.

### Rope and Belt Transmission of Power.

Repeated experiments have proven, in the transmission of power, ropes and belts, when well arranged, absorb almost the same amount of power. Some French trials, which have attracted attention, were made with a 200-horse power engine, fitted with rope and belt fly wheels 14¾ feet in diameter. The steam engine had a fly wheel for the belt and one for the ropes. The dynamo was driven direct off the fly wheel without a countershaft, and was provided with two pulleys, one for the belt and one for the ropes, and the dynamo was mounted on adjusting screws, so that the tension of the belt or ropes could be regulated at will. A cotton belt, a leather belt, a homogeneous leather belt and ropes were ordered from standard makers. Experiments were made alternately with ropes and belts, several tests each day.

The trials being comparative, and the double fly wheels allowing alternate runs with ropes and belts, it was assumed that the mechanical efficiencies of the engine and dynamo would not vary during the experiments. Greatest care was exercised to secure exact results. A set of indicator diagrams was taken every ten minutes. With a constant resistance the power expended in the several modes of transmission was as follows:

| | *Gross Power. I. H. P.* | *Slip per cent.* |
|---|---|---|
| Ropes | 158.54 | 0.33 |
| Cotton belt | 159.67 | 0.78 |
| Leather belt | 158.84 | 0.96 |
| Leather belt | 160.23 | 0.78 |

The diameters of the pulleys were measured at the surface and line of contact. Stated in percentage value, and allowing for the variation in the mean load, the results were:

| | *Gross Power.* | *Slip.* |
|---|---|---|
| Ropes | 100.00 | 0 100 |
| Cotton belt | 100.87 | 0.237 |
| Leather belt | 100.37 | 0.292 |
| Leather belt | 101.07 | 0.237 |

During the trials with ropes the tension gear was not used; but it was employed more or less throughout the belt trials, under the control of the belt makers, who regulated it as they pleased while running. The linear speed of the belts and ropes, and their tension per square inch of cross-section, were very nearly the same. Thus the linear speeds at the surface of contact with the pulley and the corresponding tensions were as follows:

Ropes ran at 66.9 feet per second under 156.5 pounds per square inch.

Cotton belt (Lechat) ran at 67.2 feet per second under 177.5 pounds per square inch.

Leather belt (Lemaire) ran at 67.1 feet per second under 133.5 pounds per square inch.

Leather belt (Domange) ran at 67.3 feet per second under 156.1 pounds per square inch.

The needle of the voltmeter was practically steady with the ropes, while with the belts it oscillated through one or two divisions Though sufficient at times to render the reading difficult, the oscillation did not cause any fluctuation in the light. As it coincided exactly with the passage of the belt joint over the pulley, it proves the importance of making good joints.—Engineering Mechanics.

---

THE *American Machinist* has done the public a service in exposing the operations of parties operating from Cleveland, O., as headquarters and disposing of low-grade oils by crooked methods. The first exposure was made some time since; but it failed to put an end to the business. The oil sharps have simply invented new names for their supposititious companies, and sought customers in lines of business that had not been worked before. The plan of operation is as follows: A letter is sent to some mill or factory owner stating that they have a barrel or half barrel of oil in his neighborhood, shipped to some party who has been found to be unsafe, financially, and consequently the oil has not been delivered. Rather than have the oil reshipped to Cleveland, they make a temptingly low price. The oil comes (straight from Cleveland), and proves to be miserable stuff, not worth anything like the price paid for it. This old game is being worked with more or less success by a number of concerns, all doubtless mere aliases of one or two men, and because we have reason to believe that they are working the public. It will be well to ignore all offers of oil at a near-by station at cut prices. This dodge of oil at a low price to save reshipment has been practiced for at least fifteen years, at one time and another, and in different places.

### Procuring Water.

Water is produced in various ways in different parts of the globe. The explorer Condreau, for instance, found some time ago, while wandering among the Tumuc-Humac mountains, in the western part of Guiana, that it was not necessary for his men to descend to a creek when they wanted a drink of water. A vine known as the water vine is found all through that region. It yields an abundant supply of excellent drinking fluid whenever it is called upon. This vine grows to a height of from sixty to ninety feet. It is usually about as thick as the upper part of the human arm. It winds loosely about trees, clambers up to their summits, and then falls down perpendicularly to the ground, where it takes root again. The natives cut this vine off at the ground and then, at a height of about six or seven feet, they cut it again, which leaves in their hands a very stout piece of wood a little longer than themselves. In order to obtain the sap they raise the lower end of the vine upon some support and apply the upper end to their mouths.

Six feet of the vine give about a pint of water, which quenches thirst as effectively as water from the most refreshing brook. The bushmen in the Kalahari desert often live scores of miles from places where water comes to the surface. During a certain part of the year sharp storms pass over the Kalahari, covering the apparently arid region with the brightest of verdure and filling, for a few short days, the water courses with roaring torrents. The bushmen know how to find water by digging in the bottoms of these dried-up river beds. They dig a hole three or four feet deep and then tie a sponge to the end of a hollow reed. The sponge absorbs the moisture at the bottom of the hole, and the natives draw it into their mouths through the reed, and then empty it into calabashes for future use. In that enormous waste known as the Gobi desert, north of China, showers sometimes fall during the summer, and the torrents of a day fill the dried-up watercourses, through which water seldom runs. It is in these channels that the Mongols dig their wells, expecting to find a little water, when upon the surface of the plateau itself the soil has lost all traces of humidity. It is owing to the fact that a part of the moisture falling during a few rainy days is thus preserved within reach that it is possible for caravans to cross the desert.

---

ARCTIC EXPLORER ANDREE has left Gothenburg, Sweden, on his steamer Virgo for the North Pole. He proposes to land on one of the northern isles in the Spitzbergen group, build a small house, make hydrogen gas, inflate his balloon, supply his car with several months' rations and some scientific instruments and charts, and, when the wind favors, start. He expects that within forty hours he will have reached the Pole, 650 or 700 miles away.

---

THE census of London, just taken, shows a population of 4,411,271, an increase of 200,528 since 1891.

# CALIFORNIA MINES AND MINERS.*

## Name, Character and Location of Mines in This State—Name and Postoffice Address of Owner, Superintendent or Agent.

(To Be Continued.)

# Mining Summary.

## CALIFORNIA.

### Amador.

*Republican:* On the Bellwether work was started last Monday. The point selected for the shaft is 1400 feet north of the old shaft and about 1100 feet south of the north boundary of the combined Bellwether and White claims, which are owned by the present company. The shaft will be sunk about 40 feet west of the lode line and will follow the incline of the lege as near as it can be ascertained. It is to be a three-compartment shaft and will be put down as fast as possible. Mr. Adams, the superintendent, accompanied by the foreman of the mine, went to the eastern part of the county Wednesday to look at an engine and boiler, with a view to its purchase if suitable. If found unsuitable for the work, it is the intention to get one from San Francisco. With three shifts per day, it is expected to sink nearly 100 feet per month. A depth of at least 500 feet is to be reached before any crosscutting is done.

The South Spring Hill Consolidated group consists of the South Spring Hill, the Talisman and the Median mines. This week a fine body of ore was encountered within the boundaries of the Median ground, but a distance of 400 or 500 feet from the point at where they have heretofore been extracting quartz from that mine. It is the intention of the company to sink the old South Spring Hill shaft to a considerably greater depth without delay.

The bond on the Loyal Lead mine near Drytown has been forfeited by non-payment of first installment.

Operations at the Amador Queen mine were suspended for a few days last week, on account of awaiting advices from the head office in London. Mr. Dye is the local manager.

The Alma shaft has reached a depth of 670 feet. The slate was entered this week, indicating a near approach to the ledge. Sinking will be continued until a depth of 1,000 feet is attained.

The shaft of the Argonaut has passed the quarter-mile mark, 1,320 feet. It is still in soft gouge.

*Dispatch:* Near Riverside Park the Belden, or Contention, mining shaft, under the foremanship of Mr. F. H. Murry, is 100 feet deep.

The Wallace mine, which has been closed down for some months past, will start operations again in a few days under the management of a new company.

### Butte.

*Mercury:* The Morning Star mine, near Yankee Hill, is now owned by C. Waldeyer, who has had a 5-stamp mill built and has begun crushing ore. The ore is what is known as sulphate of baryta, which is nearly twice as heavy as quartz. Mr. Waldeyer has a 10-foot ledge that assays from $5 to $25 per ton of free milling gold. He has over 2,000 tons of ore on the dump ready for crushing. This is the only mine in Butte county known to be composed of sulphate of baryta.

The Aurora mine, near Nimshew, started up again on the 1st.

### Calaveras.

(Special Correspondence).—The Esperanza Quartz Mining Co.'s principal office is in San Francisco; the stock is principally held in the East. The mine is situated three miles E. of N. of Mokelumne Hill, J. O. Stewart resident acting supt. The ore body is about one-half mile in length, runs N. and S. and pitches to the E. on an angle of from 45° to 50°, with a ledge of from 40 to 60 feet in width. The hanging wall is of a micaceous slate, the footwall of syenite. The improvements consist of a fine hoist, a 20-stamp mill, complete chlorination works run by water power, and ten other buildings. The mine is being developed through a tunnel 440 feet in length and a shaft down 350 feet. With 70 men in mill and mine, they are extracting and crushing 55 tons ore daily. The ore carries from 2 to 3 per cent of sulphurets that pay well. They are adding 10 stamps to the mill.

Roanoke Mining Co., 1½ miles SE. of Mokelumne Hill; principal stockholders reside in Stockton. W. T. Harris is superintendent. The character of this location is gold quartz, and consists of the Moser and Lamphere mines. The Moser mine is bonded to the corporation which owns the Lamphere. The whole comprises about 64 acres, covered by U. S. patent. The improvements consist of two sets of hoisting works, one on each mine, and a 20-stamp mill nearing completion. A shaft is down 200 feet on the Lamphere and an incline shaft down 160 feet on the Moser mine. The ore body will average about 5 feet thick in both mines, confined between walls of slate. The quartz is of several varieties, but it all carries about 1½ per cent of sulphurets. This company is working 30 men and seems satisfied with the output. The outlook of the mines at San Andreas, the county seat of Calaveras county, at the present writing is bright.

The California Exploration Co., formed in San Francisco in April of this year with a capital stock of $2,000,000, to operate in the vicinity of San Andreas, Calaveras county, has its principal office in the Crocker building in your city. Mr. E. H. Brandt, now residing at San Andreas, is the superintendent. The object of this corporation is to bring electrical power into this section for mining, manufacturing and transportation purposes; to accomplish which, this company has a water right extending for four miles on the Mokelumne river. The water is to be brought from a point known as Sandy Bar, some twelve miles north of San Andreas, by ditch and flume. At this point (San Andreas) the company will obtain a pressure of 211 feet, and from the past record, it will have at least 3000 inches of water to operate with the year around. In addition to operating mines for itself, the company proposes to furnish power for the development of mining enterprises at so cheap a rate that many prospects now dormant will again be in operation. The company anticipates that the maximum charge will not be over 25 cents per H. P., as against 55 cents per H. P., the average price now, and it expects to be able to furnish Mokelumne Hill and San Andreas with electric lights at the rate of 60 cents per month for each light of sixteen-candle power, and it also contemplates an electric railroad from Valley Springs to San Andreas. The company has bonded twelve mines along the lode within a few miles each way from San Andreas, upon which four shafts are to be sunk to a depth of 1000 feet each. No thought will be given to the erection of mills for the next two years, or until the company has thoroughly tested its property and finds out whether it has paying mines.

The Donnellan mine is located two miles north of San Andreas, on the Mokelumne Hill road. Mr. E. H. Hackett, superintendent, residing at San Andreas, is managing this mine for a company from Salt Lake City, to which syndicate it was bonded a little over a year ago. This property consists of two locations of 1500 feet in length each, covered by a U. S. patent over an area of 250 acres. The ledge is on the east vein of the mother lode; it runs north and south, pitches east and runs from 40 to 200 feet in width, of gold quartz of a low grade. This mine at present is being developed through an open cut. The improvements consist of a 15-stamp mill, run by water power taken from the north branch of the Calaveras river, with a head of about 50 feet. The company has free water from this source the year around. The ore body of this mine is of a talcose slate formation. With ten men working at this time in mill and mine, about sixty tons of ore is extracted and crushed daily. I am informed by the superintendent that the ore is paying the company a net profit of $2 per ton, and costs an average of 50 cents per ton to mine and mill the rock.

The Thorpe Mining Co., located one-half mile southeast of Fourth Crossing, or about (6 miles) midway between San Andreas and Angels Camp, is corporation of $5,000,000 capital stock, with its principal office located in your city. Mr. L. Allgewahr is supt. This company owns 450 acres of land covered by U. S. patent, upon which they have already developed an ore body 250 feet long by an average width of 10 feet. This mine is being worked through a shaft 500 feet deep. The shaft is double compartment, over which they have a fine steam hoisting works, with 10-inch Cornish pump. At present they are working fourteen men. The superintendent says he has 450 tons of ore on the dumps that will pay $8.00 per ton, the character of which is about two-thirds free milling ore, and about one-third of the value is carried in the sulphurets. They are opening up the 4th and 5th levels, from which points they are able to designate the depth and width of their ore body as above stated.

Angels and Altaville mining district are at present probably the most active mining camps in this State. The principal working mines, of course, are the Utica and Stickle mines, owned by Hayward & Lane; Mr. C. D. Lane, general manager, at present is absent in Alaska; Theo. Allen is superintendent. This company keeps 450 men at work in mines and mills. The Utica mill has 60 stamps; the Stickle mill 60 stamps, and the Madison mill has 40 stamps; all running to their full capacity. Their chlorination works are among the largest in the State, to which they run a tramway to carry the sulphurets from the mills. They run 80 concentrators.

The Gold Hill Mining Co.'s works and mine are located 1½ miles west of Angels, on the Milton road. This is a corporation with a capital stock of $75,000, principal office Chicago, where all the stock is held. Mr. S. V. Ryland is the general manager. This company owns about 100 acres of mining ground, on the mother lode, covered by U. S. patent. The ore body runs northwest and southeast, pitches to the east and runs from 60 to 70 feet in width between slate walls, the whole of which will pay a small profit; portions of the ore body are rich. The improvements on this mine consist of hoisting works, rock-breaker and a 20-stamp mill (900-pound stamps), all of which are run by water power under a head of 155 feet, operating four hurdy-gurdy wheels. This mine, up to the present writing, has probably been run at the least cost per ton of rock extracted and crushed of any mine in the State. It is only recently that they have added 10 stamps to the capacity of their mill. All last summer this mine was worked through an open cut, 65 tons were mined daily, and with 10 stamps it was crushed at an average cost of 57 cents for mining and milling the ore per ton. They are now sinking an incline shaft, double compartment, keeping about 30 feet from the vein. When completed, at each 100 feet, levels will be run on to what is called the "blue quartz vein," which is 22 feet thick at the heart of the main vein. At present they are working but ten men.

At the Carson Hill mining district it is authentically stated that the great mining suit and misunderstanding between the Morgan mine owners and Irwin & Fair, which has extended over one-third of this century, and cost over $1,000,000 and several valuable lives, is about to be or has been settled. It is now expected that Carson Hill will again resume activity, and that in the near future. On the road to Carson Hill, southwest from Angels, the Blyth mine, one mile southwest of Angels, A. N. Butts owner, is being worked.

The Bruner, or Bald Hill, mine, located about 1½ miles south of Angels, is one of the most promising mines on the road, is bonded to Capt. Macfarlane of the U. S. Army, and is now under the management of H. C. Woodrow. They have a very complete hoisting works, run by steam at present, but expect soon to run by electrical power. This mine is being developed through a shaft, now down 120 feet. The ore body of this mine runs, like all others on the mother lode, northeast and southwest, and as far as penetrated averages about 25 feet thick. Several men are employed. The manager reports that a mill is to be erected on this property next fall.

The Tulloch mine, located 2½ miles south of Angels, is being operated by the trustees of the late Mr. Tulloch. This mine is completely equipped with hoist and 10-stamp mill run by steam power. Their shaft is down 250 feet, working a full force of men. Louis Tulloch is the superintendent.

The Santa Ana and Missouri mines, located opposite the Tulloch, are bonded to a Salt Lake capitalist. Under the management of H. C. Woodrow, these mines are being developed, working a full force of men eight-hour shifts. This property is 3,000 feet in length, located on the first raise of the vein after it leaves Carson Hill. These mines are being developed through a shaft now down 200 feet, over which they have a fine steam hoist, with all the usual appurtenances. Their shaft will be sunk to a depth of 1,000 feet before a mill is contemplated. The width of the ore body and value of the ore thus far extracted has proved satisfactory to the management.

At Carson Hill are the Morgan, Reserve and Iron Rock mines, all owned by San Francisco parties. The latter is now working a full force of men, and the others will be by the time this is in print.

Then there are the Carolina, the Woods and Calaveras Consolidated, all working and large machinery recently put in position. The above-mentioned are all mines of history and are paying and satisfying their owners.

In Washington Flat mining district, five miles south of Murphys, are the Birney quartz mine, at present idle; it has lately changed hands, and it is stated that it will again be prospected and worked in the near future; the Ozark gravel mine, located 4½ miles south of Murphys, is being worked at this time through a shaft down 78 feet to bedrock, from the bottom of which they are crosscutting, and will drift and work the whole channel, which is over 50 feet wide. The hoisting is done by a whim. The character of this mine is cement gravel, which, after being extracted, has to be slacked in the sun before washing. The gravel body, which would pay to hydraulic, is over 40 feet in depth; in drifting only about 6 feet is taken out. For this portion it prospects about 50 cents per tub of 1000 pounds. At present they are working four men. Mitchler Bros. of Murphys are the owners and W. M. Hamilton is the superintendent. The Central Hill hydraulic mine, located one mile south of Murphys, is owned by Bisby, McCormick & Thomas. At the present writing they are working 14 men, and I am credibly informed that the output is large and satisfactory to the owners.

My next will be from Tuolumne county.

L. P. Mc.

*Prospect:* In the Gwin mine the shaft has reached a depth of 1245 feet. The foot wall has been reached, and shows a body of quartz 14 feet from wall to wall. The shaft is now about 30 feet below the point where the drill encountered the water from the old works. The water comes from the hanging wall gouge, but does not show any increase. The plans for mill are being prepared as fast as possible, and with the intention of having the stamps dropping by the 1st of September.

### El Dorado.

Placerville, Cal., June 9th, '96.

(Special Correspondence).—Phelps & Wood of Oakland have closed a deal with Snow brothers for 600 acres of drift gravel and will begin immediately to run a 600-foot tunnel. Eastern capital is interested with these gentlemen. The property is ten miles east of here. A. A. Wood will be superintendent.

The Gold Bug Mining Co., an eastern organization have begun work two miles from Georgetown, on the great mass of tailings accumulated during the past forty years from the Georgia Slide properties.

The shaft on the Lucky Marion near Greenwood, has reached 120 feet on a large ore body said to be of good value. The property is operated by people from St. Louis. Greenwood is on the stage road about fourteen miles north of Placerville.

The Boulder Mining Co., sixteen miles to the southwest has about finished eight miles of ditch. Work on this property is progressing rapidly.

On Sam Kaiser's mine, known as the Ohio near Greenwood, the shaft has reached 140 feet on a 4-foot ledge. The property is being developed by San Francisco people, operating under bond.

Frazer & Varozga have reached 182 feet on their tunnel two miles west of town. The tunnel will strike the shaft after 15 feet more work, and top the ledge at a depth of 70 feet.

Head & Clark at the end of the old tunnel they opened on the Theisen copper property twenty miles east of here struck an ore body of 26 feet. Active prospect work will now be pushed forward.

The *Democrat* announces the closing down of the Lady Emma. Supt. Beardslee tried to keep things going, but the stockholders declined to meet the indebtedness. It is to be hoped that an adjustment will be reached to pay the incumbrances and continue work. Great mines are not made nor discovered in a few months, neither are they often built up on a small sum of money.

### Inyo.

*Register:* The Cometti mine at Fish Springs is working six men. The ledge runs from 8 to 15 inches in width averaging $80 per ton. The Rose mine near by is also working six men.

Some of the dry-washer placer mines in Mazourka canyon are doing well. Labarge & Hamilton average about one ounce a day. The ground generally is yet too damp for effective work.

### Kern.

The Barossa Mining and Milling Co., No. 150 South Broadway, Los Angeles, is pushing the erection of the stamp mill on the Christopher Columbus claim in Kern county. This is one of the six claims owned by this company. M. P. Freebey, president of the company, now at the mine, reports that the stamps will be dropping by June 15th.

### Mariposa.

Coulterville, June 9th, '96.

(Special Correspondence).—The all-absorbing topic here is the reported sale of the Mariposa grant. There is no responsible person connected with the property in Mariposa county, and the report yet lacks confirmation.

At the Kohler Hill group of mines, on Bean creek, ten miles northeast of Coulterville, B. S. Hill, the managing owner, expects to spend $3000 during the next two months, principally in sinking. In the Coward shaft, now down about 45 feet, there is $20 ore, and Mr. Hill intends to go down 250 feet to see if it holds.

The Louisiana mine in the upper Coulterville district has been sold by J. T. Gove to C. R. Treat, of Chicago, and C. B. Rustin, of Omaha. The superintendent of the Louisiana proposes to sink as rapidly as possible to considerable depth. The operations of this mine are likely to be on an extended scale.

The old Bondurant mine, owned by Messrs. Bruner, of St. Louis, Mo., Charles Bruner, superintendent, was recently pumped out with a view to inspection. Two tons of ore were taken out and shipped to Selby's sampling works. If the test proves satisfactory the Bondurant will be purchased by Mr. French, the secretary of the Red Cloud company of Boston.

At the Red Cloud mine, in the same district, nothing is doing and there is only a watchman in charge. It was a very rich mine in its day, as much as $150,000 having been taken out of one chute. The ore was sometimes so rich that the gold would "hinge" when the quartz was broken. The mine never had a fair chance owing to mismanagement. There is a 22-stamp mill on the property, but no concentrator or rock-breaker. The ore when work was discontinued was very highly sulphureted. From time to time there are rumors that the Red Cloud is to be started up, but there are no signs of activity yet.

The Feleciana mine, twelve miles from Mariposa on Sweetwater creek, has been sold to E. S. Davis of Fresno. In the Sherlocks and Whitlocks districts there are several Fresno mining investors looking at properties. Fresno is taking more interest in mining along the auriferous belt than any other of the valley towns.

The Merced company is working as usual. There is no change of any kind to report.

At the Virginia most of the men have been laid off, pending the arrival of Professor Clarence King this week. It is stated that on Professor King's arrival, there will be a change in the method of working the property and that a shaft will be sunk to tap the north and most valuable portion of the ground.

There is no change to report at Pinon Blanco. Capt. A. H. Ward has returned from San Francisco and is now at the mine.

The Merced river is running bank high with snow water owing to the recent hot weather. When the snow waters run off, there will be a great deal of work on the river all the way up to the National Park boundary.

### Mono.

At Dunderberg, preparations are making to erect a mill. Superintendent Kermeen has sixteen men employed.

Iron pipe for the Mono Lake Hydraulic mine is arriving.

### Nevada.

The following is condensed from a recent article in the Marysville *Appeal*, describing the inspection by anti-debris representatives of present hydraulic operations on the San Juan ridge. It is from a point of view avowedly hostile to the hydraulic miner and illustrates the inability of those antagonists to find any just cause for complaint:

On the invitation of W. T. Phipps, manager of the State Anti-Debris Association, Supervisor Burns of Sutter county, L. P. Farmer of that county, a member of the Executive Board of the Association, and the editor of the *Appeal* took a trip last week through that portion of the mountains south of the main fork of the Yuba river, lying in Nevada county and comprehended in the general application—San Juan ridge. The trip occupied the better part of five days and resulted in a very thorough inspection of a district in which the greatest mining operations known to this or any other time have been prosecuted during the last thirty years with varying success to the promoters.

The initial stop was made at Smartsville. The operations at the Campbell place are confined to an arrastra process and a pick, bucket and shovel brigade, though the surface of several of the elevations in the distance were suspiciously tinted with a shade of aqua pura. Various reports concerning operations at this point have reached the Anti-Debris Association from time to time, and with the expected resumption on the part of the Excelsior company, will result in a closer investigation and more frequent inspection. The water supply is said to be copious and in perfect condition for extensive operation.

At Mooney's Flat Messrs. Phipps and Burns undertook to seek the source of a decidedly red stream, but were not successful and investigations into the character of the work were passed until the return trip.

At Bridgeport we crossed the South Yuba, the stream dashing over the huge boulders with a velocity that gave no promise of making a deposit of the heavily charged debris waters. Mr. Phipps here took a sample of the water, as has been the custom of anti-debris representatives for years past. From the sample it was quite evident that it came from a region where the monitor was shaking hands with Mother Earth in a vigorous manner.

From this point altitude is made at every

step until French Corral is reached. The town has the appearance of having once been hastily built. Its denizens look askance at the wayfarer and to us the few on the roadside turned suspicious gaze. Several complaints have been made from that quarter by the valley watchman but not of a serious character, since the operations were generally considered to be small. The smallness of the operations are no doubt due very largely to the fact that the diggings have been pretty well worked out and that owing to the lay of the ground restraining works of moderate cost could not be built to satisfy the requirements of the Federal Debris Commission. From the elevation at the road it is to be observed that in years past much hydraulic mining had been done. It was out of this section of the Ridge that the Milton company, now known as the Kate Hayes, a Boston and New York corporation, obtained its earliest and greatest revenues. Mr. Phipps was relating some historical facts in relation to the concern when the eyes of one of the party lighted upon two large streams of water shooting their pressure against the embankment to the south but partially hidden from the view of travelers by clusters of trees.

"There's one," said Supervisor Burns.

"You bet," said Mr. Farmer.

Three of us were out of the conveyance in a jiffy and headed for the scene of operation. We had hardly started before the men in the pit began to scramble and in no time at all there was nothing but the sound of gurgling pipes and their discharging ends. We were upon the grounds in a few minutes and were greeted by the men with very doubtful politeness.

Instead of finding monitors we found two good seized nozzles of something larger than the ordinary fire department pattern with canvas hose connections. The men very plausibly pleaded that they did not know that such work, without permit, was in violation of the Caminetti or any other law. They gave their names as B. W. Eckman and W. E. Moulton. Mr. Phipps told them that the character of their work under a 100-foot pressure could not be countenanced, and that they were liable. The watchman will be told to keep them under careful guard and further operations will mean the usual legal proceedings. Right near them a man by the name of French was turning up the dirt and rocks, but as he was not disturbing the "natural bank," as the codes define it, no exception could be taken to him or his "sluicing" head of water.

Tuesday we were on our way through Sweetland diggings. The first view from the hillside revealed the works in the distance. The men and the monitors were mere specks. Down through the great washout from which enough material had been taken to make one of the Marysville Buttes with its spreading base we went. Supt. Miller was absent and we were shown about the place and had explained the modus operandi of the mine under the Debris Commission by Foreman Rooney. They were then cleaning up the sluices and a part of the great 3300-foot tunnel. The material in this mine looked as though it would easily dissipate under the influence of the monitors. There were two of them here with 5½ and 6½-inch nozzles, operated with water of 225 feet pressure. Leaving the mine and walking back to and down the ravine something over a mile we came to the dam, said to be the best in the mountains, and not considered any too stable at that. It is of rock, earth and brush. From its foundation to the top it rises 74 feet, has a 220-foot base, measures from bank to bank 160 feet and is 90 feet through on the top. The debris is filling it very rapidly and but 60 feet more can be added in height until the grade will be lost. As it grows the cost increases and it is doubtful whether the output will stand the expense. This company, the Kate Hayes, is not giving much trouble and seems to be conforming to regulations. From the dam one gets a view of the Browns Valley irrigation ditch flume on the opposite side of the Middle Yuba.

From Sweetland we went through San Juan and on to the Cherokee, noting the many excavations and washes that had left ugly gashes on the mundane surface as a remonstrance against the devastation. In many little ravines could be seen many small miners working away with pick and shovel and little hose lines. To the north of Cherokee we observed the old marks of the 49'er and his rocker. On reaching Badger Hill we went to the homes of James and John Quick. They, with their sons, were operating in a great excavation some two miles long and a half mile or more wide. They were handling rockers when our party came upon them, and denied that they had been using a monitor. The dampness of the banks contradicted that, as did the statements of several of the family to the effect that it had been in use two days before. The Quicks' mine had a good supply of water, good pipes and they reach the 5-inch monitor with about 100 feet fall. They tail directly into the Middle Yuba and it is said have a tunnel so as to overcome the grade from the lower part of the pit out. They don't like valley folks a bit but treated us very nicely except in the matter of information. Such a mine can undoubtedly do much harm. On one or two occasions they have been detected using the monitor.

We returned to Cherokee and after dinner started for the Hustler mine on Shady creek. The great fillings in this stream are enormous, beyond the picturing of words and are not to be comprehended even by the tale of the camera. The first startling revelation was the broken dam which the Debris Commission had accepted and said was good. We saw where water had been running through the aperture, contrary to the rules of the Commission, under whose jurisdiction this mine has operated. The water had cut away and carried out through two cuts fully 100,000 yards of the debris that the dam had been constructed to hold. It undoubtedly was a flimsy affair, but no more so than the one further up where they claim to be retaining the debris of to-day. When we reached there it was quite evident the water from the sluices had been turned back from the old outlet into the new because there was barely a discoloration of the surface on the damsite water and the rocky bed to the north over which it would have to flow to the broken dam outlet was covered with fresh and sparkling slickens. This mine, which is practically operated by three men, has a 5-inch monitor with a pressure of 60 feet. If all the dirt torn down in a week's operations was retained behind the dam now permitted by the Debris Commission it would be filled and more too. The Hustlers are very cheerful ones and demonstrated to their own satisfaction that their work was devoid of harm to the streams.

Columbia Hill mine has an excavation of old works that is easily a mile square. It is now known as the Ferral claim and is operated by Mr. Bigelow. He walked us to the dam behind which the debris is being settled in part. It has thus far stood the action of the elements but it is really no better than the one at Hustlers. It has been accepted by the Debris Commission, however, and with that the valley representatives will have to be content until it has been proved that it is of no account. Mr. Bigelow showed us over the diggings and related that within five years, from 1876 to 1880, off of one little end he took a profit of $650,000. They are now operating with a force of about twenty men, a 5½-inch monitor under a pressure of 80 feet. The gravel is panning out twenty-five cents to the cubic yard.

One little mine reported to have operated with a 3-inch monitor under light pressure from rain water storage was not visited, as the Dudley brothers, who conducted it were in town, having exhausted their water supply.

We reached Lake City, having an elevation of about 3,700 feet, for the night. The next morning we passed the Backbone House, which Mr. Farmer was anxious to see having heard the bills of watchman read during the last eighteen years for entertainment at that place. On the road to Moore's Flat there was a continuity of the gaping wounds to the green coating of the earth that told additional tales of the devastating influences that have given so much trouble to the rivers and the valley. Moore's Flat is a hard place to get to. The hydraulic mine there is now operated by about twenty Chinamen playing a 6-inch monitor with a 200-foot pressure against banks of extremely soft material that tails into a canyon leading to the Yuba river down something like a precipiece, In this canyon, about two miles distant, is a dam. It is made of logs and brush in a very flimsy manner, as can be readily determined by the photographs as well as personal inspection. The logs are a foot and eighteen inches apart and not fastened so that they will stand more than a few season's wear. It is filling up rapidly and is one of the kind of structures which will cheat the regulations of the Debris Commission with very little difficulty. The service of papers on these Chinamen to restrain their operations was made on the grounds. Charles Hagerty, the merchant at that point, entertained the *Appeal* man with some interesting reminiscences in which he made the names of early pioneers at that place, Marysville and Sacramento, figure quite conspicuously. The return was made to Bloomfield in the afternoon. In passing the Derbec drift mine on the way an illustration was obtained of the value of such enterprises over hydraulic mining as a sustainer of population. The town of North Bloomfield derives its life from the operation of drift mining, which gives employment to many fold more men than hydraulicking.

On reaching the Bloomfield mine we were taken in charge by Supt. Myers and escorted all over the works. This mine, as has often been repeated, was the largest known in the world. Certainly at this time it presents an imposing sight. Its great walls extend up over 500 feet. The great pipes systematically wind themselves around the embankments and to the monitors, and these play against the dirt with terrible noise and force. About fifty men are engaged in this work. The monitors on the banks have 7-inch nozzles and operate under about 250 feet pressure. The monitors used in creating the elevator process each have a 7-inch nozzle and about 400 feet pressure. These are set at the mouth of an old tunnel and force both the water and the gravel from the sluice boxes over a high embankment or dam, thus taking the material into two monstrous settling reservoirs or pools. It does the work well. There is a bazy doubt in the minds of many as to whether or not the elevator process is not dropped and the tunnel, a much more convenient means, used. This is a charge that has frequently reached the anti-debris people. Since Mr. Myers' superintendency Mr. Phipps stated that no such complaint had been made save in one instance, and that was by the father of a retiring superintendent.

Our party was very hospitably entertained here by Supt. Myers, Foreman Thomas and one of the directors, A. J. Bowie.

On the fourth day we headed for Nevada City, taking observations of the old works at Blue Tent and vicinity. This side of Rough and Ready Messrs. Phipps and Farmer examined two small hydraulic claims known as Hackett's and Spanish John's. Neither use more than 100 hundred inches of water, with slight pressure, and confine their slickens fairly well.

At Mooney Flat a small nozzle with canvass hose connection is used on the Sanford & Loomer hydraulic claim. They retain their slickens in a remarkably good manner, as does one of the sluice mines in that neighborhood. One of the others does not do so well in the matter of restraint, but is so small as to be of little consequence.

At this point ended the revelations as to the hydraulic operations, past and present, on the San Juan ridge.

*Union*: The Junction mine on Slate and Deer creeks is looking well and shows rock worth $78.50 a ton.

The miners at the Delaware won their point for an eight-hour shift on Sunday and resumed work Tuesday.

The mill and chlorination works of the Providence mine will be closed the latter part of this month to make needed repairs.

### Placer.

*Sentinel*: At the Pioneer mine the company expects to have steam up in the new boiler the first of the week.

Ex Governor N. B. Willey, the present superintendent of the Redstone quartz mine near Blue Canyon, has contracted for five additional stamps and two concentrators. Twelve men are now employed at the mine.

The Ralston Divide Gold Mining Company will operate their gravel property extensively this season. W. C. Ralston and E. H. Benjamin went over on that divide this week. The company, which is backed by French capital, own nine mines of lava-capped channel on the Ralston Divide.

### Plumas.

The Plumas *National-Bulletin* says N. E. Boyd and S. W. Rex, employes of the Anti-Debris Association, came in on the Reno stage, hired a team and went up to the Spanish Ranch country to inspect such hydraulic mining as was in progress, particularly the operations of the Quincy Mining and Water Company. At Gopher Hill, they found the work conducted in conformity with the conditions imposed by the Debris Commission. Samples of water were taken below the dam, and the parties returned to Quincy well satisfied, we are informed, that no damage was resulting from the operation of this and other mines in that section, by the hydraulic process. Next day they went on a tour of inspection as far as Shoo Fly, and at several points took samples of water from Spanish creek. They also investigated the Higgins mine and found it to be working satisfactory.

A Quincy dispatch says the largest restraining dam in the State is to be built across Spanish creek at Devil's Elbow by the Quincy Mining and Water Company. Flumes will fill up the bed of the stream for the length of 400 feet and to the height of 180 feet with rock and debris, forming a settling reservoir. This will require over 300,000 cubic yards of material for its construction. It is estimated that 15,000,000 cubic yards of debris can be held above the dam.

### Riverside.

The Bess mining claim, about one and a quarter miles southeast of the Good Hope properties in Riverside county, is improving daily. According to the Perris *New Era* this is probably the most valuable mining property in the section. The shaft is down 25 feet and there is a ledge about 10 inches in width that sparkles with free gold.

### Sacramento.

*Record-Union*: Constable Spinks has attached the boat belonging to the Golden Sands Mining Company, which is at present lying above the Twelfth-street bridge in the American river. The attachment was sued out by W. S. Doane for $300 for wages alleged to be due. The boat was engaged in an effort to extract gold from the sands of the river.

### San Bernardino.

Redlands *Citrograph*: The Mint group of mines, near Kleinfelter station, west of Needles, was sold last week to an Irish syndicate for $120,000, who will soon begin active work on the property.

*Investor*: Reports of rich strikes continue to come in from the desert, which seems destined to become the great mining section of southern California, although various other sections are rapidly becoming better known as promising mining fields. But while there are many parts of this southern country which will well repay investigation, there are a few places which will not. Such an instance is given in the Goler mining district, which, according to a San Bernardino miner, is a good place to keep away from. Last February there were about 400 prospectors around Goler and now only fourteen can be found. Wood and water are scarce and very costly, and the high winds, which blow the sand in all directions, make work almost impossible. The Goler placer mines, which are believed to be rich, lie from 25 to 75 feet under the surface.

### San Diego.

At Julian the Owens mill started on the 1st, improvements are being made so that as much as possible of the concentrates can be saved. It is estimated that not a larger average than fifty per cent of the gold in the Julian ores can be saved from the stamp mills by the most experienced and careful mill men, and from some recent assays of tailings even a less per cent than that is free milling. The Owens ore in common with others contains a larger amount of sulphurets as depth is reached and as the ores have always been considered free milling, no particular effort was ever made to reduce them. The amount of Julian or Banner ores ever treated in a smelter is very small.

The Cincinnati Belle Company is making preparations to resume operations at the Gold King. J. M. Farley is superintendent.

The Golden Cross Mining and Milling Co., with mines at Hedges in San Diego county, has brought suit against the trustees, to whom the company recently turned over its mines for the benefit of its creditors. The mines, among which are some very valuable properties, were to be worked by the defendants as trustees, and the proceeds were to be devoted to paying off the company's debts. The company prays for their removal, and for the appointment of new trustees; $150,000 is also asked for alleged damages.

### Shasta.

*Free Press*: McLean brothers, contractors on the Iron Mountain railway, filed a suit in the United States Circuit Court, May 27th, against the Mountain Mines, Limited, to recover $51,000, alleged to be due upon grading contracts.

G. R. Graves, at the Nicholas mine, Little Backbone creek, has cleaned up the lower tunnel, which was fifty feet in length, and has run fifteen feet farther in, where he struck sulphuretic ore at a depth of 250 feet on the ledge.

At the mine at Portuguese Flat, owned by Supervisor Conant and others, a 45-foot shaft was sunk on the ledge, but at that depth the water became troublesome and a tunnel was started to crosscut the ledge. It is estimated that the drift will have to be run 170 feet to strike the ledge. One hundred feet of it has already been completed. The ore is rich in free gold.

Bass & Joiner contemplate putting in a stamp mill on their mine near Round mountain.

### Siskiyou.

*Journal*: A couple of miners made $80 in eight days in a small placer mine on Humbug. There are some good placer mines in that section, and there has been plenty of water to work them during the present spring.

Means & Mahan, of the Nebraska mine on Cherry creek, brought over 30 ounces of gold dust this week, realizing about $500.

The placer miners at Hawkinsville will soon begin to clean up, as their supply of water is running short. They have been able to run a little longer than usual this year.

Mining operations at Oro Fino are unusually active. Work is progressing on the Columbia mine at Scot Bar.

At Scott Bar the Columbia Co. has fifty men working on the new road for hauling ore from the mine to the mill. At the Mabel mine, owned by Timmons & Chamberlin a five-stamp mill will be erected.

At the Gumboot mine a shaft is being sunk, which is expected to tap the main ledge at a depth of 100 feet. At the Montezuma mine an air shaft is being sunk which will strike the main tunnel at a depth of about 80 feet.

Garrett & Co., who were putting in cribs, have had to suspend operations on account of high water in the Klamath.

### Trinity.

The Trinity Placer Mining Company of this city will work its 100 acres of ground on Cedar Flat.

### Tuolumne.

Groveland, June 8th, '96.

(Special Correspondence).—There is a great deal being done in opening up new and reopening old quartz mines in this section of Tuolumne.

The Two Brothers and Wheeler group of mines, 1½ miles west of Groveland and one mile northeast of Big Oak Flat, have been amalgamated by John P. James and bonded to Captain A. H. Ward, of Pino Blaneo mine, near Coulterville. Work is likely to commence shortly, under the charge of Captain H. H. Todd of Alameda. It has passed the stage of a single man's operation, and now requires extensive pumping and other machinery. What ore Mr. James has taken out for crushing during the past fifteen years has averaged $35 a ton. It has sometimes gone as high as $50, and never less than $30 a ton. The general average, as a steady milling proposition, will probably be about $12. About a mile below the property, by an easy gradient and good road, is a very convenient mill site, with water power, on Deer creek.

The Mount Zion is about one-half mile east of Groveland. It has recently passed into the hands of the Tuolumne County Mining and Development Co., a corporation of which the directors are Fresno men. The president is N. W. Moody; John Baird is superintendent. Some years ago Mr. Hunter, a former owner, took about $14,000 out of it, but was choked off by the water. Supt. Baird is now sinking a shaft in a new location. The prospects of this property are good. The owners have also bonded the Eclipse, Clipper Gulch and other mines in the same locality. Work on these is to be commenced at once.

The once well-known Mount Jefferson mine is about one-fourth of a mile north of Groveland and is owned by parties in Boston. There is considerable machinery on the ground, including a ten-stamp mill, all in very bad shape, owing to disuse for many years. There is also the remains of a small chlorination plant completely in ruins. The Mount Jefferson was a good paying mine until there was a disagreement among the owners, which resulted in the employment of three "supes" to six miners. More money was spent on the bosses than on the mine and it eventually was abandoned. The shaft is down 240 feet and is the deepest yet sunk in the Groveland district.

The Rhode Island is the eastern extention of the Mount Jefferson. Recently it has been bought by John Callaghan of Boston. Work is now beginning, and the prospects appear favorable. The Rhode Island property is likely to attract some attention in the future.

The Belcher Consolidated Gold Mining Company, Limited, of London, has taken over the old Belcher mine near Groveland. F. H. Hill is the superintendent. This property has been in operation since the ten-stamp mill was burned down some years ago. The hoisting and other machinery is in good condition and the mine is now being put in running order. The present shaft is down 125 feet, and when work was discontinued was on a 5-foot vein of $25 ore. Mr. Hill says that from now on the Belcher is to be worked in earnest, and that he intends to sink to a depth.

Two miles below Priest's on the Sonora road is the Wheeler Hill, also under the charge of F. H. Hill. This mine is owned by the Wheeler Hill Gold Mining Company, Limited, of Glasgow, Scotland. Next to the Wheeler is a claim known as the Morning Star. It is being incorporated in Scotland for working purposes, and will be known in future as the Golden Star. Mr. F. H. Hill takes charge of this property also.

The Grizzly and Eureka mines are about

half a mile from Priest's, and are owned by Harper brothers, who have worked on them for about five years. There is a pay streak of rich ore from 1 to 4 inches in thickness which the Harper brothers have been following for pockets and not taking out milling ore. In this they have been so far successful as to render them careless as to systematic development of their property, which appears to be well worth it.

The Never Sweat is owned by James Ballantyne and is situated about one mile from Big Oak Flat and one and one-half miles from Priest's. There is a tunnel in about 300 feet and a raise to the surface about 125 feet. Some rich crushings have been taken out of the Never Sweat, on one occasion rising to $90 per ton. The mine is remarkable from the fact that it is in most excellent order. Everything is ship-shape and in the most approved style of scientific mining, and it is all the unassisted handiwork of Mr. Ballantyne, who is in his 80th year. This fact says much for the healthiness of the district for working miners.

At Big Oak Flat there are now about thirty families, all more or less dependent on mining. Work is starting up in a small way at several of the surrounding mines, including the Longfellow, the Mississippi (McLaughlin & Callaghan, owners) and the Accident, an extension of the Longfellow (William and Arthur James, owners). Nearly all the rock raised in this district is crushed at the Big Oak custom mills. There are two 5-stamp mills, both being very much out of date. One belongs to E. B. James and the other to Oliver Fiske. They save some proportion of the free gold and none of the sulphurets. There are indications of gold everywhere, and the district deserves better appliances for the reduction of its ores. The present cost for crushing amounts to from $4 to $6 per ton, according to the distance for haulage; but it is the gold that is lost in the mill leavings that is the most expensive feature of the process.

The Kanaka mine is about five miles northeast of Groveland and is owned by Louis Casseretto. There is a 10-stamp mill at the Kanaka that has been running for a number of years continuously. It is about one mile back from the river and is driven by Indian creek, a tributary of the Tuolumne. The mine is worked from the gulch by five successive tunnels of from 300 to 500 feet in length. No returns are to be had, but it is understood that the Kanaka has paid handsomely all along. At present the lower level is being driven to the pay chute of the mine.

At Humbug, 3¼ miles northeast, a new mine is being opened up by an incorporated company, of which Mr. Lowe is the president and John McLauchlin of Alameda is a prominent stockholder. The company sank a shaft 120 feet with a windlass and then drifted on a vein between walls 30 feet apart, having quartz on both walls, sometimes on one and sometimes on the other. From this about 200 tons of rock was crushed, giving an average of between $12 and $13 a ton. The prospects are satisfactory to the owners, who are putting on substantial machinery at once.

The Slapjack mine, near Second Garrotie, is owned by Urquahart & Argall. They have shafts down on large veins 70 and 100 feet. The rock is very heavily sulphuretted, but is rich in gold.

The Cosmopolyte is an old mine about one mile west of Groveland. It is now worked on a lease by Messrs. Poole Bros., Smith & White. They are working out pillars and running a tunnel to get into new ground. The Cosmopolyte has turned out large quantities of gold in the past and its owners are confident that it will repeat the process. In fact, there is an air of general renewed confidence throughout the district around Big Oak Flat and Groveland—or, as most of its inhabitants call it, "Garrotie," as it was known in the '50s.

**Yuba.**

The Marysville Tunnel and Quartz M. Co. is working the Bullard mine, near Smartsville. Work will soon be resumed on the Mark Antony, adjoining the Bullard. It is locally stated that the Yuba river will be worked by hydraulic elevator.

**NEVADA.**

H. H. Beck, superintendent of the Reno Reduction Works, will put in a gold mill and concentrating plant, in addition to the silver chlorination works and the water jacket smelter now in place.

The lot of ore recently brought in from the property of the Dexter Mining Company, at Tuscarora, Nev., was purchased on the 3d by the management of the Germania smelter. It consisted of twenty-four tons and netted the owners $5,608.58.

William Zirn, the discoverer and principal owner of the mines at Pine Nut, was killed at his mine on the 6th inst. An overhanging boulder fell upon him, crushing out his life. Zirn evidently heard the boulder start and crowded toward the wall, but his chest was crushed in and both legs broken. The accident occurred just after the noon meal, when Zirn was alone.

ESMERALDA COUNTY.

The first load of ore from Aurora to be practically tested by Parr & Tyack has been hauled to the Syndicate mill. The tailings will be submitted to the cyanide process, and if there is an encouraging profit it is probable that reduction works will be erected at Aurora.

LINCOLN COUNTY.

*Tribune*: R. R. Tanner of Milford, through whom the gold bars produced at the DeLamar are shipped, says that the bullion coach continues to arrive regularly under armed guard, and that the first clean-up at the April Fool mill will be made about June 15th.

Last Monday's issue of the De Lamar *Lode* says: It is currently reported on the streets that the De Lamar property changes hands to-day, the new owners being the English syndicate who have been making an examination of the property for the past month. The consideration is reported to be $6,000,000, and it will be remembered by many here that Capt. De Lamar paid something in the neighborhood of $175,000 when he purchased from the locators, and while he has spent a very considerable sum since, the property has maintained itself. Thus it may be said that $6,000,000 is velvet.

**OREGON.**

BAKER COUNTY.

W. P. Russell tells the Spokane *Chronicle* that in the Gypsum mine, on Snake river, the gypsum is 95 per cent pure, and he can mine and manufacture the article ready for use and place it in the market at Portland for $3.50 a ton. A plant will be put in that will mine and manufacture the calcined product at the rate of 200 tons a day.

The French syndicate is developing the Flagstaff, Gertrude and Empire, three miles from Baker City.

JACKSON COUNTY.

Thomas & Daw, who sent fifty pounds of ore from their ledge in Uniontown precinct to the Selby Smelting Works in San Francisco, last week received a check for $146.50, the net result of the reduction. They had previously taken $650 from the same place.

JOSEPHINE COUNTY.

The Grants Pass *Courier* says the copper mines will employ some 200 men this season. A new smelter is to be erected at Waldo, and one at the Illinois river works.

Wm. Bybee has bonded his mining property in Josephine county, consisting of several hundred acres, to A. J. Paul and others for $30,000.

A new camp is reported at the mouth of Biggs creek, where the mining industry is assuming greater proportions than ever.

LINN COUNTY.

In the Lawler mine on the Santiam river the 20-stamp mill is running on full time and the ore bodies show well.

**WASHINGTON.**

Nearly 5,000 mining locations have been made on the Colville reservation, and the county auditor keeps eight clerks busy.

Prof. Langhammer is going to erect a large milling plant on the property of the Wyandotte Mining and Milling Company in the Similkameen district. The mill as at present constructed will treat from fifty to sixty tons per day, but it is being equipped with machinery of 100-ton capacity. It is what might be termed a combination mill, the principal feature of which is a cyanide process of Mr. Langhammer's own invention. It will be built in terrace style, five stories high, and lighted by electricity.

**BRITISH COLUMBIA.**

Manager Hendryx of the Pilot Bay smelter, talking of his bullion there, says he will build refining works, and two or three additional stacks to the smelter.

At Vernon, A. H. Craven, representing English capitalists, has a working bond on the mineral claims owned by the Swan Lake Mining Company—$120,000; $1000 to be paid within a month, and the balance by the 15th of December next if the company decide to complete the bond. Mr. Craven states that if he finds an average value of $4 per ton he will be well satisfied to go ahead and complete the purchase, in which case he will build an 80 or 100 stamp mill.

**ALASKA.**

The Juneau *Mining Record* says an immense auriferous gravel deposit, carrying $5 in gold to the yard, has been discovered at Anchor Point, on the north side of Kachemak bay, the ground having been taken up by a Boston syndicate. A ledge has been discovered in the Silver Queen mine, on Sheep creek, running $400 in gold to the ton.

**IDAHO.**

Hailey *Times*: The Crœsus mine hoisting works is completed. The Idaho Democrat people will begin work on a deep tunnel as soon as the survey is completed. The Red Cloud has resumed operations with twenty-five men. The Fortuna Mining Company will soon add to its force, both at the mine and mill. These are a few only of the mines where more men are to be put to work.

Mr. Johnesse having failed to secure a complement of miners, even by resorting to an advertisement in the *Times*, it is evident that miners are scarce and that the demand exceeds the supply.

At Wardner, on the 5th inst., Harvey Jackson, shift boss on the Bunker Hill and Sullivan mines, was struck by a falling rock and killed.

**MONTANA.**

The Anaconda Mining Co. has closed down all its mines at Camp Creek on account of water encountered, which it was found impossible to handle. The company has spent a quarter of a million dollars in development work there in the last two years.

No action, says the Anaconda *Standard*, resulted from the meeting of Red Lion stockholders relative to the new process now under consideration. The treatment of the ores in question is as follows: The pulp coming from the stamps is run through an immersion amalgamator, in which it has to pass through about 10 inches of mercury. On its way through this apparatus it leaves all its free gold, however fine or coarse it may be. The remaining pulp runs from the amalgamator through a separator in which the mercury which may have been carried along is recovered. From the separator the pulp goes to the concentrator, and from there to the leaching tanks, working by the electrolytic clorination process. A series of leaching tanks forms a battery; while the first tank is filling the last one is emptying the intermediate ones being in the different stages of leaching. The liquid is constantly regenerated by the electric current, and the gold is obtained in the shape of a dark brown slime, ready to be submitted to the ordinary melting of bullion. The amount of gold saved by this process, as demonstrated in a mine in the Caucasus and in another in south Siberia, is about 90 to 95 per cent of the assay value.

**SOUTH DAKOTA.**

Black Hills *Times*: Eleven hundred pounds of phenomenally rich ore from the Reddy mine, situated in Lead City, was shipped yesterday by express to the Omaha refinery to be reduced to bullion. Previous to the shipping the lot was put through one of the crushers at the D. & D. smelter and fully sampled. It was then sacked and shipped. The lowest assays yet made gave returns of $6018 and the highest $60,142 gold per ton. Of this character and grade of ore there is now exposed a seam 7 inches thick and 19 feet wide. The width of the face of the present workings, as a cap or roof of this seam, is an ore shoot from 2½ to 3 feet thick and 10 feet wide that varies from $187 to $250 gold per ton. Only six men are employed in getting out ore, three on day and three on night shifts, yet the average amount of ore daily extracted is two tons. In addition to the rich stuff taken from the lower seam, the latter is increasing in size as the workings are advanced.

The Black Hills *Mining Review* of the 1st inst. says plans are nearing maturity for the building of an additional 150-ton cyanide plant in Lawrence county, together with the purchase of mineral land involving an investment of upward of $1,500,000, under the auspices of J. S. Childs, president of the G. & S. Ex. M. & M. Co.

**COLORADO.**

W. F. Kendrick reports: "There is being heavy sifting out of stocks, separating the worthless, or those in which the people have no confidence, from those of merit. The people of America made the same mistake that the English people did in South African shares. Many London operators put worthless shares on the market on the strength of the good ones, which has also been done in the United States by both Eastern and Western people. In weeding out the worthless stocks many good propositions are injured, although the better class of Colorado mining shares is advancing at the present time. The profits from the dividend-payers are so large that they command a price, although many are selling below their value as an investment.

"The rebuilding of the town of Cripple Creek with brick stone and steel structures that would do credit to a large city, shows that large wealth is being taken from the ground. The Florence & Cripple Creek Railroad Company are employing every engine they have and hiring from the Rio Grande to transport the building material. The same is true of the Midland Terminal Railroad.

"The two lower levels from the main shaft of the Victor have opened larger ore bodies than anything before discovered in the property, increasing the large reserves. The development work of the Isabella has been as satisfactory as that of the Victor, and these two properties have reserves from which to pay dividends for a long time. The shipments of ore from Cripple Creek have increased materially the last thirty days, the burning of the town having affected but little the working of the mines.

"At Leadville there is more systematic mining than in any other portion of the State. There are several companies that have miles of underground workings, from which millions of dollars have been taken, and are producing to-day the heaviest in their existence. The daily output of ore from Leadville is about 1,500 tons for the smelters.

"At Alma immense reserves of ore are being blocked out. It is situate on the opposite side of the mountain from, and of identical formation to, Leadville. This district is showing considerable activity, with several new reduction works built and in process of construction for handling the ores at the mines.

"A new district is being opened in Allen's Park, at the base of Long's Peak, in the northern part of the State. The veins are similar to those of Black Hawk and Central City, as are those of the Pine Creek district, which is but a few months old and has twenty shipping mines.

"The increased production of the San Juan and the Gunnison districts over that of last year is phenomenal. The discoveries in Routt county, in the western part of the State, give promise of opening some of the veins which have aided in supplying the immense placer deposits existing in that district.

"In summing up the mining condition of the State, it is in the best condition of our history; the silver output will be an increase over 1895, with a gold output probably 50 per cent greater. Colorado has nothing to complain of, but much over which to feel good."

**NEW MEXICO.**

Silver City *Enterprise*: At Mogollon the Confidence mill is running to its full 30-stamp capacity and crushing about seventy-five tons of ore per day, which the mine easily supplies.

The Maud S mill is running steadily and producing as much bullion as ever in the history of the property.

**ARIZONA.**

Near Jerome the Etta mine and mill is doing well. In '82 a 10-stamp mill was built to work ore from this mine. They could not make it pay—tenderfeet being placed at the head of every department. It stood idle until the mill had almost fallen to pieces and the mine workings had caved in, when, last February, J. L. Giroux, took a lease and bond on the mine and mill, and has since had a weekly clean-up of $2000.

Yuma *Sentinel*: Supt. R. M. Strauss of the La Fortuna mine reports the mill running night and day and the camp in a prosperous condition. The work consists of three levels. The first is down 65 feet, showing 14 feet of ore. A drift has been run last on this ore body 120 feet. On the second level, at a depth of 130 feet, the ore body is larger and shows 18 feet. One hundred feet of drifting has been done on this level. The third level is at a depth of 215 feet, with a crosscut showing the ore body to be 30 feet. The quartz is equally divided between white and pink. The pink quartz seems to be the most valuable. The estimated value of the ore is $40 per ton. The mill consists of 20 stamps, erected on the mine. The working shaft is on an incline of 60°. The steam hoist operates a grizzly directly to the rock broken and then by gravitation to the stamps. The framework of the stamps is the heaviest in the Territory. The runs are each 25 feet long and of heavy plates. There is a drop after the first run, making 50 feet of plates to be run over. The water reaches the mine from a well in the Gila valley through a 4-inch pipe, twelve miles long, at an elevation of 650 feet. There are sixteen men employed in the mine.

News reaches Yuma of another big strike in the Bonanza mine at Harqua Hala. For the past year the mill has been running only on tailings, treated by the cyanide process, and for the past six months the mine has been leased to a number of old miners, headed by J. M. Murphy. The old workings had indeed been stripped of ore, but on the new incline a streak of iron oxide ore had been passed with little notice. This streak was remembered by the leasers and upon it they sank at a venture. At a depth from the surface of 200 feet, and but a short distance from the incline, the streak expanded into an ore body, strong and continuous, averaging 4 feet in width and running in gold, free milling, $5 to the ton. The mill is already at work on the ore and the leasers are hiring all the miners who apply.

**MEXICO.**

*Mining and Metallurgical Journal*: It is authoritatively stated that certain Spanish capitalists in Mazatlan, who have been investigating the output of the Minas Prietas mines, in behalf of home correspondents who have investments in the Transvaal, and are now seeking investments in Sonora, after careful inquiry, reported that the mines at Prietas, during the year 1895, yielded $2,600 in gold per month for every stamp dropping, against a yield of $1,300 per stamp per month by the best two mines at Johannesburg.

**AUSTRALIA.**

Sydney, N. S. W., May 2, '96.

(Special Correspondence). — At Lucknow, seven miles from Orange, less than one hundred miles from Sydney, is a group of mines belonging to the Wentworth Goldfields Proprietary Co. The total product of these mines in 1895 was 66,656 ounces of gold. The dividends paid during the same period aggregated £170,000. One of the remarkable characteristics of the Lucknow mines is that there is no lode. The essential feature is a contact joint between two distinct formations—diorite on the footwall, serpentine on the hanging wall. At very irregular intervals along a limited section of this contact joint occur ore bodies, varying greatly both in extent and in richness. Whilst this contact joint can be traced for a considerable distance, amounting certainly to several miles, the area in which these ore bodies manifest themselves is comparatively restricted. So extensive are the underground workings in this property that it would not be possible to walk through them in a day, though the total length between the extreme points is only 3520 feet. This is due to the erratic nature of the ore bodies. The workings in following them up are very intricate, and form a perfect labyrinth. The deepest shaft on the property is now nearly 900 feet, and the deepest stopes yet being operated upon are 650 feet, so that there is a promise of a very long life before the mine. The workings are remarkably dry, only surface water having to be contended with. There appears to be a tendency in the ore to increase in richness as depth is attained. The ore has peculiar features of its own which render it an easy matter to identify it with certainty. Although the composition is of the ordinary character, represented by the familiar mineral mispickel, or arsenical pyrites, the manner in which the crystals range themselves is very interesting, the crystals radiating from a central point, and looking very beautiful. This peculiar feature led to a recent conviction of some men who had stolen or received ore from the mine. Another feature of the ore is that instead of being associated with the almost universal matrix of gold, viz., quartz, it is invariably associated with carbonate of lime, and though the property is intersected by several very well-marked and persistent quartz reefs, these reefs do not afford sufficient gold to pay for extraction. The remarkable richness of the mines is partially indicated in the returns, which, however, embrace a great deal of barren rock necessarily broken down with the ore. It is not an uncommon thing to ship five or ten-ton lots of special ore from these mines carrying 250 ounces of fine gold per ton, and many hundredweights of picked ore could be selected which would exceed 1000 ounces to the ton. The very rich ore in the mine is so rich that they do not attempt to treat it here. It is shipped direct to Swansea without any treatment whatever. In addition to 145 tons of such ore shipped to Swansea, the total bullion sent direct to the Sydney Mint during 1895 exceeded one ton.

**NEW ZEALAND.**

Official statistics show that the quantity of gold entered for exportation through the New Zealand Customs for the year ending March 31, 1896, was 222,981 ounces, representing a value of £889,545; the quantity for the same period of the previous year was 240,702 ounces, valued at £970,220, a decrease of 17,721 ounces. The West Coast and Otago supplied 72 per cent of the entire production of gold.

## Coast Industrial Notes.

—The Escondido, California, Oil and Gas Company have begun boring for oil.

—The Nevada Southern Railway has been bought in by the California Eastern Company.

—It is thought at South Vallejo the Southern Pacific Company may build repair shops there.

—The Denver & Rio Grande railroad has declared a dividend of one per cent, payable July 15th.

—The plant of the Union power-house at Portland, Or., was totally destroyed by fire on the 8th, loss $75,000, insured.

—Of $130,000,000 deposited in the savings banks of this State, $104,000,000 is in the savings banks of San Francisco.

—The shut down of the Colton Cement Works, caused by quarreling stockholders, throws seventy men out of employment.

—Successful tests were made this week with the motor and machinery at Big Creek which are to supply power for Santa Cruz electric lights.

—The railroad from Stockton to the Corral Hollow coal mine will be formally completed to-day. It is the ultimate idea to extend the road to Oakland.

—The wine bill which passed both houses of the Honolulu Legislature this week, admits duty free all California wines under 18 per cent alcohol for five years.

—The Nevada hatchery this year will distribute over 1,000,000 young trout. There are 450,000 eastern brook and 50,000 rainbow trout in the hatcheries at Carson.

—Columbia river canners and fishermen have not got together. The river is full of salmon, for which the canners offer four cents. The fishermen want five cents, and neither side yields.

—A company has been incorporated in The Dalles, Or., capital stock $35,000, for a general freight and passenger line between Goldendale, Wash., and The Dalles. The corporate name is Dalles & Goldendale Transportation Company.

—Reclamation District No. 673 (the "Pocket") and the Pacific Dredging and Reclamation Company have contracted for the construction of a cross levee near the Sacramento drainage canal, two and one-fourth miles in length. 175,000 cubic yards.

—The Spokane, Wash., Lumbermen's Association has advanced prices about 5 per cent, and the new schedule is as follows: Common rough, in yard, $8.50; common rough, delivered, $9; common rough, s. 1 s., $10; common shiplap, $12; No. 2 quality, $16; No. 1 quality, $21.

—Irving and Ford, of Everett, Wash., have a contract with the Everett Pulp & Paper Company, for 35,000 cords within twelve months, amounting to about $80,000. Of this 35,000 cords, 20,000 are to be fuel wood, and 15,000 pulp wood, 5,000 each of fir, spruce and cotton wood.

—The Trade Mark Committee of the Manufacturers' and Producers' Association has reported in favor of granting the use of the trademark to all members in good standing. It will be used on goods or products made in California. An electro is to be sent to every paper in the State.

—Over 5000 people attended the reception to the Union Iron Works at the Mechanics' Institute in this city last Saturday evening, in honor of the builders of the battleship Oregon. Addresses were delivered by Pres't Denicke of the Mechanics' Institute; Oscar Lewis, one of the trustees; Irving M. Scott and Geo. W. Dickie.

—The Dunsmuir *News* says the firm of Sisson, Crocker & Co., will build a railroad from Upton to the McCloud river. Mr. Cooley is now in the field surveying the road. They have already bought their rails and are ready to commence grading. The road will run along the upper side of the town of Sisson.

—On the 9th the San Francisco and San Joaquin Valley Railroad made another 10 per cent assessment, the eighth call of 10 per cent, aggregating $1,955,600, out of the total subscriptions of $2,444,450. The remainder will be called before August 1st in two 10 per cent assessments. Chief Engineer Storey says the track is now laid to a point three miles south of Merced.

—The Alpine Land and Water Company, recently incorporated at Carson, Nevada, proposes to reclaim and put under cultivation 80,000 acres of arid land and place settlers thereon. The company says it will build twenty small reservoirs to supply water for the 80,000 acres of land along Carson river, commencing at Alpine county, Cal., and continuing on through Douglas and into a portion of Churchill county, Nev., cut this track up into forty and eighty-acre lots to be colonized.

—In the case of Smilie vs. Fresno county, it is held that where a county contracts for the erection of a building, the payment to be made in instalments each year as the work progressed, the debt or liability created is not the aggregate amount of such instalments, but only that which arises from year to year on the separate instalments; and if the instalment is within the income each year it is not illegal, under a provision of law forbidding counties to incur an indebtedness or liability in any year exceeding the income and revenue provided for that year.

—Japan has learned not only to fight, but to manufacture, and with the abundance of cheap labor, and the plentiful supply of raw material close at hand which she possesses, she may well become our rival, she has the enormous advantage over gold-using countries, that she pays her labor-bill in silver. The silver-using countries have an immense advantage over the gold-using countries in all manufactures owing to the depreciation of silver. In America one gets about $5 for an English sovereign, in Japan about $9, yet the silver dollar in Japan buys as much as the gold dollar in America, and very nearly as much now as it did when it was worth one dollar in gold instead of the 57 cents it is about worth here now. The result is that labor in Japan is extraordinarily cheap when reckoned in English or American money. In the Government works at Tokyo and at Yokosuka the men work from ten to twelve hours a day, and earn from 20 to 50 sen—from about 10 cents to 25 cents. The women work (and female labor is employed very largely) the same hours and earn from 15 to 35 sen—7½ cents to 17½ cents. Gold men deny there is any danger to be apprehended, and the only reply yet given is that our exports to silver-using countries have increased at a greater rate than our exports to gold-using countries, so that clearly we have not suffered so far; which is no answer at all.

—The Oregon Improvement reorganization committee have prepared a plan of reorganization which provides for the issue of the following new securities: $5,000,000 of first mortgage 5 per cent fifty-year gold bonds; $5,000,000 of 4 per cent non-cumulative preferred stock, and $9,000,000 of common stock. First mortgage bondholders receive in cash the amount of the coupon on their bonds maturing June 1, 1896, namely, $30 per bond and 110 per cent in new five per cent bonds, bearing interest from June 1, 1896. The new first mortgage bonds not set aside for the present firsts are to be issued at no greater rate than $100,000 per annum, and only for the purchase of new steamships and other needed property, which is to be added to the security for such bonds. Holders of consolidated mortgage bonds who pay 12½ per cent, or $125 per bond, receive 62½ per cent in new preferred stock and 75 per cent in new common stock. Holders of preferred stock who pay 12½ per cent, or $12.50 per share, receive 62½ per cent in new preferred stock and 75 per cent in new common stock. Holders of common stock who pay 10 per cent, or $10 per share, receive 10 per cent in new preferred stock and 50 per cent in new common stock.

—The *Union* reports that the Marysville and Nevada Power and Water Company has been organized by residents of Grass Valley, Marysville and Smartsville. Work will begin at once and a dam will be built at the "narrows" on the Yuba river. The company will commence business with the right to 70,000 inches of water, and in addition will own over twelve miles of ditches already in use, with clear title to the rights of way for sufficient ditches to supply a large area east of Marysville. The company also owns the land where their dam will be built, and have acquired the entire system of water rights and ditches of James O'Brien of Smartsville, who is one of the leading promoters. The capital stock of the corporation is $2,000,000, divided into 200,000 shares of a par value of $10 each. The following are the incorporators of the company: John Spaulding of Auburn; James O'Brien, Sr., James O'Brien, Jr., William O'Brien and Louis Conrath of Smartsville; W. H. Carlin, D. P. Donahue and Hugh Maguire of Marysville; R. C. Walrath, W. F. Englebright, George L. Hughes and W. W. Waggoner of Nevada City. The principal place of business will be at Smartsville.

## Personal.

CLARENCE KING will be in this city next week.

W. C. RALSTON has returned from the Atlantic slope.

JNO. HAYS HAMMOND is returning to California via England.

MANAGER RUST will spend $250,000 in improvements on the Tacoma smelter.

STEPHEN J. FIELD of the U. S. Supreme Court, is here from Washington, D. C.

JAS. BURKE of Grass Valley is the new foreman of the Gold Valley mine, Sierra Co.

WM. MOOREHEAD succeeds Geo. Quinn as superintendent of the App mine, Tuolumne Co.

J. R. THOMAS has the foremanship of the Florida Mountain Mining Company at Silver City, Owyhee county, Idaho.

A. R. MEYER, president of the Consolidated Kansas City Smelting and Refining Co., has returned from a trip to Mexico.

S. KOENIGSBERG, general manager of some Ural mountain, Russia, mines is here to study California mine methods, and to buy considerable American mining machinery.

DENNIS RYAN of St. Paul, Minn., is here on a brief visit. He was once owner of the Horn Silver which he sold to the Cunards for, it is said, $4,000,000. He still owns the Gold Hunter mine in the Cœur d'Alenes.

AT the graduating exercises of the Boston Institute of technology on the 9th, Aug. J. Bowie of this city, was honored with two degrees in mechanical and electrical engineering, passing first in a graduating class of 188.

J. E. SPURR, H. B. Goodrich and F. C. Schrader, members of the United States Geological Survey appointed to make a report on the mineral resources of the Yukon basin, Alaska, took passage at Seattle, Wash., this week on the steamer Queen for Juneau, and will journey thence across the pass to Forty Mile creek, about which region their work will center. The survey will probably take a year and a half, and the winter will be spent at Circle City. When complete the party will return to Washington city, and a report setting forth the results of their investigations will be published.

UNITARIAN LITERATURE sent free on application. Address Postoffice Mission Committee, First Unitarian Church, corner Geary and Franklin streets, San Francisco. Mention this paper.

THE HARRINGTON & KING PERFORATING CO. CHICAGO.

DOUBLE PIPE AIR COMPRESSOR.

This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to us at 306 Pine St., San Francisco, Cal. We could save you money though in cost of foundations, as our Compressors are half the size of other makes.

Tremain Steam Ore Stamp.

COMPLETE FREE-MILLING PLANT FOR $1,000.

Consisting of One TREMAIN STEAM STAMP, with Automatic Feed, capacity from 8 to 12 Tons a Day; One Upright Boiler; 20 Feet Electro Silver Plate, and all Pipes and Fittings necessary to connect Boiler and Mill.

Total Weight, About 5000 Pounds.

It requires no belting, shafting, pulleys or building.
Can be transmitted in section or whole. Well adapted to localities difficult of access. Weight, 3000 pounds.
Its practicability was fully demonstrated by its enormous sales of 1895, which exceeded those of two former years, and is now in successful operation in Africa, Alaska, Mexico, Colorado, South America, California, Canada, Montana, Oregon, Central America, Arizona, Dakota, New Mexico, Wyoming, etc.

EXCEEDS that of any other manufacturer in the United States, and Includes Everything in the Electrical Line. . . . . .

WASHBURN & MOEN MANUFACTURING COMPANY,
8 and 10 PINE STREET, SAN FRANCISCO, CAL.

RUPTURE CURED.

Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absoutely without danger. Usually but a single treatment required.

## Commercial Paragraphs.

THE San Francisco Novelty and Plating Works, Justinian Caire agent, has the contract for covering with copper the dome of the New City Hall.

THE Colorado Iron Works recently completed and shipped twenty-one cars for W. S. Stratton, of Cripple Creek. The cars were made from a special design originated by Mr. Stratton.

A HOISTING plant for the Corral Hollow coal mines is being built by the Fulton Engineering and Shipbuilding Works—two direct-acting, 20x60-inch engines, weighing 175,000 pounds.

THE Washburn & Moen Manufacturing Company, at its annual meeting held at Worcester, Mass., on May 26th, voted to increase its capital stock from $3,500,000 to $4,000,000. The old board of directors were re-elected as follows: Wm. E. Rice, president; Philip W. Moen, treasurer and general manager. A quarterly dividend of 2 per cent has been declared.

THE diversity of uses to which electric motors are now being put is forcibly exemplified by a glance at the orders which the power and mining department of the General Electric Company received during the first two weeks of last month. The motors were called for to operate printing presses, saws and planers in a box factory, an assortment of mining machinery in a coal mine; machinery in a large bakery; blowers in a stove works; a Gould fire pump; a mine pump; large Brush arc lighting dynamos; a jib crane; travelling cranes; machinery in an oil cloth works; inclined railway, etc., etc.

JAS. S. BROWNELL, Western agent Frue Vanning Machine Co., this city, reports the following sales: Eight 4-foot patent lip flange corrugated belt Frue vanners, Golden Gate mine, Sonora, Tuolumne county, Cal.; two 6-foot plain belt Frue vanners, Kinkead M. & M. Co., Virginia City, Nev.; Julian G. M. Co., Funter Bay, Alaska, four 4-foot patent lip flange plain belt Frue vanners; Roanoke Mining Co., Mokelumne Hill, two 6-foot plain belt Frue vanners; Dutch Mining & Milling Co., Quartz Mountain, Tuolumne county, four 4-foot patent lip flange belt Frue vanners; Gold Park Mining Co., Austin, Nev., one 6-foot plain belt Frue vanner; New Citizens G. M. Co., Coarse Gold Gulch, Madera county, one 6-foot plain belt Frue vanner; Parke & Lacy Co., Sydney, Australia, four 4-foot patent lip flange plain belt Frue vanners.

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

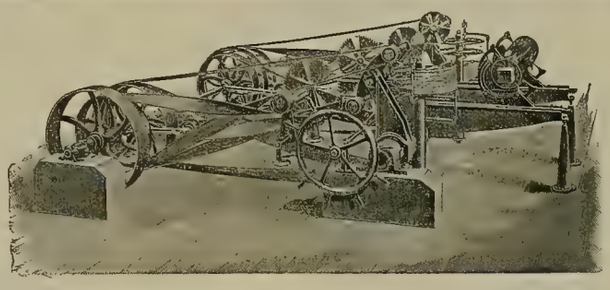
FOR THE WEEK ENDING JUNE 2, 1896.

561,192—ROTARY PUMP—Bartlett & Lewis, Portland, Oregon.
561,485—LOAD DUMPER—T. Carroll, Anaheim, Cal.
561,494—GATE HINGE—W. J. Crawford, Spokane, Wash.
561,308—BUCKLE—C. F. Francisco, Lakeside, Cal.
561,267—LIFE SAVING DEVICE—W. H. Martin, Military Home, Cal.
561,429—ENGINE EXHAUST—Perry & Hancock, Needles, Cal.
561,518—MALT KILN—F. Rademacher, Los Angeles, Cal.
561,240—ABSTRACT BOOK—S. H. Rice, Ukiah, Cal.
561,354—BUTTER MOLD, ETC.—R. A. Simpson, Ferndale, Cal.
561,464—CORSET—Mina Woodruff, Los Angeles, Cal.

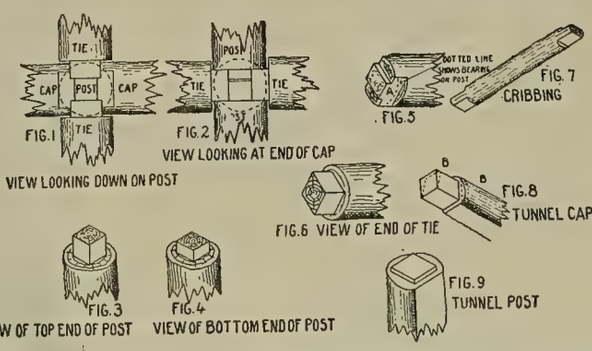
NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:



BUTTER MOLDING AND CUTTING MACHINE.—R. A. Simpson, Ferndale, Cal. No. 561,351. Dated June 3, 1896. This invention relates to a machine for moulding and cutting butter, in which independent removable strips are mounted upon a suitable bed which is bounded by removable walls, forming a receptacle within which the butter is packed and molded; the molded mass being subsequently cut into proper squares, and the walls gradually removed in sections. The object of the invention is to simplify the construction of this class of machines. It consists of a stationary bed having cleats extending across from its opposite side; a temporary and removable bed above the stationary bed formed by a series of transverse bottom boards placed side by side, with their ends resting loosely on the cleats; mold sides hinged together in pairs at diagonally opposite angles, so that the sides are separable laterally and independently of the bottom boards. Blocks are pivoted to the cleats, turnable thereon, so that their ends may project beyond the cleats and form a support for the mold side and increase the depth of the box or mold. When longer and heavier rolls are desired, a partition wall is removable, fitted within the mold sides and adapted to be introduced at any point to reduce the capacity of the box. The butter is cut by wires stretched upon a frame, and this frame has slidable foot strips with means for adjusting it from the main frame, and using it thereon as required.



THE CHRYSOMETER.

A CHEMICAL ASSAY OUTFIT. Anyone can use it. Chemicals enough for 100 assays with each $25 outfit. J. W. PETTEE, Sole Manufacturer, 907 17th Street, Denver, Colo.

## The Denver Engineering Works Company.

Herewith are three illustrations of part of the works of the Denver Engineering Works Co., manufacturing and consulting engineers, corner of Thirtieth and Blake streets, Denver, Col. The works, under the name of Hendy & Myer, were originally started in 1876, and are pioneers in the West in the construction of mining, smelting, milling and concentrating machinery. They have made many improvements in this line of late years and have lately finished the largest silver-smelting furnace in the world.

Among their many special machines for the saving of labor, we here illustrate their patent mine timber framing machine, which will do the work of twenty skilled carpenters and do it more accurately.

It will make the tenons equally true on *round* or *square* timbers, no matter how crooked or winding they may be, and the shoulders and sides of the tenons will be parallel and true to each other; also the ends.

Every stick will be of *exactly equal* length between shoulders and every tenon will be the same length. Should a round log be two or three inches larger at one end than the other, the tenon will always be exactly in the center.

Any length of timber can be framed up to ten feet between the shoulders and up to sixteen inches diameter on the standard machine.

By referring to the cut shown, it will be seen that there are ten saws—five at each end—so both ends are framed at the same time and at the one setting. It is usually the practice to make the tenons of mine timber to have a clearance of one-half inch to one inch between the ends of the tenons, depending on the shoulders and side grain of the sticks to sustain the weight. By so doing, the best part of the log is not used for direct strain endwise.

This machine enables the framer or timberman to make full use of the whole stick or log, by having the tenon cut the proper length, to allow for the shoulders setting into the cross grain to a solid bearing, and then meeting, end to end; in this case leaving the tenon as large as possible and bringing most of the weight to bear on the ends, thus relieving the shoulders of the great strain and preventing the settling of the timbers, so often seen in the lower sets of large veins and chambers.

Round logs are much cheaper than square timbers and are far superior, as the outside is the strongest part of the log, and, by their use, the price of the machine is saved every month or two; but, if square timber is preferred, it handles it equally well. To describe the operation, if round logs are used, they are cut in lengths about one-half to one inch longer than they will be when finished in the frame.

The saws being adjusted to cut the right size and length of tenon, the log or stick is rolled into position with the proper angular bolster under each end to bring it in the center, and made fast by the dogs shown, thus holding it firmly in position.

The company takes pleasure in referring to any of the following companies who are now using their machine, and will send special circulars and letters on application: Aspen Mine, Aspen, Colo.; United Verde Copper Co., Verde Station, Arizona; W. A. Clarke, Butte, Montana; Bunker Hill & Sullivan M. & C. Co., Wardner, Idaho; Colorado Smelting & Mining Co., Butte, Montana; Bullion Beck Mining Co., Park City, Utah; Centennial-Eureka Mining Co., Eureka, Utah.

This company has a special electrical department for the manufacture and installation of electric light and power plants, electric hoists, and have just completed an electric pump, to lift 1,000 gallons of water per minute, and have fitted up one of the largest smelters in Colorado with an electric plant, for lighting, operating their stock floors and running their sampling works.

They also manufacture high speed automatic, plain slide valve and Corliss engines of any capacity, and will send special circulars and prices on application.

# THE PELTON WATER WHEEL,

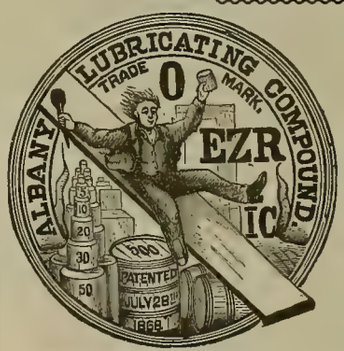
Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Setf-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.



THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

Manufacturers and Importers of
Assayers', Mine and Mill Supplies, Chemicals and Chemical Apparatus.
We frequently have Second-Hand Assay Balances, which we put in order and sell at reduced prices. We can now offer for sale a fine new portable balance, made by Oersterland, Freiburg, Germany. This balance, including glass case, will fold up to 6½x12x4½ inches. Beam, 7 inches long; sensible to 1-10 milligram. New movement to release pans. All parts nickel plated. Specific gravity bottle and hook pans; 3 sets removable pans, one set of horn; pincets and weights; 1 platinum gram down to 1-10 milligram. Formerly listed at $85, now offered for $55.
Oertling's Assay Scale, No. 10, in glass case; powers, 10 grains down to 1-100 grain and riders, with weights; price, $60, offered for $40.
Oertling's Pulp Scale. No. 1, in case; power, 500 grains to 1-50 grain; without weights; price, $40, offered for $30.
German Assay Scale, not in case; steel bearings, 10-inch open beam, index pointing below; mounted so as always to be level; pans suspended by three platinum wires and hook; all packs in drawer 12½x6½x2 inches; without weights; price $35, offered for $23.
German Scale; agate bearings for center knife; all packs in drawer 12½x6½x2½; price $30, offered for $22
German Chemical Scale, in glass case, with two folding doors in front and one at each end; long open beam with 8-inch radius; center knife rests upon agate; pans suspended by platinum wire chain and jewelled hooks; rider movement; beam graduated into 100 parts. This is a new scale left on sale; price $70, offered for $30.
German Assay balance cat No. Z; solid beam, 8 in. long, index pointing upwards; pans suspended by platinum wires and hooks; in glass case with sliding door; price $40, offered for $30.

PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

(MACARTHUR-FORREST PROCESS)

**MacArthur-Forrest Process.**

CAPITAL, - - - £110,000 STERLING

To MINE OWNERS and others having Refractory Gold and Silver Ores hitherto untreatable at a profit, the MACARTHUR-FORREST (Patent) Process of Gold and Silver Extraction offers a solution of the difficulty.

Advisory Board in the United States: Thomas W. Goad, Manager; Hugh Butler, Attorney; John F. Bell; P. George Gow.

California and Nevada Agency and Experimental Plant, 23 Stevenson Street, San Francisco, Cal. P. G. Gow, Sole Agent.

OFFICE: MCPHEE BUILDING, DENVER, COLORADO.

**MILLS BUILT WITH GUARANTEE OF SUCCESSFUL OPERATION.**

**KENDALL GOLD AND SILVER EXTRACTION CO.**

The Kendall Process is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

*The Kendall system is covered by patents which this company will defend.*

The American Cyanide Gold and Silver Recovery Co., organized in Denver more than a year ago to introduce and operate the Kendall Process in several States, have closed contracts with some ten mines for the use of this process after exhaustive comparative tests with the ordinary plain cyanide method.

Capt. De Lamar has adopted the process at his Nevada mines, where a 250-ton plant is being completed. He writes that he is saving 95 per cent of his gold values, and regards the Kendall Process as the cheapest and best he is aware of for the treatment of gold ores.

*All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.*

Owners of mines and reduction works can obtain full information on application to

## Gold in Ecuador.

It is now claimed that among the gold-producing countries of the world Ecuador will be noted. The placer gold fields, situated in the Province of Esmeraldas, in the northeastern part of Ecuador, cover nearly 200 square miles. The most of this tract, it is said, is held by four companies, prominent among which is the Playa de Oro Mining Company, which has already expended over $600,000 on its plant, which is being rapidly pushed on to completion, and already shipments of gold have been made by the company of over 1150 ounces from the washing done during the progress of development operations. The three other companies working in the district are also engaged in active development, and the necessary machinery for the treatment of the gravel is being erected. The deposits are situated at the foot of the Andes, and from their location can be worked economically, the water power for hydraulic mining being supplied by the Santiago river and other large streams in the neighborhood of the properties, while the lands are well timbered. Under the amended Ecuadorian mining laws, mining property, mining machinery and the output of the mines enjoy immunity from any description of taxation for a period of twenty-five years. Cable communication is being established by the Ecuadorian Government, and negotiations are in progress with the Pacific Steamship Company for the establishment of a service.

## Recent California Mining Incorporations.

Waterford Mining Co., S. F.; F. L. Pritchard, W. F. Ambrose, E. F. Campion, P. Walsh; capital stock $2,000,000, $500 subscribed. The company proposes to operate in Paterson district, Mono Co.

The Chivato Mining and Milling Co., San Francisco; capital stock $1,000,000; W. J. Sutherland, E. S. Spring, W. G. Holmes, B. Royce, W. E. Greene.

Bunker Hill Mining, Milling and Power Co., San Francisco; capital stock $500,000, $375,075 subscribed; W. B. McSherry, G. W. Osborn, T. M. Carroll, E. W. Burke, M. M. Miller, J. B. White.

## Recently Declared Mining Dividends.

On the 15th the Portland of Colorado pays a 1c per share dividend. The Moon-Anchor Co. pays a similar dividend on the same date.

The Morning Star gravel mine, Placer Co., has declared a $6 dividend per share—its sixtieth dividend.

The miners should be partial to San Francisco. The MINING AND SCIENTIFIC PRESS estimates that fully $5,000,000 of San Francisco capital has been invested in California mines during the past year.—Placer Herald.

## Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

*There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.*

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong), this agency has the best knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address. *Illustrated Weekly*, Denver, Colo.

An Experienced Millman

Desires position in mill; understands concentrators; has had 8 years' experience. Address Amalgamator, care MINING AND SCIENTIFIC PRESS.

## GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 66, Placerville, Cal.

## Great Reduction in Light!

# IMPERIAL

# Automatic Gas Machine

Produces a Beautiful Light.

The difference between the brilliancy of light produced from gasoline gas and from coal gas is 3 to 1. The gasoline light is clear and soft, rests the eyes and brings comfort to the home.

The latest and most perfect Automatic Gas Machine now in use, particularly for illuminating private dwellings in the country, as well as residences in the suburbs of a city or town, public institutions, asylums, hotels, etc. The light is steady, soft, bright and pleasant to the eyes and can be furnished at an expense of but eighty cents per 1000 feet of gas. It is much safer than coal oil lamps, which are so dangerous to have in the house on account of an explosion.

These Gas Machines are perfectly safe, and free from any danger whatsoever. Every modern house built for gas should have one of these machines. No public institution should be without one. I have no hesitancy in saying that there is no other gas machine in the market that can compete with mine as to prices, and they surpass as to perfection in all its requirements.

For supplying gas for gas stoves for cooking or heating these gas machines have no equal. Address

JACOB SCHRIEBER,

East Berkeley, Cal.

Or H. E. STEMLER, Agent, Merced, Cal.

## PAYNE'S

PATENTED

# GOLD SAVING RIFFLE.

This Riffle is just what placer miners want whether they are working large or small claims, as it is the only riffle ever invented that holds the mercury entirely exposed to the material, no matter what force of water is used. A large number of these Riffles have been sold, and are now in use in Colorado, Montana, New Mexico and elsewhere, and the first complaint has yet to be made against them. Many testimonials have been received from parties who have used and are now using them, giving them the highest praise. Are made of chilled cast iron, cheaper and more durable than any other process. Agents wanted. County and State rights for sale. These Riffles are manufactured at Denver only. Address all orders and communications to

JOSEPH J. PAYNE, Sole Owner,

1710 Champa Street, DENVER, COLORADO.

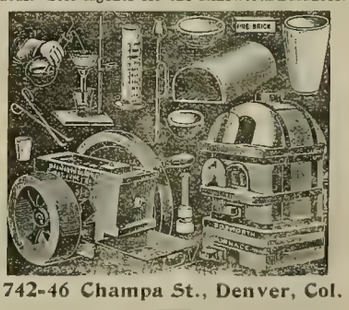
☞Would sell an interest to right party.

# MERCUR.

UTAH'S NEW EL DORADO.

Wonderful Development of the Camp Floyd Mining District.

The Camp Floyd Mining District of Utah, distant but forty miles from Salt Lake City, is now attracting the attention of the mining world as the only Western rival of Cripple Creek, Colo. The district has had a most remarkable history. The town of Lewiston rose, flourished and passed into decay twenty-five years ago, on the very spot on which Mercur has been built within the last eighteen months. It was renowned as a silver camp in '71, and from that time until 1880 old timers tell of the many big strikes in the district, but it was not until 1890 that gold was found. Attention was then called to the MacArthur-Forrest cyanide process, and a test of the ore was made in Denver, with such elaborate results that the old mines and many new ones were put on a dividend-paying basis. The formation at Mercur is very similar to the region about Johannesburg in South Africa, except that the Camp Floyd ore bodies are larger and richer. Geologists and mineralogists differ as to the origin and formation of the ore body, some claiming three distinct gold-bearing veins, while others seem to favor the single blanket vein theory. On one point, however, all agree, that no such gold deposit has ever before been discovered. In the Mercur mine the ore bodies average $15 in gold to the ton, while some assays run into the hundred's mark. With the aid of the cyanide process this ore is mined and milled at an average cost of $2.50 to $3 per ton, leaving a profit of $12 to $12.50 per ton. On this basis the mine has, in the year just passed, paid dividends to the extent of $810,000. The adjoining properties—the Golden Gate, Marion and Geyser—are equally as rich. The vein or veins have already been traced from the cluster of mines at Mercur to Sunshine, a distance of six miles, where the Sunshine mine and mill, another large property, is located, together with numerous claims of less magnitude. If the discoveries recently made, twelve miles west of Mercur and far to the south, are uncoverings of the same vein, then there is strong evidence that the great deposit covers an area of from 100 to 150 square miles and is the greatest ore body in the world.



Mercur or the Camp Floyd Mining District is best reached by the Rio Grande Western Railway to Salt Lake City. For further particulars or for printed matter apply to F. A. WADLEIGH, General Passenger Agent, Rio Grande Western Railway, Salt Lake City. *

E=.....

We beg to call attention to our "RISDON HAMMERED" Shoes and Dies, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend it to all mine owners and mill men.

# DEWEY & CO'S Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. patents since 1872. All worthy inventions patented through Dewey & Co's Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

## THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

**Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines,** using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

| | |
|---|---|
| Coal Gas, ten hours' run, 1000 feet | $2 00 |
| Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c. | 1 25 |
| Coal Oil, ten hours' run, 7½ gallons @ 10c | 75 |
| Crude Petroleum, asphaltum base, 16 gallons @ 3c | 48 |
| Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c | 65 |

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon—21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

# Market Reports.

## The Markets.

SAN FRANCISCO, June 11, 1896.

Business continues good. The demand is not increasing but enlarging for all lines. It is the belief that general trade will continue fairly active during the summer months with a very decided increase this fall over that of several years past. The attention of the capitalists and investors generally is still attracted to gold mining properties. Transfers are reported daily, but particulars are withheld. Referring to the demand for mining properties, the *Wall Street Journal* says: A prominent mining man, speaking of the mining situation in the west, says that the lull in the mining matters in the east does not extend beneath the surface. Underneath, there is great activity, which is placing things in shape for a genuine mining boom. He named six or eight leading houses, any one of which could justly claim a national reputation, that have acquired options on or interest in genuinely good properties. This movement is still going on, and buyers are naturally bears at the moment. They have attempted in a legitimate way to discourage all expansion in the East until they secured their position. The time will come when they will be ready, and then we may look for an excellent market for mining stocks in New York City. From data at hand it is perfectly safe to assume that the properties bought out by these houses will be moderately capitalized, and there will be no 5 and 10 cent shares.

Up to this time the Cripple Creek region has been the favorite, although some excellent properties have been secured in New Mexico, Arizona, Utah and Southern California. Gold mine investments are about the only ones in this country that could not be hurt by free silver. English capital is expected to find mining channels in this country before it goes into rails and industrials.

The local money market is without essential change. The supply of available funds is quite large, in excess of present requirements, but the usual crop moving demand is expected to set in soon. It is the impression that more funds will be advanced on wheat than usual owing to farmers having bullish ideas regarding the future of the market. The large increasing output of the mines is adding still more to loanable funds as is the investment of eastern and foreign capital in mining properties. The East reports continued ease in the money markets. So soon as crops begin to move a strengthening in the rates of interest is looked for.

### New York Silver Prices.

NEW YORK, June 11.—Following are the closing prices for the week:

| | Silver in London. | Silver in N. Y. |
|---|---|---|
| Friday | 31⅜ | 68⅝ |
| Saturday | 31⅜ | 68⅝ |
| Monday | 31 5-16 | 68⅛ |
| Tuesday | 31 5-16 | 68⅛ |
| Wednesday | 31 5-16 | 68⅛ |
| Thursday | 31 5-16 | 68⅛ |

| | Copper. | Lead. | Iron. | Tin. |
|---|---|---|---|---|
| Friday | 11 40 | 3 00 | 10 75@13 00 | 13 35 |
| Saturday | 11 40 | 3 00 | 10 75@13 00 | 13 35 |
| Monday | 11 40 | 3 00 | 10 75@13 00 | 13 25 |
| Tuesday | 11 40 | 3 00 | 10 75@13 00 | 13 20 |
| Wednesday | 11 40 | 3 00 | 10 75@13 00 | 13 25 |

The local bullion, money and exchange quotations current are as follows:

| | |
|---|---|
| Commercial Loans, % per annum | 7@8 |
| Commercial Loans, prime | 6@8 |
| Call Loans, gilt edged | 6@7 |
| Call Loans, mixed securities | 7@8 |
| Mortgages, prime, taxes paid by lender | 6@8 |
| New York Sight Draft | 12½ |
| New York Telegraphic Transfer | 15 |
| London Bankers' 60 days | $4.88¼ |
| London Merchants | $4.88¼ |
| London Sight Bankers | $4.89½ |
| Refined Silver, peroz., 1000 fine | 68⅝ |
| Mexican Dollars | 54@55c |

SILVER.—The market has held steady and fairly firm throughout the past week. For the first five months of the calendar year the exports from this city aggregate $2,336,440 in bullion. The last steamer for Japan and China took out $342,000 in bullion. A New York exchange of June 6th says: The bullish feeling on silver seems to be based on the idea chiefly that everything unfavorable in regard to the metal is already known, and it can receive no further important blow in the near future. There is evidence, moreover, that the low price has begun to tell on production which is not so great as it was, and is declining. Besides this, foreign coinage demand has absorbed most of the floating supply, and the market is in a condition where it would readily respond to anything favorable. Nobody takes much stock in politics, as a serious factor in the case of silver, but as conditions favor a rise anyhow, it is easy to make bullish sentiment effective for the time being. People who have interested themselves rather actively in the silver market say that there might very easily be a 2 or 3c. advance in the price at any time. Quite a considerable amount has been speculatively bought in the last two or three days. The figures of silver exports from this port:

In 1891 exports from New York were $21,000,000; 1892, $23,000,000; 1893, $32,000,000; 1894, $34,000,000; 1895, $38,500,000; 1896, (5 months) $21,000,000.

The present rate of exports so far this year would indicate exports of perhaps $45,000,000 for the year.

MEXICAN DOLLARS.—The last steamer for China took out 339,867 dollars, which is more than has been taken at any one time for some time past. The exports for the first five months of this year aggregate 3,323,400 dollars. The market is steady to firm at quotations.

COPPER.—The market has held firm. The East continues to report a good demand for both home and export. A New York exchange of recent date says: "The violent fluctuations in copper in the London market this week are reported due to the unusual demand and supply coming upon the market suddenly. The demand for copper has become enormous for the transmission of power. Mines which heretofore could scarcely be operated because of the scarcity of fuel to generate power are now being operated easily and economically by the transmission of power over copper wires from distances of from fifteen to seventy-five miles. The growth of the trolley system and telegraph and telephone systems all over the world has also increased the demand enormously."

The market is quoted as follows:

| | |
|---|---|
| Bolt | ¼ & 5-16, 20c; ⅜ and larger, 17c |
| Lake Superior Sheathing | 20 |
| Ingot, jobbing | 13 |
| Ingot, wholesale | 12 |
| Sheet copper | 17 |

QUICKSILVER.—The market is steady. The East reports a good movement, with the market weaker.

The market is quoted as follows:

| | |
|---|---|
| Home trade, per flask | 39 00 |
| Distant points up north | 38 00 |
| West coast of Mexico, for export | 34 00 |

ANTIMONY.—The market is quiet but steady at 8@9c cents in a jobbing way. New York mail advices quote 7⅛@7¾c for Cookson's, 6⅝@6¾c for Hallett's and 6½@6⅝c for Japanese, from store.

TIN.—Our market is easy, with a light demand ruling. The East reports slightly easier markets, in sympathy with a slight decline abroad.

The market is quoted as follows:

| | |
|---|---|
| Pig, per lb | 14½c |
| Plate, I C coke, heavy, per box | $4 25 |
| " " " light, " | 4 10 |

BORAX.—The market is quoted as follows

| | |
|---|---|
| Refined, in car lots | 6⅛ |
| Refined, in sacks | 5⅞ |
| Powdered, in car lots | 6⅛ |
| Concentrated, " | 5⅝ |

LEAD.—The market is steady both here and at the East.

| | | | |
|---|---|---|---|
| Pig | 3 75 | @ | 4 00 |
| Bar | — | @ | 4 15 |
| Sheet | — | @ | 5 50 |
| Pipe | — | @ | 4 75 |

SHOT.—The market is quoted as follows:

| | |
|---|---|
| Drop, sizes smaller than B, per bag of 25 lbs | $1 40 |
| Drop, B and larger sizes, " " | 1 65 |
| Buck, Balls and Chilled, do, " " | 1 65 |

POWDER.—Manufacturers continue to report an active demand, almost entirely for mining purposes. The market is strong at unchanged quotations.

The market is quoted as follows:

| | |
|---|---|
| Hercules, No. 1, per pound | 11½c |
| " No. 2, " " | 8½c |

IRON.—The market is fairly steady. The consumption continues large. Eastern mail advices state that there is a lighter call and with more selling offers there is some cutting in prices by those outside of the combination. Our market is quoted as follows:

AMERICAN.

| | To Arrive. | Spot. |
|---|---|---|
| Sloso | $21 00 | $23 50 |
| Thomas | 22 00 | 23 50 |
| Salisbury | 30 00 | 33 00 |

ENGLISH.

| | | |
|---|---|---|
| Barrow | $21 00 | $23 50 |
| Gartsberrie | 21 50 | 23 50 |

COAL.—Notwithstanding light imports of Australian and no vessel being able to load at Australian coal ports, our market continues steady. The liberal supply of coast coals is against higher prices. Advices from Kelso, Washington, are confirmatory that in the Anchor coal mine they have run into a good grade of coal, which improves as the deposit is worked. It is the opinion of experts that it will prove superior to any in that State.

COKE.—The market is quoted as follows:

| | | | |
|---|---|---|---|
| Gas Companies' | — | — | — |
| English, to load | 9 00 | @ | 10 00 |
| " spot, in bulk | — | @ | 11 00 |
| " in sacks | — | @ | 12 00 |
| Cumberland | — | @ | — |

LUMBER.—There is a continued good home and export demand.

The market is quoted in this city from dock or yards as follows:

| | | | |
|---|---|---|---|
| Redwood, Fluming | 17 00 | @ | — |
| Pine | 14 00 | @ | 19 00 |
| Spruce | 26 00 | @ | 31 00 |

## Mining Share Market.

SAN FRANCISCO, June 11, 1896.

The market made quite an advance, with the highest prices reached on Monday. The move was chiefly in the middle shares, under the lead of Chollar. As usual, the Gold Hill shares did very little. The highest call prices were as follows for the leading shares in each group: Con. Virginia $3.25, Ophir $2.40, Gould & Curry $1.75, Savage $1.90, Hale & Norcross $3.40, Chollar $4.30, Potosi $2, Belcher 81c, Crown Point 76c, and Yellow Jacket 73c. The market began to ease off towards noon of Monday and fluctuated down for the middle and north end shares up to yesterday, when a slightly steadier tone set in. The lowest prices yesterday on call were as follows: Con. Virginia $2.70, Ophir $1.90, Gould & Curry $1.30, Savage $1.50, Hale & Norcross $2.05, Chollar $2.90, Potosi $1.55, Belcher 76c, Crown Point 68c, Yellow Jacket 69c. At the informal morning session the prices were lower than the above. While the middle and north ends were selling down the Gold Hill shares sold up a few cents. At the decline there was liberal selling by outside holders and shorters. The bulk of the shares sold were taken in by strong parties, which would indicate that the deal is not over. It seems to be an open question whether the pool can make outsiders buy enough shares on the present prospects in the mines to admit of levying and collecting the line of assessments that is contemplated. From all that can be learned there are at least ten companies that must levy assessments within the next thirty days, for the banks will not allow them to overdraw much, if any, unless secured against the possibility of loss. The banks will not only not advance much money to the companies, but they will not loan money on shares unless to brokers of sound financial standing, and even then the latter have to give a note which draws interest, even if there is money to their credit. This makes it difficult to promote a large-sized deal, for the trading public is not blessed with sufficient funds to pay for many shares when the latter get up to from two to over four dollars each. It must be conceded that more ore must be shown up than has, as yet, been found to induce moneyed outsiders to come in as large operators. While saying this, it must be admitted that the work under way in some of the mines is of a highly interesting character, and as it progresses the shares in these particular ones will be subject to lively fluctuations—quick jumps and breaks or setbacks. This may possibly make the market sufficiently interesting as to induce more persons to come in as traders who care little, if anything, what is in the mines or how many assessments are levied, so long as the market is made active, with lively fluctuations.

An assessment of 25 cents a share was levied the past week by the Chollar Mining Co.

From the Comstock lode the news is about the same as heretofore made public. Everything points to time and assessments—how much time or how many assessments it is hard to say. The work in the mines on this lode requires to be done with the utmost care, so as to avoid loss of life through poor ventilation and caves by the moving character of the ground. There is not a mining district in the world which calls for such a systematic working as does that of the Comstock—therefore the heavy expenses and many unavoidable delays. In the Alta group the only work reported is in Alta, and this is about the same as heretofore made public. In the Gold Hill group work has been resumed in Overman. Stringers are reported as having been cut. Seg. Belcher and Belcher continue to report raising ore, but not enough to pay running expenses. In Crown Point the work under way points to time; but while it is being pushed more or less ore is liable to be cut, but it is not at all probable that it will be of sufficient size or value to count for much yet awhile. No news is allowed to leak out from Yellow Jacket, outside of a pending assessment. In Confidence they are still raising from the 60-foot level, above the 200-foot level, to the surface, so as to get ventilation. Slow progress is still being made in the joint west crossdrift of Confidence, Challenge and Con. Imperial. In the latter mine they are at work on the surface tunnel level. Work is continued on the 500-foot level of Alpha. No work is being done in Excheq. er, so far as the public is advised. The long west crossdrift in Bullion and also that in Gould & Curry are being pushed slowly ahead. In Potosi they report more or less stringers of ore on two levels. The work in Chollar is essentially unchanged. About 50 tons of ore are raised each week. In Hale & Norcross work is continued on several levels and some ore is raised, but not enough to pay expenses. The official letter from Savage reports that 202 cars (about 190 tons) of ore were raised the past week, which assayed over $62, as per car samples. The letter also stated that 260 tons of ore had been milled, which gave over $41 a ton, as per battery assay. This small return, it would seem, ought to be inquired into by the management, so as to find the reason for it. In Best & Belcher the work is on the same levels as heretofore made public. There was quite a falling off in the number of tons raised by Con. Virginia and also the car sample assays, but this was generally expected by miners. The work in this mine continues to be closely watched by mining men. The work in Ophir and Mexican is on the same levels as heretofore reported. It ought to be near an interesting point in each mine. The work reported in Sierra Nevada and Union is not materially changed. In Andes they have raised and are milling some ore left from former working.

Advices from the Brunswick lode are decidedly mixed and conflicting so far as private information is concerned: The ore has not as yet developed enough in quantity to warrant any great excitement in the shares of the mines working on that lode. What will be found is a problem which time alone can solve: at present there is nothing to justify the expectations of finding a bonanza. The crosscuts run on the 200-foot level of the mines are of an encouraging character, but what will be found when the crosscuts are run on the 300-foot level is an open question. Many look for an improvement over the 200-foot level. Active work is being done by Chollar, Savage, Hale & Norcross, Gould & Curry, Best & Belcher and Con. Virginia on the 200-foot and 300-foot levels. In Occidental they are working as low down as the 750-foot level. While the work in the above mines is underway considerable activity and rapid fluctuations in the shares will be in order.

The market opened this morning barely steady with moderate trading. After Call, prices shaded off, with Chollar sold down to $2.65. Towards noon the list strengthened under fairly active trading. At the 2:30 session business was light, with a disposition to sell. The impression prevails that top prices were touched on Monday and that the market will fluctuate to still lower figures. The news from the mines is not of a discouraging character; but, on the contrary, it is such as to encourage the belief that better things can be looked for before long. It is said that outsiders have been selling quite freely. If this is correct, then there ought to be a rally soon.

The following illustrates the changes of the week:

| Mines. | June 4. | June 11. |
|---|---|---|
| Alpha | | $ 22 |
| Alta Consolidated | $ 19 | 25 |
| Andes | 52 | 44 |
| Belcher | 76 | 76 |
| Best & Belcher | 1 50 | 1 30 |

## Assessment Notice.

OCCIDENTAL CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Silver Star Mining District, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 2d day of June, 1896, an assessment (No. 24) of fifteen cents (15c) per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 69, Nevada block, No 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of July, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before will be sold on TUESDAY the 28th day of July, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURROW, Secretary.

Office, Room No. 69, Nevada block, No 309 Montgomery street, San Francisco, California.

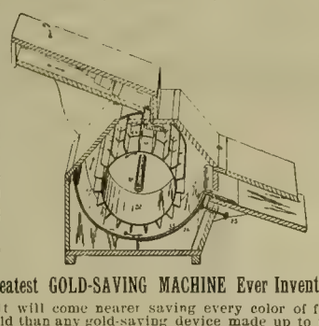
---

NIMSHEW GOLD MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Nimshew, Butte county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of June, 1896, an assessment (No. 1) of Three cents (3c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Mission Pier, No. 1, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of July, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 3d day of August, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.



C. D. COOK, Secretary.

Office, Mission St. Pier, No. 1, San Francisco, California.

## VICTOR AMALGAMATOR
(PATENTED.)

FOR MILL OR PLACER USE.

Greatest GOLD-SAVING MACHINE Ever Invented.

It will come nearer saving every color of free gold than any gold-saving device made up to the present time. Whether the gold is fine, flake or flour, its work is perfect. The only machine that works the black sands of the ocean perfectly, saving the fine flake gold contained therein. Our machines are now running on beach sand and on tailings from some of the best mills in California, and they are working successfully. We give guarantee with each machine. In working over old tailings from a stamp mill that contains free gold, amalgam and quicksilver, this machine has no equal. Send for catalogue and particulars. Manufactured only by the **VICTOR AMALGAMATOR CO., 703 S. Main St., Los Angeles, Cal.**

# THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

**MINING AND SCIENTIFIC PRESS,**
**220 Market Street..... San Francisco, Cal.**

*Assaying.—Part I—Gold and Silver Ores.*
Second edition. By C. H. Aaron. Embraces 130 12-mo pages, with illustrations, well bound in cloth; 1889. Price, postpaid.....$1 00

*Assaying.—Parts II and III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.*
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

*Notes on Assaying and Assay Schemes.*
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

*Prospector's Field Book and Guide.*
By H. S. Osborn.....$1 50

*A Practical Guide for Prospectors and Miners*
By C. W. Moore. With numerous illustrations.....$4 75

*The Explorer's and Assayers' Companion.*
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$5 00

*Aaron's Leaching Gold and Silver Ores.*
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

*Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.*
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid.....$3 00

*The Lixiviation of Silver Ores with Hyposulphite Solutions.*
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

*Modern Copper Smelting.*
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated.....$5 00

*The Metallurgy of Gold.*
By M. Eissler. Profusely illustrated.....$5 00

*Losses in Gold Amalgamation.*
By W. McDermott and P. W. Duffield.....$2 00

*Electricity in Mining.*
By Sylvanus P. Thompson.....80 cts.

*Practical Treatise on Hydraulic Mining.*
By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, postpaid.....$5 00

*Practical Hydraulics.*
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

*The Metallurgy of Silver.*
By M. Eissler. Profusely illustrated.....$4 00

*Manual of Hydraulic Mining for the Use of the Practical Miner.*
By T. E. Van Wagenan.....$1 00

*The Sampling and Measurement of Ore Bodies in Mine Examinations.*
Well printed on fine paper, with plates; complete. Price, postpaid.....25 cts.

*Manual of Mining.*
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

*A Text Book of Mineralogy.*
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

*Manual of Determinative Mineralogy.*
With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth...$3 50

*Metallurgy of Silver, Gold and Mercury in the United States.*
Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7

*Metallurgy of Silver, Gold and Mercury—Continued.*
Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50

*Notes on the Treatment of Gold Ores.*
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

*A Practical Manual of Minerals, Mines and Mining.*
By H. S. Osborn.....$4 50

*Matte Smelting—Its Principles and Later Developments, with an Account of the Pyritic Processes.*
By Herbert Lang.....$2 00

*Cyanide Processes for Gold and Silver Ores.*
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

*Practical Metallurgy and Assaying.*
By A. H. Hiorns.....$1 50

# Improved Ore Concentrator Belts. PATENTED.

(RIFFLED OR SMOOTH.)

## Suitable for all Ore Concentrating Machines in General Use.

These belts, with slight riffles at intervals, *will save* a greater percentage of valuable concentrates *than any other vanner belt.* Our new style flanges on the edge of the belt make it much more durable than any other. Send for circular and price list.

THE BLASDEL IMPROVED ORE CONCENTRATOR BELT CO.,

H. G. BLASDEL, Jr., Manager. Cable Address: BLASDEL. Haywards Building, 419 California St., San Francisco, Cal.

# RISDON IRON WORKS,

SAN FRANCISCO, CAL.

## READ WHAT MINERS THINK OF THE BRYAN IMPROVED ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.

One set of dies will crush from 1500 to 1600 tons.
One set of tires will crush 1500 tons.
One ring plate will crush from 2200 to 2300 tons.
The mills require very little attention. At our mill an ordinary peon," earning one dollar per day, has complete charge.

In regard to sliming, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a MUCH less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator it is unequaled by any mill now in existence. Yours truly,

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK. Pres.

SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec't'y.

BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly, JOHN BECK. Pres.

SIMON BAMBERGER, Director. W. J. BEATIE, Sec't'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY.
S. BAMBERGER, President and Manager.
SALT LAKE CITY, UTAH, October 10, 1895.

B. R. TAWNDRAW, ESQ., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly,
[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO.
C. C. McIVER, President; D. CUSHMAN, Secretary.
MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. McIVER, President.

# FULTON ENGINEERING AND SHIPBUILDING WORKS.

## MINING AND MILLING MACHINERY,

ADAPTED TO EVERY DESCRIPTION OF MINING AND MILLING.

Office and Branch Works, - - - - - - - 213 First Street, San Francisco, Cal.

For the **Transportation of Ore, Fuel and other material over mountainous and rugged country the HALLIDIE ROPEWAY** stands pre-eminent as to simplicity, efficiency and economy.

Parties desiring to remove large quantites of Sand, Gravel, Earth, Ore, Rock, etc, to construct levees, dams or embankments, or to make long cuts, as in canals, ditches, etc., can do more efficient work at less cost by the HALLIDIE SYSTEM OF ROPEWAY TRANSPORTATION than by any other system.

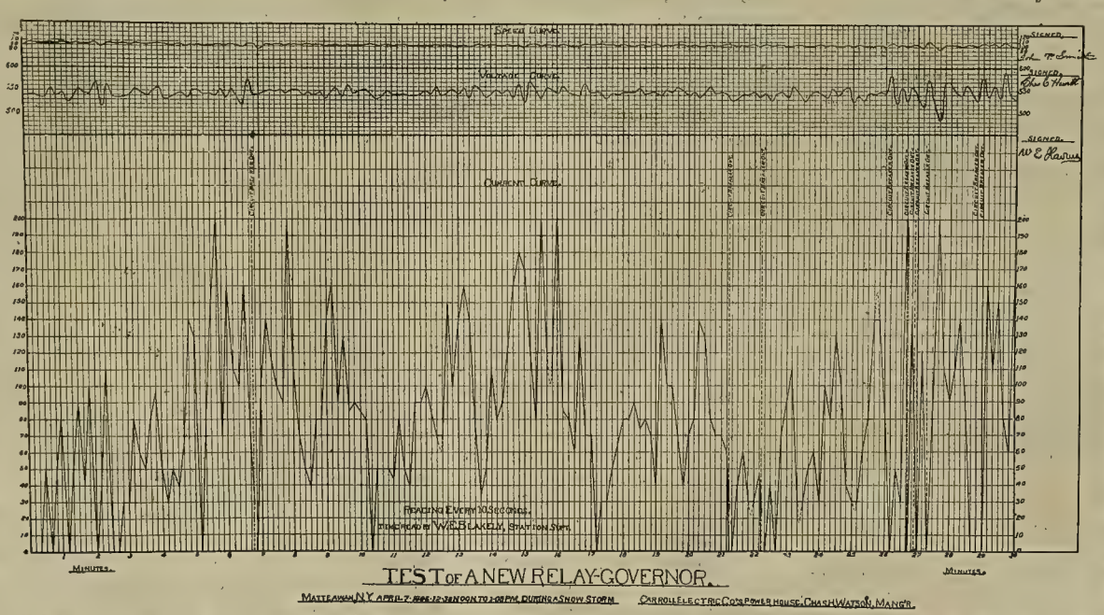
## A New "Relay" Water-Wheel Governor.

Government of water power for electric railway work has always been considered a very difficult problem even under the most favorable conditions. Power plant operators, where the changes in load are great and sudden, frequently find their government so uncertain and so near the danger line that it has been said that railways cannot be run successfully by water power.



In a recent test it was intended to show what can be done in extreme cases. The electric railway on which the test was made is a seven-mile road at Fishkill, N. Y., with a maximum grade of 8½ per cent. At the time of the test four double motor cars were in operation, using from 30 to 50 H. P. each. One of the cars became short circuited, which is the direct cause of the extreme variations in the speed during the latter part of the test, but goes to show the efficiency of the governor under adverse conditions.

The power is furnished from a pair of 48-inch water-wheels, under about 15 feet head of water, and is conveyed by belts to a counter-shaft, which in turn drives by belt an M. P. 100 generator. The wheel can be supplemented with an engine, which is belted to the same counter-shaft as the water-wheel, but during the test the engine was disconnected, leaving all the power to be furnished by the wheel, making a safe sample of results secured under such conditions.

CALIFORNIA STATE LIBRARY.

NEW "RELAY" WATER-WHEEL GOVERNOR.

TEST OF A NEW RELAY-GOVERNOR.

MATTEAWAN, N.Y. APRIL 7, 1896. 12 TO NOON TO 1:08 P.M. DURING A SNOW STORM. CARROLL ELECTRIC CO'S POWER HOUSE. CHAS. H. WATSON, MANG'R.

J. T. Smith, president of the road, read the speeds from a Schaeffer & Bubenberg tachometer; C. E. Hewitt, electrician, read the voltage from a Weston voltmeter; W. E. Havens, superintendent, read the amperes from a General Electric Co. ammeter; W. E. Blakely, power house superintendent, noted the time by tapping a gong at the end of every tenth second, and the end of every minute was noted by two taps of the gong. The readings began at 12:38 P. M. and continued for thirty minutes, until 1:08 P. M., when the papers were signed by their respective readers and committed to the hands of Mr. Hewitt, who furnishes the tabulation of curves herewith presented.

Referring to this tabulation, it will be noticed that there are three curves. The top one is the speed curve, the middle one the voltage curve, and the bottom one the current curve. It will be noticed that the average or normal speed was 105 revolutions on the wheel shaft, and the average voltage was 550. It will also be noticed that the first reading occurred ten seconds after the first gong, and the numbers that designate the minute occurs at the bottom of the chart, and at the ends of the minutes numbered. That is, the line that is vertical from number one shows that there were 80 amperes of current, 540 volts pressure, and 103 revolutions on water-wheel shaft, at the end of the first minute.

At the end of the second minute the chart shows no current, 546 volts, and a speed of 104 revolutions of water-wheel shaft; and twenty seconds later there are 110 amperes used, and the voltage has dropped to 516. The reading ten seconds later shows no current, 564 volts and 107 revolutions. Over one-half of the load has dropped off in ten seconds, and yet the speed has gone only two revolutions above normal. This is less than 2 per cent increase of speed on a 55 per cent decrease of load. At the end of the first ten seconds in the sixth minute there is no current, the voltage is 552, and the speed 104, and thirty seconds later there is full load, 200 amperes, 540 volts and a speed of 102 revolutions. The following reading ten seconds later is 70 amperes, 556 volts and 105 revolutions, showing that 65 per cent of the load dropped off in ten seconds, and yet the speed did not go above normal. At six minutes and forty-five seconds the circuit breaker went out, dropping the whole load instantly, yet five seconds later the reading is no amperes, 540 volts and 107 revolutions. This is equal to the best engine work. The circuit breaker went out during the twenty-second and twenty-third minutes with practically no increase in the speed. At twenty-six minutes and forty seconds the readings are 200 amperes, 529 volts, and speed 101. During the following ten seconds the circuit breaker went out, and at the end of these ten seconds the readings show 140 amperes, 560 volts, and 105 revolutions, normal speed. This is a remarkable showing. The extreme fluctuations are all recorded accurately and were caused by the short-circuited car and the new fallen snow.

The test, showing that water power government has advanced to such a stage that it is safe and reliable, will be of interest to street railway and electric power operators.

The governor herewith illustrated is built and furnished by the Replogle Governor Works, Akron, O.

Notices of Recent Patents, 520.

## Heat in the Earth's Crust.

The commonly accepted theory in regard to the earth's internal temperature is that, in going down through the crust, there is an increase of one degree Fahrenheit of heat for each 40 to 50 feet of depth attained; some say 50 to 60 feet and others 60 to 80. Doubtless there has been observed such increase of heat with increase of depth, as has been reported, but it shows nothing more than the temperature in a certain geological zone. The theory is that, as we go below the surface, we reach a depth beyond which the interior of the earth seems to have no sympathy with the external causes of heat and cold, and its heat appears to be its own. The zone of constant temperature is generally placed at 60 or 80 feet. Below this zone there is supposed to be an increase of heat at a regular rate. If this law were universal at a depth of less than thirty miles, the heat would be such as to hold in fusion all known substances.

In the artesian well at Grenelle, near Paris, 1800 feet deep, the increase in heat is one degree for 57 feet and about the same increase is found in the well at Mendarff, near Luxemburg, 2400 feet deep. The mean results of a number of experiments made in the deep mines of Cornwall, France and Germany seem to show an increase of one degree of heat to every fifteen yards of descent. This simply shows that the rocks composing the crust of the earth in that part of the world are of about the same temperature, being of similar age and character. Assuming a rise of one degree Fahr. of heat for each 60 feet of depth, the source of a spring whose temperature is 120° would be 4200 feet below the surface, and water at the boiling point should rise nearly 13,000 feet. The temperature of hot springs depends much on their surroundings. The hottest springs are found in volcanic districts, though there are warm springs away from such districts. A great volcanic eruption or the upheaval of a big range of mountains heats up the rocks underlying a large district for thousands of years. But there are also variations in the increment of downward heat due to the varying conductivity of rocks at or near the surface. The resistance of opaque white quartz is expressed by 114; that of basalt by 273; and that of cannel coal at 1538, or thirteen times more than that of quartz.

Evidently there are in the earth's crust hot and cold zones, dependent upon locality and nature of the rocks, proximity to hot springs and active volcanoes. In some great zones of plain or comparatively level country the crust of the earth is cold to great depths. It is because these zones are composed of very old stratified rocks containing few minerals and showing no chemical action. These cold districts generally underlie the great interior valley regions of the continents. In the mountain regions about the great fractures of upheaval, and ing and generate heat. Districts in which igneous rocks largely prevail are likely to be hot in depth.

It is only when the sun's rays reach our atmosphere that they part with much heat. Swemberg and Fourier calculate the temperature of celestial space at 50 degrees Centigrade below freezing. Waters of the seas and lakes absorb a vast deal of heat from the sun, but principally near the surface. Peron relates that at the depth of 2144 feet in the ocean the thermometer falls to 45 degrees when it is 86 degrees at the surface. Masses of ice resting upon the surface of the earth for ages doubtless decreases the temperature to a very considerable depth. Though the theory is that the temperature of the earth is constant at 60 to 80 feet below the surface, a great depends upon the locality. Near Yakutsh, Siberia, 62 degrees N., the ground is constantly frozen to the depth of 700 feet, while in the island of Java constant temperature is found at a depth of 2 or 3 feet.

While the sinking of deep shafts and bore-holes may show an increase of one degree of heat for each 15 yards of descent in a certain district in Europe, sections of country in America, Australia and South Africa may show different results. Different parts of the earth's crust evidently have a different temperature. The evidences of internal heat disclosed by the sinking of shafts and deep borings are not everywhere alike. The earth evidently has its hot and its cold zones. Subterranean temperature at explorable depths appears to depend much upon the character of the rocks composing the crust of the earth in different sections. Regions underlying sandstones and similar sedimentary rocks that have long remained undisturbed are generally cold, while in districts of country in which intruded igneous rocks abound, evidences of internal heat are found on going below the depth at which the zone of constant temperature is supposed to exist. Where there has been a great upheaval of igneous rock the temperature of the rocks of the earth's crust must be greatly raised throughout a large district and probably holds a certain degree of heat for ages. As a fracture or fissure extending down to the regions of central heat must be formed when there occurs an upheaval of igneous material, it is probable that the heat rising through the opening may serve to heat up the rocks underlying a considerable district for a long period of time.

The crust of the earth is not everywhere of the same thickness. These doubtless cause variations of subterranean temperature. Even at the region of central heat in the earth the temperature is not constant. The molten interior of the earth is gradually cooling. As the heated interior of the earth cools it shrinks and the crust must settle down and conform to the changed conditions. It is this shrinkage of the earth's crust and the crowding and pushing incident to settling down into smaller space that has produced the surface wrinkles which we call mountains and valleys. This action is still going on and is supposed to be the cause of many great disturbances of a seismic character. It is estimated that the diameter of the earth is now less by 189 miles than when the planet was a mass of liquid.

The portion of America least disturbed by the shrinkage of the crust of the earth is that stretching as an immense plain from Lake Superior to the shores of the Arctic ocean—a distance of not less than 1500 miles. This is a region of very ancient crystaline rocks, chiefly trap, gneiss and granite. Through all the convulsions incident to the upheaval of the Rocky mountains and the Appalachians, this region lay quiet. The rocks forming the flooring of this region are free from the superincumbent beds of more recent formations, showing that even in the silurian age they formed dry land, which has ever since held its place with wonderful stability. This ancient belt is about 200 miles wide. That it is older than the silurian rocks is shown by the fact that it dips under the latter on the east and west sides.

This undisturbed region is, as might be expected, one of the cold zones of the crust of the earth. It has long been known that, even at great depths, the copper mines of the Lake Superior region are so cool that clothing is comfortably worn by the miners. As this fact upsets the theory of an increase of one degree of temperature for each 50 feet of depth attained, it was disputed by some of the scientists. In along the borders of the sea, there is almost everywhere sufficient action—chemical, mechanical or volcanic—to keep the rocks warm. Rocks containing ores and minerals are always decomposing or changorder to settle the matter, Professor Agassiz visited the region and placed thermometers in the Calumet and Hecla mines. The point of constant temperature was assumed to be at a depth of 105 feet, and observations were taken to a depth of 4,580 feet. To the surprise of Professor Agassiz, the temperature at the great depth of 4,580 feet was 79 degrees Fahrenheit—only 20 degrees higher than at the 105-foot station. In the Tamarack and other deep shafts in these mines the temperature is about the same. No heat appears to be emanating from the rocks in which work is being done.

On the Comstock the conditions are very different from those prevailing in the Lake Superior region. The Comstock lode is in one of the hot zones of the earth. At the comparatively small depth of 1,500 to 2,000 feet boiling hot water was encountered. The rocks were so hot as to be painful to the hands. In places with the best ventilation attainable there was a temperature of 110 to 120 degrees. In some spots where there was no ventilation the heat rose to 130 and 140 degrees. Men lost their lives by falling into the hot water at the bottom of shafts, and eggs were cooked by being placed in holes drilled in the rock. To enter some drifts was like going into an oven. The miners figured that at no great depth all below must be in a molten state.

However, in sinking the deep shafts—the Combination, Yellow Jacket, and Union Consolidated—it was found that at points below 2000 feet the heat was less than it was above. At the depth of 3300 feet the miners found it much more comfortable than above in places only 1500 feet below the surface. It was found that there were hot places and cool places in the lode. The mineral contents of the rocks seemed to have much to do with the temperature. Where there was much lime in the lode it was always hot. The decomposition of the sulphurets contained in the vein also produced heat.

Although some scientists are still figuring on the increase in temperature in subterranean regions at the rate of one degree for each 50 to 60 feet of depth attained, it is far from being a universal law. It may hold good in certain sections in Europe, but in other places—as at Lake Superior—a new rule is required. Increase of temperature with depth at a certain ratio is probably observable in many places, but each region is liable to have a different ratio. We are obliged to conclude that there are hot zones and cold zones in the crust of the earth. The subterranean temperature of a district of country depends much upon the age and character of the predominating rocks; also volcanic action, recent or remote, must be taken into consideration.

## Silver in Politics.

At St. Louis, last Thursday, the Republican National Convention, before nominating Wm. McKinley of Ohio for President, by a vote of 812½ to 110½ adopted the following as the financial plank in its party platform:

*The Republican party is unreservedly for sound money. It caused the enactment of the law providing for the resumption of specie payments in 1879; since then every dollar has been as good as gold. We are unalterably opposed to every measure calculated to debase our currency or impair the credit of our country. We are, therefore, opposed to the free coinage of silver except by international agreement with the leading commercial nations of the world, which we pledge ourselves to promote, and until such agreement can be obtained the existing gold standard must be preserved. All our silver and paper currency must be maintained at parity with gold, and we favor all measures designed to maintain inviolably the obligations of the United States and all our money, either coin or paper, at the present standard, the standard of the most enlightened nations of the earth.*

On the same day the Democratic State Convention at Sacramento adopted the following financial plank in its party platform:

*The Democratic party of the State of California is unalterably in favor of the free and unlimited coinage of both gold and silver at the ratio of 16 to 1, without waiting for or depending on the action of any other nation, and it demands the use of silver as well as gold as a full legal tender in payment of all debts, both public and private.*

On the 7th prox. the Democratic National Convention will meet at Chicago. Those who claim to know say that that convention will adopt a platform that will declare as flatly for free silver as the Sacramento platform does.

This paper has nothing to do with party politics. The prominence that politicians give the question of silver shows that the people understand well that the question is not an industrial one, but a financial consideration of the deepest import. The ordinary party platform is usually a compromise collection of ambiguous platitudes, the real party utterance being the inaugural address of the successful candidate. It looks now as if on this subject, as on the question of protection, party lines will not be strictly drawn, and that geographical location will have much to do with party majorities.

## Concentrates.

THE deepest mine in Arizona is the Congress mine, 1450 feet.

DEVELOPMENT, not "boom," is best for mines in any locality.

AT the Treadwell mine, Douglas island, Alaska, are employed 325 men.

THE new tailings plant at Utica mine, Calaveras Co., is reported an entire success.

LAST WEEK T. Judge found a 95-ounce nugget in the Union mine at Gibsonville, Cal.

USUALLY 75 per cent of the gold in cleaning up a sluice is caught in the first 200 feet.

ROSSLAND, B. C., is reported full of miners, prospectors, mining experts and investors.

THERE has been no recent change in the U. S. mining laws or the mining laws of this State.

THE third edition of Aaron's Assaying, Part I, rewritten and improved, will be ready July 1st.

THERE is talk of gold going to a "premium." It's been at a premium for the past thirteen years.

THE Burke, Idaho, Miners' Union now graciously permits its members to read the Cœur d'Alene *Miner*.

THE directors of the State fair say they will have a rock-drilling contest and good prizes therefor next September.

THE $15,000 dividend of the Bullion-Beck (Utah) on the 15th makes an aggregate of dividends from that mine of $2,055,000.

THE release of the political prisoners in the Transvaal has caused a general advance in South African gold mining shares.

THE Washington State Mining Bureau, a private enterprise, has organized at Seattle. The members pay 25 cents a month dues.

AMADOR COUNTY has so far found the old chlorination process to give the best results of any with the sulphurets there.

THE locator of a mining claim in 1896 has till Dec. 31, 1897, to do the $100 worth of work or improvements necessary to hold it.

JOS. INGERSOLL, of San Bernardino, Cal., has built a one-stamp mill with three discharges, which he claims will work a ton of ore daily.

A REDUCTION from 12 to 8 hour shifts has gone into effect at the B. & M. smelter, Butte, Montana, with corresponding reduction in the pay.

A UNITED STATES BOND or any other Government obligation is and always has been payable in silver without any violation of direct contract.

SUPT. WILSON is building two 10-stamp mills—one at New Pass and the other at Gold Park, on the western slope of the Toiyabes, Nye Co., Nevada.

THE Bennett amalgamator, weighing 180 tons, and costing $45,000 is reported making paying progress in working placer sands at Green River, Utah.

AT the Mount Morgan mine—the largest gold producer in Australia—the total cost of production, including development work and plant, is stated to be $12 per ton.

IF in sufficient quantity gold ore running as low as $3 per ton can be worked at a profit, where intelligent management and close attention to economical detail is practiced.

THE State Board of Trade is making a fine display at 16 Post street, this city, of California products, many of which are monopolies, so far as this State is concerned.

M. B. KERR is making a success of the South Paloma mine, near Valley Springs, Calaveras county, where he is developing what promises to be a very valuable property.

"THE Mining and Industrial Exchange of New York" is a new concern in New York City that appears to start on a better business basis than its meretricious predecessor.

THE Mountain Mines, Ltd., in Shasta Co., Cal., and the Congress M. Co., Congress, Arizona, do not allow the sale of liquor on their premises, and discourage its use in every way possible.

THE shutdown of the Old Dominion Copper mine at Globe, Arizona, consequent upon friction between the manager and his men, is another illustration of the need of a harmonious understanding in all such cases.

THE present cost of reducing the ore at the furnaces of the Mountain Mines Co., Ltd., Keswick, Shasta Co., is $2.50 per ton. It is expected that further improvements will secure a reduction of $1 per ton from these figures.

BRITISH COLUMBIA mining papers are naturally hostile to the new law to sample and assay imported silver and other ores at different points on the boundary. The new rule is as unpopular in Canada as McKinley is in England.

GOODRICH reservoir, holding water for working the Nelson mine, Baker City, Or., burst last Wednesday night, doing considerable damage to property and drowning seven persons, whose bodies were recovered when the flood had passed.

WHOLESALE jumping of mining claims in the reservation part of Camp Floyd, Utah, district occasions bad blood. The jumpers contend that all locations made prior to the throwing open of that military reservation—April 9, '95—are invalid.

THE Broken Hill Proprietary (Australia), for week ending May 28, treated 7915 tons ore, yielding 304 tons of lead, containing 144,937 ounces silver. The clean-up yielded in addition 363,678 ounces, including 215,237 ounces from matte produced during the preceding six months.

THE Lewiston, Idaho, *Teller*, says a stock company has been organized there with a capital of $250,000 for the purpose of placing a good up-to-date mill at Florence, to save both gold and silver. H. K. Owen, of Seattle, is president of the company, and C. M. Huff is manager.

TO GET the H. P. of a water supply, a simple rule is: Multiply number of gallons per minute by the pressure in pounds per square inch, and divide by 1500. To determine "the pressure in pounds per square inch," multiply number of feet in height—number of feet fall—by decimal .433.

THE tremendous force with which the water leaves the nozzle of a giant was illustrated in British Columbia last week, where, at Granite Creek, H. Cahoe, formerly an official of the C. P. R. R., was flung fifty feet and almost instantly killed by getting in front of a monitor, piping at 250 feet pressure.

TUSCARORA, Nev., reports considerable stir on Bull Run creek, where gold is said to be found. Half the population of Tuscarora has gone there and Elko is contributing considerable of its population to the rush. Bull Run creek lies between Columbia and Cornucopia and empties into the Owyhee river.

GOLD mining in Africa is no new thing: in the days when the pyramids were building it was a leading industry there. Soetbeer estimates that in the four centuries ending 1875 Africa exported £106,857,000 in gold. The aggregate gold yield of that country since the dawn of human history must be a stupendous one.

THE Idaho City *World* attacks the Boise City, Idaho, Mining Exchange, says the $388.10 spent for the last issue of the organ of that association was worse than thrown away, and charges that injury is done to the miners of Boise basin by incorrect and misleading statements as to the extent and value of the mines therein.

THE annual election of the Bodie Con. M. Co., last Monday, put in an entirely new set of men. H. D. Walker had been president of the company at a salary of $200 per month. The accounting showed that he owed the company $6000 which he was unable to pay, saying he had used the money for private purposes. His friends are trying to make good the deficiency.

CALIFORNIA men are putting in an extensive and expensive plant to get gold from the black sand and mud of the upper Fraser river, B. C. It is to be noted incidentally that as a "bye product" it is confidently expected that their dredging will improve the navigation of that stream and that steamers can subsequently go up the Fraser fifty miles farther than at present.

THE industry of organizing new mining companies, with large capitalization, has at present reached its fullest development in the State of Washington. A good many mining organizations of sterling merit have also been incorporated in that State, and considerable development of valuable property, both there and in British Columbia, has been done by these latter concerns.

"THERE is no rhyme for the word silver" is the general statement. Our Australian friends, who have furnished fighters, a voting system, a Torrens land transfer plan, etc., also furnish a provincial rhyme for the word "silver." In some parts of the great woolgrowing regions of Australasia a month old lamb is called a "chilver." The campaign poet can hardly use this, though.

E. J. NORCUTT, of Lewiston, Idaho, in a communication to the Oregon Pioneer Association says that the first mining code in the State of Oregon was enacted on Canyon creek, Josephine county, in April, 1852. The principal provisions were those fixing the limit of channel claims at 50 yards and bank claims at 40 feet, and that all the claims not worked when workable were jumpable after five days.

SAYS the Plumas *National-Bulletin*: "Don't put up the bars against the investment of capital. It requires money to develop our great mineral resources and place them on a paying basis. If you have a mine to sell, don't ask an impossible price for it, thus preventing a sale and injuring yourself and the community. Be wise. Poor men can't afford to take the chances which rich men very properly do."

THE number of "mining companies" now being organized for various purposes in this country averages about ten daily. A large percentage of them start with a "capital stock" of $1,000,000, sometimes more. Mining and undermining, working the claim and working the stockholders are about equally divided therein, and the names and reputation of the incorporators are usually an index to the intent.

SINCE the shutting down of the mills at Aurora, Nevada, several attempts have been made to work the rebellious ore of that district by various processes, but they were all unsatisfactory. Now, however, R. K. Colcord, agent for the company owning the property, reports that twenty tons of the ore taken to Bodie, Cal., to be worked in the cyanide plant there has given satisfactory results, and a big plant is contemplated in the old camp.

THE property of the Juneau M. and M. Company, Alaska, which has been in the hands of Receiver Behrends for a year, comprising two mill sites, saw mill on mouth of Sheep creek, three mining claims on Douglas island, three mill sites in Silver Bow basin, four mining claims in Silver Bow basin, and the 10-stamp mill and appurtenances, destroyed last winter by a snow slide, are sold to J. T. Gilbert, of Milwaukee, Wis., for $32,000.

TO DATE the Con. Cal. & Va. mines on the Comstock, Nevada, have a record of production, in gold, $62,431,000; in silver, $70,324,000; total, $132,755,000. These mines declared dividends as follows: Con. Virginia, $42,930,000; California, $31,200,000; Con. Cal. & Va., $3,899,000; total, $78,029,000. The bullion averaged 46⅔ gold and 54⅓ silver. This record of production and dividends exceeds that of any other gold and silver mine in the United States.

THE Secretary of the Interior has approved the following lists of lands selected by railroads: Northern Pacific Railroad, 66,826 acres in the Bozeman, Mon., district; 2,039 acres, Vancouver, Wash., district; 3360 acres, Fargo, N. D., district; 18,380 acres, St. Cloud, Minn., district; 550 acres, Miles City, Mon., district; 478 acres, Vancouver, Wash., district; 481,748 acres, Bismarck, N. D., district; Central Pacific Railroad, 1,901 acres, Redding, Cal., district.

UPON completion of the annual required work on an unpatented claim, an affidavit of the fact should be filed with the county clerk. The trouble and expense would be trifling compared with the convenience of proof in case of possible litigation. This year, however, no claim owner who can do more will content himself with simply performing just enough to hold possession. The inducements are certainly sufficient to do as much development work as possible.

ALPINE COUNTY has not been heard from for fifteen years and now comes a statement regarding a copper mine there that contains to each ton of ore 800 lbs. copper, $3 gold, and eight ounces of silver, which at present all-round prices would aggregate $154.43. The mine is called the Leviathan and the owners say they are just completing its sale. If all the statements are correct the buyers have a big thing, though ore that yields so much copper, gold and silver to the ton is very unusual.

IN the Republican National Convention at St. Louis last Thursday, a free coinage of silver plank was defeated by a vote of 105½ for and 818½ against. A gold plank was adopted by a vote of 812½ for and 110½ against. McKinley, Morton, Reed, Quay and Allison were placed in nomination for the Presidency. McKinley was nominated on the first ballot by a vote that was practically unanimous, he having more than enough on the rollcall of States before his own State—Ohio—was reached. Hobart of N. J. was nominated for Vice-prest

OF THE development work in the vicinity of Butte, Montana, the *Inter-Mountain* says that at many of the properties of the Anaconda company, within a few years shafts 3,000 and 4,000 feet in depth will be as common as the 1,000-foot shaft of to-day. The new High Ore shaft will probably be the first to reach the greater depth. For the past two years a force of men has been employed exclusively in pushing it to the 4,000-foot level, to which depth it is said the shaft will be developed before the extraction of ore begins.

THE Marysville *Democrat*, which has always evinced a desire to be just and right, thinks the *Appeal* of that city shows poor judgment in its attack on Capt. C. E. Gillette, of the United States Debris Commission. He is a United States officer who has impartially discharged his duties, and who is about as unprejudiced as it is possible for any individual to be. His only interest is to faithfully fill the position he occupies, and it is characteristic of the cause the *Appeal* champions, that it should be the first and only one to attempt any insinuation in that quarter.

IN Witwatersrandt district, South Africa, in April, the Wemmer mine operated fifty stamps, running twenty-eight days, eight hours and thirty-two minutes, crushed 6,614 tons; bullion from mill, 3,695.27 ounces: tailings treated, 4,875 tons; cyanide bullion, 1,198.02 ounces; concentrates caught, 160 tons; average assay value of concentrates, 4 ounces and 8 dwts. Total from all sources, including concentrates, 5,597.28 ounces. In the Eastleigh mine during April fifty stamps ran twenty-six days, twenty-two hours, crushing 3,919 tons, which yielded 554 ounces; tailings treated, 2,200 tons, yielding 933 ounces; slimes treated, 735 tons, yielding 352 ounces; direct treatment, 1,430 tons, yielding 316 ounces. Total output for month, 2,155 ounces.

AS IN other industries, the Chinese long since got a foothold in surface gold mining in this State, and annually take out well on to $2,000,000. No Chinese are ever found in a quartz mine, but they haunt old trails, rework abandoned ground, lease tailings on shares or buy them outright, and, living "on the smell of an oilrag," make considerable in the aggregate. The State would be better off without them, but the question, like all those things, solves itself. As no more Chinese can come here, and these now here are getting too old to buy any more claims, they are gradually dropping out. They are not as numerous in Siskiyou, Trinity and Placer counties as formerly, and, like Chinatown in San Francisco the decrease in their number begins to be noticeable.

SEVEN fugitive Chinese were convicted in the U. S. District Court last Saturday of violation of the Caminetti act. This is the first proceedings of the kind. No better instance could be cited of the law-abiding character of the California miners than this. The Caminetti law has been in force for three years, yet in all that time throughout the whole hydraulic mining area affected by it, despite the efforts of a small army of paid spies and informers, no infraction of its provisions or violation of its requirements by California miners has been brought before a court. The first and only instance is as cited—a gang of irresponsible Chinamen, who, on their own account, started hydraulic operations in Placer Co., in ignorance or defiance of the law. Upon the facts being reported to the U. S. Debris Commission, the Mongolians were promptly punished, being sentenced to six months in the Alameda County jail.

THE State Democratic convention at Sacramento last Thursday, in its platform, congratulated the State that "the mining industry in all its branches has received an impetus which to-day gives it a leading position in the development and progress of the State," and favored "a continuation of the work so auspiciously commenced, and recommended continued aid by the National and State Governments on the lines laid down in the law, to the end that all interests involved be fully and adequately protected and each given the recognition demanded by the important bearing each has upon the general welfare." The convention declared its belief "in fostering the mining industry in all its branches and the rehabilitation of hydraulic mining wherever it can be carried on without material injury to any other industry." The convention also "*Resolved*, That we are in favor of the mineral land bill passed by the last Congress, and we denounce the conduct of those whose action prevented its becoming a law."

COLORADO and Utah railroads are issuing finely illustrated and superbly printed books describing the different mining regions of those States, and are spending thousands of dollars advertising Colorado and Utah. Probably after the California railroads have corraled all the unpatented mineral area of the State, they will do likewise. Some of the statements in some of the pamphlets received are not in exact accordance with the facts and mar the excellence of what are otherwise very creditable productions. For instance, in the handsomest one of the lot, "Under the Crust," issued by the Gulf Road and South Park Line, the statement is made on page 6 and again on page 8 that in '95 Colorado's gold yield exceeded that of California. Official statistics say differently. On page 49 the claim is made that the California mine, Central City, Col., is the "deepest gold mine in the world," which is not so. Colorado has enough to boast of with truth without having assertions made that cannot be backed up.

MANY of the richest mining plums in Colorado, says the *Mining Review*, are being gathered by private owners or close corporations, whose profits, except in unverified estimates on the part of reporters and correspondents, are never published. A very rich mine is apt to fall into this situation. The principal stockholders, having better information in regard to its value, gradually absorb all the stock, and then, having no occasion to sell it so long as it pays large and regular dividends, they salt it down and keep the affairs of the company a profound secret. In such cases the district in which the mine is situated does not enjoy the full prestige which an authentic statement of all the profits earned by all the companies would give it; for the investing public, generally at a distance, are partial to exact figures, and are loth to believe in profits which are not matters of record, capable of being verified. Fortunately the mill and smelter reports, and the statistics of the express companies and the United States mint serve to show, pretty accurately, the total production, from which a fair idea of the actual profits may be derived.

IN number and aggregate magnitude, some incorporated mining companies have made a splendid showing of dividends paid. Taken alphabetically come the names of many who have each paid over a million dollars in dividends since their incorporation up to May 1st, '96. Among them are the Alaska-Treadwell, $2,750,000; Belcher, $15,397,000; Bimetallic, $1,630,000; Bodie Consolidated, $1,677,000; Boston & Montana Consolidated, $4,025,000; Centennial Eureka, $1,970,000; Chrysolite, $1,650,000; Daly, $2,850,000; Deadwood-Terra, $2,490,000; De Lamar, $1,312,000; Elkhorn, $1,212,000; Eureka Consolidated, $5,112,000; Evening Star, $1,437,500; Franklin, $1,240,000; Gould & Curry, $3,826,000; Granite Mountain, $12,120,000; Hale & Norcross, $1,882,000; Hecla Consolidated, $2,130,000; Homestake, $5,837,500; Horn Silver, $5,130,000; Iron Silver, $2,500,000; Kennedy, $1,796,000; Mammoth, $1,040,000; Minnesota Iron, $2,992,500; Mollie Gibson, $4,080,000; Montana Limited, $2,890,000; Morning Star Consolidated, $1,025,000; New Custom, $1,198,120; Ontario, $13,235,000; Osceola, $2,022,500; Parrot, $1,622,215; Quicksilver Preferred, $1,823,911; Quincy, $8,070,000; Savage, $4,460,000; St. Joseph, $2,524,000; Silver King, $1,950,000; Small Hopes, $3,275,000; Standard Consolidated, $3,771,160; Tamarack, $4,270,000; Tombstone, $1,250,000. While this is by no means a full list, it is illustrative of the enormous profits in successful mining enterprises.

THE difficulties that sometimes lie in the way of a bona fide purchaser of mining ground in California, who humbly makes petition to the United States Government for permission to buy a little piece of ground and pay for it is illustrated in the case of Messrs. McCamma and O'Keefe, of Grass Valley, Cal., who, last Saturday were allowed final entry and got a certificate of purchase from the local land office for the South Idaho Con. quartz mining claim. They have been trying to get that for ten years but rival claimants, among whom was the railroad corporation, have been endeavoring to show that the claim was "agricultural land." The miners were too poor to hire a squad of attorneys, but produced some clinching evidence. At one time when their opponents produced sworn testimony that there was no pay ore on the ground, the two men got the officials of the U. S. land office to personally visit the claim, and in their presence they drilled a hole in the quartz ledge, put in a shaft and blasted out quartz with gold in it that the officials could see for themselves. There was no going behind that. Twenty perjurers might swear to lies but there was the very claim, and there was the gold. No great lawyer ever made a more powerful point of proof than did these two miners in thus showing the justice of their claim. This is believed to be the first time that such a mode of procedure has been recorded; it is worthy of repetition in similar cases. Such an experience would be an eye-opener for the Secretary of the Interior and the Commissioner of the General Land Office.

### The "Chispa."

The old-time placer miners talked of "colors," "chispas" and "nuggets." The colors are the fine particles of gold obtained in prospecting with the pan. They range in size from the mere dust of gold that forms a yellow streak in the bottom of the pan to grains worth a fraction of a cent or a cent. As for the nuggets, it is unnecessary to particularly describe those big ugly lumps of gold which all have seen and nobody wants to own. The chispa is a piece of gold worth from ten cents to half a dollar. The Spanish word "chispa" is very expressive when applied to such a little spangle of gold. In Spanish "chispa" means a spark of fire, also a very small diamond is called a chispa, because of its sparkle. A chispa of bright quartz gold, or of any gold that is not rusty, seen among black sand in washing out a pan of gravel, looks much like a spark of fire—seems to be alive. The word chispa used as a mining term to denote a small, bright fragment of gold is very expressive. The bit of gold shines out like a spark of fire. The old-time miners were always glad to find plenty of chispas in their rockers and toms. They were not only pleasing to the eye, but they counted up much faster than did the very fine dust. We do not hear so much said of the chispas these times as in the good old days when the "boys"—then all young and gay—were gathering in the golden harvest of the great placers. Many of the mining terms in use among the Mexicans are very expressive and appropriate, but few of them are now heard among Pacific coast miners. We are no longer dependent on Mexico, Germany or any other country for our knowledge of mining processes. With the development of American mines came American methods.

### Gold Dredging in New Zealand.

TO THE EDITOR:—In the issue of your valuable paper of May 23d I notice a letter from A. B. Paul, drawing attention to the immense field there is in this State for river dredging for gold. I have recently come from New Zealand, which, although a small country, admittedly does more gold dredging than any other country in the world. For some considerable time I have been engaged in designing and building gold dredges, and, knowing what can be done with them, have no hesitation in expressing my belief that they can be used to build up a great industry in California. One river in New Zealand—the Molyneux—is larger and more dangerous than any in this State, and on a 70-mile stretch of this river there are 57 dredges working, nearly all of which are yielding rich returns. I know one which saved 700 ounces of gold, worth some $14,000, in three weeks. This is, of course, exceptional, but shows the possibilities of the business. The average returns are somewhere in the neighborhood of $400 to $500 per week, and the running expenses, including everything, is between $200 and $250 per week. The barren tailings, or drift, which have to be lifted before the gold-bearing stratum is reached, runs from 10 to 20 feet deep—the longest ladder so far found necessary is 68 feet—which gives a dredging depth of about 50 feet. The dredges lift from 60 to 100 tons per hour and take two men to run them. If the gravel averages all through only 3 cents per ton, it will pay all the running costs, including wear and tear and interest on outlay. We have tried various kinds of dredges and methods of getting on to the wash-dirt and have finally settled down to an improvised bucket-dredge, with tailings elevator, where necessary, to allow lowlying flats along the river banks to be dredged. From what I have seen of the rivers of California, they appear to offer a magnificent opportunity for dredging, which, if carried out on a thoroughly practical and economical basis, will very largely increase the gold production of the State.

In New Zealand we have passed through the initial and experimental stage, and my hope is that those who put their capital into gold dredging in this State may reap as great a return as owners of gold dredges are now doing in New Zealand.

### Decrystallization of Iron and Steel.

TO THE EDITOR:—In the PRESS of June 6th, page 461, is an article credited to *Machinery*, which states a belief existed that iron and steel crystallize under vibration. Further on it says ore stamp stems, piston rods, rock drills, channeling machines, and drop hammers, cam shafts for bolt headers, ore and rock crushers, all break after being in service a short time. My attention was particularly called to the statement that "there is no reason why crystallization should occur." No; because decrystallization is in process and is the only reason of their failure. The coarse, granulated fracture presents the appearance of separate particles. The vibratory and trembling motion has to a certain extent changed the natural shape of the crystals; as a result the grains adhere with less strength. The guy rods of derricks after a time of tension and trembling must be taken down and heated red hot. By this process they regain their strength, because by heat they are reduced to a semi-fluid state and the crystals resume their natural shape. In that shape all organic and inorganic things adhere with greatest strength. Steamer shafts after years of torsion and trembling break square in two, and present no leafy or laminated fracture, as would be the case in twisting sound iron. Many years ago the steamer Golden Age broke her shaft and was brought up to the Pacific Works, then at Benicia. Upon examination I noticed that the fracture was exactly at right angles with the length of the shaft. I did not measure the diameter of the shaft, but guessed it 20 inches. Capt. Lappidge was present and said my explanation was reasonable, and asked what could be done to prevent breaking of steamer shafts. I gave him this answer: "In welding up a shaft twist the faggots all one way, with as much coil as can be without springing the grain; and place more bearings aloug the shaft athwart ship." This is the way to do it now.

Fairfield, June 12, '96.

### The State Mining Bureau.

The following are recent additions to the museum of the California State Mining Bureau: Auriferous granite, Overall mine, White river, Tulare Co., Cal.; F. McMillan. Gold quartz, Randsburg, Kern Co., Cal. Raw materials and cement, as manufactured by the California Portland Cement Company, Colton, San Bernardino Co., Cal. Very fine crystallized cinnabar (several specimens) from the Altoona Mining Company, Trinity Co., Cal. Rich gold quartz, showing abundance of coarse gold, Taylor (Idlewild) mine, El Dorado Co., Cal.; E. W. Chapman. Several specimens of gold quartz from various mines in El Dorado and San Diego counties. Gold quartz from Shasta Co.; J. Zachert. Gold quartz from Carson Creek mine, Calaveras Co., from William Howell, superintendent. Gold quartz, with fluorite and telluride of gold, Cripple Creek, Col.; A. R. Cook. Lawsonite; J. Z. Davis. Terical, Saline Valley, Inyo, Cal.; F. Conn. Molybdenite, Fresno Co., Cal.; F. M. Jerney. Chrysoprase, Tulare Co., Cal. Pyrargyrite, Amalie mine, Kern Co., Cal. Turquoise (very fine specimens), from Mineral Park, Arizona; Jas. W. Haas. And numerous other specimens of gold quartz from California, minerals, etc.

H. S. DURDEN, Curator.

## Scientific Progress.

### The Modern Theory of Light.

NUMBER II.

By PROF. OLIVER J. LODGE.

The old and familiar operation of charging a Leyden jar—the storing up of energy in a strained di-electric—any electro-static charging whatever—is quite analogous to the drawing aside of our flexible spring. It is making use of the elasticity of the ether to produce a tendency to recoil. Letting go the spring is analogous to permitting a discharge of the jar—permitting the strained di-electric to recover itself—the electro-static disturbance to subside.

In nearly all the experiments of electro-statics etherial elasticity is manifest.

Next consider inertia. How would one illustrate the fact that water, for instance, possesses inertia—the power of persisting in motion against obstacles—the power of possessing kinetic energy? The most direct way would be to take a stream of water and try suddenly to stop it. Open a water tap freely and then suddenly shut it. The impetus or momentum of the stopped water makes itself manifest by a violent shock to the pipe, with which everybody must be familiar. This momentum of water is utilized by engineers in the "water ram."

A precisely analogous experiment in electricity is what Faraday called "the extra current." Send a current through a coil of wire round a piece of iron, or take any other arrangement for developing powerful magnetism, and then suddenly stop the current by breaking the circuit. A violent flash occurs if the stop is sudden enough, a flash which means the bursting of the insulating air partition by the accumulated electro-magnetic momentum.

Briefly, we may say that nearly all electro-magnetic experiments illustrate the fact of etherial inertia.

Now return to consider what happens when a charged conductor (say a Leyden jar) is discharged. The recoil of the strained di-electric current causes a current, the inertia of this current causes it to overshoot the mark, and for an instant the charge of the jar is reversed; the current now flows backwards and charges the jar up as at first; back again flows the current, and so on, charging and reversing the charge with rapid oscillations until the energy is all dissipated into heat. The operation is precisely analogous to the release of a strained spring, or to the plucking of a stretched string.

But the discharging body thus thrown into strong electrical vibration is embedded in the all-pervading ether, and we have just seen that the ether possesses the two properties requisite for the generation and transmission of waves, viz., elasticity, and inertia or density; hence, just as a tuning fork vibrating in air excites aerial waves or sound, so a discharging Leyden jar in ether excites etherial waves or light.

Etherial waves can, therefore, be actually produced by direct electrical means. I discharge here a jar, and the room is for an instant filled with light. With light, I say, though you can see nothing. You can see and hear the spark indeed (but that is a mere secondary disturbance we can for the present ignore). I do not mean any secondary disturbance. I mean the true etherial waves emitted by the electric oscillation going on in the neighborhood of this recoiling di-electric. You pull aside the prong of a tuning fork and let it go; vibration follows and sound is produced. You charge a Leyden jar and let it discharge; vibration follows and light is excited.

It is light, just as good as any other light. It travels at the same pace, it is reflected and refracted according to the same laws; every experiment known to optics can be performed with this etherial radiation electrically produced, and yet you cannot see it. Why not? For no fault of the light; the fault (if there be a fault) is in the eye. The retina is incompetent to respond to these vibrations—they are too slow. The vibrations set up when this large jar is discharged are from 100,000 to 1,000,000 per second. But that is too slow for the retina. It responds only to vibrations between 400 billion and 800 billion per second. The vibrations are too quick for the ear, which responds only to vibrations between 40 and 40,000 per second. Between the highest audible and the lowest visible vibrations there has been hitherto a great gap which these electric oscillations go far to fill up. There has been a great gap simply because we have no intermediate sense organ to detect rates of vibration between 40,000 and 400,000,000,000 per second. It was, therefore, an unexplored territory. Waves have been there all the time in any quantity, but we have not thought about them nor attended to them.

It happens that I have myself succeeded in getting electric oscillations so slow as to be audible. The lowest I have got are about 125 per second, and for some way above this the sparks emit a musical note; but no one has yet succeeded in directly making electric oscillations that are visible—though indirectly every one does it when he lights a candle.

We have, however, electric oscillators which vibrate 300 million times a second, and emit etherial waves a yard long. The whole range of vibrations between musical tones and some thousand million per second is now filled up.

These electro-magnetic waves have long been known on the side of theory, but interest in them has been immensely quickened by the discovery of a receiver or detector for them. The great though simple discovery by Hertz of an "electric eye," as Lord Kelvin terms it, makes experiments on these waves for the first time easy or even possible. We have now a sort of artificial sense organ for their appreciation—an electric arrangement which can virtually "see" these intermediate rates of vibration.

The Hertz receiver is the simplest thing in the world; nothing but a bit of wire or a pair of bits of wire adjusted so that when immersed in strong electric radiation they give minute sparks across a microscopic air gap. Similarly, gigantic solar waves may produce auroræ; and minute waves from a candle do electrically disturb the retina.

The smaller waves are, however, far the most interesting and the most tractable to ordinary optical experiments. From a small oscillator, which may be a couple of small cylinders kept sparking into each other, end to end by an induction coil, waves are emitted on which all manner of optical experiments can be performed.

They can be reflected by plain sheets of metal, concentrated by parabolic reflectors, refracted by prisms, concentrated by lenses. I have a large lense of pitch, weighing over three hundredweight, for concentrating them to a focus. They can be made to show the phenomenon of interference, and thus have their wave-length accurately measured. They are stopped by all conductors and transmitted by all insulators. Metals are opaque, but even imperfect insulators such as wood and stone are strikingly transparent, and waves may be received in one room from a source in another, the door between the two being shut.

The real nature of metallic opacity and of transparency has long been clear in Maxwell's theory of light and these electrically produced waves only illustrate and bring home the well-known facts. The experiments of Hertz are the apotheosis of that theory.

Thus then in every way Maxwell's 1865 brilliant perception of the real nature of light is abundantly justified; and for the first time we have a true theory of light, no longer based upon analogy with sound, nor upon a hypothetical jelly or elastic solid.

# Mechanical Progress.

## Steam Boilers: Their Equipment and Management.

Read before the National Electric Light Association, May 7th, 1896, by ALBERT A. CARY.

One of the first considerations to be taken up in designing a new boiler plant is found in the question, "What style of boiler is best adapted to our work?" And after this is answered the other question following closely at its heels is, "Are our available funds sufficient to equip this plant with the chosen form of boiler?" Unfortunately, we find by no means a small percentage of prospective steam users asking these questions in the reverse order, and it is due largely to this fact that we find so many tankmakers in the boiler business, so many coal companies flourishing and growing rich at the steam user's expense, so many boiler insurance companies springing up in every section of the country, to say nothing of the profits of the owner of the boiler, which unnecessarily go to keeping the boiler plant in repair and the coal pile replenished. All these troubles do not result from the doings of the "penny wise, pound foolish" man, but there is also a large percentage of the plants erected where ignorance has been the partner of the designer, and we find the outsiders again reaping the profits which properly belong to the victim.

After many years of close contact with steam users, I have been led to believe that there is no branch in engineering in which more money is foolishly spent, due to the ignorance of the purchasers, than in steam plants, especially those of small size, say from 300 H. P. down.

I have met many manufacturers who are bright, practical, mechanical men, understanding their business in all its details to a degree that commands your admiration, but when it comes to their steam plant, alas! how little they know, although they think, in their own conceit, that they have mastered this "easy subject" way back in their early days, and there is nothing left for them to bother themselves with, and nine times out of ten you will hear them boast that their steam plant is a model one in every respect.

In these very plants you often will find smoky chimneys painting the whole neighborhood with blackness, and not a single attempt is made to stop this. You will find many of these boilers filling up with scale, and this is calmly accepted as a necessary evil. You will find miserable firemen wasting coal, and so I might continue this list of unnecessary evils to a considerable length.

In many of this class of plants no effort is made to determine the actual amount of power used, unless by a very popular process called guessing, and this extremely delicate operation is often left to the man who opens the throttle or shovels the coal under the boiler. He, naturally, wishing to show up in the best possible light, often decides upon a pretty high figure, which I have on more than one occasion been forced to lower by a large percentage after conducting a careful test. This man, after finally deciding upon the amount of power he thinks the plant is taking, carries these figures to the "boss." Then follows a lot of profound figuring, and finally it is shown that the steam plant is wonderfully efficient, and often the boiler is found to be evaporating something like sixteen pounds of water to a pound of coal, and all of the owners and attendants of the plants in the neighborhood are made envious over these wonderful results.

From such false results as these the excessive amounts of coal used in these plants is considered a remarkably low consumption for the "very large amount of power developed," as has been determined by the guessing process. The owner settles back perfectly contented with his steam plant, and then all progress and improvements stop. His self-satisfied ignorance and boasting finally induces his neighbor (who knows just as much about steam plants as he does) to put a similar plant in some new mill he is building, and so the installation of inferior steam plants continues and becomes almost epidemic.

There is no one who enjoys and profits more by this state of affairs than the coal dealer. He stocks up up with all kinds of coal—good, bad and indifferent. He furnishes the class of steam users we have described with everything in the coal line and gets good prices for what he is selling, but this is not the condition of affairs in up-to-date plants, designed and managed by competent engineers. The coal dealer knows that in these plants the amount of coal used and water evaporated is continuously kept account of, and as an inferior coal will evaporate less water than the good, pound for pound, he knows that a delivery of inferior coal will be detected at once, and it will cost him a customer if he is not very careful.

Now, to return to the equipment of our new boiler plant, and consider the matter of selecting the best boiler adapted to our use. This is a somewhat weighty question, and unless we are thoroughly posted in the practice of to-day we had much better hire a competent engineer to make this decision for us, and the money paid to him will, in the end, be found to be an excellent investment.

There is probably no branch of trade employing abler men to discuss the merits of their output and sell their product than is found in the boiler business, and I am really forced to pity the inexperienced purchaser who is not perfectly capable of forming his own individual opinion of the relative merits of the various boilers offered to him and their adaptation to his use. Such a man is very apt to be influenced by the words of the smoothest talker, or the one who tells him his "story" last, and in the end he is pretty sure to make a serious mistake by selecting a boiler very poorly adapted to the service it is intended for, or one far inferior to the boiler he started out to buy.

I am sure that those present who have passed through this ordeal will bear me out in these statements, and this merely emphasizes what I have said before—that is, that if you were not thoroughly competent to select one of the many boilers, hire a good, able mechanical engineer, one experienced in boiler practice, and let him decide for you. I do not mean by this that you want a man who knows simply one make of boiler and uses it for every plant for which he is retained. There are too many men of this kind, unfortunately, and by the narrowness of their decision they prove that they are incapable of judging the respective merits of the various boilers offered to them. Such men are apt to make you pay exorbitant prices, or else they are apt to give you something you really do not want, and they prove in this way that they are not worth their hire. In selecting the best type of boilers for a certain specific use the conditions under which it is to be run, of course, must be considered.

To cite a few examples: Let us first take up the case of a boiler to be used in a rolling mill, where we find a long line of connected rolls running across the middle of the mill, with a large reversing engine connected at one end, in most cases by gearing. This engine, we generally find, has a cylinder of large diameter and a comparatively short stroke. We find lacking some of those refinements in valve gear which promote economy in the engines used for other purposes, and, in consequence, we find these engines calling for from fifty pounds of steam upward for each H. P. developed. These engines are frequently started up with the full load on, taking steam about the entire length of their stroke, and making the severest kind of a demand on the boiler for a supply of steam, which is required to furnish this large amount in a very short space of time. In such a case as this the boiler must be of such design that it will deliver a very large quantity of steam in a very short space of time, and this may be accomplished in several ways, viz., first, by having a boiler with an abnormally large steam space; second, by having a boiler with a large water capacity and a moderate-sized steam capacity; third, by having large hot-water storage cylinders to supplement the quantity of water held in the boiler; fourth, by running the boiler at a steam pressure several times higher than that used at the engine and delivering the steam through a very large reducing valve, which reduces and delivers the steam from the high pressure to the pressure required at the engine.

# Electrical Progress.

## The Fluorescent Lamp.

Thomas A. Edison says:

"I have succeeded in solving the problem of the new white light. The lamp is finished—that is, the scientific part of the work, and it solves the problem. The remainder is mechanical."

The new light, or fluorescent lamp, as Edison named it, is somewhat similar to the incandescent lamp now used everywhere. There is not so perfect a vacuum as in the incandescent lamp. Unlike the electric lamp, the whole globe glows with a pure white light of marvelous illuminating power. The light comes from a metallic crystal known as "tungstate." Edison says the slightest rubbing of these crystals will make them glow.

He continues: "I have succeeded in fusing these crystals into the inside of a glass globe by heating the glass until it is soft enough to receive the tungstate crystals, which hold it firmly when it cools. Two wires enter the globe at one end, but do not meet. By means of an induction current generated in a Faradic battery, the molecules of the wires are thrown into motion, and the impulse thus given travels along the wires until it reaches the ends inserted into the globe. The molecule impulse is communicated to the molecules of air within the globe. These air molecules are driven with almost inconceivable rapidity against the crystals of tungstate, welded into the inner wall of glass. The impact causes the crystals to glow. The glow, caused by a single blow of these air molecules, is of course but slight, but multiplied thousands of times, and the blows repeated continously at an enormously rapid rate, they produce the new white light.

"The incandescent lamp transforms 95 per cent of the electrical force into heat and only 5 per cent is turned into light. With my new lamp I absolutely can discover no heat. Not satisfied with one test, and concluding that my instruments were at fault, I used other instruments, but with the same result. I am compelled to believe that nearly the whole force used in the new lamp is employed in producing the light. I do not attempt to explain it; I only accept it as a fact.

"The high amount of electricity required in the incandescent lamp to overcome the tremendous loss of electrical energy, and which is turned into heat, is not needed here. This means an astounding cheapness in lighting and a consequent commercial gain. The new lamp will last as long as the globe lasts. There are no expensive films to consider. It is a singular fact that a two-candle new light lamp, according to my photometer, gives out to the eye almost twice the illuminating effect that a two-candle incandescent lamp does. A two-candle tungstate lamp will light a room as well as a sixteen-candle power incandescent light. It is a pure white light—the whitest light known."

---

To generate electricity cheaper than by means of an engine and dynamo is still an unsolved problem. To produce it direct from coal, without the ordinary intervention of combustion, is still sought by leaders in electrical research. Recently Dr. Jacques, of Boston, has made some wide claims regarding experiments in that line and has announced his success in economic generation of electric power. He used a rod of carbon immersed in a bath of caustic soda, the latter being contained in a slender iron pot. Heat was applied from below to keep the soda melted, and a jet of air forced in. His theory was that the oxygen of the air united with the carbon, in a sort of cold combustion, and that electrolysis (or dissolution of the material by electric action) occurred. To this process, in fact, was attributed the development of current in the wires connecting the upper end of the carbon rod with the iron pot. Several eminent scientists were quoted as having confidence in the correctness of this idea. Prof. Reed of Philadelphia, before the Franklin Institute, says: (1) If the best quality of carbon rods are selected, they will not dissolve; (2) copper could be substituted for carbon with no change of result, and (3) illuminating gas, containing no oxygen, could be used instead of air, without spoiling the effect. It appears, therefore, that in Dr. Jacques' laboratory experiment the current is developed by heating two dissimilar substances while in contact, and that all the air jet does is merely to keep the upper layer of the melted soda cool. There is no consumption of the carbon.

---

THE Lachine rapids of the St. Lawrence river are at last to be utilized. For some time past work has been carried on by the Lachine Rapids Hydraulic Co. upon a large wing dam which runs out for more than a thousand feet into the St. Lawrence river. A fall of water is secured by means of this dam sufficient to develop at the low water season 15,000 horse power. This water power is to be transformed into electricity. Upon the dam a power house will be built, which will run its entire length and show an unbroken interior 1000 feet long. The basement of this will be occupied by water wheels. The main floor will contain the dynamos, of which there will be twelve, each of 1000 horse power, or 12,000 horse power in all. They will be of the General Electric Company's latest multiphase type, and will generate current for transmission to Montreal, for use there in lighting the city, operating the street railroads and in any and all other lighting and power purposes. Apart from the fact that this plant will exceed in interest any yet installed, the contract for this electrical installation is the largest ever placed at one time for electric dynamos. It is also worthy of note that, although it was competed for by every prominent electrical manufacturer in the world, the superiority of the American apparatus kept the order with home manufacturers.

---

EDISON received a few days ago at his laboratory at Orange, N. J., the hollow eye-pieces of a pair of opera glasses with the request that he "fit them with the X rays" and return them to the Vermont sender. Evidently this Green Mountain individual had a desire to see things. Another seeker after the unobtainable, writing from Pottstown, Pa., sent the following matter-of-fact epistle: "Thos. A. Edison, Dear Sir: "Will you please send me one pound of X rays and bill as soon as possible." This order was filed away with the opera glasses.—New York Electrical Review, June 10.

---

IN foundries and workshops where large castings or forgings are handled by a crane, considerable labor is devoted to fastening chains around the object to be moved and then in detaching them. There is a growing tendency toward the use of powerful electro magnets for this purpose. One of these is carried by the tackle, and it is only necessary to bring its poles into direct contact with a mass of iron or steel and then turn on the current in order to secure adhesion. When deposited in the proper place the current is switched off.

---

ALASKA reports a novel proposition in the application of electricity to mining in the shape of drills to be operated by electric motors—a steam tug, having dynamos on board to supply current through an armored and insulated wire.

# Practical Information.

## You Cannot See Fire.

It is a general idea that visible flame is fire in its most notable form. But in fact it is not fire at all. You look into a grate in which soft coal is burning. The flame is leaping in strange fantastic form 15 or 20 inches upward from the coal, and with it a good deal of black, sooty smoke. The sooty smoke and the flame are one and the same, with only a difference of temperature. The soot which forms the flame is red hot. It is soot half burned, or, rather, heated to incandescence, but not yet burned—not yet really burned at all. Every particle of the flame is a red-hot coal or particle of carbon. The real fire we do not see; no eye has ever seen real fire. The instant that the carbon atoms become really burned, eaten up by the oxygen of combustion, they are invisible. A particle of the red-hot soot which forms flame contains very many atoms of carbon, and the oxygen eats at them atom by atom, and this atom-by-atom seizure by the oxygen is the real burning, for which the red-hot state is only the preparation.

A soft-coal fire which has died down and apparently gone out may be found twenty-four hours later with red-hot coals "kept," we say, but in fact still burning. The soft ashes closely wrapping them do not keep them alive or burning; they keep them hot enough to let the oxygen go on nibbling furiously at them. The oxygen works inside of the ashes without any trouble, provided only that the red lumps do not get too cold. It, of course, makes fresh heat all the time, and the close wrap of fine ashes keeps the heat right there. The process of such burning is a slow one, but it answers to keep the coal burning.

In burning three pounds of carbon, the heated state of which gives us flame, the fire work is done by eight pounds of oxygen. The oxygen we do not see. The carbon we see only just before it is burned; and the result of the burning is eleven pounds of the compound of oxygen and carbon, which the eye cannot see. When a monster steamship burns 300 tons of carbon in coal every twenty-four hours, that means that the 300 tons of carbon are made red hot for burning, and are then consumed by 800 tons of oxygen, with the passing off up the chimneys of 1,100 tons of the compound of carbon and oxygen. The heated carbon not yet burned is intensely visible, but as it burns, atom by atom, it ceases to be visible, and the compound of carbon and oxygen is no less invisible, being a gas, each molecule of which consists of a molecule of oxygen (composed of two atoms locked together) into which one atom of cerbon has been swallowed, making a three-atom molecule.

The first belongs wholly to the oxygen. An atom of oxygen is in a state of motion, of spin or whirl like a buzz-saw, only many thousand times faster. These atoms unite in pairs, forming molecules, which have the same spin, only somewhat less swift. It is this lightning spin of the oxygen molecules by which each one devours an atom of carbon, with the effect which we call fire; only the real fire is back of what we see.

The oxygen of the air is a solid cloud of fire; it is essential fire which we breathe; a terrific conflagration only means that this universal fire has found stuff of some kind heated to the degree which prepares it to be consumed. In every case of fire the operation is that of oxygen consuming the atoms of combustibles through that intensity of whirl or spin which all oxygen has, and which is the essence of fire. But the oxygen atom is not a solid atom. It is rather a whirlpool of electric substance or fluid, composed of inconceivably fine atoms in a state of inconceivably rapid whirl. We see a fire start, but in fact there is no start. All the motion that may make to-morrow a conflagration, eating up a thousand square miles of forest, is going on to-day with an intensity very much greater than that of a conflagration. In the conflagration every fiery motion is checked by whatever combustible it may devour. The essential fire of the universal air is greater while it gives no sign than it is when it gets at work on combustible materials. We cannot too carefully reflect that there never anywhere occurs any new start of motion. What seems a start is only motion, which had existed all along, taking effect as the current of Niagara takes effect on anything thrown into it or launched upon it.

## Glossary of Mining Terms.

L. W. Tatum, of Denver, Col., has made a compilation of terms in common use in that State and elsewhere that is of practical value and of interest to many who are not practical miners but who like to understand what is meant when a word is used the meaning of which is not clear to them. Under the head "A," "B" and "C," among others, is furnished the following:

Absolute Temperature—The temperature reckoned from—459° F. or—273° C.
Adverse—To oppose the granting of a patent to a mining claim.
Aerophone—A respirator in the form of a tank receiving the exhalations from the lungs, which contains chemicals designed to revive the air and render it fit for rebreathing. It is used by rescuers after mine accidents.
After-damp—An irrespirable gas remaining after an explosion of fire-damp.
Air-shaft—A shaft for ventilation.
Aliaceous—The odor of garlic; given off by mispickel.
Anemometer—An appliance for measuring the velocity of an air-current.
Anorthite—Lime feldspar.
Anticlinical—A fold of the rock or strata, convex upward. The opposite of synclinical.
Apex—The top or highest part of a vein.
Arch—A part of the gangue left standing for support.
Arenaceous—Sandy; applied to rocks.
Agillaceous—Containing clay. The odor of wet clay.
Artesian Wells—Holes bored through solid strata and often overflowing.
Ascension—The theory that the matter filling fissures was introduced below.
Assay—A test of mineral to determine quality or quantity.
Assay Ton—A weight used by assayers containing 29,166 milligrams. As a ton of 2000 pounds of ore contains 29,166 troy ounces, it follows that each milligram in the assay button equals one ounce of metal to the ton of ore.
Assessment—Percentage levied on the capital stock of a company; annual work required by law on a mining claim.
Attle—Waste rock. (Cornish.)
Azoic—Without life.
Back—The roof of a drift, stope or other working.
Bal—A mine. (Cornish.)
Balance-bob—A heavy, triangular truss, the long, horizontal arm of which supports a weight at one end ballasted to balance the weight of pump-rods at the other.
Barrier Pillars—Pillars larger than the ordinary, left at stated intervals to prevent the crushing of the roof from extending beyond the section enclosed by them.
Bar Timbering—A system of supporting a tunnel roof by long top bars while the whole lower tunnel-core is taken out, leaving an open space for the masons to run up the arching. Under certain conditions the bars are withdrawn after the masonry is completed, otherwise they are bricked in and not drawn.
Base Bullion—Lead combined with other metals after smelting, cast in an ingot.
Base Metals—All metals except gold, silver, mercury and the platinum group, which are termed noble metals.
Battery—Generally applied to a set of five stamps.
Bearing-up Stop—A partition of brattice or plank that serves to conduct air to a face.
Bed—A horizontal seam or deposit of ore.
Bed Rock—Solid rock outcropping at surface or underlying alluvial and other surface formations.
Belt—A range of metal-bearing rocks.
Bench—Used to express the artificial divisions in the process of mining; also a terrace at the outcrop of a seam.
Bitter Spar—Crystal dolomite.
Black-Damp—Carbonic acid gas.
Black Jack—Zinc-blende. Zinc sulphide.
Blankets—Blankets, carpets and other fibrous material used for catching precious mineral in a wet process.
Blast—The operation of forcing air by blowing. Rending rock by explosives.
Blende—An ore of zinc, consisting of zinc and sulphur.
Blind Drift—A horizontal passage in a mine not yet connected with the other workings.
Blind Lode—A vein without an outcrop.
Blossom Rock—Outcrop of a vein indicating the presence of mineral (Gossan,) (Iron Hat).
Blow Out—A spreading outcrop.
Blower—A discharge of gas from coal; also a fan for forcing air into a mine.
Booming—A kind of placer mine where the water is accumulated in a dam and let out at intervals, so as to use its cutting power in the form of a torrent.
Boom Ditch—The ditch from the dam used in booming. (2.) A slight channel cut down a declivity into which is let a sudden head of water intended to cut to bed-rock and prospect for the apex on underlying lode.
Borraska—The reverse of bonanza. Out of pay.
Brace—The collar at the mouth of the shaft.
Brattice—A canvas or plank partition, nailed to posts longitudinally, within a level or shaft to divide the same into two compartments for the purpose of separating two air currents.
Break-Through—A narrow passage cut through a pillar connecting rooms.
Breast—The heading of a drift, tunnel or other horizontal working.
Breasting Ore—The ore taken from the face or end of a tunnel, drift or stope.
Breccia — A conglomerate of angular fragments.
Brittle Silver — Stephanite. A sulphide of antimony and silver containing 68.5 per cent silver, with the antimony variable. Sometimes contains iron, copper and arsenic; variable in color, hardness and specific gravity.
Broaching — Trimming or strengthening a working.
Buddle—The tub or machine used to wash slimes and separate the gangue from the mineral.
Buddling—Separating gangue from mineral by washing.
Bulling bar—An iron bar used to pound clay into the crevices crossing a bore hole, which is thus rendered gas-tight.
Bullion—Ingots of gold or silver ready for the mint.
Bumping-Table—A concentrating table with a jolting motion.
Bunch—A rich pocket of ore.
Buntons—Timbers placed horizontally across a shaft. They serve to brace the wall plates of the shaft lining, and also, by means of plank nailed to them, to form separate compartments for hoisting or ladder-ways.
Button—The globule of metal, the result of an assay.
Cache—A place where a prospector's provision or outfit is buried or hidden. (French)
Cage—A mine elevator. The frame to hold the bucket or car.
Calamine—An ore of zinc. Lapis Calaminaris.
Cam—The curved arm which raises the stamp in a mill.
Canon—A narrow valley; termed box canon when the sides are perpendicular. (Spanish) Pronounced canyon.
Cap—A vein is in the "cap" when it is much contracted, or of no value.
Cap Rock—The rock overlying the ore or vein.
Carbonate—Applied to oxides, when carbonic acid is united.
Carbonates—Ore containing a considerable proportion of carbonate of lead, often rich in silver. Soft carbonates have lead for a base. Hard carbonates have iron for a base—an ore of lead and silver.
Casing—The tubing of a well-hole to prevent caving. The sheathing or parting between the wall and vein.
Cement — Gold-bearing gravel united and hardened into a compact mass.
Chain Pillar—An untouched block of mineral on either side of the gangway.
Cheek—The side wall of a vein.
Chimney—The richer parts in lodes as distinguished from poorer ones, when found pipe shape with general perpendicular position.
Chlorider—One who extracts ore from mines by agreement with the owners, paying royalty for the privilege but has no lease.
Chlorides—A common term applied to ores containing chloride of silver. Compounds of chlorine with other elements.
Choke-Damp—Carbonic acid gas.
Chute (or Shute)—A body of ore, usually of elongated form, extending downward within a vein; a slide for ore or waste rock.
Cinnabar—Sulphide of mercury.
Claim—Space of ground located and worked under the mining laws.
Clastic—Fragmental. When a rock is composed of pieces.
Clean-Up—Collecting the valuable product of a given period of operation in a stamp mill or placer.
Cleat—A joint produced by the natural tendency of coal or rock to cleave or split in a certain direction not parallel to the plane of bedding.
Cleavage—The property of splitting more or less regularly in certain definite directions.
Coaster—One who picks ore from the dump or gleans in abandoned mines for ore.
Cobbing—Breaking ore for sorting.
Collar—Top of shaft or winze.
Color—A particle of metallic gold found in the prospector's pan or horn after washing earth or pulverized rock.
Column-pipe—The line of pipe through which the mine water is pumped.
Concentrates—Mineral from which gangue and dirt have been removed.
Concentration—The removal by mechanical means of ore from the gangue or slime.
Concentrator—A machine for removing waste matter from mineral.
Contact—A junction of two kinds of rock, such as lime and porphyry.
Contact Vein—A vein between two dissimilar rock masses, separating the two formations.
Copper-plates—Plates of copper, coated with quicksilver, upon which the gold is caught as the ore is washed from the stamps.
Cord—A cord of ore weighs about 8 tons.
Counter—A cross-vein.
Counter Balance — Counterpoise — A weight used to balance another weight or the vibrating parts of machinery.
Country—The ground traversed by a vein.
Country Rock—The rock beyond the sides of a lode. The strata between or across which the lode is found.
Course of Vein—Its strike. The horizontal line on which it cuts the country rock.
Coyoting—Spasmodic irregular surface mining.
Crab—An iron windlass for moving heavy weights.
Creep—The crushing in of the top or side rock, resulting in the floor rising and gradual closing of an opening.
Crevice—Fissure, split or crack; a vein is called a crevice.
Crib—A framework built like a log cabin. It may be a mere pillar afterwards filled with rock, or it may be the lining of a mill-hole or shaft.
Cribbing—The timbers used to confine wall-rock. The lining of a shaft.
Cropping-Out—Mineral or rock rising to the surface.
Cross Course—An intersecting vein.
Cross Cut—A level driven across the course of a vein.
Cross Vein—An intersecting vein.
Cupriferous—Copper-bearing.
Curb—A timber frame intended as a support or foundation for the lining of a shaft.
Cut—Where a vein is intersected, crossed or divided.
Cyanide—A compound of cyanogen with a metal.

## Commercial Paragraphs.

THE Sacramento city trustees have awarded the Risdon Iron Works a $6400 contract for boilers for the water works.

THE J. H. Montgomery Machinery Co., of Denver, Col., recently shipped two of their largest whims to the mines near Monterey, Mexico.

THE Midas Gold Saving Co., have sent two of their Gold King amalgamators to Wilcox, Arizona, two to San Andreas, Cal., and two to Burson, Cal.

THE stockholders of the Westinghouse Electric and Manufacturing Company, at a special meeting held the 5th inst., formally voted to increase the capital stock of the company from $10,000,000 to $15,000,000.

MESSRS. COBB & HESSELMEYER, mechanical and hydraulic engineers have moved into new quarters at 421 Market St., rooms 70 and 71. They are busily engaged upon the details of several large power plants in different parts of the State.

THE Truax Manufacturing Co., of Denver, Col., report recent shipments of their patent ore cars as follows: Five cars to Montana, six to British Columbia, four to Mexico, five to Idaho, three to Utah, two to New Mexico and a large number to Colorado points. These cars were patented in 1892 and 1895.

FRANK BARRERE, representing the McGlew ore concentrator reports recently sending one to Australia, one to Wadsworth, Nev., one to Bakersfield, Cal, three to Tucson, Arizona, and one to Scott Creek, Cal. The office and works have been removed to 129-135 Frst St., this city. W. H. Birch & Co., will in future manufacture the machines.

THE Colorado Iron Works Company of Denver are remodeling the W. J. Chamberlain & Company's sampling mill, and are putting in a set of their 54x8 inch high speed crushing rolls, with Cazin's patent end adjustment and self adjusting main boxes. They have also put in a set of the same size rolls in the Nellie Bly mill, near Boulder, Colorado.

THE recent sale of Wallace & Sons' plant at Ansonia, Conn., to the Coe Brass Manufacturing Company, of Torrington, Conn., makes the latter company the largest brass manufacturer in the United States, and therefore the largest American consumer of copper. It is said that the sale was made privately by the Calumet & Hecla people, who were the largest creditors of Wallace & Sons.

## Recently Declared Mining Dividends.

THE Union mine, Colorado, pays a dividend of 1 cent per share next Thursday.

THE Tamarack, Mich., will pay a dividend of $3 per share on the 30th.

THE South Idaho Mining Company of Nevada county has declared a stock dividend of 10 per cent.

THE Golden Gate Development Co., of Tuolumne Co., Cal., has declared a dividend, its fifth, of 15 cents per share.

THE Tamarack, Mich., Copper Mining Company has declared a $3 dividend, aggregating $150,000, payable on the 30th inst.

THE Homestake, S. D., Company has declared its regular monthly dividend of 25 cents per share, payable on the 25th.

## Recent California Mining Incorporations.

Larch Mining Company, San Francisco; S. L. Lent, J. F. Hinrichs, E. N. Atwood, G. T. Ruddock, W. D. Chambers; capital stock, $1,000,000; $1000 subscribed.

Hancock Mining Company, San Francisco; W. S. Chapman, V. E. Matthews, L. H. Smith, J. S. Minear, A. P. Minear; capital stock, $400,000, all subscribed.

Oro Vista Mining and Milling Company, Los Angeles; capital stock, $100,000, all subscribed; J. F. Walker, H. Todd, J. H. Webb, M. Walker, C. E. Todd, Los Angeles.

Sierra Azul Mining Company, San Francisco; capital stock, $500,000, all subscribed; W. J. Sutherland, E. S. Spring, W. G. Holmes, San Francisco; W. G. Greenen, Tombstone, Ariz.; B. Rogers, Seattle, Wash.

# CALIFORNIA MINES AND MINERS.*

## Name, Character and Location of Mines in This State—Name and Postoffice Address of Owner, Superintendent or Agent.

Continued from last issue.

THE POOR MAN'S MILL AND ENGINE:

## THE . . . . . DANIEL BEST CRUDE OIL . . ENGINE. . . . .

CAPACITY, 2 to 200 HORSE POWER.

**The Cheapest Power Known; Invaluable Where Fuel is Scarce.**

The most economical motive power ever invented, costing but 10 cents per H P. per ten hours; run, using crude oil. Cheap, safe, reliable and clean. Strong and simple to operate. Requires no engineer, and when you stop, all expenses cease, and no fire is left to endanger your building. Send for Illustrated Catalogue with full particulars, and mention the MINING AND SCIENTIFIC PRESS.

## THE KINKEAD QUARTZ MILL.

**The Kinkead Quartz Mill** will do the work of five stamps with less than half the power, and can be built and put into operation for less than half the cost of stamps. The only wear is the shoe and die, which is less than that of one stamp. The cheapness in first cost and operation of this mill makes it possible to work with profit ores so low in value that they have heretofore been treated as waste. Each mill will crush 10 tons in 24 hours through a 40-mesh screen.

It requires only a 2-horse power Daniel Best Crude Oil Engine, to operate this Mill and one concentrator. Engine and Mill can be set up and running in 48 hours.

**Price of Mill $1,000, f. o. b. San Francisco,** including Self-Feeder. Ore Hopper, Frame and Foundation Timbers all framed, and one Silver Copper Plate. Weight, 2½ tons; heaviest piece, 1350 pounds.

One ordinary mortar for a 5-stamp battery will weigh more than our whole Mill. This Mill can be made in 300 lb. sections, if desired, at extra cost. Send for Catalogue.

# MINE BELL SIGNALS.

**Adopted, Used and In Force in Accordance with State Law.**

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

## Coast Industrial Notes.

—The Sacramento Drying and Packing Co. will build a large fruit cannery at Visalia.

—The Fresno Chamber of Commerce wants the Yosemite Railroad Co to start their road from that city.

Coalinga, Fresno Co., reports a new gusher from which flows 1000 gallons of oil per hour.

—A new wooden $125,000 dry dock 425x80x21 feet is to be built by J. E Higgins at west Tacoma, Wash

—Washington expects this year's wheat crop to be 15,000,000 bushels—the biggest in the history of the State.

The Valley Railway directors have decided to issue $6,000,000 of fifty-year bonds, bearing 5% interest, to complete the road to Bakersfield.

—The inspection board in their official report give high praise to the battleship Oregon and pronounce the California-built vessel in every respect satisfactory.

—The California Wine Association is about to build the largest winery in the world near Fresno, with a daily capacity of 900 tons of grapes. Elevators, a distillery, etc., will be built in connection with the winery.

—The Atlas Lumber Company and Stetson & Post of Seattle, Wash., are filling two orders, amounting in the aggregate to 3,600,000 feet, of wood paving blocks for Indianapolis, Indiana, street pavements.

—The Mechanics' Institute and the Manufacturers' and Producers' Association have every assurance of a successful exposition in the Pavilion. Nearly three-fourths of the available space is already applied for.

—The steamer Washtenaw is being overhauled at the Fulton Engineering and Shipbuilding Works, preparatory to being placed in competition with the Pacific Mail Co., to carry freight between here and New York, via the Straits of Magellan.

The annual fishing troubles at the mouth of the Columbia river are unusually prolonged and fatal this year. So far no agreement has been reached by the canners or gill-net fishermen. The river is full of salmon and men who can make $150 per day are risking their lives in their capture.

Fires during the week destroyed two blocks in Merced, Cal., causing a loss of $100,000, a $50,000 hotel at La Jolla, San Diego Co., another $50,000 hotel at Oceanside; the works of the Standard Asphalt Co., Asphalto, Kern Co., $30,000; the Northwestern Lumber Co.'s mill at Hoquiam, Wash., $75,000.

—During May coal shipments from the Vancouver Island, B. C., collieries aggregated over 60,000 tons. The Premier says there is a tax of 2½ per cent on the value of coal at the mine. If so on the coal product of May the Dominion Government would collect a tax of $3500. There is not a mine on Vancouver Island which pays that tax.

—H. Glen of The Dalles, Or., has a contract for forty-seven miles of clearing, grading, riprapping, tunneling and rock work on the Astoria and Columbia River Railroad between Goble and a point within ten miles east of Astoria. The work must be finished within a year, and will require a force of 200 men, besides a large amount of machinery.

—Few persons, says the Seattle, Wash., *Post-Intelligencer*, realize the magnitude of such orders as those now being filled by the Atlas Lumber Company and Stetson & Post in supplying 3,600,000 feet of cedar paving blocks for the city of Indianapolis. Perhaps a better idea of their extent may be gained from the fact that 300 cars will be required to move the blocks East.

—The special report of the condition of the Oregon Improvement Company estimates the assets of the company in actual use at $8,463,234 and these with a contingent value at $2,123,725. The approximate income from operations in 1895 was $440,000. The compiler says that the Port Townsend Southern Railroad never paid operating expenses and that it was a wild scheme without business foundations. He does not think that it will be self-supporting for several years. He says that the Seattle and Northern returns to the Oregon Improvement Company some revenue, but there is no likelihood of its becoming valuable. These two roads cost the company $2,500,000 in consolidated bonds at a heavy discount, "upon which, as a whole, no income has been received."

—Mr. Louis Mead, of the Manufacturers' and Producers' Association has sent to the California prison directors the following letter: "*Gentlemen*: We have been informed that your honorable board has deferred consideration of the bids for coal and hardware for the prison at San Quentin until next Saturday. Among the bids for coal there will be found one from a California company, namely, the Pittsburg Coal Mining Company. The coal put on the market by this company, besides being a California product, is, we are informed, of as good if not better quality than any coal used in this market, and if your tests have proven such to be the case, as we have no doubt they have, we would most respectfully urge that you award this contract, if the bid is as low or lower than other bids for an equal quality of coal, to the California coal company."

## Books Received.

"*Artesian Wells as a Means of Water Supply*," by W. G. Cox, published in Brisbane, for sale by D. Van Nostrand Co., 23 Murray St., New York City, price $3.00, an interesting treatise on the subject as concerning Australia, but of little practical benefit to California or the United States, local publications on the same subject making its circulation here entirely unnecessary.

## Personal.

JAS. D. HAGUE has returned from the Black Hills and New York City

P. GEO GOW, San Francisco manager of the Gold and Silver Extraction Co. of America, is in Denver, Col.

W. S. WILLIAMS succeeds C. M. Spangler as superintendent of the Standard Mine at Henry, Butte county.

CHAS. SMITH, amalgamator at the Kennedy mine, Amador county, is building a new style amalgamator and concentrator.

GENERAL MANAGER W. C. BUTLER, of the Everett smelter and the Monte Cristo mining companies, will spend the summer at Monte Cristo, Wash.

U. S. SENATOR GEO. C. PERKINS, who with his colleague, U. S. Senator S. M. White, did such good work for the miners of the State, has returned from Washington, D. C.

J. E. MCMANUS, of Everett, Wash., has been appointed mineral land inspector at a salary of $10 per day and expenses, and assigned to service in Montana and Idaho.

J. J. HILL, president of the Great Northern Railway, is in Portland, Or. He still proposes a combination under one management of his road and the Northern Pacific.

"CLEVELAND, REED & CARLISLE" is announced as the name of a new legal firm, to commence business in New York City next year. The announcement, though based on possibility, is premature.

G. F. ALLARDT, Lyman Bridges, Howard C. Holmes, E. J. Molera, Hermann Kower and Luther Wagoner, civil engineers of this city, have been appointed a committee to take charge of the entertainment of the American Society of Civil Engineers during their meeting in this city next week.

## Obituary.

H. L. VAN NOSTRAND, formerly superintendent of the Arnold mine near Albuquerque, N, M., died at San Deigo, Cal., last week.

HENRY JACKSON, shift boss at the Bunker Hill and Sullivan mine at Wardner, Idaho, was killed there last week by being struck on the head with a falling rock.

JESSE THORPE and Robert English were drowned last Wednesday while on a prospecting trip by the upsetting of their boat in the Pitt river, sixty miles northeast of Redding, Cal.

JOHN D. WILSON, a pioneer mining man, died in Oakland, Cal., on the 15th inst. Mr. Wilson was a charter member of the San Francisco stock board and a member of the Vigilance Committee of '56.

GEO. RILEY, a miner was recently killed at Mercur, Utah, in a singular manner. He was working in a 300-foot tunnel, and after putting in a shot and lighting the fuse came out of the tunnel and stood on the dump until after the blast should go off. When the explosion occurred, a piece of rock flew straight out of the tunnel—a distance of 300 feet—and struck him between the shoulders, inflicting injuries from which he died soon after.

**"HISTORY OF CRIPPLE CREEK."**

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address. *Illustrated Weekly*, Denver, Colo.

UNITARIAN LITERATURE sent free on application. Address Postoffice Mission Committee, First Unitarian Church, corner Geary and Franklin streets, San Francisco. Mention this paper. *

**DOUBLE PIPE AIR COMPRESSOR.**

This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

**It Is a Fact**

THAT OUR ANNUAL PRODUCT OF . . . . . .

**INSULATED WIRE**

EXCEEDS that of any other manufacturer in the United States, and Includes Everything in the Electrical Line. . . . . .

**WASHBURN & MOEN MANUFACTURING COMPANY,**

**RUPTURE CURED.**

Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absoutely without danger. Usually but a single treatment required.

# Mining Summary.

## CALIFORNIA.

### Amador.

At the Wildman-Mahoney mine, at Sutter Creek, seventy stamps are dropping. General Manager Ross estimates that when the 1200-foot level of the Mahoney is reached, the ore-shoot in that mine will connect with the Wildman ore body at the 1300-foot level of the latter mine, making a known ore body 1600 feet in length and from 8 to 40 feet in width.

### Butte.

Clark Bros. are running an arrastra at their mine near Yankee Hill. C. Waldeyer works five stamps on ore from another part of the same ledge. He calls his mine the Morning Star, the Clarks call their's the Evening Star.

John Wagner of Merrimac will soon resume operations on his mine, a mile west of the Golden Butterfly in Morris ravine. W. Treat & Son have twenty-five men at work at their mine. On bedrock they are handling about 200 inches of water. The water pumped is used to wash the gravel.

A new supply ditch has been built into the Fahey mine from the Palermo ditch, giving 30 feet fall, a hydraulic elevator is talked of.

One hundred and forty Chinamen are reported working on the bar at the mouth of Berry creek. Mooney and Herrin have opened their river mine, near Enterprise. Brooks & Co. will start up their mine near Enterprise about July 1st.

*Mercury*: A. P. Frary and H. J. Langdon have bought a one-third interest in the Blue Jay mine at Oregon Gulch, one mile east of the Banner mine. They also have a working bond on the other two-thirds of the property. They will begin operations in a few days and will run night and day until the ledge is reached. They hope to open a vein from 2½ to 4 feet wide.

The shaft in the Magalia mine struck the old Pershbacker works on Saturday and emptied it of its immense body of water without an accident. The work of taking out some of the coarse gold from the ancient channel will soon begin. This opens up business on the Magalia ridge and other developments will soon follow.

### Calaveras.

*Prospect*: The ranch of Allen Clorac, Happy Valley, a mile east of Mokelumne Hill, was bonded last Wednesday to Prince Andre Poniatowski for two years for $10,000. During the life of the bond and until its final settlement, monthly installments of $30 per month are to be paid to Clorac.

### El Dorado.

(Special Correspondence).—W. E. Jones has bought four claims adjoining the Larkin on the east. He finds three ledges on the property and will run a tunnel to tap them at good depth.

On the Salisbury they are sinking a shaft to a depth of 500 feet; meanwhile they are milling the surface from different parts of the property to a depth of 15 feet.

On the Larkin a station and tank have been completed on the 200 level. Sinking will be resumed for an additional 100 feet.

A shaft has been started on the Lone Star, and is down 50 feet. This property is one mile south of the Larkin.

On the Live Oak, adjoining the Larkin on northeast, the tunnel has reached 145 feet on two feet of quartz.

Chas. Edner, twenty-six miles east of here, is developing a 2-foot ledge of ribbon rock, of which he milled 15 tons and realized $331.

Otis Graves, of Cripple Creek, has bought the Ed. Hummel mine near Greenwood and is continuing the work by sinking to a greater depth. The property has a fair-sized ledge of free milling ore that runs $5 and upward.

San Francisco people have bonded the Welsh property near Greenwood. They have sunk 100 feet, drifted and crosscut 150 feet, and erected a substantial hoist run by water power. The ledge is said to be 3 to 8 feet, and mills $5 per ton.

Mr. John Smith, the storekeeper at Greenwood, is recognized as the miners' friend in that section. His readiness to grubstake and accommodate an honest man in the prospecting field has given him and his section an enviable reputation in those parts. Mr. Smith takes much interest in mining, and also intelligently advocates the prudent investment of money in mining grounds.

Placerville, June 16th, '96.

### Inyo.

*Register*, June 11: P. W. Palmer, who returned from San Francisco yesterday, informs us that he has purchased the Mammoth mine, millsite, and everything connected with the property except the mill itself, which belongs to J. S. Cain. The terms of the sale are private between himself and the Bank of California, which has owned the property since the boom days of the camp. Work will be vigorously pushed in the mines and mill this summer, we hope with rich returns.

### Kern.

At the new mines recently noticed, there is now a postoffice known as Garlock. There is also one at Randsburg.

Water was struck at 207 feet sufficient to insure the running of the mill.

The ores milled since May 20th show:—May 20th, 11¼ tons, 14¾ ounces, $18 per ton. May 21, 19 tons, 18½ ounces, $2,888. May 20th, 5¼ tons, 190 ounces, $2,809.

The 5 stamp mill erected at Kane Springs, twenty miles away, is completed.

Robert Taylor of Mojave, contemplates putting up a stamp mill.

Willard and Harrison in the Rand district are putting in a five-stamp mill and 10-horse power engine and pushing the work on two of their claims—the Rawhide and Ophir. They have a 4½-foot shaft down 100 feet and about 100 tons of ore on the dump which they will go to work on as soon as the mill is in running order. They report about 1000 people at and near Randsburg and Cow Wells, with three stages daily from Mojave.

### Mariposa.

(Special Correspondence).—Coulterville, although dull to the single-handed miner, is still quite active with the larger corporations. The country at large has been treated of late to considerable of the sensational from this section, so we will treat upon the statistical only.

The Merced Gold Mining Co., located south of and adjoining the town of Coulterville, is a corporation with a capital stock of $1,500,000; head office, Boston; J. R. Gilbert, resident superintendent. This corporation's property here consists of several groups of mines, the principal of which are the Margarette, Louisa and Mary Harrison. On the Louisa they have a shaft down 350 feet in three compartments. The Mary Harrison has a two-compartment shaft down 160 feet. The principal works of this company, however, in this section, are located one and one-half miles southwest of Coulterville, and consist of the Potosi, Malvina, Malvina No. 2 and several other mines of lesser note. The Potosi has been pierced by a tunnel 2600 feet in length, at the mouth of which is located their 40-stamp mill, with sixteen concentrators. Their assay office, blacksmith shop, machine shop and Rand air compressor are also located at this point. This compressor has a capacity to run six drills, which are constantly in use. On the Malvina a double-compartment shaft is down 600 feet. The ore of this group of mines is a silicate white quartz, tinged with slate, about four per cent sulphurets. It is a medium-grade ore, and the vein runs from 10 to 25 feet wide. This company at present employs 130 men in all departments, and mines and mills about 100 tons of rock daily. The Sunny Ridge mine, located sixteen miles northeast of Coulterville, on the Yosemite road, is owned by Levi Keys of Coulterville. It runs northwest and southeast on the East belt. The development consists of three shafts down severally 30, 30 and 45 feet, uncovering a ledge 140 feet in width. It is a low-grade ore, but in the principal shaft prospects $5.40 per ton, about seventy-five per cent of which is free milling. The base portion consists of magnetic iron tinged with manganese. At present this mine is idle, but will soon start up. L. P. Mc.

Coulterville, June 15th, '96.

### Nevada.

*Union*: Although North Bloomfield is not the lively little mining camp it was six or seven years ago, the prospects are that inside of a year or two it will be a better town than ever. The prospects for one of the greatest drift mines in the State are here and capitalists are beginning to realize it.

Since the famous Derbec mine ceased work, on account of running to the end of their line, practically nothing has been done to work the Bloomfield channel. Of late, though, capitalists have been inquiring into the merits of working the channel further up the ridge.

It is a well known fact that where the Derbec Company suspended work the gravel was very rich, and they could not make satisfactory arrangements to purchase the adjoining ground from Mrs. DeNoon. General A. M. Dobbie recently made a trip to San Francisco, and through his efforts the old Watt ground, the Blue Coat, the Backbone and several other properties were bonded to an English syndicate represented by M. Simianson. All the papers have been signed, and it is understood that in about a month's time the Englishmen will commence the work of running a tunnel to tap the channel.

It is known that the Derbec is a continuation of the famous North Bloomfield channel and that it turns up the ridge for a distance of six miles. Another advantage is the fact that it is known at just what depth the channel can be tapped and then the whole ridge can be worked.

The English syndicate consider this is the largest gravel mining scheme in the State and that, after the tunnel is once in, millions of dollars will be taken out, the Derbec alone having produced over $2,000,000.

The tunnel would have to be run a distance of about 800 feet, and there is plenty of water power for running air compressors or for installing an electric plant. The people of North Bloomfield have bright hopes for the future, and it is to be hoped that they will be realized.

### Placer.

*Sentinel*: The tunnel at the Eureka mine was in 1023-foo tmark June 1st—198 feet during May. The "I Will Try It" Drift Gravel Mining Company will work their property this summer. The mine is at Fall Creek, Nevada county, and the nearest postoffice is Emigrant Gap. The Zuver Bros., of Auburn, are owners of the mine. Augustus Buchanan will superintend the work this season. They expect to work about fifty men.

### Plumas.

*National-Bulletin*: At the Taylor diggings, between Genesee valley and the north arm of Indian valley, a bank 75 feet high is being washed by the company and the yield of gold, though bedrock has not been reached yet, is satisfactcry.

G. M. Compton has resumed work on the King Solomon mine.

After a seven days run of the Kittle mill, Standart & McGill cleaned up amalgam valued at about $2,700. During the month before closing down last fall, it yielded nearly $15,000, only a fifteen-stamp mill being used for crushing.

### San Bernardino.

(Special Correspondence).—On April 15th I discovered gold on Porphyry mountain, a reef of conglomerate or sedimentary porphyry carrying gold, 800 feet north of the Waterloo silver mine. This reef is several hundred feet in width, about 2,000 feet in length, which carries gold all through it. This deposit is soft porphyry, small particles of broken quartz and carrying red oxide of iron. It seems to be perfectly free—no sulphurets or other base material that would interfere with its working.

H. B. STEVENS.

Calico Mining District, June 12th, '96.

The San Jacinto *Register* says the gold mines in San Jacinto mountain, near Strawberry valley, are attracting a great deal of attention, many have taken up claims.

According to R. G. Dun & Co.'s circular, the Vanderbilt Mining Company has levied an assessment.

### Shasta.

*Free Press*: The large dredging boat was successfully launched Wednesday afternoon by the Shasta Dredging Company. It is 35 feet long and 20 feet wide. When the necessary machinery is put on it will probably draw 1½ feet. J. M. Gleaves, the president of the company, thinks the boat will be in full operation by the 25th. The pump is so arranged that nothing larger than an 8-inch boulder can be hoisted. The capacity of the pump is between 900 and 3000 yards of sand per day, and as the sand prospects $2 per yard, the gross returns per day on 900 yards is estimated to be about $1800. Col. Button will have charge of the work.

### Siskiyou.

*Journal*: The small placer mines in the vicinity of Hawkinsville are closing down for the want of water. The larger hydraulic mines which get their supply of water from the high mountains will be able to keep at work until after the 4th of July.

The new road which the owners of the Columbia mine are building from their mine to the mill on Mill creek, will be completed some time in July. Forty men are employed. A concentrator arrived in Yreka the latter part of last week for this company, and it has also been said that they intend to increase the capacity of their mill after a little, by adding more stamps. It is said that the quartz in the Columbia mine continues to grow richer, and at the next crushing the cleanup will be better than ever.

The Distlehorst Dredging Company, on Klamath river, will be ready for operation in another month.

The Culver & Co. mine on Klamath river will not be opened up again for some time. They have done considerable development work since putting in their new pump, which is said to be one of the best ever brought to the county. This mine is worked very much on the same plan as the Blue Gravel at Greenhorn, near Yreka.

Nothing has been done yet toward opening up the Spencer mine on Humbug. This mine will require quite an outlay of money to get where the last work was left off. The mine will have to be retimbered and the water pumped out, or a tunnel dug to let the water run out, either method being quite expensive. A great deal of money has been taken from this mine, and it will probably continue to pay when some one has sufficient courage to sink several thousand dollars in it.

### Tuolumne.

(Special Correspondence).—Some of the mines, mills and reduction works recently visited in this famous old county go to show that more activity exists now than at any time since the early sixties.

The White Lead, a gravel deposit, running nearly north and south and extending from Mariposa county on the south through this county into Calaveras and on through the several counties to the north, has almost been forgotten by name, but it is still worked all along the line under various names and titles. All classes are engaged, from the Spaniard with his batea and the Chinaman with his rocker to the sluice and flume with undercurrent catching the gold sent down by the monitors, where privileges have been granted to mine by such methods. This channel shows a width of from 100 feet to one-fourth of a mile, made visible by the white-capped rocks of decayed marble and limestone that have been the obstacle to successfully mining this channel in the past. In a few places this lead crops out but in other places it runs at great depth. It is said on reputable authority that this lead has never been bottomed. When you think of the millions of dollars that have been extracted from it in the past, and never reaching bedrock, what must there be in waiting for the miner of the future who will succeed in reaching bedrock. This lead has been practically abandoned by white men for many years; the well-to-do Chinese companies along the line have led the white men to investigate. White men are now engaged in attempting to enter this lead on the line of the bedrock, at a point where the Stanislaus river cuts the channel on the northern boundary of this county near Columbia. If sufficient capital is found among those who have abiding faith in this enterprise, it may again show the output of the early fifties.

The Sunset quartz mine, located on the south fork of the Stanislaus river three miles north of Columbia, owned by Vassalo & Co., is soon to start up.

The Green Tibbitts mine, twelve miles northeast of Columbia, on the south side of the south fork of the Stanislaus river, and about one mile northeast of old Riverside mill, is owned by Green, Tibbitts, Clark and French. This mine was located in February of this year. They are sinking a chute on the trend of the vein. Steps will be taken in the near future to work it on an extensive scale. Supt. L. C. Tibbitts says that they have recently milled a small lot of rock from this mine that averaged nearly $150 per ton.

The Black Oak quartz mine, one-half mile southeast of Soulsbyville, is owned by Scott, Dowe & Co. W. P. Scott is superintendent. The character of this mine is a quartz granite formation between walls of slate. It runs north and south and pitches to the west. The ore body is about five feet thick, of a rebellious character; worked by mill and concentrator process. They have a twenty-stamp mill, crushing about twenty tons daily; working thirty men in mill and mine. Just now they are preparing to put in a cyanide plant that is to have a capacity of thirty tons daily.

Summersville mining district, Carter's P. O., the center of which is situated about three miles southeast of Soulsbyville and ten miles east of Sonora, has within its limits a number of working mines, and many notable mines, at present idle, soon to resume activity. The principal working mines are the Con. Eureka Gold Mining Co., a corporation of $100,000 capital stock. C. H. Thomas is the resident superintendent. This company's property is located three-quarters of a mile south of Carter's P. O. and consists of all the usual outbuildings surrounding a successful mine, including a 20 stamp mill. The ore body of this mine runs from northeast and southwest with an easterly pitch; it is composed of quartz and black metallic slate, between a hanging wall of slate, and a foot-wall of quartzite. The general formation of this and most other quartz lodes in this section is a gray dorite and talcose slate; running in places 1½ miles in width. The width of the Con. Eureka varies from 10 inches to 20 feet and averages 12 feet between the walls. This mine is worked through a double compartment shaft now down 1450 feet, the present workings are from the 1400-foot level. The shaft and mill are operated by water power, using a wheel, with an effective pressure of 636 feet. They use two skips of 1½ tons capacity each; their air compressor runs a giant ram and a double power drill. Twenty-eight men are employed in mine and mill, extracting and crushing from forty-five to fifty tons of ore daily. The rock in the past has averaged $3.00 per ton in free gold, and about $1.00 per ton in sulphurets.

The Sunny South and Wallace Gold Mining Co., is situated about 1½ miles north of the Con. Eureka (at Carters). W. H. Hawkins is the superintendent. Their improvements consist of a steam hoist, shops, etc. A shaft through which the mine is worked, is now down 85 feet, eight men working on double shift; are making upraises, and extracting ore. The ore is free milling, and twenty tons now on their dump I am informed will mill $10.00 per ton. At a depth of 85 feet in their shaft tunnels have been extended 80 feet in opposite directions on the vein, which averages 3 feet in width, and the formation between walls averages fully 20 feet. A 20-stamp mill is talked of to be erected in the near future.

The Consuelo quartz mine located about three miles southeast of Carters, on the north fork of the Tuolumne river, is owned by D. B. Warfield, Oakdale. This location is said to be the extension of the Con. Eureka, and although but limited development has been reached, it is favorably spoken of by mine owners in that vicinity. It is at present idle.

The Providence mine, south extension of the Consuelo, of which A. Ogden is superintendent, is being developed by a shaft and two tunnels. They have several men at work; the ore thus far extracted is said to be of a high grade.

Little Blue Mountain mine, located on the same vein as the Providence, and just south is a recent location, owned by Risley and Stewart, of Alameda, is now being developed in a small way, with very encouraging prospects.

The old Spring Gulch mine, located still farther south on the same lode with the above-mentioned, is owned by R. Marshall, of Sonora. It is at present under bond of $20,000 to a Utah company, who are prospecting.

The Con. Golden Gate & Sulphuret Mining & Development Co., located 1½ miles SW. of Sonora, has a capital stock of $6,000,000. J. A. Fischer is president and general manager and Samuel Smitherum is superintendent. This property consists of three claims—the Golden Gate, Golden Sulphuret and South Extension of the Golden Sulphuret. The whole is covered by U. S. patent. Their improvements consist of some fifteen buildings, arranged with such harmony that the whole group looks more like a small village than one mining claim, consisting in part of first-class hoisting works over a double-compartment shaft down 700 feet, the first 450 feet of which is on an angle of 80°, then runs off at an angle of 60°; a 20-stamp mill, with twelve concentrators; air compressor, run by steam, with a capacity of 125 H. P.—claimed to be the finest in this county; chlorination works complete. Seventy men are employed in the different departments of the mine. They are crushing 400 tons weekly. The ore of this mine is rich in sulphurets and the gold output is among the first of the mines of this county. This company has just declared its fifth dividend—one of 15 cents per share.

Rappahanock Gold Mining Co., located 6½ miles northwest of Sonora, adjoining the Rawhide mine on the north, R. Chute superintendent, has a steam hoist over an incline shaft, now down 350 feet; working 11 men.

The Rawhide mine, situated six miles northwest of Sonora and two miles nearly north of Jamestown, is somewhat celebrated from the fact of its having formerly been possessed by the great magnate of mining industries, Alvinza Hayward, who is seldom known to let a good thing go. That he missed it in this instance goes without saying. This is a corporation with 100,000 shares, of $1,000,000 capital stock. W. A. Nevills is the principal owner and general manager. The ledges and ore body of this mine are contained within an area of 220 acres of land, covered by U. S. patent. The improvements of this mine consist of forty-five buildings, three sets of hoisting works over shafts down severally 300, 400 and 1,000 feet; a 40-stamp mill, with sixteen concentrators; very extensive chlorination works, with a daily capacity of three tons. The power used for the mammoth engine is electricity, brought to the mine some six miles from near Columbia; 110 men are employed, and with this force they mine and mill

about 100 tons of ore daily, about 4 per cent of which is sulphurets.

The App Gold Mining Co., consisting of the App, Heslep and and Hitchcock mines, is located at Quartz Mountain, about 6½ miles south of Sonora, and about 1½ miles southeast of Rawhide mine. W. A. Nevills is the principal owner and general manager of this mine, Charles Jacobs is superintendent. The grounds of this company are also patented. Their improvements are two sets of hoisting works, a 20-stamp mill, with eight concentrators, and about twenty other buildings, being proportionately equipped to that of the Rawhide. This mine is being developed through two shafts, one down 600 feet and the other 800 feet. At this mine water power is used; fifty men are employed, and with this force fifty tons of ore is mined and milled daily. The character of the rock is similar to that of the Rawhide mine.

The Whisky Hill group of mines, consisting of the Trio, Mooney and McCann, located one-quarter of a mile southwest of Jamestown, have just been sold to a Boston syndicate for $150,000. Formerly owned by H. A. Preston and Alvinza Hayward. Under the management of B. M. Newcomb, the present purchasers will immediately start up work. A shaft is to be sunk 1000 feet, and other developments will follow.

The Sweeney mine, situated 1½ miles south of Jamestown, is personally owned by H. A. Preston. This claim, at present idle, has been previously developed by a shaft sunk to a depth of 300 feet, revealing a ledge from eight feet to fifteen feet thick, which like all other mines located on the mother lode, runs northwest and southeast, with an easterly pitch (in this mine) at an angle of about 45°. Mr. Preston informs me that the rock prospects from $5 to $7 per ton, and that a Salt Lake company will take charge of this claim, erect hoisting works and thoroughly prospect the mine.

Bella Union mine, five miles south of Jamestown, owned by H. A. Preston, has been bonded to A. Halsey and L. Rosenfeld, who are now engaged in developing it. Through a tunnel they have crosscut the ledge at a depth of 150 feet from the surface, revealing a ledge twenty five feet thick of low-grade ore.

The Golden Rule mine, located at Stent, 2½ miles east of south of Jamestown, has just completed an extensive steam hoisting works, and begun sinking a shaft. Heretofore this mine has been worked through a tunnel, at the mouth of which they have a complete 10-stamp mill, which is kept constantly running on ore from this mine. E. A. Stent is superintendent, and he keeps twenty-five men employed.

Shawmut and Eagle mines (adjoining) are located 1½ miles north of west of Jacksonville, and 1¼ miles east of Chinese Camp, or two miles southeast of Stent, on Woods creek. Owned by Rosenfeld & Halsey; A. Halsey superintendent. These mines are being developed from opposite directions by tunnels. That of the Shawmut is now in 1125 feet, and the Eagle has a tunnel in 780 feet running toward the Shawmut leaving about 1000 feet to connect the two mines, which when connected will be worked through the Shawmut. An incline shaft 463 feet in depth, sunk on the trend of the vein and previously used in developing the mine is now used only for an air shaft. The tunnel of the Shawmut taps the lode at the bottom of this incline; at which point they have crosscut the vein north 170 feet, and still going, and south 475 feet and still pushing ahead. At a point 200 feet in the south drift they are sinking a shaft 6 by 14 feet on the incline of the vein which runs from 4½ feet to 7 feet thick as far as penetrated. They have their rock crushed as a test at the Mammoth mill, 1½ miles distant, having no mill at present. They have a 100-horse power compressor that runs four drills, in piercing the two tunnels, the compressed air to reach two of the drills is carried over 4000 feet. Water is the power used under 440 feet pressure, to run the air compressor. They have about 800 tons of low-grade ore, at this writing, on the dumps of their millsite. Forty men are employed and the management seems satisfied with the outlook.

The Mammoth mine is located on Woods creek, half mile above the junction of that creek with the Tuolumne river, at Jacksonville, and about four miles east of Chinese Camp. It is owned by the Sierra Buttes Gold Mining Co., J. F. Bluett is superintendent. This corporation has 3400 feet, their improvements consist of a hoist, 5-stamp prospecting mill, air compressor, office, boarding house and blacksmith shop. The mine is being developed through a tunnel 670 feet in length, and taps the vein at 350 feet from the surface, which at this point is 33 feet wide. An upraise of 107 feet has been made connecting with an upper tunnel 200 feet in length; the vein at this point is 23 feet thick. A shaft is being sunk in the lower tunnel to thoroughly test the mine, which is now down 155 feet. A ditch 3½ miles long with water taken from Wood creek, furnishes the power to their air compressor which runs the hoist and mill. Their mill has a capacity to crush about ten tons of ore daily, now running on Shawmut rock. The ore of this mine is of a low grade, but they seem to have plenty of it. As soon as they demonstrate to themselves that they have a sufficient ore body to warrant it, a complete plant will be put up. At present they employ twenty-two men in mill and mine.

To any one visiting the southern mines at intervals of a year apart, they will be surprised to see the activity in prospecting. Clerks and students from your city taking their summer outing have donned the miners' garb, erected brush tents, and in hundreds of places new prospect holes are visible. This is very marked, from Jacksonville, on the Tuolumne river, through Big Oak Flat to Groveland, on the road to Yosemite Valley.

My next letters will follow from the counties of Yuba, Butte, Plumas, Shasta, Trinity and Siskiyou. L. P. Mc.

June 15th, '96.

## NEVADA

Geo H. Sanford, who is developing a group of mines at El Dorado canyon, 200 miles south of Pioche, left this city yesterday with a complete outfit for that locality. He says the ore averages $31 per ton. The El Dorado canyon mill is now running on ore from the mine dumps and is paying well. The mill has been converted into a wet crusher and its capacity doubled. Mr. Mills is the superintendent.

*The Silver State* says that the new electric process at Kennedy is a pronounced success and will save 95 to 98 per cent. It is a sure thing for Kennedy this time. On a trial with less than a ton of ore, there was saved from the tailings $4 in gold and an ounce in silver.

*Enterprise*: The C. & C. dump is presenting a scene of great activity these days. Twenty men are now engaged in and about the Kinkead mill. The success of Mr Kinkead's enterprise of working the waste rock of the Comstock mines has already proved a boon.

### LINCOLN COUNTY.

The first shipment of gold bullion from the April Fool at De Lamar, reached Salt Lake last Thursday, worth $2,000.

## OREGON.

### BAKER COUNTY.

The Perry mine, six miles east of Baker City, an extension of the Rachel mine, is reported sold to C. C. Stratton, of Chicago, for $11,500 cash.

### UNION COUNTY.

At La Grande, J. Palmer from the Basin mines has twenty pounds of gold, of the value of $4,400, the product of twenty days' run.

At East Eagle the company has in its employ a Mexican packer, with a pack train of forty-four mules. The train packs 14,000 pounds of ore each trip from the mines to the mill, a distance of one and one-half miles, making two trips daily.

*Mining Journal*: The Griffin ledge is near the south side of Rogue river. On February last ten tons of the ore from this ledge treated at the Schiefflin mill on Footes creek, yielded the owners over $100 a ton. The ore travels somewhat in kidneys and varies in quality. It is so far all free milling.

## BRITISH COLUMBIA.

(Special Correspondence).—J. Wendle, formerly of Marysville, Cal., J. Mockler, Wm. Taggart, formerly of Seattle, and R. N. Campbell have struck $12 diggings on Little Valley creek. S. J. Marsh will be ready to treat ores by the cyanide process at the reduction works next month. Cariboo Gold Fields, Ltd., are not doing much work at present. The drain tunnel is at a standstill on account of soft ground. Work will be resumed with three shifts after the freshet. All the hydraulic claims are working. The season promises to be a very good one for them as the snow is going very slowly. The Slough Creek company are clearing out the old drain and drifting for the partially worked bench near the mouth of Nelson creek. Fred T. Laird, of Laird & Lee, Chicago, is sinking a bedrock shaft on Willow river, where Mosquito creek empties. He is well prepared to bottom the deep ground on Willow river which has hitherto baffled all attempts. The first loaded wagon since last December came into camp yesterday.

Barkerville, B. C., June 5th, '96.

Work at the Blue Bell mine in Tribune closed down. It is reported that the smelter will be closed down during the week. It has been running constantly for some three months and is in need of repairs. So far as can be learned the shutdown at the mine will continue for a month or six weeks, and there is a probability that work may not be resumed until the company's refinery is in working order. A number of men are new employed burning brick for the refinery.

Kaslo *Kootenaian*: Seven thousand or more $3 and $3.50 miners will be surprised to learn that the Wellington, one of the best shippers in the Slocan, is now manned with a crew of men just brought from Eastern Canada under a compact to work for $1 per day and board, above ground, and $2 per day and board below ground.

Edward Watt, the late successful manager of the Wellington, has just returned from Ottawa, where he arranged to step out, being dissatisfied, it is said, with the policy of the company. Hector McRea, the secretary-treasurer and new manager, followed Mr. Watt, arriving this week with nineteen men and a carload of provisions from Ottawa. These men were taken at once to the mine, where they are now at work.

With the exception of an unsuccessful attempt by this company, made several years ago, this is the first time an effort has been made to introduce cheap labor into this part of Kootenay.

The North Star mine at Fort Steele, has contracted to deliver 7000 tons of ore this season to the Great Falls smelters.

British Columbia has its Uitlanders, a large and constantly increasing body of gold hunters who for the past two years have been thronging into the heart of the Kootenai district from the United States. The provincial government has not made the mistake committed by the volksrad of the Transvaal, however; it has not loaded down the newcomers with heavy taxes. The Dominion *Mail and Express* points out that it has enacted a new mining law, not unlike that in force in Ontario, and though received with some murmurs of dissatisfaction by the mining interests, it seems to be easy enough on those interests.

From the time the first prospectors and diggers struck the trails of the Kootenai the work of development has gone steadily on. Perhaps not many of them have turned up a fortune with their picks, but by their united labor they have added greatly to the wealth of British Columbia, and materially to that of the whole country. They have made great changes in the solitude they found there. In a little over six months Rossland, starting from nothing, sprang into a town of 3000 people. On August 1st it became a port of entry, and in the following four months its imports amounted to $294,021 and its exports to $619,023. These figures as to population and trade are a considerable advance for a few short months, starting from nothing. Most of the exports consisted of the ore of the War Eagle and Le Roi mines.

But though this town of Trail Creek region has made great progress it is not the only part of the Kootenai that has moved. From Slocan, by way of Kaslo, and by way of Nakusp, great quantities of silver lead ores have been shipped, while the smelters of Nelson, Pilot Bay and Trail Creek are producing large quantities of matte and bullion. These smelters add enormously to the benefit the province derives from its mining industry. It is only a few months since they were erected.

*The Mail and Express* explains how the action of the Dominion government in granting a bounty on all ore smelted in the country, has prevented the export of ore to the reduction works on this side of the line. Had it not been for this the Everett reduction works would have received enormous business from this source alone.

Since the beginning of the year there have been 23,000 tons of silver lead ore treated in Kootenai, and 7,000 tons exported for treatment. To this is to be added 3,000 tons of gold ore shipped from Trail Creek. Camps are scattered all over the Kootenai country, some of them already promising to be the nuclei of considerable towns. Capital has freely assisted labor, and like it, comes from the most part from the United States. But British investors are now taking a keen interest in the mines. Since last midsummer several have visited the country in person, syndicates have sent over mining experts to report on the prospects, and London financial houses are handling some of the best properties. If Old Country investors put their hands to this mining enterprise there will be a rapid transformation in that corner of British Columbia.

There are already above 100 mining companies registered in the new province, many of them American, a few Canadian, and some British. Their stocks are listed on the exchanges of the chief cities of the province. The making of British Columbia is undoubtedly going on at a very rapid rate. Its new and industrious population contributes very greatly to the demand for food stuffs produced by farmers, and for the manufactured goods produced by skilled workmen. The Seattle *Post-Intelligencer* declares that a hundred times as many men could find employment upon the ore of that region, and immigrants will swarm into it. The *Mail and Express* asks, with evident alarm, Is the trade of these developers of our mineral wealth in British Columbia to be switched off from our own agricultural and manufacturing industries, and connected with those of the United States?

## IDAHO.

At Burke, work on the Poorman-Tiger concentrator is being pushed.

Harvey & Co., who have part of the Poorman leased, will resume work as soon as the water is lowered sufficiently, putting their ore through the Granite mill at Gem.

At Murray, the Arizona and the Consolidated Vestal hydraulic mining companies are working full crews on Alder gulch. The spring has been cold and backward. Plenty of snow towards the head of the gulch insures water for a good long run.

Placer miners all over the north fork region are busy, water being plenty and the weather generally favorable for work. Little new ground is being opened up, but nearly all the old claims are being worked more or less. A few claims will be worked out this year.

At Thiard, the Jenkins mill is dropping ten stamps, crushing twenty-five to forty tons of rock each twenty-four hours. The slime tables are successful, the amount of gold saved by them paying the cost of operating several times over.

There are mines in the northwest, says the Spokane *Review*, which pay dividends and nothing is ever heard from them. They go on quietly producing wealth and the owners make no talk of it. The Standard Mine Company, in the Cœur d'Alenes, paid $600,000 in dividends last year. They go on paying $50,000 a month just as regularly as clockwork. These facts do not always come out, because it is a close corporation. There is no excitement about this dividend and there is no need of one. It is entirely a matter of private interest.

During April the DeLamar Mining Co. reports: Number of tons crushed (wet), 4,057.66; number of tons crushed (dry), 3,651.90. Assay value of the pulp: Gold, $14.75; silver, $5.87; total, $20.62. Assay value of the tailings: Gold, $4.26; silver, $5.09; total, $5.35. Percentage saved, total, 74.05; number of Dore bars produced, 15; number of ounces pure gold produced, 1,814,525; number of ounces fine silver produced, 27,413.30; value of gold produced, $36,290.50; value of silver produced, $17,818 64; surplus on bars to date, $3,677.17; ore sales, $4,300; miscellaneous revenue, $645; total, $62,731.31; expenses, $37,553.39; profit for the month, $25,177.92.

## UTAH.

*Tribune*, 16th: The English-American syndicate, having failed to make the final payment on the Lammersdorf interest in the property of the Sevier Gold Mining Company, the holder pockets $41,000 and continues in the saddle as its president, its treasurer and general manager. Negotiations for the interest of Mr. Lammersdorf, which consisted of 140,000 of the total of 250,000 shares, began about eleven months ago, at which time the syndicate, after an examination of the property, deposited $,1000 on an option and for the privilege of making an examination. This resulted so favorably that on September 14th the syndicate followed it up with a payment of $40,000, which placed to Mr. Lammerdorf's credit $41,000 on the deal. There was a balance of nearly $51,000, which became due yesterday.

## MONTANA.

The annual report of the Iron Mountain Mining Company of Missoula shows the mine and mill paid in dividends $85,000. There were mined during the year 66,856 tons of crude ore, which produced 5,767 tons of concentrates. These concentrates were loaded into 265 cars for shipment and produced net returns of $326,578 44, or an average of $1,231 62 per car. From these shipments there were 497,888 ozs. ; silver value, $333,586.23; 4,466,103 pounds lead, value $138,422 14 a total of $472,008.67. The freight and treatment cost $145,630 24; net returns, $326,378 43. The current expenses for the year were $203,318.57, leaving a profit of $123,059 86.

The *Miner* says that another big strike has been made in the Broadwater mine at Neihart, on the lower level, 3,000 feet from the mouth of the tunnel.

P. A. Fusz has resumed at Phillipsburg work on the drain tunnel on which work was abandoned two years ago. When completed it will be one mile in length, and will drain the Bimetallic and Granite mines at considerable depth. There are 450 feet of the tunnel to be built.

## WYOMING.

Boston capitalists have purchased the Clark placer grounds near the head of Big Wind river on Warm Spring creek, and have landed at the mines six loads of machinery for working gravel.

A stream of prospectors in wagons and horseback, with packs, are daily passing through Lander bound for the upper Wind river and Black Fork country.

## COLORADO.

Frank H. Pettingell writes from Colorado Springs: "The indifference displayed by the mine owners of Cripple is driving away an unlimited amount of Eastern and foreign capital which invariably seeks refuge in other camps, and all too frequently goes to other States. All one has to do is to price some fair prospect in Cripple and the figures asked are generally ten times the amount of ore in sight. This may speak well for the confidence of those who are most familiar with the camp, but Colorado wants the capital and we want our properties developed as the ordinary miner will not or is unable to do."

In the Ward district the Montgomery property in California gulch is reported sold for $40,000, $10,000 in cash and a bond running for two years for the remaining $30,000. The new owners are said to be connected with the Schlitz Brewing Company of Milwaukee. A contract to drive 50 feet farther in the east drift of the Gray Eagle mine, on Left Hand, has been let by the company, of which ex-Congressman McShane of Omaha is at the head. The company also has men working on the Little Alice, another one of their properties: they are overhauling the mill and fixing it up for a new cyanide-electric process. The Kobbri mine at Sunset, operated by the Gulf Gold Mining Company, reports a strike. The ore body is 2 feet in width and was struck at a depth of 20 feet while drifting. Assays of $81 have been received.

*Republican*: One of the most important projected mining enterprises in the State is the great tunnel that is to be run through the mountain from Ouray to Telluride. It is to connect with the Revenue tunnel on the Ouray side. On the Telluride side it starts from the Hector mine, owned by A. E. Reynolds and his associates, who are also the owners of the Virginius and the Revenue tunnel. The latter is now in the mountain about 8,000 feet and work is to be prosecuted from both ends until the connection is made. A 10x16x16 compound steam and air compressor has recently been put in position on the Hector and another is soon to be put in operation on the Ouray end.

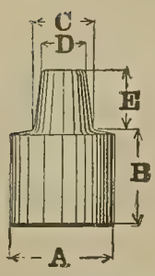
*News*: All the shares in the Cripple Creek Reduction Company, Limited, have been subscribed for and steps will at once be taken to commence building the first plant of the company at Florence, this State. The Cripple Creek Reduction Company is formed for the purpose of treating Cripple Creek ores by a process owned by Prof. Page of this State. This is a process wherein cyanide is used in conjunction with another preparation and the claim is made for it that the process will save ninety-five per cent of the gold in ore treatment.

The reduction company has acquired ten acres of ground in close proximity to the reduction works at present in operation at Florence. The guaranteed $100,000 is to be at once expended in the erection of a plant and operations pursued without delay.

## ARIZONA.

T. G. Massicks has been appointed receiver for the Little Jessie mine near Prescott: W. J. Martin is superintendent.

Yuma *Sentinel*: The Desert Mining Company recently sunk a well in Cullen valley, this county, between Harrisburg and Mesquite Wells, and at a depth of 67 feet got an excellent supply of water. The water will be pumped three miles over a divide and from there it will run by gravitation to the company's mine, five miles farther. The company has a ten-stamp mill on their property, which will now be increased to forty stamps.



Globe *Silver Belt*: At the Kasser Gold Mining Company's camp, Lost Gulch, the pipe line, about a mile in length, has been completed and the mill is now running. Water was struck in the shaft last week at a depth of 80 feet below the fourth level. The character of the ore changes at the water level to sulphurets and pyrites and shows an increased percentage of gold. Machinery for hoisting water will be put in at an early date. Development work in the mine will be pushed and the mill will be kept running.

Tucson *Citizen*: There are no mining camps in the southwest where more men are employed,

E=..... "

We beg to call attention to our "RISDON HAMMERED" Shoes and Dies, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend it to all mine owners and mill men.

better wages paid, more copper produced and better times existing generally than at the copper camps of Clifton and Morenci.

### LOWER CALIFORNIA.

Davis, Hartzell and Munson have sold one-fourth interest in their Viznagar mine for $25,000 cash, to J. B. Bliss, of New York. The Viznagar mine is located in the Alamo mining district. The property has been worked the past year. A ten-stamp mill has been running for the last eight months and has produced considerable gold.

### SOUTH AFRICA.

Following is the report of the Robinson Gold Mining Co. for April. The directors' monthly report is as follows: Quartz mined, 13,505 tons. Development: Drives, 785 feet; raises, 166 feet; crosscuts, 135 feet; total, 1086 feet. Main incline shaft (west), sixth level: Driving west on south reef, 20 feet; driving east on south reef, 46 feet. Seventh level: Driving east on south reef, 35 feet; raise, 32 feet; crosscut, 27 feet. Eighth level: Driving west on main reef, 57 feet; driving east and west on south reef, 82 feet. Ninth level: Driving east and west on main reef, 83 feet; driving west on south reef, 74 feet; raise, 14 feet; crosscut, 9 feet. Tenth level: Driving east on south reef, 32 feet; raises, 56 feet. Main incline shaft (east), fifth level: Driving east on main reef leader, 28 feet; crosscut, 8 feet. Sixth level: Driving east and west on main reef, 64 feet; raise, 50 feet. Seventh level: Driving west on main reef and main reef leader, 38 feet; driving west on south reef, 31 feet; crosscut, 19 feet. Eighth level: Driving east and west on south reef, 9 feet; crosscut, 16 feet. Ninth level: Driving east and west on main reef and main reef leader, 49 feet; raise, 25 feet. Tenth level: Driving west on main reef leader, 48 feet; raise, 45 feet; total, 1086 feet. Mill: Stamps at work, 120; net running time, 24¾ days; tons crushed, 13,505; tons per stamp per diem, 4.6; gold won from above, 10,117 ounces 16 dwts. Chlorination and cyanide works: Gold won from own concentrates (by chlorination), 750 ounces; bullion from tailings (cyanide process), 2216 ounces 5 dwts.; bullion from slimes, Rand Central Ore Reduction Company, Limited, 783 ounces 14 dwts.; from own ore, 13,867 ounces 15 dwts.; gold from concentrates purchased (by chlorination), 2059 ounces; total, 15,926 ounces 15 dwts.

EXPENDITURE AND REVENUE.

Crushed 13,505 tons.

Working expenditure.

| | | | | Cost per ton. | |

# MINING AND MILLING MACHINERY.

## "HENDY" IMPROVED
TRIPLE-DISCHARGE
## Two Stamp Mills.

**Superior to all other Mills of the same form for the following reasons:**

**First.** Because **Two Stamps** will do **More and Better Work** in a mortar than any other number, as the motion of the stamps causes a discharge at the ends of the mortar, in addition to the front discharge, thereby increasing the stamping capacity, and leaving the pulp of uniform fineness.

**Second.** They are the cheapest mills to the stamp that were ever offered to miners.

**Third** They do not slime the ores or flour the quicksilver, as the lateral motion of the pulp prevents such effect.

**Fourth.** They crush all kinds of ore, rock, cement or conglomerate perfectly.

**Fifth.** They are more durable, as the framework is secured to the mortar and thoroughly bolted together.

**Sixth.** The several parts are interchangeable and can be readily set up or taken down and duplicated.

**Seventh.** No skilled labor is required to assemble the parts.

**Eighth.** The discharge is larger in quantity to the stamp, and the number of drops per minute, (110) of the stamp is greater than any other mill.

Weight of Stamps (each).....850 pounds.
Weight of Mill complete.....7500 "

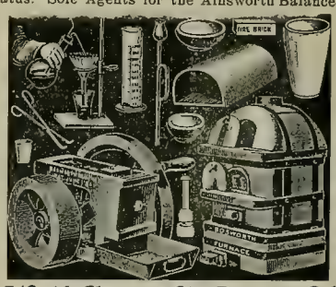
## PAYNE'S
PATENTED
## GOLD SAVING RIFFLE.



This Riffle is just what placer miners want whether they are working large or small claims, as it is the only riffle ever invented that holds the mercury entirely exposed to the material, no matter what force of water is used. A large number of these Riffles have been sold, and are now in use in Colorado, Montana, New Mexico and elsewhere, and the first complaint has yet to be made against them. Many testimonials have been received from parties who have used and are now using them, giving them the highest praise. Are made of chilled cast iron, cheaper and more durable than any other process. Agents wanted. County and State rights for sale. These Riffles are manufactured at Denver only. Address all orders and communications to

**JOSEPH J. PAYNE, Sole Owner,**
**1710 Champa Street, DENVER, COLORADO.**
☞Would sell an interest to right party.

OFFICE: McPHEE BUILDING, DENVER, COLORADO.

**MILLS BUILT WITH GUARANTEE OF SUCCESSFUL OPERATION.**

**KENDALL GOLD AND SILVER EXTRACTION CO.**

The Kendall Process is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

*The Kendall system is covered by patents which this company will defend.*

The American Cyanide Gold and Silver Recovery Co., organized in Denver more than a year ago to introduce and operate the Kendall Process in several States, have closed contracts with some ten mines for the use of this process after exhaustive comparative tests with the ordinary plain cyanide method.

Capt. De Lamar has adopted the process at his Nevada mines, where a 250-ton plant is being completed. He writes that he is saving 95 per cent of his gold values, and regards the Kendall Process as the cheapest and best he is aware of for the treatment of gold ores.

*All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.*

Owners of mines and reduction works can obtain full information on application to

PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

# HORACE F. BROWN, CONSULTING ENGINEER.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION
CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.
THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.
Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.
Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.
You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

JOSHUA HENDY MACHINE WORKS, 42 Fremont St., San Francisco.

# Market Reports.

## The Markets.

SAN FRANCISCO, June 18, 1896.

Jobbers report business more active than at this time last year. Continued failures of retail merchants in the interior are against a pronounced restoration of confidence in the agricultural districts, where about all have taken place. As a rule they are pushing for business in the mining districts owing to a continued growing boom in gold mines. Eastern and foreign capital continues to arrive for investment. According to Joseph Rosenthal, a well known business man of this city who has returned from an extended trip through Europe, our mines would receive greater attention abroad were they differently handled. His judgment, derived from personal experience abroad, is that if some of the best dividend payers, like Utica, were capitalized in London they could be successfully floated for many million dollars. He says the Utica could be floated at fully $20,000,000 on its present dividend-paying proposition. He believes that the dividends from such a mine would create a great furore for investment in this State that would lead up to a boom similar to that which raged in South African mining shares.

The local money market is in favor of borrowers, but the latter have to be blessed with gilt-edge security to get ready accommodation from banks. It is stated that there is a growing feeling of confidence that business will steadily improve. It is also thought that fair prices will be received for farm products, which will help producers to pay up their indebtedness. There is some inquiry for funds for crop moving purposes. The East reports an excess of funds, but as the crops promise a fair average, there will be soon an increasing demand for moving them. Speculation at the East is tame, but this is always the case there around the mid-summer holidays.

**New York Silver Prices.**

NEW YORK, June 18.—Following are the closing prices for the week:

| | Silver in London. | Silver in N. Y. |
|---|---|---|
| Friday | 31 5-16 | 68¼ |
| Saturday | 31⅜ | 68⅝ |
| Monday | 31 7-16 | 68¾ |
| Tuesday | 31⅜ | 68⅝ |
| Wednesday | 31⅜ | 68⅝ |
| Thursday | 31 7-16 | 68¾ |

| | Copper. | Lead. | Iron. | Tin. |
|---|---|---|---|---|
| Friday | 11 62½ | 2 90 | 10 75@13 00 | 13 40 |
| Saturday | 11 62½ | 2 90 | 10 75@13 00 | 13 40 |
| Monday | 11 75 | 2 90 | 10 75@13 00 | 13 45 |
| Tuesday | 11 65 | 2 90 | 10 70@13 00 | 13 50 |
| Wednesday | 11 65 | 2 92½ | 10 70@13 00 | 13 40 |

The local bullion, money and exchange quotations current are as follows:

| | |
|---|---|
| Commercial Loans, % per annum | 7@8 |
| Commercial Loans, prime | 6@8 |
| Call Loans, gilt edged | 6@7 |
| Call Loans, mixed securities | 7@8 |
| Mortgages, prime, taxes paid by lender | 6@8 |
| New York Sight Draft | 12½ |
| New York Telegraphic Transfer | 15 |
| London Bankers' 60 days | $4.88¼ |
| London Merchants | $4.86¼ |
| London Sight Bankers | $4.89½ |
| Refined Silver, per oz., 1000 fine | 68⅜ |
| Mexican Dollars | 54@55c |

SILVER. — The market has held fairly steady throughout the week. An Eastern correspondent writes that to prevent a corner in silver five of the principal exporting houses at New York have combined to control the visible supply. The plan is to permit each house, in turn, to make shipments for all orders during one week. This will prevent competitive buying and is on a similar line to that which exists in this city. Referring to the shipment of 1,025,000 ounces of silver on one steamer from New York to London, the New York *Journal of Commerce* says: "It is the largest single day's shipment in recent years, so far as the records of leading bullion houses show. Agents of the London buyers scoured the market yesterday and bought about all the silver in sight at the going prices, so that it would have been most difficult to secure any round amount after the London buying was completed. The large outward movement of the white metal was due to the speculative advance in the price here this week, which has made London houses with contracts for future delivery of bars very nervous about their coming deliveries on the same. London does a large business in silver in this way for future delivery, and the market has developed so much strength that many have thought it best to secure stock now against their contracts, rather than risk a setback in the market at the time when they will have to make deliveries. Another consideration which has caused London to buy silver is the belief that Japan will buy the metal with a considerable portion of its Chinese war indemnity money now on deposit with the Bank of England. Japan's paper currency is stated to have been increased during the war from 50,000,000 to 225,000,000 yen; so that, as there has been no increase in the amount of silver held against it, the nation's currency lacks a sufficient metallic basis."

MEXICAN DOLLARS. — The market is firm with a fair export inquiry at from 54 to 55 cents.

COPPER. — In our market no change in quotations is reported. The demand is of the usual character. At the East the markets have made another advance, closing strong. The demand there, while chiefly for export, shows considerable of an inquiry for home consumption. It is stated that American consumers did not stock up much owing to the belief that lower prices would rule under an increased output of the mines, but the very heavy foreign consumption has more than absorbed the latter, thus bringing about higher prices.

The market is quoted as follows:

| | |
|---|---|
| Bolt | ¼ & 5-16, 20c; ⅜ and larger, 17c |
| Lake Superior Sheathing | 20 |
| Ingot, jobbing | 13 |
| Ingot, wholesale | 12 |
| Sheet copper | 17 |

QUICKSILVER. — The market is steady at the decline.

The market is quoted as follows:

| | |
|---|---|
| Home trade, per flask | 37 00 |
| Distant points up north | 36 25@37 00 |
| West coast of Mexico, for export | 32 50 |

ANTIMONY.—The demand is fair, with the market easy at 8@9c in a jobbing way. New York mail advices quote 7⅞@7¾c for Cookson's, 6⅝@6¾c for Hallett's and 6½@6⅝c for Japanese, from store.

TIN.—In our market there is nothing new to report. At the East the markets have been barely steady, with a fair consumption demand ruling.

The market is quoted as follows:

| | |
|---|---|
| Pig, per lb | 14½c |
| Plate, I C coke, heavy, per box | $4 25 |
| " " " light, " | 4 10 |

BORAX.—The market is quoted as follows

| | |
|---|---|
| Refined, in car lots | 6½ |
| Refined, in sacks | 5⅞ |
| Powdered, in car lots | 6¼ |
| Concentrated, " | 5⅝ |

IRON.—The local market is essentially unchanged. Large buyers do not find any difficulty in having their wants met at slight concessions on asking prices. At the East the output of the furnaces is being reduced owing to the production being in excess of the consumption. While those belonging to the combine do not openly make concessions in prices, furnacemen outside of it are cutting which unsettles values.

Our market is quoted as follows:

| | To Arrive. | Spot. |
|---|---|---|
| **AMERICAN.** | | |
| Sloso | $21 00 | $23 50 |
| Thomas | 22 00 | 23 50 |
| Salisbury | 30 00 | 33 00 |
| **ENGLISH.** | | |
| Barrow | $21 00 | $23 50 |
| Gartsherrie | 21 50 | 23 50 |

LEAD.—The large supplies at the East are telling against the markets there. In our market buyers can secure concessions.

| | | | |
|---|---|---|---|
| Pig | 3 75 | @ | 4 00 |
| Bar | — | @ | 4 15 |
| Sheet | — | @ | 5 50 |
| Pipe | — | @ | 4 75 |

SHOT.—The market is quoted as follows:

| | |
|---|---|
| Drop, sizes smaller than B, per bag of 25 lbs | $1 40 |
| Drop, B and larger sizes, " " " | 1 65 |
| Buck, Balls and Chilled, do, " " " | 1 65 |

POWDER.—The demand continues large, considerable in excess of that ruling at the corresponding time for several years past.

The market is quoted as follows:

| | |
|---|---|
| Hercules, No. 1, per pound | 11½c |
| " No. 2, " " | 8½c |

COAL.—There is practically nothing new to report. The consumption of steam is increasing while that of household is decreasing. The liberal supplies of coast are against any advance in the market, notwithstanding the lessening supply of Australia.

COKE.—The market is quoted as follows:

| | | | |
|---|---|---|---|
| Gas Companies' | — — | | — — |
| English, to load | 9 00 | @ | 10 00 |
| " spot, in bulk | — — | @ | 11 00 |
| " in sacks | — — | @ | 12 00 |
| Cumberland | — — | @ | — — |

LUMBER.—There is a continued good home and export demand.

The market is quoted in this city from dock or yards as follows:

| | | | |
|---|---|---|---|
| Redwood, Fluming | 17 00 | @ | — — |
| Pine | 14 00 | @ | 19 00 |
| Spruce | 26 00 | @ | 31 00 |

## Mining Share Market.

SAN FRANCISCO, June 18, 1896.

The market the past week was of a decidedly mixed character, but not more so than the average trader, particularly those who figure the moves on what has been. It cannot longer be denied that the market is under strong manipulation, and that it has been placed in position for easy handling, which makes it equally dangerous for magin traders and short sellers. The depression in the market the past few days has the unmistakable earmarks of a freeze-out. That it has been successful to a large extent goes without saying. The line of shares carried by brokers for outsiders has been greatly narrowed, while the cash shares carried have also been greatly reduced. Who has taken them in is an open question, but it can be affirmed that whoever has done so feels warranted in doing so by the work going on in the mines and the general condition of the country pointing to more prosperous times, and when the latter obtains it is fairly easy to promote a mining share deal without showing up a large quantity of ore. The feature of the market the past week was a setback in the shares of Con. Virginia, which sold at a decline of 20 per cent. In this downmove the other north end shares sympathized, as did the Gold Hill shares (the latter always decline on the flimsiest excuse), but those of the middle group of mines held strong, Savage and Chollar even advancing. The downmove in Con. Virginia was due to a leakage in the bulkhead which confines the foul, gaseous air in a part of the old workings. The escape of the latter was enlarged and made an excuse for a raid on the shares. The leakage was soon stopped and the bulkheads further strengthened as a precautionary measure. This interfered with ore extraction. At this writing, work of extracting has been resumed. The company is milling about 1100 tons of ore, which will give a net bullion return of over $30,000, so the company is not so bad off as the bears would have the many to believe. The impression, at this writing, with outside dealers is that there will not be an upmove until after the national holiday, and in the meantime the market might weaken off. Whether this belief is correct or not we are unable to say, but the present situation at the mines does not warrant or justify it.

At the annual election of the Bodie Mining Co. the old management lost control. There is a contest on for the control of the Savage mine by Herman Zadig and associates. Mr. Zadig has done no little to promote active times in the share market; and, believing this, many operators are said to be working in his interest. The wide range between car-sample assays and battery assays of the ore extracted and milled will give Mr. Zadig quite an advantage in his fight for control. One assessment was levied the past week—5 cents on Kentuck—but others are expected to follow in regular order.

The news from the mines on the Comstock lode, while essentially unchanged, is of an interesting character so far as it concerns several of them. In the Alta group work is still continued in Alta on the levels heretofore reported. In the Gold Hill group official advices report a general resumption of work in Overman and that a few tons of fair-grade ore are being raised. In Caledonia and Kentuck no work is being done. Seg. Belcher and Belcher continue to report the raising of ore going around $20 a ton. The latter company is milling about 350 tons. In Crown Point the dead work is about finished and more active exploiting can be looked for soon, as also the extracting and milling of the gold ore around and below the 600-foot level. No news comes from Yellow Jacket. The upraise for ventilation in Confidence is the chief work in that mine. In Con. Virginia another west crossdrift has been started from the surface tunnel. The joint west crossdrift of Confidence, Challenge and Con. Imperial is nearing the west lode. The work in Alpha, Bullion and Gould & Curry is the same as heretofore reported. In Potosi and Chollar work is being prosecuted on several levels. While pushing work in Hale & Norcross a few tons of ore are raised each day. The work being done is closely watched by mining men. In Savage ventilation connection has been made so as to expedite the extraction of ore. About 200 tons were raised the past week which assayed as per car sample over $58.50 per ton, and 200 tons were milled which gave a battery assay of over $46 per ton. More men have been added so as to increase the output of ore. Work in Best & Belcher is on the same levels heretofore reported. The work in Con. Virginia on the 1050-foot level grows in interest. The gaseous leakage in the mine interrupted the extraction of ore for a few days. The work in Ophir and Mexican is in the same levels as heretofore made public. It is in the right direction for striking ore. In Union, Sierra Nevada, Utah and Andes the work is essentially unchanged.

The news from the Brunswick lode is of a decidedly interesting character. Work is being pushed with vigor in the grounds owned by Gould & Curry, Savage, Chollar and Hale & Norcross. Any day may bring about quite a change for the better as the work is pushed ahead. Attention is centered on the work that is being done on the 300-foot level. Miners are confident that there will be quite an improvement in the ore on this level from that found on the 200-foot level. If this is realized then a most decided movement in shares can be looked for. Strong parties have been steady buyers of these shares at the recent decline and they are still in the market as buyers notwithstanding they make the market look "rotten" as if it was going all to pieces.

From the Bodie district no news of importance comes to hand, although more interest begins to be taken in that district than for several months past.

The market was dull and heavy throughout to-day. It had the appearance of going to pieces, still it did not. Although the Gold Hill shares and some of the north end shares sold lower, those of the middle group were well maintained with Savage sold slightly higher. The public sold more than they bought. This afternoon the market was dull but fairly firm. After Call it was firmer with more disposition to buy. Occidental sold up to $1.40. Advices from Virginia are quite bullish on the situation on the Brunswick lode. The better informed look for a decided improvement soon. The development in Savage on the Comstock lode is said to be larger than generally believed. They have not commenced extracting ore in Con. Virginia yet although the mine is all right.

The following illustrates the changes of the week:

| Mines. | June 11. | June 18. |

Michigan Mining School.

A high grade State technical school. Practical work. Elective system. Summer courses. Gives degrees of S. B., E. M., and Ph. D. Laboratories, shops, mill, etc., well equipped. For catalogues, address M. E. WADSWORTH, Ph. D., Director, Houghton, Mich.

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR THE WEEK ENDING JUNE 9, 1896.

561,754—POWDER MEASURE—T. R. Barney, S. F.
561,658—VALVE—W. Curlett, S. F.
561,659—CHALK HOLDER—J. W. Currier, Los Angeles, Cal.
561,978—GALVANIC BATTERY—T. E. Fogalsang, Sac'to, Cal.
561,800—GAS IGNITER—G. E. Hoyt, S. F.
561,667—BICYCLE ALARM—R. E. Kelly, Alameda, Cal.
561,670—BOOK BINDING—L. Kosby, S. F.
561,675—FILTER—C. K. Lamb, S. F.
561,594—BICYCLE BRAKE—L. A. Larsen, S. F.
561,679—ELEVATOR—T. M. Martin, Los Angeles, Cal.
561,806—TROUSERS STRETCHER—W. J. McCoy, Santa Barbara, Cal.
561,601—TELEPHONE REGISTER—E. L. Morey, Portland, Or.
561,823—WRENCH—J. Shafer, San Bernardino, Cal.
561,021—TEA INFUSER—J. H. Sutthoff, Seattle, Wash.
561,629—CONCENTRATOR, L. R. Tulloch, Angels, Cal.
561,630—CONCENTRATOR FEEDER—L. F. Tulloch, Angels, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FILTER—Christopher K. Lamb, San Francisco, Cal. No. 561,675. Dated June 9, 1896. The object of this invention is to provide a filter apparatus which may be used either in double or single form, a mechanism for supplying water to be passed through the filter or to cleanse it and discharge sediment by means of a single cock, and a means for separating and securing the parts together. It consists of an exterior cylindrical case having a receiving chamber for the water to be filtered, a conical perforated plate or plates fitted to form ground joints with the interior periphery of the case, a plate of filtering material similarly shaped and fixed to the receiving side of the perforated plate, a filling of charcoal within the case and exterior to the filter plates, a second perforated conical disk with a lining of asbestos cloth fitted against its interior surface, a water receiving chamber with discharge pipe exterior to the filtering plates, a water-tight cover fitting the outer end of the case, and means for holding the disks and filter plates in position and allowing the escape of air from the various chambers.

HOISTING AND PUMPING APPARATUS—Frederick H. Nease, Bellevue, Idaho, assignor of one-half to Frank Brown same place. No. 561,723. Dated June 9, 1896. This invention relates to the class of power mechanism adapted for either hoisting or pumping, or both. It consists in a hoisting apparatus of a frame-work, a vertically rotatable shaft mounted therein, a horizontally disposed winding drum loosely mounted on the shaft, with teeth upon its upper surface, a slidable clutch on said shaft adapted to engage and operate the drum, a clutch shifting mechanism and connections for operating the same.

## Assessment Notices.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 2d day of June, 1896, an assessment (No. 23) of fifteen cents (15c) per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of July, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before will be sold on TUESDAY, the 28th day of July, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

NIMSHEW GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Nimshew, Butte county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of June, 1896, an assessment (No. 1) of Three cents (3c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Mission Pier, No. 1, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of July, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 3d day of August, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

C. D. COOK, Secretary.

Office, Mission St. Pier, No. 1, San Francisco, California.

## DIVIDEND NOTICE.

**SAN FRANCISCO SAVINGS UNION,**

532 California Street, Cor. Webb.

For the half year ending with the 30th of June, 1896, a dividend has been declared at the rate per annum of Four and thirty-two one hundredths (4.32) per cent on Term Deposits and Three and sixty one-hundredths (3.60) per cent on Ordinary Deposits, free of taxes, payable on and after Wednesday, the 1st of July, 1896. LOVELL WHITE, Cashier.

MANUFACTURERS OF

## Stamp Mills, Ore Feeders

DETACHABLE BUCKET WIRE-ROPE TRAMWAYS,

Roller Grinding Pans, Desulphurizing Furnaces, Etc.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill.

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.

THIRD: The Large Amount of Space Saved.

Late improvements in the amalgamation and concentration of ores enable us to offer to the mining public, in connection with our Self-Contained Mills, an apparatus which amalgamates and concentrates at the same operation and provides a perfect trap for escaping quicksilver. Write to us for information.

# FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of
April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

## The Increased Demand for Silver.

The shipment of silver to the Old World goes on, and has been going on for years. One might view these weekly shipments and the aggregates for months and years with complacency were each ounce of silver bullion paying $1.29 of debt across the water, as previous to demonetization, but the white metal turned over to Lombard street at a little more than half this price is a throwing away of our national wealth. The loss by the outlawing of silver was great, but a trifle in comparison with the losses sustained by the people at large by the destruction of property values and the reduction of the price of all products one-half, the result of throwing away half the volume of primary money and making gold alone the standard of values. Since the demonetization of silver there has been in use among the nations hundreds of millions of paper money which could and should have been replaced by solid metallic money.

The fact that all the silver we mine is readily sold shows there is no overproduction. There is a demand for all we can produce. This shows the senselessness of the talk about this country being flooded with silver from Europe. Instead of diminishing, the demand for silver from the Old World has been increasing. Recently a shipment of no less than thirty-two tons of silver bullion was made in one day. It is supposed that most of this silver goes to Japan and other countries of the Orient. The rapid increase of manufacturing industries in those countries has called for an addition to the stock of money among all the silver-using nations of the Orient. These nations were rather slow in availing themselves of the advantages accruing to them through the demonetization of silver by the Western nations, but since the great and constant appreciation of gold they soon became active in the promotion of manufacturing enterprises. The Japanese were the first to awaken to the necessity of establishing home manufactories of various kinds, particularly in the line of cotton goods. The profits resulting from the use of modern machinery and the utilization of cheap labor in the cotton-spinning industry proved so great that many have engaged in the manufacture of cotton goods. From a small beginning a few years ago there are now in Japan sixty-one cotton mills with 1,500,000 spindles. Recently silk factories with half a million spindles have been established. In other lines manufactories are being set up and profitably operated. As fast as they secure the up-to-date machinery of the Western nations the Japanese set to work to duplicate it in their home shops; thus they are now able to manufacture any kind of machinery required in the cotton and silk mills and other industrial works. The Japanese are fast becoming independent of the Western nations. With the development of its long dormant resources after modern methods, the Orient will find it necessary to increase its stock of money. This will cause a steady demand for silver, and this demand will increase with the increase of manufacturing industries and the employment in them of more and more operatives. The greater the progress and prosperity of a country the greater the demand for money with which to develop idle resources and set on foot new enterprises.

Although our silver is now in brisk demand in the Orient and in France, Germany, Russia, and other European countries, we are shipping it across the sea and turning it over to the Lombard street money sharpers at their own price. There is no reason why we should not be receiving the old price for every ounce of silver we produce. We have only to return to our old monetary system and the money of the Constitution and at once silver will command its former figure—the price previous to demonetization. There is no swifter cure for the stagnation and retrogression now upon the country. It is idle to talk of prosperity under a single standard, that necessitates for its maintenance the borrowing of hundreds of millions of dollars. It is ruinous, and on a par with the spider's production of web by spinning out its own bowels. The hundreds of millions have been borrowed and brought to our shores, but so far as the people at large are concerned the gold might as well have been sent to South Africa; nobody outside of the financial centers has seen a dollar of it, and instead of the promised prosperity we have but a deepening of the gloom of adversity and stagnation.

With our 70,000,000 people, almost boundless extent of territory, and thousands of undeveloped resources, we can find use for every dollar in silver that our mines produce, for with the starting up of new enterprises and renewed activity in the industries the demand for money would increase. Our Eastern friends say that the remonetization of silver would result in silver monometallism. Such a result seems impossible. But is it not better to make a profit under the silver standard than to lose money under the gold standard? The worst that could happen under the silver standard would be no worse than what we now have under the present monetary system. Under the gold standard farm lands and all other kinds of outside property show a steady decrease in price from year to year. This being the case, there is nothing to induce either home people or foreigners to invest their money in such property—in anything, indeed, except our gold mines. With a return to remonetization of silver there would be bimetallism—the full use of both gold and silver instead of either money alone.

## McKinley's Record on Silver.

The following is Wm. McKinley's official record in relation to silver:

On November 5, 1877, in the House of Representatives, he voted for Bland's free coinage bill.

On January 28, 1878, he voted for a resolution declaring that all the Government bonds issued under the resumption act were payable, principal and interest, at the option of the Government, in silver dollars.

When the Bland bill came back from the Senate with amendments providing for the coinage of not less than $2,000,000 nor more than $4,000,000 of silver per month, Hewitt, of New York, moved to lay it on the table. On February 21, 1878, McKinley voted "No."

President Hayes vetoed the bill. On February 28, 1878, McKinley voted for its passage over the veto.

April 8, 1886, on a proposition to suspend the purchase and coinage of silver bullion on July 1, 1889, McKinley voted "No."

August 28, 1893, when the repeal of the silver purchase act was carried, McKinley was not a member of Congress, but he made a public address in which he urged that "the silver product of the country should not be discriminated against."

On September 27, 1894, in another public address he denounced those who voted for the repeal of that law.

## Nevada as a Gold Producer.

Nevada astonished the mining world as a silver producer and is now likely to create a sensation as a gold producer. Something is being heard of from her gold mines notwithstanding Nevada has so long been known as the Silver State that no one outside of the State, except a few mining men, thinks of it as an area producing gold. The Comstock, of world-wide fame, was always spoken of as a great silver lode, but in reality it was and always has been as much a gold as a silver producer. More than one-third of all the hundreds of millions taken from the mines of the Comstock was in gold. In all the big lode has yielded not less than $150,000,000 in gold. Even the silver-lead ores of central Nevada carry a large per cent of gold. At Silver City, five miles south of the bonanza mines of the Comstock, are gold mines that have been worked nearly forty years. These mines are now paying better than at first and new finds in them are frequent. At Pine Grove and in one or two other places are gold veins that have been worked for thirty years. This permanence and persistence in depth is characteristic of all the gold-bearing veins of the State. No paying vein has ever given out.

Though some rich gold-bearing veins are found in western Nevada, the great gold belts and the big mines of the State lie well out to the east toward the west line of Utah. The De Lamar mine, at the town of De Lamar, has been yielding about $100,000 a month, to be increased with augmented capacity of the mill to 300 tons a day. They regularly run a special bullion coach, accompanied by armed guards, from the mine to the railroad at Milford. For special reasons they do not report the amount of their shipments, nor do they tell just what they are doing. The lode is opened up by ten tunnels, in all of which ore is in sight.

In opening up the mine, bringing in water and the construction of reduction works Captain DeLamar has expended nearly half a million dollars. A British syndicate is negotiating for the purchase of the mine. It is said it will not be sold for less than $2,750,000.

The April Fool mine is little behind the DeLamar as a gold bonanza. This mining property paid big from the start, though it was necessary to ship the ore to Salt Lake and a long part of the way by wagons. The owners of the mine have taken out and sold sufficient ore to enable them to bring in water at a cost of $40,000 and to erect mills worth $30,000.

The gold belt of the DeLamar covers many square miles of territory. Few locators in the district had the capital or the capacity to push ahead in development as was done by the DeLamar and April Fool people. The town of DeLamar is growing. The mining world is only beginning to hear a whisper from DeLamar—before snow flies it may be a shout.

Another mineral belt which is making some noise is the State Line mining district. The mines of this belt lie partly in Utah and partly in Nevada. The district is a new one—just discovered last winter—but good prospects are being shown. Some of the mines are rich in silver, besides carrying a paying amount in gold. In the district there are really two mineral belts—one gold and the other silver-bearing. The gold veins are in a formation of granite and quartzite and the silver in porphyry. The two belts lie parallel and only about a mile apart. Of course, the metals in the veins are more or less mixed in places, but in addition to whatever silver they carry, all the mines show well in gold.

Already a town is founded at this point and miners are going in. The owners of the mines first opened are shipping ores to Salt Lake, and the camp, like DeLamar, will soon be more than self-sustaining. In this district veins showing well in ore are found to cover a belt of country twelve miles long by four miles wide. All the mining men who have visited the new State Line district pronounce it a promising region.

In Eastern Nevada, along near the Utah line, are several big gold belts. At Osceola there is an auriferous belt containing both quartz veins and placers. A little back from this border section, in Nye county, lies Montgomery district, and near it several other districts, all containing prospects, and justly promise to be rich mines. Just now, as matters stand, Nevada is a happy hunting ground for all who wish to secure valuable mining properties without being obliged to pay boom prices for their purchases.

## Concentrates.

ABOUT 500 stamps are now in constant operation in Alaska.

THE Young America mine, Sierra county, is to be operated this summer.

AT the Gwin mine, Calaveras Co, the shaft is now down 1275 feet and is in slate.

THE Cripple Creek *Mail* is the best paying and the poorest printed paper in Colorado.

A CHICAGO man wants to buy "some dividend-paying mining shares." He's not a bit lonesome.

ON Miners' Union Day, the 18th inst., a holiday in Montana, 4000 union miners paraded in Butte.

IN southern California, including Kern county, there are now 135 quartz mills, aggregating 980 stamps.

THE Rothschilds have had renewed the lease of the Alamaden quicksilver mines with the Spanish Government.

OVER 1800 miners are now at work in the vicinity of Deadwood, S. D., an increase in a year of nearly 50 per cent.

TO date, the Homestake, S. D., mine has paid its owners in San Francisco and elsewhere dividends aggregating $5,868,750.

THE pumps in the Tiger mine at Burke, Idaho, have been stopped, and there is now 800 feet of water reported in the shaft.

THE old silver camp of Pioche, Nev., is in line with changing conditions and gold properties are being developed thereabouts.

THE 1012-lb. stamps at the App mine, Tuolumne Co., have been hung up to have a concrete foundation put under the battery.

COW WELLS, Kern Co., is eight miles from Randsburg and twenty miles from Goler. A postoffice—Garlock—has just been established.

AT the Utica mine, Calaveras Co., miners' wages are $3.00; shovelers and other laborers, $2.50. The supply of proffered labor exceeds the demand.

ABOUT eighty men have been employed during the past season at the borax mine of the Pacific Coast Borax Co., near Calico, San Bernardino Co.

ACTIVITY in oil in California is now only second to that displayed in the pursuit of gold. At present the mining industry of the State leads all others.

THE Golden Eagle mine at Winnemucca, Nev., has become a producer and is yielding smelting ore that, besides a fair value in silver and lead, averages $20 gold.

THE abundance of last year's snow in the mountains has enabled hydraulic miners in Siskiyou, Shasta and Trinity counties to continue work till the present time.

FROM Gold Basin it is reported that the Scotch syndicate which owns the Cycloptic mine has a force of men at work developing it and now will put in a 60-stamp mill.

AT the Rawhide mine, Tuolumne county, last Saturday, James Colter and Ernest Diepzel were tamping powder in the 900 drift when it exploded, blowing both men to pieces.

THE Butte, Mont., *Inter-Mountain* says work will shortly be resumed on the new silver mill at Anaconda for the Anaconda Company, upon which work was suspended 60 days ago.

THOS. A. EDISON has spent nearly $3,000,000 on his Sussex, N. J., iron mine plant and expects to shortly produce a large daily output of iron at the cost of seventy-five cents per ton.

DIFFERENCE of opinion among the managing directors has occasioned a temporary cessation of active operations at Keswick, Cal., of the extensive works of the Mountain Mines Company.

THERE are 500 stamps in present operation in Alaska, with about 175 more contracted for. There is a notable absence of speculation, the work being confined to legitimate mining development.

ASSESSMENT work sufficient to hold four adjoining claims, held in common, can be put on any one of the four by the coowners, but must aggregate $400, to comply with legal requirements.

A THIRTY-THREE-OUNCE nugget picked up near Randsburg, Kern Co., by Thos. Gaggers last Tuesday has greatly excited Mojave residents, most of the residents having gone to look for another like it.

WERE California to do as Utah—charge fifty cents per $1000 as a fee for filing the incorporation papers—some of the organizers of the ten-million-dollar mining companies might capitalize at lower figures.

AFTER next Saturday the field or union of the national flag will consist of forty-five stars, in six rows, the first, third and fifth rows to have eight stars and the second, fourth and sixth rows seven stars each.

THE handsomest production received this week is from Leo Von Rosenberg, 35 Broadway, N. Y., a superbly illustrated description of the property of the Gold Coin Mines Co. at Central City, Colorado.

THIS issue closes volume seventy-two of this paper. Ordinarily a volume of the MINING AND SCIENTIFIC PRESS contains 416 pages. The volume of which this is the 26th and last number contains 540 pages.

CONSIDERABLE is at present being said and sung as to whether shares in a mining company should be assessable or not. The strength of the argument appears to lie with the affirmative side of the proposition.

THE prospect of the next four months of political turmoil and unrest does not disturb the gold mining industry—probably the only industry in the country that is unaffected by the party dust of the presidental campaign.

THE case of the Government vs. the North Bloomfield Hydraulic M. Co. is still before the U. S. District Court in this city; no conclusion has been reached. It is, practically, a test of the constitutionality of the Caminetti law.

THE Golden Scepter Mining Co., at Quigley, Montana, already has a pay-roll of $50,000: it is such enterprises as that that are the backbone of the nation's life in these days of dullness in all other industries but that of mining.

AT Leadville, Colorado, last Saturday, 800 miners struck because the mine owners would not pay $3 per day. They have been paying $2.50 per day, and claim that at the present price of silver, which is a Leadville product, they can pay no more.

THE Fellowcraft, once known as the Bode mine, near Angels, Cal., is sold to P. L. Hobb and A. J. Weatherhead of Cleveland, O., who will sink a shaft 1000 feet. They have already bought a 10-stamp mill, air compressor and electric-light plant.

NEVADA COUNTY men say that the recent purchase of the old Caillot sulphuret works by the Selby Smelting Co. for $5000 will net the purchasers a large profit when everything on the place is made to yield up the gold with which it is impregnated.

THE creditors of the Lady Emma Mine Co., El Dorado county, have assigned their claims to H. S. Morey, who has attached the plant. The company had the mine bonded, and the owners disclaim any responsibility for debt as to the property itself.

RAINY LAKE, Minnesota, papers claim that there will be 200 stamps in that country by August 1st. The Mines Contracting Company of London has prospectors in that section and has in a measure abandoned the system of bonding locations, now buying outright.

J. J. L. VALENTINE, foreman of the Leland Stanford group of mines, Groom creek, Arizona, on the 17th inst. descended a shaft in which two shots had just been fired. As he did not reappear, the men went down, where they found him dead, having been overcome by powder smoke.

THE index to the contents of the latest volume of this paper, published on the last pages of this issue, gives a good idea of the varied values of its issues for the past six months. Thousands keep this paper for permanent reference, and it is for their use and convenience that the index is semi-annually prepared.

THE burden of proof is on the claim jumper; he must show that the $100 work or improvements was not done, and the absence of any absolute rule of determination in those matters makes it frequently difficult for the individual who tries to wrest a claim from its original owner to substantiate his assertion.

MOST assuredly the California Miners' Association will hold its annual convention in this city next fall. It is neither dead nor sleeping. Its work is just begun, there is considerable for it to do, and it is none too soon to begin contemplation of how best to secure further success and wisely administer its affairs.

SOME of the more promising copper properties at Copperopolis, Cal., owned by the Fisher Ames estate, Boston, Mass., are to be given renewed attention. Next to gold, copper is in greatest present favor, and the wonder is that that productive property in Calaveras Co. has been so long allowed to remain idle.

COL. J. W. DONNELLAN, President Salt Lake, Utah, Mining Exchange, has returned from a visit to this State, and in the *Tribune* expresses his surprise that the immense gold wealth of California has not received greater attention and development, and thinks that the State's output of gold in '96 will largely exceed last year's aggregate.

THE United States mint at Philadelphia is experimenting on the adaptability of pure nickel, aluminum, and other metals for use in the minor coinage of the United Sates. It is possible that in the event of pure nickel being found superior to the alloy now used for the 5-cent piece an effort may be made to have its exclusive use authorized for the minor coinage of the country.

"CONCENTRATES" is asked why or how is the "½" vote used in the national conventions. Sometimes, when there are two contesting delegations from a State, a compromise is effected by the committee admitting both delegations, each member to have half a vote. Should that State delegation fail to vote solid on any proposition, a "½" would appear in the total.

The deepest vertical mining shaft in the world is the 6-compartment 14x22½ Red Jacket shaft of the Calumet-Hecla, Mich.—4914 feet. The shaft at the Kennedy mine, Amador Co., this State, is about 2200 feet deep. Several Nevada Co. mines are deeper than the Kennedy shaft. The Geyser mine at Silver Cliff, Col., has probably the deepest shaft of any in that State—2100 feet.

AN employe of the Golden Cross M. & M. Co., Hedges, San Diego Co., reports a temperature of 126 degrees last week. That sounds terribly torrid, and would be fatal to many in a humid climate. But in that locality 126 degrees implies about the same relative discomfort as 75 degrees in San Francisco. He adds that the company pays $525 per month for water, which seems reasonably dear.

THE first report of gold output from the Witwatersrandt, South Africa, district was in '87, when there was a total yield of gold reported for that year of 23,155 ounces. A steady annual increase was noted, the highest yield being in '95—2,277,685 ounces. The largest monthly yield was in August, '94—203,573 ounces. The yield for the first four months of '96 aggregates 663,566 ounces.

BUTTE, MONTANA, thinks it possible the Rothschilds may now close down the big copper mines there, in which they have so large an interest. Such action is very unlikely, as they do not yet own a controlling interest of the stock; the present demand for copper is fully up to the supply; great as is the output of the big Montana copper property, there are other producers that prevent its action from being a controlling feature in the world's price for copper.

MUCH reflection thereon causes the Clancy, Montana, *Miner* to believe that: "The mining business is unlike any other business on earth. A prospect ambles along through its different stages of development, and during these stages it generally changes hands two or three times. Some men could not make a mine pay if its footwall was the Philadelphia mint and its hanging-wall the United States Treasury, while other men would squeeze bullion out of grindstones."

NOTHING was done definitely at the recent session of Congress toward arranging for the classification of mineral lands in Oregon. Congressman Hermann and Senator McBride, with honest intent, introduced bills creating a mineral land commission. Senator Mitchell succeeded in having an amendment injected into the California mineral land bill including Oregon in its provisions, which defeated the California bill, so far as the first session of the 54th Congress was concerned.

AT the Golden Cross mine, at Hedges, Cal., which has the largest number of stamps under one roof in the State, W. W. Stewart, of San Diego, is receiver at a salary of $8,000 per annum. About 175 men are employed. The present debt of the company is reported to be $150,000, and it is thought that sufficient can be taken out of the mine this year to pay that in full. The property is considered an excellent one, and the cost of mining and milling the ore is stated to be but $1.50 per ton.

SEATTLE men claim to have discovered a 60-ft. ledge of graphite on the British Columbia coast, and talk of organizing a company to make pencils thereof. 'Twill also make stove polish, paint, crucibles and lubricant, but is not worth $1200 per ton as they claim. About 30,000,000 lbs. are annually imported, chiefly from Ceylon and Austria, the best quality being worth about five cents per lb. It is found in two or three localities in this State, but not in sufficient quantity to be of commercial value.

IN the case of Castle vs. Womble, Stockton district, the Secretary of the Interior decides: "That a mineral discovery, sufficient to warrant the location of a mining claim, may be regarded as proven, where mineral is found, and the evidence shows that a person of ordinary prudence would be justified in the further expenditure of his labor and means, with a reasonable prospect of success in developing a valuable mine." In Smuggler Mining Company et al. vs. Trueworthy Lode Claim et al. he decided that: "A protestant, who alleges no surface conflict, is not entitled to be heard on appeal before the department. An adverse relocation, made during the pendency of an order holding the original claim for cancellation, gives the relocator no standing to be heard as against the right of the claimant."

THE Tenares mine, Durango, Mexico, has been worked for nearly 300 years. The official records show that it has produced over $20,000,000. It has been worked to a depth of about 700 feet and a mile in length, in the most primitive way. Today the Mexican miners carry on their mining, where permitted, by underhand stoping, and carry rock and ore to the surface on their backs, using a ladder made of a single-notched pole. They can carry about 200 pounds. The mines are perfectly dry and the rock hard.

THE U. S. Debris Commission last Monday issued their last hydraulic permit for this fiscal year, granting permission to the Lone Star Mining Company to resume hydraulic mining in Plumas county, work having been suspended on account of a break in the company's restraining dam. Since the organization of the Commission there have been 223 applications made, and 166 granted. For some months the Commission has been straitened for funds, but after next Wednesday the appropriation of $15,000 will be available.

WHETHER one wants to hold his claim or sell it, it is best, whenever practicable, to get a United States patent for it. Once that is secured, it is unnecessary to do any further annual assessment work on it. In case it is desired to sell it, the possession of a United States patent is second only, in the eyes of the purchaser, to the value of the claim itself. In any event it stops probability of litigation, and every miner knows that where not so protected the discovery of unusual value in a claim is nearly always the signal for vexatious lawsuits.

SECTION 11 of Arizona's new mining law says: "The relocation of forfeited or abandoned lode claims shall only be made by sinking a new discovery shaft and fixing new boundaries, in the same manner and to same extent as is required in making a new location; or the relocator may sink the original discovery shaft 10 feet deeper than it was at date of commencement of such relocation, and shall erect new or make the old monuments the same as originally required. In either case a new location monument shall be erected, and the location certificate shall state if the whole or any part of the new location is located as abandoned property."

UNLIKE silver properties, copper mines are not directly affected by the continued effort of England to dictate and control the financial policy of the United States. English and French capitalists recognize the consequent value of American copper properties, which with them constitute a favorite form of investment. Close upon the announcement of the sale by the Hearst estate of a big block of Butte, Montana, copper stock to the Rothschilds, comes a statement that the United States copper mines at Jerome, Arizona, owned by W. A. Clark, of Montana, have been sold to a French syndicate for $5,000,000. It is reported that the purchasers propose closing down to reduce the country's output.

DREDGING is a form of river mining now receiving considerable attention. On the Colorado river, about fifteen miles above Yuma, Arizona, dredging machinery has been anchored on two large flatboats and a system of sluices is placed on others. The debris from the bottom of the river is scooped up and run through the sluices, which are placed a little below the surface of the stream. The Distlehorst Bros. have been operating dredgers on the upper Sacramento river, this State, for two years with very satisfactory result, and the same plan is to be tried this season on an extensive scale on the Klamath. A California company is also putting in a big plant to dredge on the upper Frazer, B. C.

THE Merced Gold Mining Company furnishes a statement of its Mariposa county operations during May. There were treated 2,280 tons of ore, yielding in gold $5,100, and 20 tons of sulphurets, assaying $79.55 per ton—a value of $2.93 net per ton to the ore. The March returns showed a value of $3 per ton; April, $4.59—an average of $3.50 per ton for the three months. The Homestake mine makes big profit on $2.75 ore; the Treadwell mine declares regular dividends on ore running from $2.50 to $3.50 per ton; another mine at San Andreas, Calaveras county, pays on an ore value of $3 per ton. The Spanish mine, Nevada county, paid on an ore value of 91 cents per ton.

THERE are several "Pioneer" Gold Mining Companies in California. One of them has created considerable recent comment in Boston, where its stock has been the subject of speculation. In the early part of the year a Boston brokerage firm agreed to buy the property for $150,000, a commission of 20,000 shares of stock to be allowed certain mining experts, one of whom is said to have parted with 10,000 shares. The purchasers subsequently decided to attempt abrogation of that part of the agreement, and secure title from the owners direct. The stock fluctuated from 10⅞ to 5¾; suits were begun, and some mutual dissatisfaction displayed, the latest result being that a compromise is effected, whereby T. M. Brazell and Hugh McDonald of this city get $8,500 each. The price paid for the mine is reported to be $150,000; it was capitalized at $1,000,000.

JUDGE LAMOUREUX, Commissioner of the General Land Office, was here this week. He came from Washington via Montana. It would be unjust to assume that he came to California to get instructions from his owners at short range, for a Federal official is supposed to be superior to such influence. His indecent haste in complying with corporate wishes, and refusal to recognize the plainest dictates of justice in the matter of the claims of the mineral land committee of the California Miners' Association, would, however, go far to justify the assumption that his case is an exception to the ordinary honorable rule. He, his superior, Secretary of the Interior Smith, and Speaker of the House Reed constituted a triumvirate that, officially intrenched, successfully thwarted all efforts to prevent corporate absorption of the mineral area of the State. The official has forfeited any claim to the respect of self-respecting men.

RECENT reports that the usual "English syndicate" had bought the Mariposa grant for $10,000,000 have now given place to a statement that the owners of that great property are about to develop it themselves. Senator Jones of Nevada, Alvinza Hayward, the Hobart Estate and Jno. W. Mackay own the grant, are all experienced mine operators with unlimited capital, and if they go in with the vim and vigor displayed in other great mining enterprises in which they are interested will wake up that long-neglected county. Mariposa county has long suffered from that grant. It has been erroneously supposed that the grant was all there is of the county; there are good mines inside and outside the limits of the grant, but that vast idle property has been an obstacle in the way of proper development of Mariposa's gold resources for the last forty years. It comprises about 49,000 acres, considerable of which is considered good mining ground. It will be a great day for Mariposa's mining industry when the work of development of that ground begins.

# Scientific Progress.

## The Modern Theory of Light.

NUMBER III.

By PROF. OLIVER J. LODGE.

Light is an electro-magnetic disturbance of the ether. Optics is a branch of electricity. Outstanding problems in optics are being rapidly solved, now that we have the means of definitely exciting light with a full perception of what we are doing and of the precise mode of its vibration.

It remains to find out how to shorten down the waves—to hurry up the vibration until the light becoms visible. Nothing is wanted but quicker modes of vibration. Smaller oscillators must be used—very much smaller oscillators not much bigger than molecules. In all probability (one may almost say certainly) ordinary light is the result of electric oscillation in the molecules of hot bodies, or sometimes of bodies not hot, as in the phenomenon of phosphorescence.

The direct generation of visible light by electric means, so soon as we have learnt how to attain the necessary frequency of vibration, will have most important practical consequences.

Our present methods of making artificial light are both wasteful and ineffective. We want a certain range of oscillation, between 800 and 400 billion vibrations per second; no other is useful to us, because no other has any effect on our retina; but we do not know how to produce vibrations of this rate. We can produce a definite vibration of one or two hundred or thousand per second; in other words, we can excite a pure tone of definite pitch, and we can command any desired range of such tones continuously by means of bellows and a keyboard. We can also (though the fact is less well known) excite momentarily definite etherial vibrations of some million per second, as I have explained at length; but we do not at present seem to know how to maintain this rate quite continuously. To get much faster rates of vibration than this we have to fall back upon atoms. We know how to make atoms vibrate; it is by what we call "heating" the substance, and if we could deal with individual atoms unhampered by others, it is possible that we might get a pure and simple mode of vibration from them. It is possible, but unlikely; for atoms, even when isolated, have a multitude of modes of vibration special to themselves, of which only a few are of practical use to us, and we do not know how to excite some without also the others. However, we do not at present ever deal with individual atoms; we treat them crowded together in a compact mass, so that their modes of vibration are really infinite.

We take a lump of matter, say a carbon filament or a piece of quicklime, and by raising its temperature we impress upon its atoms higher and higher modes of vibration, not transmuting the lower into the higher, but superposing the higher upon the lower, until at length we get such rates of vibration as our retina is constructed for, and we are satisfied. But how wasteful and indirect and empirical is the process. We want a small range of rapid vibrations, and we know no better than to make the whole series leading up to them. It is as though, in order to sound some little shrill octave of pipes in an organ, we were obliged to depress every key and every pedal, and to blow a young hurricane.

I have purposely selected as examples the most perfect methods of obtaining artificial light, wherein the waste radiation is only useless, and not noxious. But the old-fashioned plan was cruder even than this; it consisted simply in setting something burning, whereby not the fuel but the air was consumed, whereby also a most powerful radiation was produced, in the waste waves of which we were content to sit stewing, for the sake of the minute, almost infinitesimal fraction of it which enabled us to see.

Everyone knows now, however, that combustion is not a pleasant or healthy mode of obtaining light; but everybody does not realize that neither is incandescence a satisfactory and unwasteful method which is likely to be practiced for more than a few decades, or perhaps a century.

Look at the furnaces and boilers of a great steam-engine driving a group of dynamos and estimate the energy expended, and then look at the incandescent filaments of the lamps excited by them, and estimate how much of their radiated energy is of real service to the eye. It will be as the energy of a pitch-pipe to an entire orchestra.

It is not too much to say that a boy turning a handle could, if his energy were properly directed, produce quite as much real light as is produced by all this mass of mechanism and consumption of material. There might perhaps be something contrary to the laws of nature in thus hoping to get and utilize some specific kind of radiation without the rest, but Lord Rayleigh has shown in a short communication to the British Association that it is not so, and that therefore we have a right to try to do it.

We do not yet know how, it is true, but it is one of the things we have got to learn.

Any one looking at a common glow-worm must be struck with the fact that not by ordinary combustion, nor yet on the steam-engine and dynamo principle, is that easy light produced. Very little waste radiation is there from phosphorescent things in general. Light of the kind able to affect the retina is directly emmitted; and for this, for even a large supply of this, a modicum of energy suffices.

Solar radiation consists of waves of all sizes, it is true; but then solar radiation has innumerable things to do besides making things visible. The whole of its energy is useful. In artifical lighting nothing but light is desired; when heat is wanted it is far best obtained separately by combustion.

---

THE paradoxical discovery that the speed of a sailing vessel may be increased by perforating its sails is claimed by Capt. Vasallo, an Italian mariner. He supposes that the fixed cushion of air filling up the hollow of an inflated sail lessens the effect of the wind, and he has sought to prevent the collecting of this cushion by making a number of holes in the canvas. Several trials, made in all weathers, have given surprising results. In a light wind a vessel made 4 knots with ordinary sails, and 5 knots with perforated sails; in a fresh breeze, 7 and 8¾ knots respectively, and in a strong wind, 8 and 10 knots. The ship's value would be increased one-fifth—its trips of five weeks being reduced to four weeks—if the increased speed can be sustained throughout a long voyage.

---

THE following simple formula will purify ordinary water, especially in reservoirs and filtering basins: Calcium permanganate, one part, aluminum sulphate, ten parts; fine clay, thirty parts. These are thoroughly mixed and one part is added to about 10,000 parts of water. It is said that even sewer drainage is almost completely purified by this mixture. It precipitates all of the impurities and living organisms, and the clear portion may be drawn off and used with perfect safety.

---

AN unfinished invention left by John Ericsson, when he died, was a mechanism for developing power from solar heat. The idea appears to have been taken up again, as a corporation, to be known as the New England Sun Power Company, has been organized in Portland, Maine, with a capital of $6,000,000, to utilize this kind of heat on a large scale.

---

BLEUNARD finds that the X rays do not penetrate certain chemical substances, among which is potassium bromide. He has written a letter in an ink containing potassium bromide, and on placing this letter in an envelope by means of the X ray has obtained a perfect and legible reproduction upon a photographic plate.

# Mechanical Progress.

## New Hoisting Machinery.

The mines of the Anaconda Copper Mining Co., in Montana, have produced in fifteen years 400,000 tons of fine copper, with considerable silver and gold, the operations being now 1200 feet deep. In the same period, says John Birkenbine, over 580,000 gross tons of copper were obtained from the Lake Superior mines, but the present output of copper from the Lake region is less than that of Montana. To illustrate the class of machinery at the Calumet and Hecla copper mines, the dimensions of one pair of quadruple expansion engines may be given. Each engine has its four cylinders, 18 inches, 27¾ inches, 48 inches and 90 inches in diameter, with a stroke of 60 inches, driving through gearing, conical hoisting drums, 14 feet to 24 feet in diameter, and 12 feet wide, which lift cages carrying six tons of ore at the rate of a mile in one and one-half minutes. At the Tamarack mine an average hoisting speed of 3200 feet per minute has been obtained by a direct-acting engine, having 42x84-inch steam cylinders, driving hoisting drums 30 feet in diameter. At the same mine a 32x84-inch engine operating a double-cone drum 13 feet 6 inches to 36 feet diameter, lifts a cage carrying two and one-half to three tons 4500 feet in one and one-half minutes. These are vertical shafts. At the Quincy mine there are two principal shafts. No. 6, on a slope 51 deg. 44 min., has a total depth of 3680 feet, the weight of the loads hoisted being about six tons. No. 2 shaft, with the same average dip, has a total depth on the slope of 3954 feet, the loads hoisted weighing about ten tons each. The governors of the hoisting engines are set so that the maximum speed does not exceed 3000 feet per minute. Other important mines in the copper region could add points of interest in the extent of underground workings, machinery equipment, concentrating plant, including pumping machinery of great capacity, refining works, or even in the handling and distribution of the refuse slimes.

As an instance of the economic results achieved in this district the Atlantic mine may be mentioned, which obtains the copper-bearing rock at an average depth of 1800 feet below the surface. The rock is mined out with explosives, sent to the surface, crushed, hand-sorted, carried to concentrating mill, passed through stamps to jigs and slime tables, the concentrate is finally conveyed to a smelting works, and the entire operation was carried on with a profit, although the ore yielded but three-fourths of one per cent of copper, and but 10 cents per pound was obtained from the refined metal. In other words, the operation of this mine was successful and profitable when the company received but $1.70 for each ton of "pay-rock" which was mined, crushed, pulverized, concentrated, and the metal refined.

As indicating what has been accomplished in the copper district, the operations of the Quincy Mining Company may be quoted. On a paid-in capital of $200,000, dividends of $7,670,000 had had been paid to the close of 1895, the total expenditures having exceeded $20,000,000. During the year 1895 the average force employed was 968 men, of whom 336 were miners, earning an average of $50 each per month; 563,560 tons of rock were mined, from which 16,304,721 pounds of copper were obtained. Still larger figures could be used to indicate the operation of several other mines.

Near Thunder Cape, 1300 feet above the lake and three-fourths of a mile from the Canadian shore of Lake Superior, is Silver Islet, originally a mass of rock 90x90 feet, which projected a few feet above the lake surface, but which has been docked and cribbed until three acres are enclosed, to accommodate the shaft-house, shops and miners—barracks for operating the mine, from which $3,000,000 in silver has been obtained. Operations were continued to a depth of 640 feet, and extended horizontally 500 feet under Lake Superior. While the enterprise (owing to the expense of mining the limited amount of ore) cannot be considered as having been successful, its engineering features are worthy of recognition.

Most of the silver sent from the Lake Superior region occurs in a native state in connection with copper on the Keweenaw peninsula. Gold mining has been carried to a depth of 850 feet near Ishpeming, Mich.

---

## Improvements in Free Milling Practice.

The successful working of all low-grade free-milling propositions, says H. M. Chance in the *Engineering Magazine*, depends mainly upon the ability of the mill to crush a certain quantity per stamp per day. On ore not requiring crushing finer than to a 30 mesh the output per stamp ranges from 2½ to 5 tons per day, the most successful mills passing from 3 to 4 tons per stamp every 24 hours.

Crushing to 30 or 40 mesh will rarely give as high a percentage of extraction (by simple amalgamation) as crushing to 50 or 60 mesh, and the size to which a free-milling ore should be crushed to yield the largest profit—not the largest gross returns—must be determined separately for each ore. As an example illustrating this problem, we may assume an ore which contains $4 per ton of gold yielding to plain amalgamation, of which 75, 85, 90 or 95 per cent may be recovered by milling to 30, 40, 50 or 60 mesh respectively; a mill of 50 stamps putting through 4, 3, 2½ or 2 tons per day, according to the mesh used, at a cost of $120 per day total milling expenses; and a mining cost respectively of $1.50, $1.60, $1.70 and $1.75 per ton for 200, 150, 125 or 100 tons daily output—the problem being to determine to what mesh the ore should be stamped.

Reducing the assumed data to tabular form, it appears that when crushing to 30 or 40 mesh with only 75 or 85 per cent saved, the profit per ton would be greater than when crushing to 60 mesh with a recovery of 95 per cent of the free-milling gold. It might possibly be better policy to crush to 40 mesh with a daily profit of $150 (saving 50 tons of ore for future work) than to crush to 30 mesh and obtain a profit of $180 per day, the problem, under such conditions, being resolved into a question of whether the present value of 50 tons of ore left in the ground for future use is more or less than thirty dollars. The principle here illustrated has been the keynote to American free-milling practice, involving the pushing of mine, mill, and management to their greatest earning capacity, with large quantities handled at low cost, correspondingly large aggregate profits, and correspondingly large losses in the tailings. This practice has been carried to the limit, some mills running through a 20-30 mesh as much as 5 or 6 tons of ore per day. American milling practice is thus quite in harmony with modern management at large industrial works, where the "intensive" theory of production is applied by working every machine to its greatest capacity, regardless of ordinary wear and tear.

The large capacity attained in present free-milling practice is due partly to the use of narrow mortars and a rapid short drop of the stamp, and partly to the relative larger portion of the work now done by the rock crushers, and is finally made possible by the use of rather large mesh screens; successful amalgamation of the gold under such conditions can be traced to the narrow mortar, with moderately high discharge and the use of inside plates.

The construction and method of operation gives every particle of ore small enough to pass through the screens an opportunity of quickly escaping, while with wide mortars and high discharge, such particles may remain in the mill until repeatedly caught below the stamps and reduced to powder. This construction is also well fitted for working certain special classes of ore, notably those requiring concentration, in which

the subsequent treatment is made troublesome by excessive sliming, and to which it may readily be adapted by lowering the discharge and lessening the height of drop; even when very fine crushing is required, the narrow mortar, with moderately high discharge and short rapid drop of stamps is capable of doing good work.

# Electrical Progress.

### Electricity in Railroad Work.

Discussing this subject, Dr. Louis Duncan sums up that speeds as high as 120 or 150 miles could be made without increasing the power to an impossible amount, provided the train is of a proper shape. The form of electric machinery allows the builder to dispose weights near the track, and so allows higher speeds to be safely used than could be allowed with the present type of equipment. The rotary motion of the armatures is much more advantageous than the reciprocating motion of the piston, and the wear on track and bridges would be much less. Up to the present rotary field alternating motors have been used only experimentally, but the experiments have been promising, and the characteristics of the machines fit the requirements of the traffic. Such motors are most efficient for the constant speeds, while their construction and regulation are of ideal simplicity. Besides this, the multiphase alternating system is peculiarly adapted to long-distance transmission. The great plant at Niagara, which is in successful operation, and from which it is proposed to transmit power over long distances, is a multiphase plant. The system allows us to use any voltage we wish on the line, and the problem which has not yet been attacked—the collecting of the current at these speeds—is helped by this fact.

The first road that may, to a certain extent, fulfill the conditions of an electric express road is now being built between Baltimore and Washington, and its operation will solve many of the questions which come up in the higher speed work, such as the type of car that may be used, the mounting of the motors, etc.

It is only between crowded centers of population that such roads can be made to pay. Between Washington and New York, New York and Boston, and possibly between New York and Chicago, they might be constructed at present; but, as the distances increase, the demands for the comforts of trains like the Chicago limited work against the condition of light trains. On long trips one is accustomed to dining and sleeping cars, to observation and smoking cars, and trainmen cannot provide all these on an electric train run at 100 or 120 miles an hour. The safety of such a service should be equal to the present system. With a perfectly clear track for express trains, with simple machinery that permits a low center of gravity, with less strain on the roadbed due to the rotary motion employed, with a perfect track construction and the definite block sytem that electricity permits, the service could be absolutely safe. The comfort of the passengers would depend on the construction of the track and of the cars. Such a system offers a service frequent, rapid, comfortable and safe, and there is no problem involved which our present knowledge of electric traction and transmission will not enable us to solve successfully.

### The Collet and Engelhard Electric Drilling Machine.

A movable drilling machine has always been a long felt want in machine shops, boiler works, etc. All the machines of this kind that have been produced so far had to be stationary on account of their weight, while those which receive their power from an independent motor, could not always be connected conveniently with this motor. In the electric drilling machine constructed by Collet and Engelhard, of Offenbach, Germany, the problem is solved and all the mobility desired is obtained by it. The motor is placed upon a small two-wheeled truck of solid construction, which also carries a current interrupter (cut-out) and the armature for the drill. The motor shaft drives a second shaft, which transmits the motion to the drill. As it is not always possible to reach the place where the work is to be done with the truck the motor can be suspended by a hook. By a special arrangement the rapidity of the drill can be modified according to the diameter of the holes to be drilled. The apparatus is provided with a spool of wire of about 30 feet in length and a cut-out which permits the connection of the motor with the electric light conduits. The motors are constructed to work with a tension of 65 or 110 volts. The shaft makes 13 revolutions per minute and the motive power developed is superior to that of one horse power. The transmission shafts are provided with universal joints and can be moved freely in all directions, and they can be lengthened from 50 to 80 inches. The shafts are of steel, the joints of phosphorus bronze. The weight of the motor is 450 pounds.—L'Industrie.

### A Large Shipment of Electrical Apparatus.

One of the largest single shipments of electrical apparatus was shipped last week by the Westinghouse Electric and Manufacturing Company to Great Falls, Montana. The shipment filled eight freight cars, and the freight of that cargo to its destination amounts to $8000.

The machinery will be used by the Boston & Montana Consolidated Copper and Silver Mining Company in the refining of copper and silver, and is believed to be the largest machinery of its kind ever constructed for electrical refining purposes. The Boston & Montana Company is one of the largest copper mining concerns in the world.

Until a few years ago the copper produced there was not refined, but the copper matte was sent East—some of it to England—and then refined. Since the introduction of electricity into the refining process the companies are in a position to compete with the East.

The Anaconda Mining Company purchased from the Westinghouse some time ago seven 360-horse power generators of an output of 3600 amperes each at 75 volts. Since these machines have been in operation the electrical process of refining has proved a great success. The machinery of the Boston Company will be driven by turbines from the waters of Great Falls.

The generators will be directly connected with the turbines. There are two of them, the largest ever made—each one of 1100-horse power—at an output of 4500 amperes and 180 volts. These machines are shipped in four freight cars, while the others are filled with the detail apparatus, such as switchboard appliances, etc.

C. D. HASKINS has invented a novel target-seeking torpedo. The torpedo travels until it comes within the magnetic range of the ship which it is intended to destroy. A delicate needle attachment is then deflected towards the steel vessel which causes the rudder to be so set that the torpedo travels at great speed towards its destination. Experiments have shown that the torpedo makes not less than 30 miles an hour, and that rough seas, ground swells and violent winds have little effect upon preventing its deadly arrival.

THE success of the long distance power and light transmissions in this State has directed renewed attention to future possibilities in that direction. The inaccessibility of many mountain mines, and the fact that the water flowing downward can be made the means of sending electrical power to those isolated properties, means much to the mining industry of California.

THE recent New York electrical exposition netted a profit of $20,000 to the projectors.

# Practical Information.

### Comparative Cost of Labor.

It will no doubt seem strange to many, says the *American Machinist*, that a machine, the labor cost of which is probably considerably more than nine-tenths of its cost, should be built within about two miles of this office in Brooklyn for considerably less than the same machine could possibly be built for in Germany, the reputed home and source of cheap labor.

Yet this seems to be the case with the Mergenthaler linotype machine. The company which builds it has a factory in Brooklyn, and until recently had an interest in a factory in Germany, where identically the same machine was built, and largely by the same fixtures, tools and system of manufacture. Labor in the German factory was about 40 per cent cheaper than in Brooklyn, but the Brooklyn factory produced the machines at a lower cost in dollars and cents, our authority for the statement being the president of the company.

The firm of Henry R. Worthington is said to have become satisfied that the smaller and medium-sized pumps can be manufactured at lower cost in its Brooklyn factory shops than in England, where its larger pumping engines for European trade are built, on account chiefly of relatively higher cost of material in large pumps and difficulties of transportation.

It is said that the Singer Manufacturing Company manufactures sewing machines in its Elizabethport, N. J., factory at lower cost than in its Glasgow factory, and Mr. Mandon, the French engineer who recently visited this country, told us of several instances in which exact duplicates of well-known American tools had been made in Paris, but could not be sold there as cheaply as the genuine American tools could be, notwithstanding excessive cost of carriage and the French import duty. One of the machines thus specified by him was the Gisbolt tool grinder.

Other proof is not wanting that at least some American machine shops turn out work at lower cost than the same work can be made for in any other country. The facts are cited as proof that, within reason, the highest paid labor is cheapest when employed in machine construction.

### Chromate for Preventing Boiler Incrustation.

A. Rubricius, an Austrian chemist, recommends a new method for the prevention or removal of boiler incrustation which has furnished remarkably good results since about one year that it has been in use at Anina and other localities in Austria-Hungary. To the feed water there is added a mixture consisting of 90 per cent of soluble chromates and 10 per cent of soda. These salts transform the more or less soluble carbonates contained by the water into soluble chromates which settle in the shape of slime without adhering to the walls of the boiler and the latter can easily be cleaned by washing.

The beneficial effect of the process will be felt even in the case of boilers which are already lined with thick layers of incrustation, for these will be gradually reduced and transformed into slime. On an average one-tenth of an ounce of the mixture should be added to 35 cubic feet of water. For an ordinary boiler three to four ounces per day would be sufficient. Where water with very high lime contents is being used, the dose should be increased a little; the exact quantity needed can easily be determined by a preliminary test.—Oesterr. Zeitschr. f. Berg und Huettenwesen.

ETCHING WOOD may be accomplished by coating the surface first with nitric acid and then with hydrochloric acid, which causes the wood to soften to the depth of about two millimeters. When both the acids are used together the wood becoms white, while if only nitric acid is used the part coated becomes blackened. In order to prevent the etch from running the other parts are treated previously with a thick alcohol lacquer, or with liquid wax or a mixture of two parts white wax, two parts mastic and one part asphalt, which are melted together and stirred intimately and then poured upon the places which are to be untouched.

### The Country's Growth.

In 1800 only the country between the Atlantic and the Mississippi belonged to the United States. Since that, the Louisiana purchase in 1803, the Florida, in 1821, the Mexican acquisitions, in 1840, 1850 and 1853 and Alaska in 1867 have been added. The increase, including Alaska, has been from 827,844 to 3,025,600 square miles, but the growth of population has been from 5,308,483 to 62,622,250, or nearly twelvefold. In 1800 the inhabitants were a little less than seven to a square mile (in 1790 they had been less than five, in 1890 they were over twenty-one.)

The place where the population is densest is the District of Columbia, which has 3839 to the mile, the next is Rhode Island 318, then Massachusetts 278, then New Jersey 193, Connecticut 154, New York 125, Pennsylvania 116, Maryland 105. The other States and Territories run below 100, down to Montana, Wyoming, Arizona, Nevada, which have less than one inhabitant to the mile.

The census commissioner notes that in Rhode Island and Massachusetts the density of population is as great as in many of the most densely settled European States, and that the entire North Atlantic division, pre-eminently the manufacturing section, has an average of over 100 inhabitants to the square mile. But it may be a surprise to some that among the old States Maine has only 22, New Hampshire 41, Vermont 26.—Philadelphia Paper.

### The Russian Face-Bath.

The principle of the Russian bath for the face is to bathe it with such hot water that it will make one jump every time it is applied, and then, a minute later, to bathe it with cold water. The reaction which this causes in the blood will cause the skin to glow and tingle with warmth. Then it should be wiped dry with a towel. Day by day the skin will grow firmer, and the wrinkles will gradually disappear. The use of hot and cold water for the face is important in many ways. Hard, cold water will not remove the grease and dirt which settles in the pores of the skin, but if hot water be used first, and then cold, the dirt will be removed and the skin strengthened. Dirt, grit, and grease will settle in the skin when the face is washed only with hard, cold water and soap, and this alone, in time, injures the color and softness of it. One should never bathe the face in hard water if a fair complexion is desired. The water should be softened with a little borax, or a few drops of ammonia. When the face is very hot it should not be bathed. Wait until it cools off a little. — Household Companion.

A FRENCH chemist makes a new kind of candle by dissolving five parts of colorless gelatine in twenty parts of water, add twenty-five parts of glycerine and heating until a perfectly clear solution has been formed. To this is added two parts of tannin dissolved by heating in ten parts of glycerine. A turbidity is produced which should vanish on further boiling. The boiling is continued until the water has been driven off. The mass is then cast into ordinary glass candle-molds. The candles obtained in this way are as clear as water and burn quietly, and without spreading any odor. The idea is a good one and well worth following up as it is not impossible that a number of other substances might be worked into candles of this kind.

# Mining Summary.

## CALIFORNIA.

### Amador.

*Record*: A. B. McLaughlin, above Volcano, at the Iron Mass mine, reports crushing ore at the Acme mill. The previous crushing paid $30 per ton. The shaft is down 200 feet and the owners contemplate putting up a new hoist. The vein runs from four to six feet in width.

*Record*: One hundred tons of ore are to be hauled from the Pine Vetta to the Ione depot for shipment to Selby's.

At the Anita the shaft is down 420 feet in hard granite. The company intends to continue another 100 feet by day labor.

At the Contention, formerly known as the Belden, the shaft has been enlarged to a double compartment to its present depth, about 200 feet, and will be sunk to a depth of 500 feet.

Ten additional men were put to work at the Union Consolidated mine this week.

The shaft of the Argonaut has encountered the slate, and preparations are being made for a station.

### Butte.

The Billingsly claim at Brush Creek is being worked by fifteen miners. A large flume will be put in and the mine worked by the pump system.

Fifty men are now employed in the Magalia or old Pershbacker mine, more will be put on when the pumps clear the water out of the old claim.

### Calaveras.

In the vicinity of Copperopolis, at the Dora mine, Pine Log group, Salt Spring valley, the ore mills $60 to the ton. The shaft is down 90 feet.

At the Maggie May mine, formerly known as the Cape Horn, the owner, Mr. M. Kennedy, expects to put up a 5-stamp mill.

*Citizen*: Work has commenced on the Venus mine, at Campo Seco. E. A. Pennington of Denver, Col., and W. A. Silvia, of Montana, have bonded the Benson mine. At Central Hill the first work will be to pump out the old shaft.

The work of repairing the dam above the Donnellan mine was commenced during the week. When it is completed the mill will be started up on a ten days' run.

The Bisbee and McCormack hydraulic mine at Douglas Flat is showing up very favorably. The run will be unusually long this year, owing to the plentiful supply of water insured by the late snow in the mountains. A partial clean-up of seven boxes, after a three months' run, gave bullion to the amount of $3,500.

### El Dorado.

(Special Correspondence).—An old tunnel on the Eureka mine near Grizzly Flats has been put in working order 257 feet in length. Work on the shaft has gone to a depth of 25 feet. San Francisco people have bonded the property.

The shaft on the Big Sandy is steadily finding its way to greater depth, having reached 260 feet. The contract calls for 500 feet. The property belongs to people in Toledo, Ohio, and has been idle about three years. New hoisting and pumping machinery have been placed in position. There is a 10-stamp mill ready for operation. It is expected that ere many moons the entire plant will be running night and day. This is seven miles north of Placerville.

Roelke Bros. are running a tunnel to crosscut a ledge eight miles north of here. They are into the hill 335 feet.

Preparations are on foot to begin work on the Old Judge mine near Kelsey.

The Grand Victory have again struck a new ore body, this time on the 100 level crosscutting from vein one to three for 35 feet.

H. W. Hulbert, proprietor of the Georgetown *Gazette*, has bonded a patented quartz claim to Freeman and Bell of Auburn who will continue work on the 80-foot shafts and crosscuts. There are three ledges of low-grade ore averaging from 10 to 14 feet.

R. M. Mooer has bonded the Henrietta claim from the Roelke Bros.

N. G. Sturtevant & Son of Oakland have bonded the Mykel claim and begun tunnelling for the ledge.

A few men have been put to work sinking and crosscutting on the old shaft of the Marguerite. This property is under bond to D. H. Jackson.

Placerville, June 22nd, '96.

### Lassen.

At Hayden Hill, at the Golden Eagle mine, there are 300 tons of ore on the dump. The new mill being erected on the Brush Hill claim will soon be ready to commence crushing ore.

### Marin.

(Special Correspondence.) — The Golden Crown Mining & Milling Company is working a property discovered nine months ago on which is a shaft 112 feet with two tunnels 40 feet each way in a 3-foot vein of copper, gold and silver ore. One thousand tons are on the dump. A 28-foot overshot water wheel runs the pumps. There is another 3-foot vein 250 feet east of the former where at a depth of 50 feet ore is being taken out by a whim. Twelve men are employed. W. T. Grider is superintendent.

Bolinas, June 20, '96.

### Mariposa.

The quartz mill at the Vanderbilt mine, near Snow creek, was burned last week.

### Mono.

Sheriff Hayes last week attached the Mammoth mill to secure the payment of $2000 to J. S. Cain of Bodie.

### Napa.

The net earnings of the Etna quicksilver mine for the three months ending May 1st were $20,490. A dividend of $10,000 was paid on the 10th inst.

For the quarter ending June 1st the net earnings of the Napa Consolidated quicksilver mine were $22,043. The usual dividend of $10,000 and an extra one of the same amount will be paid on July 1st.

### Nevada.

Away down 5940 feet on one continuous shoot of gold ore is a long way underground, yet such is the fact in the Idaho-Maryland mine, which has produced nearly $30,000,000 of gold up to date. For the last year or two says the *Transcript*, the ore shoot has been acting about as it did on the 1100 level. Now things are getting into better shape and the old mine promises to soon resume its former productiveness. It is the deepest and longest continuous shoot of gold quartz ever worked in the world and promises to last for quite a while yet.

The *Union* reports a strike in the Pennsylvania mine at Grass Valley, where the men on the 600 level have found free gold ore.

### Placer.

(Special Correspondence).—At the present time the attention of capital is being given to the mines of this county to a greater extent than ever known before. There is nothing of a boom, but many sales are being made, old mines are being reopened, new ones being discovered, and developing is going on with a confidence in results to come such as has not been known before. All of this is being accomplished with very little surface stir. Mines are sold and important enterprises are inaugurated so quietly that even the attention of the local newspapers is not always attracted. A bare list of the new enterprises is instructive and significant of the growing magnitude of the mining industry.

The Hancock & Watson quartz mine, situated at Bath, idle for nearly a quarter of a century, is being reopened. This mine was the second quartz mine discovered in the county. It is on a large ledge, known to be rich in gold, having yielded over $50,000 from the early-day workings.

The Devil's Basin drift mine at Deadwood and several adjoining drift properties have been bought by a San Francisco company who will work these properties on an extensive scale. The Devil's Basin mine has been closed for twenty-five years, though of known richness, having yielded half a million dollars in the early-day workings.

The Drummond quartz mine, which has been shut down for three years, is being started up again under a new ownership. This mine yielded about $100,000 from upper workings but lack of capital has heretofore prevented the mine being opened at greater depth.

The Oro & Mountain View Consolidated drift mine near Iowa Hill is also being developed under changed ownership after being idle for several years.

The Horseshoe Bar Consolidated, a river-bed mine near Michigan Bluff, is another mine that has been closed for several years that is now being reopened with increased facilities for working. A ditch is being constructed which will bring water to the mine under 400 feet head to be utilized by a hydraulic elevator.

The Gold Blossom quartz mine at Ophir is being reopened by C. F. Reed, the owner, and the working shaft will be deepened 200 feet to prospect the mine in depth.

The winter's work at the Barton or Herrmann quartz mine on the Deadwood ridge has been so satisfactory in returns that the owners are buying all the adjoining land offered, acquiring with it many promising quartz ledges. They intend building their own saw mill this summer.

The Redstone quartz mine at Blue Canyon, in the hands of the new owners, is being extensively developed and its output increased by the enlargement of its mill.

The Gray Eagle drift mine near Forest hill is yielding rich gravel and the working force has been doubled. Projected improvements will largely reduce the cost of mining and milling at this mine.

All these enterprises aggregate the employment of many more men than last year and are certain to largely increase the gold yield of this year over any former year.

Auburn, June 23, '96.

(Special Correspondence). — One of the claims purchased by the predecessors of the Big Dipper Mining Co. was the Horman placer mine. The Big Dipper mine embraces several original claims, and the name "Horman" has long since given way to that of "Big Dipper." The Big Dipper mine is also sometimes called the Hoorman, Harmon, Harman, Hermann and other similar names.

The Big Dipper mine is situated three miles from Iowa Hill, the claim adjoining that of the Morning Star Mining Co. (the claim comprising some 300 acres), and is working by the drifting process the same cement gravel channel that the latter company is operating upon. The channel, which has been worked for a distance of some 2500 feet and at a width of 150 feet, is tapped by means of a bedrock tunnel. Tunnels and drifts are driven and gravel breasted by means of three-inch machine drills and compressor. The gold is recovered by the sluicing process after being passed through a rock-breaker and 10-stamp mill. The mine is superintended by George D. Blood. The president of the company is Columbus Waterhouse. The main office of the company is located at 16 Beale St., San Francisco, and is in charge of the vice-president, E. W. A. Waterhouse.

Iowa Hill, June 24, '96.

*Sentinel*: Extensive preparations will be made this summer to work the Dam claim near Sunny South on a large scale. The Hidden Treasure Company has leased the old Dam tunnel and for the past year has had a force of men at work opening up the extension of the Hidden Treasure channel which lies between the Hidden Treasure mine and the Old Mountain Gate mine at Damascus. It promises to be one of the most extensive drift mines on the Forest Hill divide. An order for 140,000 feet of lumber for the construction of necessary buildings has been given and the work will go ahead at once. A splendid road has been graded to the mine and is one of the best grades in the mountains. Harold T. Power, superintendent of the Hidden Treasure Co. has charge of the work and it is needless to say that it will be ably managed.

Wm. Muir informs the *Sentinel* that preparations are being made to operate two hydraulic elevators at Horse-shoe Bar, below Michigan Bluff. They will be 800-horse power.

The new machinery recently put in place at the Pioneer mine works admirably and the mine continues to show up well. Some of the best dividends in the history of the mine have been declared this spring.

Work is progressing rapidly on the Redstone mine, which is situated three miles from the Pioneer on the Blue canon side. The boarding house and other necessary buildings are now going up and the new machinery will be put in place before the summer is over.

The Herman mine at Westville is doing well. There is plenty of good ore in sight. The mine never looked better.

*Sentinel*: The South Yuba Canal Company has purchased the Predmore place at Clipper Gap and intend to build a large storage dam there this summer. The dam will be built about 40 feet high and its storage capacity is estimated at about 10,000 inches or over 150 million gallons.

### Plumas.

Regarding the proposed debris dam to be built by the Quincy Hydraulic Mining Co. on Spanish creek, Wm. Watson reports in the *National-Bulletin* that the site chosen is near the northern extremity of the Devil's Elbow, 400 feet west of its extreme north point. The principal dimensions of the dam are as follows: Length of crest on top of dam, 500 feet; width of crest, 40 feet; height of dam, 109 feet; thickness of dam at base, 420 feet. The average width of the canyon at the base of the dam is 200 feet and the inner and outer slopes of the dam are 30°. The number of cubic yards of material required for the dam is 278,631, which will weigh 417,946 tons. The pressure of water against the inner slope of the dam filled to the crest would be 112,218 tons, which gives a factor of safety in favor of the dam of 3.72. In all probability, as will be seen below, the dam would never be filled to within 14 feet of its crest, and the maximum pressure against the inner slope would never exceed 97,500 tons, which would give a factor of safety of 4.28, or a little more than four and a quarter tons to resist one ton of pressure.

Advantage is to be taken of the adjacent gold-bearing gravels situated on either Gopher, Badger or Shore's hill, the base of these gravels lying from 200 to 400 feet above the level of the crest of the proposed dam. These gravels are to be hydraulicked and conveyed by flume to the proposed damsite and dumped into place behind brush barriers carried up on both inner and outer slopes as the water-borne materials accumulate. In order to secure the brush from being carried away by the pressure of water and accumulating gravels, etc., the brush would be laid in wire-bound bundles parallel with the axis of the stream, stakes would be driven through these bundles, and these stakes secured with barbed wire stretched from post to post, with the ends anchored outside the area subject to overflow. By keeping the brush on the outer slope from 2 to 3 feet higher than the inclosed material, it would form a settling reservoir, and the water percolating through this barrier would be relieved of a great part of its sand and sediments.

The spillway or outlet to the dam is at the south end, advantage to be taken of a slight depression in the Devil's Elbow range. The bottom of the spillway is to be 20 feet below the crest of dam and its width 75 feet. The sides and bottom of spillway would be in a hard micaceous schist, the bottom having a slope of 5 feet to the mile. The watershed above the proposed dam has the following area: Spanish creek basin 29 square miles; Rock creek basin 32 square miles, making a total area of 61 square miles. A run-off of 1 inch of rainfall in twenty-four hours from this area would give a discharge of 98,387 cubic feet per minute, equal to 65,591 miners inches. The area of the proposed spillway is 1500 square feet, and assuming the spillway filled to a depth of 10 feet or 10 feet below crest of dam, the area occupied by the water would be 750 square feet. This body of water would have a mean velocity of nearly 9 feet per second and the discharge would approximate 399,960 cubic feet per minute, an equivalent to a run-off of 4 inches of rainfall in twenty-four hours over 61 square miles of area. The thickness of barrier presented by the dam 10 feet below crest would slightly exceed 70 feet.

The areas flooded by the proposed dam are Spanish creek basin 90.5 acres, Rock creek basin 47.5 acres, making a total of 138 acres, with a total storage capacity (assuming that the tailings will grade back on a grade of 13 feet to the mile, which is the average slope of Spanish creek through American valley) of 11,377,350 cubic yards.

The work comprises the washing down and conveying to dam-site of 278,631 cubic yards of gravel, etc; 2350 cords of brush for inner and outer slopes of dam. The necessary posts, plain wire and barbed wire for same; 5700 cubic yards of rock excavation for spillway. The building of 6000 feet of new grade for county road, and a 175-foot span bridge. One of the principal elements of safety in the proposed dam is the fact that the overflowing waters from the spillway would regain the bed of Spanish creek some 800 feet below the outer toe of dam, and assuming that the creek there is filled with tailings to a depth of 30 feet, the hole excavated by the escaping waters would have no perceptible effect on the structure of the dam itself.

Numbers of prospectors pass daily through Quincy.

The superintendent of the Lucky S. mine, at Taylorville, has orders to shut down the mine. Two or three men are retained to run the mill. All the other employes are discharged.

Several hundred men will be at work on Slate creek as soon as the water gets low enough so that flumes can be put in. Dr. Mussey, in charge for the English syndicate, has leased several thousand feet to both white men and Chinese.

*National Bulletin*: At Thistle Shaft, about 85 men are employed. Twenty men are doing development work at Gold Bar.

At the Good Hope hydraulic mine, below Sawpit Flat, twenty miners are kept busy.

Horace Taber has resumed work in his drift mine below Gibsonville. The tunnel is to be pushed ahead to open up the channel.

Three shifts of men are employed in driving the tunnel ahead in the Claybank mine above La Porte. In an upraise, not long since, a fine channel of blue gravel was cut on the rim. By pushing the tunnel ahead about 150 feet it is expected to open up the bottom of the channel.

### San Bernardino.

The mill at the Altoona mine, Morongo district, was started last week. The Rose mine, which has never been closed since its discovery is now working eighteen men and the mill is running at its full capacity.

The Fremont district, eighty-five miles from San Bernardino, is midway between Oro Grande and Barstow, ten miles from a railroad switch. A shaft has been sunk to a depth of thirty-feet showing a ledge twenty inches wide carrying rich ore. The Robert L. at ten feet from the surface is producing ore. Kerr Bros.' mine, the Razzle Dazzle, has a shaft ninety feet in depth on a four-foot ledge, the ore going $30. A mill will be erected.

### San Diego.

It is reported at Escondido that some of the stockholders in the Geneva Mining Company have decided to a stop. They refuse to sell or allow any work to be done on the property, and things are in a bad shape, according to the *Advocate*.

W. H. Bradley is developing the Messenger mine, forty-five miles northeast of Salton in the Eagle Mountain district. There are said to be several good mines in the district, and a large number of men are at work, mostly prospectors. A stage line runs from Salton. The Messenger mine employs fifteen men sinking a shaft and doing general development work. Mill tests of the ore show a general average of $22 a ton. A mill is to be erected, the ore at present being piled on the dump.

An assay of ore from the Owens, at Julian, sent to San Francisco went free gold $334.19 per ton, free silver $401. The mine will save the sulphurets and ship them to San Francisco.

### Santa Barbara.

The Annie Moore mine on the H. C. Pierce ranch near Santa Ynez is being opened up. The tunnel is in 200 feet.

### Shasta.

*Free Press*: The Mountain Mines, limited, have suspended for a month. There is a large quantity of ore on the dump at the smelter and the experimental tests of the machinery can be continued. The work of building the large roaster will go steadily on. The cause of this suspension is said to be on account of the inability of the stockholders and officers to arrive at an agreement as to the proper plan of procedure. William H. Freeman, a foreman for the company, is now in Denver, Colorado, inspecting the smelting plants. The company is negotiating for the purchase of all the ore of the original Quartz Hill Gold Mining Company, which they expect to work in their new mill, which will shortly be erected. The electrical power for this mill will be generated by the new power plant in contemplation at Keswick.

The Conant mine at Harrison Gulch reports considerable rich ore, and Supervisor Conant is credited with intention to build a mill on his property.

*Free Press*: Rahn & Schmidt have twelve men employed at the Forbes mine, Rich Gulch, under the foremanship of J. H. Cox.

### Sierra.

At Beckwith, C. B. Wyckoff has run 1000 feet of tunnel on his property. This was formerly a paying mine, and doubtless will be again.

### Siskiyou.

The O. & C. Mining Co., of Ashland, Or., have sold their quartz mine on the Klamath, three miles from Henley, to San Francisco men represented by E. S. Smith, for $20,000, to be paid July 1st. The new company will commence developing the property by driving a 200-foot tunnel which will tap the vein at a depth of 85 feet below present workings.

*Journal*: At the Black Jack mine, near Henley, they have been crushing the ore which has been on the dump and which they have been using as ballast for the track, and are making $3 a day from it.

Jillson & Co., at Henley, have sunk a shaft and run a tunnel about 400 feet.

Wm. Hobart, who has been working the Quartz Valley hydraulic mine in Quartz Valley, has closed down. He worked 120 days, and has cleaned up $9000 with the ground sluices and a portion of the bedrock to be cleaned yet.

The Wright & Fletcher and the Eastlick Bros. hydraulic mines at Oro Fino will probably continue in operation until the middle of next month.

The 10-stamp mill at the Nebraska mine on

Cherry creek, leased by Means & Mahan, will soon be in operation.

The Seattle Placer Mining Company on Thompson creek, which purchased the old Shinar claim, have completed their ditch from Thompson creek to the mine, three and one-half miles. They were employing over sixty men a short time ago, but the number has been reduced.

Superintendent Gault, of the Del Monte Milling & Mining Co., of Sacramento, is putting up a 10 stamp mill on French Creek, to cost $10,000.

F. Beaudry, who has bought 1,600 acres placer ground near Callahan's and 1,000 acres gravel on Scott river, reports that, as far as worked, the ground pays $1 to the cubic yard.

#### Trinity.

*Journal*: At Trinity Center all the placers are at work. The time for the Berlin syndicate to make its first payment on the property bonded by it was up June 7th and no payment made or extension of time asked for.

The old Rumfelt placer mine is being worked this season after lying idle for years. There is a 40-foot bank of good prospecting gravel.

On Morrison gulch J. B. Graves and others have located 100 acres of placer ground and have named the mine the Blue Jib. The ground lies on the mountain side, has plenty of dump, with water abundant and convenient. The gravel prospects unusually well.

Considerable work is now being done on the quartz mines above Trinity Center at Carville. On the Graves Brothers' mine a tunnel has been run in on the ledge 130 feet. At the face of the tunnel the ledge is about eight inches, of very high-grade rock, going $150 a ton. The walls are about 5 feet apart and filled with ledge matter, although as yet there is only 8 inches of solid quartz, the vein widening. A second tunnel will be run to tap the ledge 100 feet deeper. There are about fifteen or twenty tons of ore on the dump. The mine is equipped with an arrastra.

H. P. Gordon, superintendent of Minersville Hydraulic Gold Mining Company, has about 100 men employed. The company operates on nearly 3500 acres of gold bearing gravel, using 4000 feet of hydraulic pipe, and three giants. The *Journal* reports that the ditch being too small and a new one is being dug to carry 2500 inches of water, to be completed July 4th. A telephone system and an electric light will be erected.

#### Tuolumne.

*Independent*: At the Jumper mine, east of Stent, the new 20-stamp mill of the company is in operation.

At the App mine, W. Moreland superintendent, work is being resumed on the 400-foot level to continue until connection is made with the lower shaft now separated by tunnel.

Work on the Confidence gold mine, abandoned in the early eighties, is progressing. There is yet 150 feet of water to be pumped out. A pump is hoisting 450,000 gallons every twenty-four hours.

At the Santa Ysabel Gold Mining Co.'s property, known as the Miller & Holmes mines, situated between Quartz mountain and Stent, work is going steadily on day and night. Three shafts are being sunk, also crosscuts and drifts, and results are satisfactory; deepest shaft, 600 feet. As soon as other shafts are deep enough, a level will connect all three. The hoist and power house is run by electricity. With the force of men now at work a total extension of work in shafts, tunnels, etc., is 120 feet per week. The company will put in a stamp mill commensurate with demands soon. W. A. Holmes, assistant superintendent, runs the mine.

### NEVADA.

#### STOREY COUNTY.

Following are the official weekly letters from Chollar and Potosi:

CHOLLAR—In the stope above No. 2 crosscut, 450 level, the eighth and ninth floors continue to yield fair grade ore.

In the south stope on this level on the third and fourth floors we are extracting ore of fair grade from stringers and old fillings.

We have shipped to the Nevada mill for reduction during the past week 134 tons and 600 pounds of ore. The average battery sample of ore with that heretofore extracted was $23.76.

Brunswick Lode—The south drift, 200 level from No. 1 shaft, was advanced 20 feet, face now being 120 feet south of Chollar-Norcross line. Face is in porphyry.

At a point 115 feet in an east crosscut has been started and advanced 51 feet.

When in 18 feet it cut a streak of ore 14 inches wide, assaying from $7 to $28 per ton, and when in 24 feet another one 10 inches wide, assaying $25 to $30 per ton. The face is in porphyry, with stringers of quartz through it.

On the 300 level the joint Hale & Norcross and Chollar south drift from the station is out 64 feet, skirting the footwall, which is well defined at this point.

Have resumed sinking incline No. 1, which is down 469 feet.

We have shipped from the Brunswick lode 24 tons of ore, saved in running the 200 level south drift, to the Nevada mill for reduction, the average car sample of which was $68.68 per ton.

POTOSI—The north drift from the top of the raise from the 450 level south drift is now out 145 feet; extended 32 feet during the week; face in porphyry, clay and bunches of quartz. We turned the drift east and cut the clay wall.

The south lateral drift, 650 level, started from the main west crosscut from the shaft, is now out 88 feet; extended 20 feet since last report; face in porphyry.

On the tunnel raise the raise started 50 feet south of the main raise is up 21 feet; top shows bunches of low grade ore.

AT GOLD HILL.—In the Crown Point mine, on the 600 foot level, they started a west crosscut 36 feet north of west crosscut No. 1, during this week, and extended it 9 feet. The face is in quartz assaying from $9 to $14 per ton. They are now putting in square sets preparatory to raising. The south drift from the seventh floor of the raise on the 1100-foot level is out 114 feet. The face is in porphyry and quartz of low grade.

The joint Confidence, Challenge Consolidated and Consolidated Imperial west crosscut No. 1 from the surface tunnel is out 557 feet. The face shows porphyry. West crosscut No. 3 from the surface tunnel is out 10 feet. The face is in quartz showing no value.

In the Belcher mine the usual work is being done. The ore extraction during the past week amounted to 56 mining carloads, averaging $21.72 per ton.

The Segregated Belcher mine yielded during the week 23 mining carloads of ore, assaying upon the average $23.21 per ton.

### OREGON.

At Baker City the Del Norte Mining and Milling Company has incorporated: B. B. Shepherd of Baker City; J. W. McCoy of Des Moines, Iowa, and C. P. Lofgrew of Chicago: capital stock, $100,000.

#### JACKSON COUNTY.

Henderson & Kalfus, lessees of the plant and placer mines of the Siskiyou Gold Mining Co., on Elliott creek, the "Joe Bar diggings," have completed the opening and equipment and are piping day and night.

#### JOSEPHINE COUNTY.

*Journal*: The Hammersly mine is again in operation under the management of the new owners, Jones & Otten. R. Rogers is acting superintendent. It is claimed that the stopes of this mine contain $20,000 of ore. The property was sold last week at the courthouse on an execution sued out by Jones & Otten. Two thousand dollars was offered for the mines and $800 for the mill and machinery. The question of the priority of liens as between them and the laborers on the mine was argued before the Judge, who held that the miners' liens took effect from the date of the beginning of work. Consequently the claims of Jones & Otten become subordinate to the other claims, and the effect of the sale must be to compel the purchasers to satisfy the liens of the men.

### BRITISH COLUMBIA.

A. E. Humphrey at Rossland has signed a contract to diamond drill four holes on the Iron Horse—one in the tunnel where ore was found last summer and the other three at different points on the ledge between the old tunnel and the line of the Virginia.

Vancouver *World*: E. J. Fader, ex-manager of the main Quesnelle Gold Dredging and Mining Company, Cariboo, Tuesday closed a sale of $62,500 for three miles of mining property on the Quesnelle river, with McLean Bros. and Gore, representing an English company. It is the intention of the company to begin operations within six months from date.

### ALASKA.

Two schooners arrived at Tacoma during the week with 803 tons concentrates of an estimated value of $100 per ton from Oonalaska, Unga Island.

F. Meeker, prospecting on Six-mile creek, Cook's inlet, writes, under date of May 19th, that in a prospect hole started after clearing away 10 feet of snow hundreds of colors and small pieces of coarse gold were found. The indications were considered very favorable, as the shaft was not down to bedrock. He tells of seeing washed from two shovelsfull of earth twelve chunks of gold varying in size from a grain of wheat to a pea.

### IDAHO.

(Special Correspondence).—Pierce City mining district is now experiencing a mining boom, as the result of the past winter's work. From forty to fifty men are arriving daily with pack animals, wagons and buggies. Of course, there are some of them get dissatisfied and leave the district without investigating our mineral resources. A recent location made about four miles from Pierce and known as the Golden Standard group gives great promise of being a big mine. The ledge runs northeast and southwest, dips to the east and averages 10 feet in width; some places it is over 20 feet wide. The ore is white and blue quartz, carrying iron pyrites oxidized in some places, but it will nearly all pan a little. Some of it shows up very well. As yet there is very little done on it, as the discoverers are not able financially to handle it profitably. It has been traced for 4500 feet on the surface. Recent work on the Calumet & Hecla group shows up some rich ore showing gold. The Crescent Gold Mining Co. is now down 60 feet below the tunnel level with its shaft, and the ore is still as rich as ever. The company intends sinking 60 feet more before drifting. Dr. H. H. Bole has sold his entire interests here to Messrs. Mitchell & Buchanan of Moscow; consideration unknown. The same parties are also said to have secured an option on the Bond mine. Chas. Henley & Co. are pushing development on the Frisco, and the property looks well. The Caledonia Gold Mining Co. will soon be ready to commence active operations. The Idaho development work proceeds as usual. The Golden Trocadero is producing some ore that runs as high as $450 per ton, and the vein is from 6 inches to 2 feet. A mill run will be made on this ore in a few days, and if expectations are fully realized a mill will be put on the property at once. A deal has been closed on the Climax group. A crosscut tunnel will be run on the property a distance of 400 feet as fast as possible. Placer mining is now in full blast, and with the large quantity of water this season big cleanups are the rule. Messrs. Howes & Sutherland will strike their pay gravel by the first of July. They have expended over $30,000 on this property. Mr. Porter from Coeur d'Alene is now in the camp, having come down to survey the pipe ditch for Howes & Sutherland. The Idaho Consolidated Placer Mining Co. is rushing its flume work and will be ready to handle pay gravel soon. This company will employ twenty men this summer. Erickson & Gaffeny are working in very rich gravel: the bank is 10 feet deep and runs from 75 cents to $2 per yard. Pierce is now enjoying fine weather and the roads are in good shape.

Pierce, Idaho, June 18, '96.

In the Coeur d'Alenes the contractors on the Poorman-Tiger concentrator at Burke have 25 men at work.

The Mammoth is running steadily, working 30 men, shipping all its high-grade ore and leaving its low-grade on the dump.

The *Review* reports the Standard shipping 200 tons per day. One shift has been laid off at the mill at Wallace. The Campbell tunnel is in nearly 2,000 feet and still going in about 8 feet daily. Work has been commenced on the ore bins to use in connection with this tunnel, and when completed they will be the largest and most substantial on Canyon creek.

The Grangeville *Free Press* says: "Geo. Riebold arrived from Warrens via Florence Tuesday with a bar of bullion valued at $1500, the proceeds of five tons of ore extracted from the lower drift of the Little Grant mine. This is some of the richest ore ever taken from the mine, and the extent of the chute has not yet been reached. Mr. Riebold reports the dredge crew busy digging ditches and expecting to resume work with the steam shovel in a few days. The company has an electric light and power plant and sawmill at Boise awaiting the opening of the road over Secesh summit to be taken into camp."

### MONTANA.

*Tribune*: Should the Granite Mountain and Bimetallic mining companies decide to resume operations it will be a great event in the mining history of that State. One of the first and hardest blows Montana mining got through the slump in silver in 1893 was the closing down of these two great mines, both owned largely in St. Louis. The Granite Mountain, the first developed, is a veritable mountain of ore, but not high-grade enough to warrant working with silver at 60 cents. In the few years preceding the panic it made a glorious record, paying dividends at the rate of $100,000 per month with clock-work regularity.

The Bimetallic is almost alongside the Granite Mountain, and by many is regarded as even a greater mine. While the companies are separate, they have practically one management, the principal owner in each being Charles D. McClure, of St. Louis. The mines almost support the two thriving towns of Phillipsburg and Granite; they started and built them up, although other mines in the vicinity now contribute to their growth. Directly and indirectly the two companies employed 2000 men.

In its career the Granite Mountain has distributed dividends amounting to $12,120,000, the Bimetallic $1,630,000.

The two new gigantic engines for the Anaconda mine, which will lift the loaded cages at the rate of 2400 feet a minute, are being put in position and will begin work July 1st.

### UTAH.

Following is a list of dividend paying mines to the 1st ult. Like California, Utah has unincorporated companies who have profitable properties, the returns of which do not appear in such lists as this:

| *Names.* | *No. of Shares.* | *Par Value.* | *Dividends.* |
|---|---|---|---|
| Ajax | 300,000 | $ 10.00 | $1,000,000 |
| Bullion-Beck | 100,000 | 10.00 | 2,000,000 |
| Centennial-Eureka | 30,000 | 50.00 | 1,620,000 |
| Crescent | 600,000 | 25.00 | 280,000 |
| Dalton & Lark | 2,500,000 | 1.00 | 12,500 |
| Daly | 150,000 | 20.00 | 2,850,000 |
| Eureka Hill | 10,000 | 100.00 | 1,450,000 |
| Gemini | 5,000 | 100.00 | 600,000 |
| Horn Silver | 400,000 | 25.00 | 5,187,000 |
| Mammoth | 400,000 | 25.00 | 1,050,000 |
| Maxfield | 300,000 | 10.90 | 117,000 |
| Mercur | 200,000 | 25.00 | 450,000 |
| Ontario | 150,000 | 100.00 | 13,205,000 |
| Silver King | 150,000 | 20.00 | 562,000 |
| Utah | 100,000 | 1.00 | 137,100 |

### WYOMING.

The Sheridan *Enterprise* says: "Stamp mills will be installed here by five more companies this summer. In addition to the three already in operation, this will guarantee a lively camp."

### COLORADO.

Denver *Mining Record*: The Mollie Gibson has a new ore body 20 feet thick, and on this ore one hundred men are working. This mine ships weekly three hundred tons of ore which will average near to 200 ounces.

### NEW MEXICO.

East of Hillsboro in Sierra county, placers worked in a small way on the surface by Mexicans since 1874, are to be worked on a large scale by men who have spent $20,000 in preliminary work. Their engineers and hydraulic experts from this State report a gravel bed 60 feet thick, all pay dirt. Water will be impounded at the head of Animas river by a dam 150 feet high, and conducted to the placers through fourteen miles of 30-inch riveted steel pipes and discharged through monitor nozzles under a pressure of 360 pounds.

### ARIZONA.

*Gazette*: Producing ore by the cyanide process evidently pays in Arizona as McLoish on Thursday shipped to the mint 100 ounces of gold valued at $1,400, the result on nine days run. He worked eight men and the rock they worked is tailings from the Vulture. At many of the old dumps of mines now abandoned the cyanide process will eventually reduce the piles of rubbish that was once thrown away and will have a fair margin of profit.

### MICHIGAN.

The mines on the Gogebic range operated by the Metropolitan Iron Company, the Norrie, East Norrie and Pabst, have suspended work for the present, discharging their forces -1250 men in the aggregate—and nearly all the other mines on that range have reduced their forces about half. The Marquette *Journal* reports the situation as follows:

"The managements say this step has been taken on account of the slack demand for ore. Ever since the producers agreed to abstain from ruinous competition, and not sell ore save at a price that would yield a moderate profit, the furnace owners have bought very conservatively, evidently expecting that a break would come by which they would profit if they held off long enough. It is to meet this attitude of the furnacemen that the leading mines have resorted to the heroic expedient of either closing down entirely or reducing their forces, their argument being that if prices are to be maintained at a fair basis the way to do this is to quit producing until the consumers quit hanging back and show a willingness to purchase freely. The hardship to labor involved in the determination of the mining companies is deeply to be regretted, but it will be better for the men in the end to have the producers of ore stand out unyieldingly for a fair price than to keep on producing and shipping until the market is overstocked and the furnace owners are in a position to force the acceptance of prices which will not admit of a proper remuneration for the labor employed in the mines or any profit for the mine owners."

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR WEEK ENDING JUNE 16, 1896.

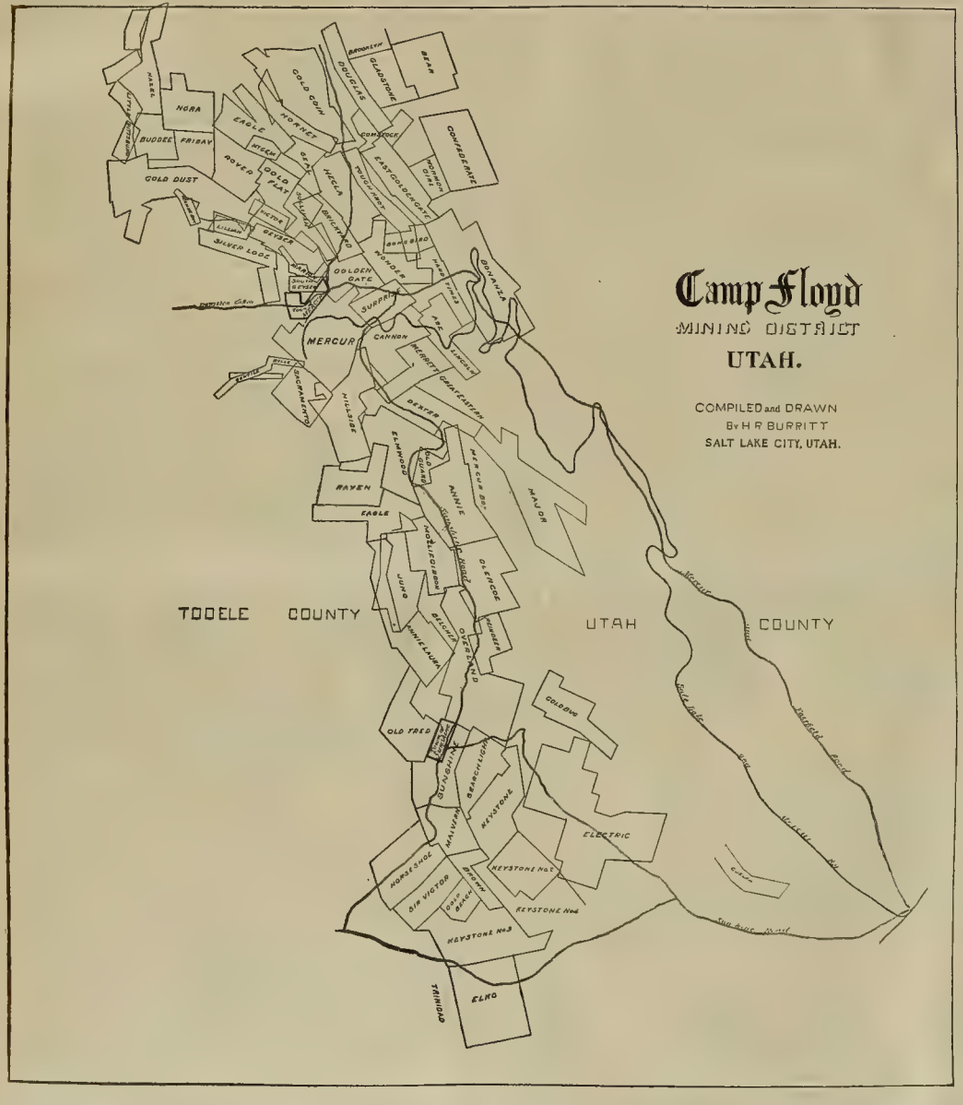
562,113.—RUBBER HEELS—A. N. Barrett, Los Angeles, Cal.
562,348.—WAGON BRAKE—H. A. Baxter, Seattle Wash.
562,171.—CAR FENDER—Cogniasse & Shultz, S. F.
562,056.—THILL TUG—A. W. Cook, Stockton, Cal.
562,127.—FAUCET—Fowler & Fettic, Genoa, Nev.
562,333.—CRUTCH—F. A. Lund, Los Angeles, Cal.
562,317.—WAVE MOTOR—C. R. Martin, Redondo, Cal.
562,017.—CURTAIN HANGER—J. M. Murdock, Oakland, Cal.
562,021.—SHAWL STRAP—L. Phelan, S. F.
562,028.—CAR COUPLING—L. E. Redden, Tempe, A. T.
562,158.—ROASTING FURNACE—J. R. Sears, Stockton, Cal.
562,254.—LAMP STOVE—M. H. Sinclair, Los Angeles, Cal.
562,102.—GATE—R. G. Stingley, Franklin, Or.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

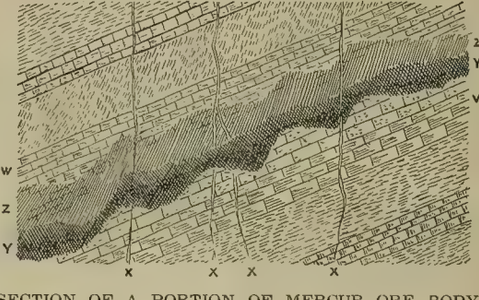
AUTOMATIC CAR FENDER.—C. Cogniasse and D. F. Shultz, San Francisco, Cal. No. 562,171. Dated June 16, 1896. This invention relates to a protecting device for railway cars. It consists essentially in an automatically operating fender, comprising a swinging fender depending from the front end of the car, a curved receiving fender depending at a point in rear of the first fender and in front of the wheels of the car, a spring by which the lower edge of the receiving fender is normally tilted upward above the surface of the street, rocker arms projecting upwardly from the shafts of each of the fenders, an elastic connection between the two whereby the swinging of the front fender also moves the rear one, with its edge in close proximity with the surface, and a pawl and ratchet mechanism by which this fender is locked in position until released.



ROASTING FURNACE.—James R. Sears, Stockton, Cal., assignor of one-half to D. C. Matteson of same place. No. 562,158. Dated June 16, 1896. This invention relates to that class of roasting furnace in which the body of ore is slowly passed from one end to the other, through a rotating cylinder. It consists of a horizontal cylindrical chamber extending approximately the length of the furnace, having closed heads at the ends provided with central openings, hollow trunnions extending from the heads to and beyond the outer walls of the furnace and journaled in bearings on wheels, the cylinder having its discharge end slightly lower than the receiving end, a driving mechanism connected with the trunnions at points exterior to the walls of the furnace, whereby the cylinder is rotated from the ends, a heating chamber within which the body of the cylinder is enclosed and through which the trunnions project, supporting rollers at the center of the cylinder and a means for delivering hydrocarbon fuel and burning it beneath the cylinder, with passages through which air is admitted adjacent to the burner. The cylinder has longitudinal hollow triangular ribs, with openings in them and a means for delivering air into these ribs so as to discharge it into the interior of the furnace along with the body of roasting ore.

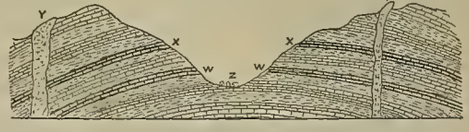
## "The Johannesburg of America."

An illustrated description of the cyanide process at Mercur, Utah, in the MINING AND SCIENTIFIC PRESS of the 23rd ult. has occasioned so much inquiry about that district that further pictured reference to that part of Utah is in order. On page 521 of this issue appear some portraitures of Camp Floyd district that to a miner are self-explanatory. On this page appear an outline map of the locations in the district and two sectional views of the rock formation.



Twenty-five years ago the Camp Floyd Silver M. Co. was organized, the "Sparrow Hawk" mill erected, and about $700,000 expended, about 25 per cent of that amount being realized from the ore. Through the years the camp had its ups and downs, and all sorts of projects had their day, even to a determined and expensive effort in '89 to successfully produce quicksilver. In '92 it was demonstrated that the cyanide process would recover the gold from the "ore carrying gold that the pan could not find," and for the last three years mining for gold has been carried on at a profit. For a description of the process at Mercur the reader is referred to the issue of this paper dated May 23, 1896.

There is some similarity between Leadville and Mercur, in each locality the profitable ore occurring in carboniferous limestone, in association with emptive rock. Mercurites, however, have styled the district "the Johannesburg of America," claiming that the character of the ore, its manner of deposit, the quantity of low-grade ore, and the manner of recovering it, form conditions analogous to the South African gold metropolis. The outline engravings of the rock formation and ore deposit are of interest. Lewiston canyon outcroppings show two ore-bearing zones about 150 feet apart, each dipping from the center of upheaval. In the lower zone silver occurs in the quartzite; in the upper zone gold is found in the limestone and shale, the theory of deposition being that the gold was diffused from below in microscopic particles. Oxidized and arsenical ores are present throughout, the producing mines working on the former; an addition to the plant is now proposed to roast the baser ore in connection with the cyanide treatment—a metallurgical problem that will be of general interest. The Mercur, Geyser, Marion, Sunshine, Sacramento, and Golden Gate works are herewith illustrated. Sunshine is a mine and mill with a townsite of its own, and claims to have the best mill of the lot, the total cost of the sixty-ton plant's ore operations being placed at $2 per ton, which includes mining the ore. In the Sunshine ore there is no trace of silver.



SUNSHINE MINE AND MILL.

SECTION OF A PORTION OF MERCUR ORE BODY.

Y—Ore, With Chert Nodules.
Z—Shaly and Soapy Material.
V—Crystalline Limestone Floor.
W—Drab Limestone Roof.
X—Heavy Spar Veins.

NORTH AND SOUTH SECTION, ACROSS LEWISTON CANON.

Z—Mercur town.
Y—Dikes.
X—Gold-Bearing Zone.
W—Silver-Bearing Zone.

The following figures are believed to be approximately correct:

DAILY ORE TONNAGE.

| *Mines.* | *Tons.* | *Value Per Ton.* | *Loss Per Ton.* | *Gold Extraction.* |
|---|---|---|---|---|
| Mercur | 200 | $14.00 | $2 10 | $2,380 00 |
| Marion | 55 | 9.00 | 1.80 | 396.00 |
| Geyser | 50 | 10.00 | 2.00 | 400.00 |
| Sunshine | 60 | 9.00 | 1.35 | 459.00 |
| Sacramento | 50 | 10.00 | 2.00 | 400.00 |
| Total | | | | $4,035.00 |

Northeast of Mercur the Golden Gate property has by recent development work shown large deposits of oxidized ore that give promise of continued profit. The district furnishes a good example of what can be done by scientific mining methods. Plenty of low-grade ores, intelligent, economial management and facility of transportation make the production of gold as prosaic and legitimate a business as any other department of the commercial world.

---

CANADA names its districts on the Arctic ocean Ungara, Franklin, Mackenzie and Yukon. They contain 1,421,000 square miles.

## Glossary of Mining Terms.

*(Continued from L. W. Tatum's Compilation.)*

Dam—A bulkhead.
Day shift—The gang of miners working during the daytime. Night shift, working nights.
Dead quartz—Quartz carrying no mineral.
Dead riches—Base bullion.
Dead work—Work that is not directly productive, as opening up a mine.
Debris—Fragments of rock; mine refuse.
Deep—The lower portion of a vein.
Denouncement—The Mexican or Spanish equivalent to "Location and Record" of a claim.
Deposit—Ore bodies not confined to a lode.
Descension—The theory that the material filling veins came in from above.
Diggings—Name applied to placers being worked.
Dike—A fissure made and filled by plutonic action. Its rock is most commonly porphyry. It is often barren, but in some cases mineralized, or may carry a mineralized selvage and so appear as the wall of a lode.
Divide—Any continuous range of mountains from which the streams flow in opposite directions. The Rocky mountains are called The Great Divide.
Diluvium—A surface deposit of sand, gravel or loam.
Dip—The slope or pitch of a vein or mine, with regard to the plane of the horizon.
Ditch—An artificial water course dug in the earth; a flume or canal.
Divining rod—A stick of witch hazel or other like device used in prospecting for lodes.
Dollar—From the German (thaler) 100 cents. Gold: 23.22 grains, alloy 2.58 grains, weight 25.8 grains; coined 1849-1889. Silver: 371¼ grains, alloy 41¼ grains; weight 412½ grains; coined 1794-1804, 1836-1838, 1840-1873, 1878-1893. Legal tender unlimited. The Mexican dollar contains 377.17 grains silver and 40.62 grains alloy. Spanish dollar the same.—E. O. Leech, Director U. S. Mint.
Down-cast—A ventilating shaft with descending current of air.
Drag—The point of union of two veins which meet without intersecting.
Drift—A tunnel; a horizontal passage underground, driven on or along the vein.
Driving—Extending excavations horizontally.
Drum—The cylinder on which the hoisting cable is wound.
Druse—A cavity lined with crystals.
Dump—A place of deposit for ore or refuse.
Dumb-drift—A gallery which conducts the air around a ventilating furnace to the upcast shaft.
Dyke—A wall-like mass of mineral foreign to the general formation.
Erosion—The act of being gradually worn away. Thus valleys are made by running water.
Escrow—A conditional deed delivered to a third person.
Exploder—A chemical employed for the instantaneous explosion of powder.
Exploitation—Working of a mine; amount of work done.
Eye—The hole in a pick or hammer head for receiving the handle. The top of a shaft.
Face—The end of a drift, tunnel or slope.
Fathom—Six feet square; a fathom of ore is six feet long, six feet high, the width of the vein.
Fault—The displacement of a stratum or vein so that they are not continuous.
Feeder—A small vein joining a larger one.
Feldspar—A viterous crystalline constituent of granite, gneiss, porphyry and many other rocks.
Ferruginous—Relating to iron.
Fire damp—A carburetted hydrogen gas, inflammable and specifically lighter than air.
Fire setting—The process of exposing very hard rock to intense heat, rendering it thereby easier of breaking down.
Fissure vein—A crack or cleft in the earth's crust filled with mineral matter, both walls having same geological formation.
Float—Loose ore or rock detached from the original formation and found below it.
Float gold—Fine particles of gold difficult to precipitate or amalgamate.
Flour gold—Gold in a very fine state of division; difficult to save by ordinary milling processes.
Floor—The rock underlying a horizontal vein or deposit; the stratum below a mineral bed.
Flume—A pipe or trough to convey water.
Flux—Substance used to promote the fusion of ores.
Footwall—Layer of rock immediately beneath the vein.
Forfeiture—A failure to comply with the laws prescribing the quantity of work.
Formation—A term applied to the country rock traversed by veins.
Free—A term employed in speaking of metals in ores, as free-milling gold or silver ores.
Free gold—Gold uncombined with other substance.
Free milling—Ores containing mineral that will separate from the gangue by simple methods.
Free silver—Silver uncombined with other substances.
Freestone—Sandstone easily dressed.
Fuse—A tube, ribbon or wire filled or saturated with a combustible compound, used for exploding powder.
Fusion—The state of melting.

*(To be Continued.)*

# Improved Ore Concentrator Belts. PATENTED.

(RIFFLED OR SMOOTH.)

## Suitable for all Ore Concentrating Machines in General Use.

These belts, with slight riffles at intervals, *will save* a greater percentage of valuable concentrates *than any other vanner belt.* Our new style flanges on the edge of the belt make it much more durable than any other. Send for circular and price list.

THE BLASDEL IMPROVED ORE CONCENTRATOR BELT CO.,

H. G. BLASDEL, Jr., Manager. Cable Address: BLASDEL. Haywards Building, 419 California St., San Francisco, Cal.

# RISDON IRON WORKS.

Office and Works: Cor. Beale and Howard Sts., San Francisco.

Cable Address: "RISDON'S" San Francisco.

MANUFACTURERS OF

**Johnston's Concentrator, Improved Bryan Mills,**
**Risdon Ore Feeders "Challenge Type," Air Compressors,**

KNIGHT WATER WHEELS—Highest Efficiency Guaranteed.

## MINING, MILLING, PUMPING and HOISTING PLANTS.

# FULTON ENGINEERING AND SHIPBUILDING WORKS.

## MINING AND MILLING MACHINERY,

ADAPTED TO EVERY DESCRIPTION OF MINING AND MILLING.

Office and Branch Works, - - - - - - 213 First Street, San Francisco, Cal.

For the **Transportation of Ore, Fuel and other material over mountainous and rugged country the HALLIDIE ROPEWAY** stands pre-eminent as to simplicity, efficiency and economy.

Parties desiring to remove large quantites of Sand, Gravel, Earth, Ore, Rock, etc., to construct levees, dams or embankments, or to make long cuts, as in canals, ditches, etc., can do more efficient work at less cost by the HALLIDIE SYSTEM OF ROPEWAY TRANSPORTATION than by any other system.

SEND FOR CATALOGUES TO

CALIFORNIA WIRE WORKS, or A. S. HALLIDIE, - - - 332 Bay Street, San Francisco.

# UNION IRON WORKS,

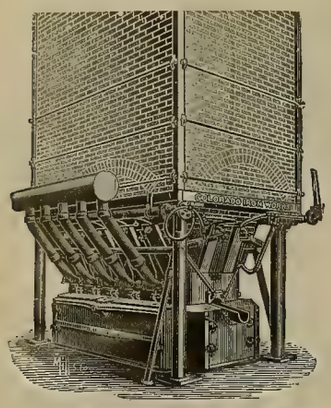
NO. 222 MARKET STREET, - - - - - - SAN FRANCISCO, CAL.

MANUFACTURERS OF

## MINING AND MILLING MACHINERY,

Automatic Cut-Off Engines, High-Speed Engines, Hoisting Engines, Quartz Mills
Manty Chili Mills, Rolls and Concentrating Machinery, Dodd Sigmoidal Water Wheel,
PUMPS--Cornish and Other, Copper and Lead Furnaces, All Classes of Marine Work.

SHIP BUILDERS. ★ BUILDERS OF U. S. WAR SHIPS. ★ HYDRAULIC LIFT DOCK.



NEW YORK OFFICE: 145 BROADWAY. CABLE ADDRESS: "UNION."

# RIX COMPRESSED AIR MACHINERY CO.

MANUFACTURERS OF

## AIR COMPRESSORS AND ROCK DRILLS,

OFFICE AND WORKS — 11-13 FIRST STREET, SAN FRANCISCO.

Standard Silver-Lead Water Jacket Smelting Furnace.

Equipped with Arch-Bar System of Mantles, insuring rigid and strong walls. No cracks.

# THE COLORADO IRON WORKS CO.,

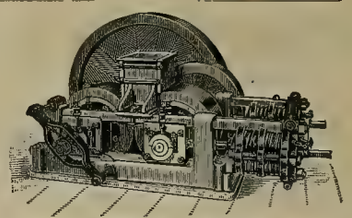
Established 1860.
1876—Incorporated—1896.

Denver, Colorado.

MANUFACTURERS OF AND CONTRACTING ENGINEERS FOR

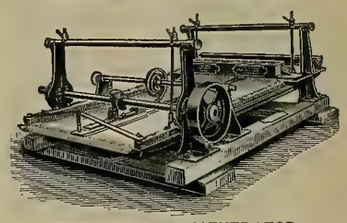
## Gold and Silver Mills & Smelting Plants

FOR THE REDUCTION OF GOLD, SILVER, LEAD AND COPPER ORES.



.....We can furnish on Short Notice MACHINERY and GENERAL EQUIPMENTS for.....

**Cyanide, Chlorination, Bromine, Concentration and Amalgamation Plants,**



COMPLETE, OR IN PART.

*Catalogues on application.....*

NOTE.—We have a Testing Plant (Mill) on our premises and test ore by Concentration and Amalgamation in ten-ton lots or more, to arrive at best possible method to save values, machinery to be selected accordingly.

CAZIN'S IMPROVED CRUSHING ROLLS.
"Superior to all others."
LARGE CAPACITY. FINE CRUSHING.

PERFECTION CONCENTRATOR.
Capacity 5 to 15 tons in 24 hours. A machine that will do the work.

CONSOLIDATED

# Kansas City Smelting and Refining Co.

Incorporated Under The Laws of New York.

Capital paid in.....$2,700,000.

Buyers of All Classes of

**GOLD, SILVER, LEAD AND COPPER ORES,**

**Bullion, Mattes and Furnace Products,**

**GOLD BARS, SILVER BARS and MILL PRODUCTS.**

21 AND 23 FREMONT STREET, SAN FRANCISCO, CAL.

NOTICE TO GOLD MINERS!

## SILVER-PLATED AMALGAMATED PLATES

For Saving Gold

IN QUARTZ, GRAVEL OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER.

AT REDUCED PRICES.

Our plates are guaranteed, and by actual experience are proved, the best in weight of Silver and durability. Old Mining Plates replated, bought, or gold separated. THOUSANDS OF ORDERS FILLED.

## San Francisco Novelty and Plating Works

Incorporated.

SEND FOR CIRCULARS. 68, 70 and 72 First Street, San Francisco, Cal.

## Justinian Caire, Agent

521 and 523 Market Street, San Francisco,

—DEALER IN—

**Assayers' and Mining Material.**

—MANUFACTURER OF—

BATTERY SCREENS AND WIRE CLOTH.

—AGENT FOR—

Hoskins' Hydro-Carbon Assay Furnaces.

DODGE AND GIANT ROCK BREAKERS.

IMPROVED MILLS
That successfully take the place of stamps.

AMALGAMATORS,
Doing away with plates on all kinds of mills for saving gold.

DISTRIBUTORS
That save a vast amount of care and labor, divide the pulp and water evenly to two or more lines of concentrators.

SEPARATORS,
Sizes the ore from the mill, separates the sands for the jig, and slimes for the slime concentrator.

JIG CONCENTRATOR
For working the sands from the separating box.

SLIME CONCENTRATOR,
Works the slimes from the separator.

DRY JIG,
Concentrates ores where there is a lack of water.

MILLS,
To crush to any degree of fineness desired.

GRAVEL MILL,
Works cement gravel, without crushing the gravel

CONTINUOUS AND CHARGE ROASTING FURNACES.

THE ABOVE MACHINERY IS BEING SET UP AND CAN BE SEEN AT OUR STORE.

MACARTHUR-FORREST PROCESS.

**MacArthur-Forrest Process.**

CAPITAL, - - - £110,000 STERLING

To MINE OWNERS and others having Refractory Gold and Silver Ores hitherto untreatable at a profit, the MACARTHUR-FORREST (Patent) Process of Gold and Silver Extraction offers a solution of the difficulty.

Advisory Board in the United States: Thomas W. Goad, Manager; Hugh Butler, Attorney; John F. Bell; P. George Gow.

California and Nevada Agency and Experimental Plant, 23 Stevenson Street, San Francisco, Cal. P. G. Gow, Sole Agent.

OFFICE: McPHEE BUILDING, DENVER, COLORADO.

**MILLS BUILT WITH GUARANTEE OF SUCCESSFUL OPERATION.**

**KENDALL GOLD AND SILVER EXTRACTION CO.**

The Kendall Process is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

*The Kendall system is covered by patents which this company will defend.*

The American Cyanide Gold and Silver Recovery Co., organized in Denver more than a year ago to introduce and operate the Kendall Process in several States, have closed contracts with some ten mines for the use of this process after exhaustive comparative tests with the ordinary plain cyanide method.

Capt. De Lamar has adopted the process at his Nevada mines, where a 250-ton plant is being completed. He writes that he is saving 95 per cent of his gold values, and regards the Kendall Process as the cheapest and best he is aware of for the treatment of gold ores.

*All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.*

Owners of mines and reduction works can obtain full information on application to

**KENDALL GOLD AND SILVER Extraction Company,**

47 BROADWAY, - - - NEW YORK CITY.

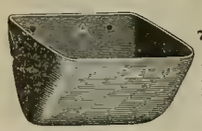
F. H. HARVEY. W. S. HUTCHINSON.
**HARVEY & HUTCHINSON,**
GALT, CAL.,
Mining and Metallurgical Work in All Branches.
Assays, Chemical Analysis of Ores and experiments on rebellious ores for treatment by cyanide or other processes. Surveys and reports upon mining properties.

**Saville, MacLymont & Co.,**
MINING and CONSULTING
Engineers and Metallurgists.
Examine and report on mines, ore bodies, and all metallurgical processes connected therewith.
Practical mill tests, assays and analyses of ores and general analytical work undertaken at the
CALIFORNIA METALLURGICAL WORKS,
10 Annie St., (opposite Palace Hotel),
Between Market and Mission Sts.,
SAN FRANCISCO, CAL.
References to leading mining men on application.



**Thomas B. Everett, M. E.**
Twenty-six years practical experience in metal mining. Will make reports upon property, or furnish properties to purchasers, if desirous to invest in the Cripple Creek gold district, all on short notice.
References furnished in Denver or San Francisco. Branch office, Room 25, tenth floor, Mills Building, San Francisco, care S. K. Thornton, or THOMAS B. EVERETT, Box 195, Denver, Colo. Registered cable, Everett, Denver.

**EDWARD C. BROADWELL,**
Chemical Assayer.
2006 Champa St., Box 840, Denver, Colo.
Chemical assayer; no loss by fire test; truth only; gold, 75c; gold and silver, $1; gold, silver and platinum, $1.85; copper, lead, nickel, zinc, etc., according to difficulty of precise determination; tests for chlorination, cyanide or proper method of treatment.

**LOUIS FALKENAU,**
STATE ASSAY OFFICE,
434 California St., near Montgomery.
Analysis of Ores, Metals, Soils, Waters, Industrial Products, Foods, Medicines, etc., etc.
Court Expert in all branches of Chemical Technology. Working Tests of Ores and Investigation of Metallurgical and Manufacturing Processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

**V. BLANC,** Analytical Chemist, Assayer. Graduate from Paris. 1620 California St., Denver, Colo.

Manufacturers and Importers of
Assayers', Mine and Mill Supplies. Chemicals and Chemical Apparatus.
We frequently have Second-Hand Assay Balances, which we put in order and sell at reduced prices. We can now offer for sale a fine new portable balance, made by Oersterland, Freiburg, Germany. This balance, including glass case, will fold up to 6½x12x4½ inches. Beam, 7 inches long; sensible to 1-10 milligram. New movement to release pans. All parts nickel plated. Specific gravity bottle and hook pans; 3 sets removable pans, one set of horn; pincets and weights; 1 platinum gram down to 1-10 milligram. Formerly listed at $85, now offered for $56.
Oertling's Assay Scale, No. 10, in glass case; powers, 10 grains down to 1-100 grain and riders, with weights; price, $60, offered for $40.
Oertling's Pulp Scale. No. 1, in case; power, 500 grains to 1-50 grain; without weights; price, $40, offered for $30.
German Assay Scale, not in case; steel bearings, 10-inch open beam, index pointing below; mounted so as always to be level; pans suspended by three platinum wires and hook; all packs in drawer 12¼x6½x2 inches; without weights; price $35, offered for $23.
German Scale; agate bearings for center knife; all packs in drawer 12½x6½x2½; price $30, offered for $22
German Chemical Scale, in glass case, with two folding doors in front and one at each end; long open beam with 8-inch radius; center knife rests upon agate; pans suspended by platinum wire chain and jewelled hooks; rider movement; beam graduated into 100 parts. This is a new scale left on sale; price $70, offered for $30.
German Assay balance cat No. Z; solid beam, 8 in. long, index pointing upwards; pans suspended by platinum wires and hooks; in glass case with sliding door; price $40, offered for $30.

PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
F. CLERICI, Manager for U. S.

# HORACE F. BROWN, CONSULTING ENGINEER.

## PAYNE'S PATENTED GOLD SAVING RIFFLE.

This Riffle is just what placer miners want whether they are working large or small claims, as it is the only riffle ever invented that holds the mercury entirely exposed to the material, no matter what force of water is used. A large number of these Riffles have been sold, and are now in use in Colorado, Montana, New Mexico and elsewhere, and the first complaint has yet to be made against them. Many testimonials have been received from parties who have used and are now using them, giving them the highest praise. Are made of chilled cast iron, cheaper and more durable than any other process. Agents wanted. County and State rights for sale. These Riffles are manufactured at Denver only. Address all orders and communications to

JOSEPH J. PAYNE, Sole Owner,
1710 Champa Street, DENVER, COLORADO.

## MINE BELL SIGNALS.

**Adopted, Used and In Force in Accordance with State Law.**

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

## DEWEY & CO'S Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. patents since 1872. All worthy inventions patented through Dewey & Co's Patent Agency will have the benefit of a description in the *Mining and Scientific Press.* We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

Advice and Circulars free.

## QUICKSILVER!

—FOR SALE BY—

The Eureka Company,
OF SAN FRANCISCO.

ROOM 1, - 426 CALIFORNIA STREET, SAN FRANCISCO.

## Coast Industrial Notes.

—The oil refinery at Ventura is turning out a fair product of illuminating oil.

—Mendocino county reported a sale of wool this week aggregating 275,843 pounds, at 9c to 10½c a pound.

—The lumber cargo shipments from Oregon and California to San Francisco in May aggregated 19,278,611 feet.

—The present number of men at work in the Vallejo docks and yards (800) will be increased to 1000 on July 1st.

—It is estimated that the prune crop in California this year will exceed 60,000,000 pounds of cured fruit. In Oregon the prune crop is reported to be a failure.

—The S. F. & S. J. V. R. R. is completed to fourteen miles south of Merced, a total mileage of seventy-nine miles from Stockton. The road is expected to be finished to Fresno by Sept. 1st.

—The differences between the salmon cannerymen and fishermen on the lower Columbia river have been adjusted, and there is now a daily catch of nearly $10,000 worth of salmon near Astoria, Or.

—The Utah and California Railroad has filed a map in the United States Land Office in Carson, Nevada, showing the course of the road from Milford, Utah, entering Nevada in Clover valley, running through Lincoln county, thence through California to Los Angeles.

—The Corral Hollow Railway is in active operation, trains running between Stockton and the mine. Jos. Treadwell says he will begin taking out coal August 15th, and will employ 2,000 men. The present thirty-six miles of railway will, he says, be ultimately extended to San Francisco.

—The Gold State Oil Co. of Fresno has incorporated; capital stock $5,000,000; J. M. Guffey, Pittsburg, president; F. Barrett, Selma, vice president; J. M. Cooper, secretary. The company has located 17,000 acres at Coalinga and is locally credited with the intention to bore one hundred wells this year.

—The Redlands Orange Growers' Association shipped this year 6,000,000 pounds of oranges of which about two-thirds were navels. The total number of boxes shipped was 83,728, or 279 cars of 300 boxes each. The last shipment for the season was made last week and consisted of two cars of Valencia lates, which were sold at $3 per box f. o. b.

—Traffic Manager J. C. Stubbs says that the Southern Pacific will shortly make Galveston the entrepot for its Atlantic Steamship line instead of New Orleans. As soon as the Charleston harbor shall have been dredged to the proper depth the Morgan Line of steamers will carry transcontinental freight to that port, thus reducing the rail haul by 311 miles and giving the Sunset route a greater competing advantage. It is said that the Southern Pacific will extend its lines from Houston to Galveston, instead of using the Gulf, Colorado and Santa Fe between those points, as it does at present.

—The report of the Southern Pacific Co. for the year ending December 31st, 1895, shows that the net earnings per mile of road have decreased from $5763.97 in 1872 to $2296.62 in 1895. The decrease in the net earnings is explained by the decrease in the receipts per ton, all of which is attributed to reduced freight rates. The figures show that the traffic has increased and the net earnings at the same time have decreased. During the eleven years which the Southern Pacific Co. has been operating the lines and branches which comprise the system it has accumulated a surplus of $10,160,712.78. The total net earnings during that time have been $25,243,622.51; of this amount $15,082,909.73 has been spent for betterments and additions.

—Very little merchandise is now imported from the United States into Mexico. Mexicans get their machinery mostly from England, except that used in mines; Germany furnishes hardware, crockery and house furnishings; dry goods come from France, and they import most of their groceries from Italy. The high charges for hauling freight from the United States is one thing that keeps Mexicans from trading with their northern neighbors. It costs only 14 shillings, $3.50, to ship a ton of freight from an English port, which is cheaper than the same ton of freight could be brought by water from the United States. Buying goods in the inland United States cities is almost out of the question, for the rate for hauling by rail places everything out of their reach. If both republics were doing business on the same financial basis, most of the difficulties that now stand in the way of close trading would soon vanish.

—The "Dressed Lumber Case" has been a topic of considerable importance to the coast. The United States Circuit Court, District of Vermont, has just reversed its former ruling and rendered a decision which practically admits all lumber free. The following is the decision as rendered: The appellant imported inch boards and 3-inch plank, planed on both sides and tongued and grooved. The collector assessed a duty of 25 per cent on it as a manufacturer of wood, under paragraph 181; the appellant protested that it was free under paragraph 676; the board of general appraisers found, on the opinion of twenty-four witnesses out of forty-six examined by them, "that the merchandise is not commercially known as dressed lumber, but has passed beyond that description by the process of tongueing and grooving, which are additional to dressing," and affirmed the classification of the collector. The testimony of another witness to the contrary has been taken since. That this material is still lumber and is bought and sold by the thousand feet, as lumber, nearly all the witnesses agree; that it is not akin to the articles of wood mentioned in paragraph 181 is quite apparent. That paragraph expressly refers to house or cabinet furniture wood, wholly or partly finished; and then to manufactures of wood without reference to the extent of finishing, thereby implying that these are referred to as finished. Manufactures of wood are articles made of wood and completed into things different from what the wood of which they are made was before. Hantranft vs. Wiegman, 121 U. S. 609; Maddock vs. Magone, 152 U. S. 368. Paragraph 676 does not refer either to sawed lumber or to dressed lumber by itself, but after naming sawed boards and plank, which the two kinds of this importation are, it mentions other lumber, rough or dressed, which must mean, as lumber is divided into two classes, rough or dressed, all other lumber whether rough or dressed. This is lumber dressed for use, and has not been made into anything beyond lumber so dressed. Articles used for kindred purposes, and which are completed things having names of their own which would not be included under the general head of lumber, are expressly placed on the free list in this schedule, indicating an intention that all those should be free. Neither sawed nor dressed lumber is usually dealt in by those names, but by what it is wanted for, so this is not a question of trade names, but of what the material is. If it is dressed lumber in fact, it is free. Robertson vs. Perkins, 129 U. S. 233. The finding of the board of appraisers upon conflicting evidence is entitled to great weight, but they did not have all the witnesses before them; and the evidence and their finding fall short of really showing that these are completed manufactures of wood. Passing them beyond dressed lumber by tongueing and grooving does not make them anything else. Classification reversed.

## Personal.

THOS. PRICE has returned from Gibsonville, Cal.

J. F. WARDNER is at Granite Basin, Plumas county.

GEO. E. AMES has returned from Los Angeles.

T. L. PETERSON is Idaho's new State mine inspector.

JOHN PARR is the new superintendent of the Bodie mine.

CAPT. A. H. WARD returned to his Mariposa property yesterday.

CURTIS LINDLEY goes to London this week on mining business.

E. B. DORSEY is in Mariposa Co., making inquiry concerning the grant.

HAMILTON SMITH is returning to London via Cripple Creek and New York.

SAMUEL ROWE is now foreman of the White Swan M. & M. Co., Baker City, Or.

E. K. STEVENOT, of this city is superintending operations at the Unity mine, El Dorado Co.

JOHN HAYS HAMMOND left Capetown, South Africa, last Wednesday for California via England.

A. D. FOOTE succeeds R. R. Roberts as superintendent of the North Star Mining Co., Nevada Co.

H. M. LANE goes this week as assistant engineer in charge of the Great Falls, Mont., Iron Works plant.

W. H. STORMS, of the State Mining Bureau, has returned from an official tour through Southern California.

SAMUEL J. HENDY, president Joshua Hendy Machine Works, has returned from a business trip through Colorado.

BARNEY BARNATO, of South African fame, is said to be turning his attention to British Columbia mining investments.

GEN. WADE HAMPTON, U. S. Railway Commissioner, is expected here next Saturday on his annual tour through the country.

W. F. ENGLEBRIGHT, of Nevada City, Cal., has completed the survey for the new dam to be built by the South Yuba Water Co.

R. C. CAMPBELL returned from Red Rock, Montana, last Wednesday, and left the following day for the Quesnelle, Cariboo, B. C.

EDWARD SHAMP has been appointed Gen. Supt. of Maricopa, Phœnix and Salt River Valley Railway, vice G. H. Honshell, resigned.

GENERAL LAND OFFICE COMMISSIONER LAMOUREAUX was in the city this week. He is making an inspection of the several land offices of the country.

F. W. MAACK, formerly foreman at the Golden Butterfly at Morris Ravine, Butte Co., has gone to the Copper Queen mine at Bisbee, Arizona.

PRINCE PONIATOWSKI has returned from England, accompanied by Messrs. Doris & Tarbutt, of London, who represent English capital enlisted in recent Tuolumne county mining enterprises.

LEGH HARNETT, correspondent of this paper twenty years ago, and well known to all the old miners of northern California and Oregon, died at Wolf Creek, Or., last week, in the 70th year of his age.

CAPTAIN THOS. MEIN of the Robinson mine and Charles Butters, managing director of the Rand Central Ore Reduction Company, have arrived in England from South Africa on their way to California.

THE Redding *Searchlight* says the Mountain Mines Co., of Shasta, have engaged "Mr. Keller, of Montana, who will receive a salary of $600 per month and be in complete charge of the mine and smelter."

E. J. MURRAY, of this city, this week assumes charge of a mining property four miles north of Shasta for San Francisco men who will spend $15,000 developing the property before putting up a mill. The purchase was completed last Tuesday.

JUSTICE FIELD, who is now in his thirty-sixth year of service as one of the justices of the Supreme Court of the United States, says he has no intention of resigning. In a few months he will have the longest record of any member of that tribunal.

DOUBLE PIPE AIR COMPRESSOR.

This is a cut of the Double Pipe AirCompressor, the Compressor that is guaranteed to save 30% in power over any other make. It is cheapest to buy, cheapest to carry about and cheapest to run. If your fuel or water costs you anything, you want this Compressor. If you can get railroad freights free, and can carry machinery to your mine without cost, and your power costs you nothing, any make of Compressor will do you. You will be under no necessity to write to PNEUMATIC POWER CO., at 306 Pine St., San Francisco, Cal. We could save you money, though, in cost of foundations, as our Compressors are half the size of other makes.

Positively Reduces Oil Bills 75 Per Cent.

THE FINCH OIL CUP.

Frictional vibration by the motion of the shaft against the point of the wire causes the oil to flow, and that this flow is not produced simply by syphonic or capillary action but by frictional vibration is proven by the fact that if the wire does not rest on the shaft then the oil will not flow. When the machinery stops the feed stops, therefore **the Finch Cup is Absolutely Automatic, Feeds Enough Oil and No More, Prevents All Waste, Needs Very Little Attention.**

Read One of the Many Testimonials:

UNION GAS ENGINE CO. SAN FRANCISCO, July 19, 1894.

During the past three years we have used your Cups for the crank shaft bearings of our engines, and also on all bearings of shaftings and tools in the shop. Our engines now *require no attention* except to fill the Cups occasionally, and therefore we can cheerfully recommend the Finch Cups to any one as *being the best in the market.*

SAN FRANCISCO, CAL.

## Commercial Paragraphs.

A Dow pump, 4-inch suction, 3-inch discharge, is unwatering the Butts mine, Angels, Calaveras Co.

Mr. Jones has completed a new mill of his own design at the National Iron Works, Main and Beale streets, this city.

Superintendent Strong of the Adelaide mine, at Robinson's Ferry, Calaveras Co., has set up a Kinkead mill on the property.

The Westinghouse Electric and Manufacturing Company has declared a quarterly dividend of one and three-quarters per cent on preferred stock, payable July 1.

D. B. Hanson, the San Francisco representative of the Edward P. Allis Co., has furnished the Western Lumber Co., of Portland, Or., a complete band mill to take the place of the one recently destroyed.

At Seattle, Wash., Moran Bros. are getting on in the building of the revenue cutter Golden Gate and the torpedo boat, which is to develop a speed of 26 knots an hour. The two are to be finished Jan. 1st, '97.

The Electrical Engineering Co., 34 Main St., this city, this week put in a double worm-gear electric elevator hoist, to run an electric elevator corner Leidesdorff and California streets, which is to be swift and noiseless. The Electrical Engineering Company is meeting with considerable success in this and other branches of electrical work in this city and elsewhere.

One of the most important electric power installations in the country has been completed and started up. The station is located in the Big Cottonwood canyon, 14 miles from Salt Lake City, where 3,400 cubic feet of water per minute is available at the lowest stage, which will produce 2,450 horse power. The water is brought to the wheels through 2,000 feet of 48-inch pipe, made of plate steel, varying from $\frac{1}{4}$-inch to $\frac{3}{4}$-inch in thickness. The power station consists of four 60-inch Pelton wheels, capacity of 650 H. P. each, running under 370 feet head at 300 revolutions. These wheels are direct-connected to four General Electric generators, three-phase type. Special wheels are provided for running the exciters. The power thus generated is transmitted to Salt Lake City and used for running an extensive street railroad system, as also for lighting the city and for general power purposes. An additional water supply is available, which it is proposed to utilize later, increasing the capacity of the station to 5,000 H. P. These works have involved an outlay of something over $500,000, all of which has been furnished by Salt Lake capitalists. Contracts for power have already been made amounting to more than $100,000 per year, with a surplus of power yet to be disposed of. It is expected that the investment will pay 20 per cent per annum over operating expenses.

## Recent California Mining Incorporations.

Spring Gulch and Minersville Consolidated Hydraulic Mining Company, Douglas City; capital stock, $100,000; $80,000 subscribed; A. G. Dunbar, S. J. Thayer, M. C. Jordan, F. C. Dunbar, H. Score, Douglas City.

Mackay Gold and Silver Mining Company, S. F., to mine in the Virginia mining district, Storey county, Nev.; P. J. Keyes, Virginia, Nev.; and J. M. Dor Mer, W. T. O'Neale, R. M. Daggett, T. Eagar, San Francisco; capital stock, $15,000,000; all subscribed.

**"HISTORY OF CRIPPLE CREEK."**

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations (with map) of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months' (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention The Press and address, *Illustrated Weekly*, Denver, Colo.

## Recently Declared Mining Dividends.

The Ontario mine, Utah, pays a dividend of 10 cents per share ($15,000) next Tuesday.

The Union mine, Colorado, paid an $11,000 dividend last Tuesday.

The Elkton Con. mine, Montana, paid a $10,000 dividend on the 20th.

The Smuggler Union Mining Company, Colorado, pays a dividend of $1 per share next Wednesday.

The Homestake mine, South Dakota, paid a dividend of $31,250 last Thursday.

The Isabella gold mine, Colorado, paid a dividend of $22,500 on the 25th.

Unitarian literature sent free on application. Address Postoffice Mission Committee, First Unitarian Church, corner Geary and Franklin streets, San Francisco. Mention this paper.

# CHEAP IRRIGATION!

UP TO DATE!

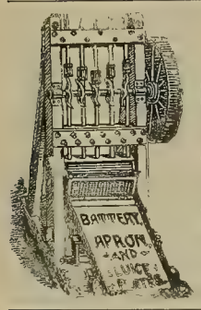
SAVE MONEY BY USING

## THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

**Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines,** using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

| | |
|---|---|
| Coal Gas, ten hours' run, 1000 feet | $2 00 |
| Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c. | 1 25 |
| Coal Oil, ten hours' run, 7½ gallons @ 10c | 75 |
| Crude Petroleum, asphaltum base, 16 gallons @ 3c | 48 |
| Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c | 65 |



On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon—21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1¼c per horse power per hour; and on gasoline, 2½c per horse power per hour.

# Market Reports.

## The Markets.

SAN FRANCISCO, June 25, 1896.

For this time of the year business is good, with orders coming in from all sections. Manufactures report good orders in hand. Iron manufacturers, as a rule, state they have more orders in hand than for several years past. The work is chiefly for machinery and structural purposes. The opinion prevails that notwithstanding this is a national election year there will be good business, better than for fully half a decade. There is a continued good inquiry for gold mining properties. Referring to this inquiry the New York *Wall Street Journal* says: "People with information as to mining speculation in Colorado say there have been a number of important sales of blocks of Colorado mines recently in France, which ordinarily would have attracted attention if the sales had been made to New York houses. There is quite a temper in France to invest in American mines and western people are dealing direct with foreign bankers which is the reason for the transactions here. Western mining brokers say that Eastern people do not begin to investigate and invest with the enthusiasm foreigners are showing."

The local money market is easy with only a moderate call reported by banks. For crop moving some engagements are reported, but so far they do not aggregate as much as in former years. The general impression is that, as a rule, farmers will meet the market, and not store in expectation of better times. The rates of interest are unchanged. The East reports a dull money market, but bankers are hopeful of a much better demand before long. Time money rates were, at last advices, steady, but call money rates are easy.

**New York Silver Prices.**

NEW YORK, June 25.—Following are the closing prices for the week:

| | Silver in London. | Silver in N. Y. |
|---|---|---|
| Friday | 31 7-16 | 68¾ |
| Saturday | 31 7-16 | 68¾ |
| Monday | 31 7-16 | 68¾ |
| Tuesday | 31 7-16 | 68¾ |
| Wednesday | 31½ | 68⅞ |
| Thursday | 31 9-16 | 69⅛ |

| | Copper. | Lead. | Iron. | Tin. |
|---|---|---|---|---|
| Friday | 11 75 | 2 90 | 10 75@13 00 | 13 35 |
| Saturday | 11 75 | 2 90 | 10 75@13 00 | 13 40 |
| Monday | 11 75 | 2 92½ | 10 50@13 00 | 13 50 |
| Tuesday | 12 25 | 3 00 | 10 50@12 50 | 13 50 |
| Wednesday | 12 00 | 3 00 | 10 50@12 50 | 13 50 |

The local bullion, money and exchange quotations current are as follows:

| | |
|---|---|
| Commercial Loans, % per annum | 7@8 |
| Commercial Loans, prime | 6@8 |
| Call Loans, gilt edged | 6@7 |
| Call Loans, mixed securities | 7@8 |
| Mortgages, prime, taxes paid by lender | 6@8 |
| New York Sight Draft | 12½ |
| New York Telegraphic Transfer | 15 |
| London Bankers' 60 days | $4.88¼ |
| London Merchants | $4.86¾ |
| London Sight Bankers | $4.89½ |
| Refined Silver, per oz., 1000 fine | 68⅜ |
| Mexican Dollars | 54@55c |

SILVER.—The market is stronger, with an advancing tendency. A New York exchange just to hand says: "Japan is buying silver, her purchases being confined to the San Francisco market at present. Brokers there, however, do some arbitrage business with Denver and New York. It was the supplying of these orders this week which kept the usual supply from the London market and led to the strength there in quotations yesterday. The New York market is expected to show strength under this buying in spite of the defeat of the cause of silver in the Republican platform." The last steamer for the Orient took out $90,000 in bars for Hongkong and $153,885 for Japan. The impression grows that during the coming presidential election there will be a silver campaign which, it is claimed, will advance the market value of the white metal at home and abroad.

MEXICAN DOLLARS.—There is a fair inquiry. The last steamer for China took out 134,318 dollars.

COPPER.—There is no change in our market, which holds strong at quotations. At the East prices are a shade higher. A New York exchange of June 15th says: "Shipments to Europe have been very heavy during the week, amounting to about 2,700 tons, and making a total of nearly 5,060 tons shipped since the beginning of the month. In the face of this remarkable movement values have advanced in the foreign market. Last cables quoted merchant bars in London at £48 17s 6d for prompt delivery, and the records show that over 7,000 tons, in warrants, changed hands there in the five business days. Electrolytic is quoted at 11⅛@11¼c and casting copper at 10⅝@10¾c, according to brand. Home consumers have placed fair orders for the several varieties of the metal, but export business is still the mainstay of the market.

The market is quoted as follows:

| | |
|---|---|
| Bolt | ¼ & 5-16, 20c; ⅜ and larger, 17c |
| Lake Superior Sheathing | 20 |
| Ingot, jobbing | 13 |
| Ingot, wholesale | 12 |
| Sheet copper | 17 |

QUICKSILVER.—There is an impression in some quarters that the market will do better the coming fall. This opinion is doubtless based on reports of the Rothschilds having virtually secured control of the Spanish mines through a loan to that government.

The market is quoted as follows:

| | |
|---|---|
| Home trade, per flask | 37 00 |
| Distant points up north | 36 25@37 00 |
| West coast of Mexico, for export | 32 50 |

ANTIMONY.—The demand is steady, with the market easy at 8@9c in a jobbing way. New York mail advices quote 7¼@7¾c for Cookson's, 6½c for Hallett's and 6½c for Japanese, from store.

TIN.—The market for both pig and plate is essentially unchanged. The European markets show a hardening tendency for the former.

The market is quoted as follows:

| | |
|---|---|
| Pig, per lb | 14½c |
| Plate, I C coke, heavy, per box | $4 25 |
| " " " light, " | 4 10 |

BORAX.—The market is quoted as follows

| | |
|---|---|
| Refined, in car lots | 6¼ |
| Refined, in sacks | 5¾ |
| Powdered, in car lots | 6¼ |
| Concentrated, " | 5⅞ |

IRON. — Our market is essentially unchanged. New York advices report that Southern iron was offered at a reduction of from 50 to 75 cents per ton. An authority there writes that the trade is in very different shape than formerly, owing to the existence of numerous combinations. These have, up to date, held together well, and he sees no reason to doubt their ability to continue in view of a change in the currency situation. He says that they form an excellent basis for improvement.

Our market is quoted as follows:

AMERICAN.

| | To Arrive. | Spot. |
|---|---|---|
| Sloso | $21 00 | $23 50 |
| Thomas | 22 00 | 23 50 |
| Salisbury | 30 00 | 33 00 |

ENGLISH.

| | | | |
|---|---|---|---|
| Barrow | $21 00 | | $23 50 |
| Gartsherrie | 21 50 | | 23 50 |

LEAD.—Our market is reported unchanged, but Eastern markets have strengthened slightly.

| | | | |
|---|---|---|---|
| Pig | 3 75 | @ | 4 00 |
| Bar | — | @ | 4 15 |
| Sheet | — | @ | 5 50 |
| Pipe | — | @ | 4 75 |

SHOT.—The market is quoted as follows:

| | |
|---|---|
| Drop, sizes smaller than B, per bag of 25 lbs | $1 40 |
| Drop, B and larger sizes, " " | 1 65 |
| Buck, Balls and Chilled, do, " " | 1 65 |

POWDER.—Eastern mail advices state that blasting powder for export has been advanced the same percentage as was the domestic. The demand with us for mining purposes continues exceptionally large.

The market is quoted as follows:

| | |
|---|---|
| Hercules, No. 1, per pound | 11½c |
| " No. 2, " " | 8½c |

COAL.—The market does not show any change since our last report. The demand continues good for all grades; but with liberal coast supplies, no advance can be established.

SPOT FROM YARD—PER TON.

| | | | |
|---|---|---|---|
| Wellington | $7 50 | @ | 8 00 |
| Greta | 6 00 | @ | 6 50 |

NAILS.—Jobbers report a good demand at quotations.

The market is quoted as follows:

| | |
|---|---|
| Wire, carloads, basis per keg | $3 22½ |
| " jobbing, " " | 3 35 |
| Cut, carloads, " " | 2 97½ |
| " jobbing, " " | 3 10 |

## Mining Share Market.

SAN FRANCISCO, June 25, 1896.

The market held weak on last Friday, but on Saturday, under the lead of Chollar, it was stronger. Yet nothing moved up much outside of Chollar and Potosi. On Monday the opening was slightly weaker, which became more pronounced as the day passed by. This weakening brought in bear sellers who, under the guidance of those connected with the inside pool, caused lower prices each day up to this writing along the entire line, except Chollar, which appeared to have had support at around $2.75. The decline brought in margin sellers and also sellers of cash shares. These sales, together with those of the bears, caused a depreciation in prices. The heaviest decline was in Savage, which closed last night at $1.10 bid, against sales at $1.95 one week ago. When the market was nearing top prices, about three weeks ago, the MINING AND SCIENTIFIC PRESS warned dealers against it, but which had little effect, owing to the strong bull points put out and also bull write-ups in the papers. Then was the time to be a bear, but now, after such a strong depression, prices cut from 40 to 60 per cent and heavy liquidating sales, it is no time to be a bear, for the mines, as a rule, are in a far more favorable situation than for many a long month. Yet it may take several weeks before the best results can be had, and in the meantime there will be favorable and unfavorable reports which will have their effects on the market. The strongest depression at the present time is on the shares in the Gold Hill and north end mines. What this is done for operators must be their own judge. The gas scare has been used quite effectually. Dealers are beginning to think it strange that no other mine on the Comstock is troubled with gas, but the shares of no other mine are so closely watched and followed as are those of Con. Virginia. The work under way on the Brunswick lode is quite important. That the development made so far exceeds expectations is a well established fact, and if the ore found on the 200-foot level, in the grounds of the middle mines, is struck on the 300-foot level much higher prices can be looked for, and justly so, as it will pay to extract and mill. All mining experts who have visited the lode are emphatic in their statements that the ore extends to the 300-foot level, and even deeper. It is well enough for the trading public to know that the mining companies on the Comstock lode having ground on the Brunswick lode are Con. Virginia, Best & Belcher, Gould & Curry, Savage, Hale & Norcross, Chollar and Potosi.

No assessment was levied the past week, but the street was full of rumors regarding them.

The news from the Comstock mines is overshadowed by that from the Brunswick lode, therefore is not so closely followed by those who trade on the complexion of the market. In the Alta group the only work reported is in Alta, but which is essentially the same as has been made public during the past few weeks. In the Gold Hill group our advices are to the effect that in Overman more active work is being done, and as far down as the 1200-foot level. No particulars are reported as to the work in Seg. Belcher and Belcher, but it is reported to be quite interesting but it points to the future. These two companies are raising ore going over $20 a ton. The most active work is in Crown Point, with interest largely centered on that being done around the 600-foot level. Our last advices are to the effect that in the west drift on that level they were in gold ore going from $9 to $14 a ton, but they had stopped work and were putting in a square set of timbers for raising on it. This ore will pay to extract and mill, which will be done at as early a date as possible. This find may increase in value as work is done on it. From Yellow Jacket no advices are at hand. In Confidence they are still raising to the surface from the work done 60 feet above the 200-foot level. When this upraise is finished more active exploiting work can be looked for. Work in the joint Confidence, Challenge and Con. Imperial west crossdrift is still being pushed ahead. It is out over 530 feet. In Alpha and Bullion the work is of the same character as heretofore reported in this department. In Potosi they continue to find stringers of ore. So far as we are advised nothing of importance has been found. In Hale & Norcross the usual work is being done and a few tons of ore raised each week. They are still running for the ore found in Savage. The official letter from Savage was not received yesterday, so no reliable information is at hand at this writing. In Gould & Curry they have started an east crossdrift on the 800-foot Bonner shaft level. The official letter from Best & Belcher does not report any material change in the work from that heretofore reported. The last letter from Con. Virginia reported they were still milling ore. The last run (595 tons) went over $56 a ton battery assay. They expected to resume the extraction of ore this week. The work on the 1000-foot level is being closely watched by mining men. In Ophir work is continued on the central tunnel and 1000-foot levels. This is to the west. In the west working of Mexican, on the 1000-foot level, they have run into stringers of ore. The work in Union, Sierra Nevada, Utah and Andes is on the same levels and direction as heretofore reported, with no material change in formation.

Interest continues to center on the work in the Brunswick lode. Mining superintendents and well-known mining men, who have examined the find on this lode, are very hopeful that the ore will not only be found lower down, but it is liable to assay higher. On the 200-foot level of Chollar, running towards Potosi, they stripped the ore for a distance of 100 feet. Throughout this length it held out in width and value. Some persons say that towards the south line black sulphurets were found. On the 300-foot level the south drift from the Hale & Norcross line will be to the Chollar line within two or three days, when the latter company will take up the work and push it ahead. It is stated that by the middle of July they will run into the ore found on the 200-foot level. From our own advices we are inclined to the opinion that they will be in before that time. A north drift is being run from the Hale & Norcross shaft and at the same time work is being done on the incline winze. Work is being pushed in the Gould & Curry tunnel. Another crossdrift has been started from this level. It is towards the Best & Belcher line. The management are confident of striking ore in this crossdrift. This opinion is grounded on what the superintendents and other well known mining men say. They are still sinking in the Best & Belcher shaft. They are down about 50 feet.

From the Bodie district nothing new is at hand. Active work is being done in Bodie, Bulwer and Mono.

The market opened to-day heavy, with fair trading. After regular Call there were large liquidating sales by holders on a margin, which caused lower prices along the line. The shares that suffered the most were those in the Gold Hill and north end mines, the middles not going off much. All the shares thrown out were taken in, when a stronger tone set in, causing a firm closing at noon. During the decline there seemed to be a panic among holders of Occidental, and under their selling it sold down to 83 cents, closing at 93 cents. There was nothing unfavorable from the mine, for last advices stated that they were running north and south on the 750-foot level with good results looked for. The official letter from Savage was on file to-day. It reports extracting 170 cars of ore, assaying as per car sample $43.80; 150 tons were milled, which returned $40.25 as per battery assay. They ran into old workings, which cut off the yield of best ore, but there was still considerable in sight. On the Brunswick lode, the joint north lateral drift had been advanced to 299 feet. Its course has been changed to a westerly direction, crosscutting the formation. At the 2:30 session, Gould & Curry, Best & Belcher, and all the north end shares sold higher; the middles were unchanged, but the Gold Hill shares were better. It looks as if the market will do better very soon.

The following illustrates the changes of the week:

## Assessment Notices.

OCCIDENTAL CONSOLIDATED MINING COMpany. Location of principal place of business, San Francisco, California. Location of works, Silver Star Mining District, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 2d day of June, 1896, an assessment: No 2o of fifteen cents 15c per share was levied upon the whole of the capital stock of the corporation payable immediately in United States gold coin, to the Secretary at the office of the company, room No 63 Nevada block, No 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of July, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before will be sold on TUESDAY the 28th day of July, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. BURROW, Secretary.

Office—Room No. 63 Nevada block No. 309 Montgomery street San Francisco California.

NIMSHEW GOLD MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Nimshew, Butte county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of June, 1896, an assessment (No. 1) of Three cents (3c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Mission Pier, No. 1, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of July, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 3d day of August, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

C. D. COOK, Secretary.

Office, Mission St. Pier, No. 1, San Francisco, California.

MARGUERITE GOLD MINING AND MILL CO. Location of principal place of business, San Francisco, California; location of works, Auburn, Placer county, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 18th day of June, 1896, an assessment (No. 3) of Ten Cents (10c) per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the company, 237 12th St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of July, 1896, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on FRIDAY, the 28th day of August, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. WINTERS, Secretary.

Office—237 12th St., San Francisco, California. Office hours from 4 to 6 P. M.

Paraffine Paint Co ..... 403
Patents Issued in '95 ..... 484
Patents, Notices of, 19, 39, 59, 72, 99, 114, 134, 159, 179, 199, 212, 232, 259, 321, 341, 361, 384, 404, 428, 448, 490, 510.
Patent Law, Indefinable Requirement of ..... 264, 286
Patent Commissioner's Report ..... 442
Patio Process ..... 482
Pelton Water Wheel Co. ..... 102, 112, 172, 306, 463
Petroleum, No. Bbls. Produced in U. S. in '93-94. 65
Petroleum in California ..... 172
Petroleum, Joints Tight ..... 308
Phonograph in Watch ..... 398
Photometry ..... 268
Photography, The New ..... 82
Photographing Through Opaque Bodies With Ordinary Light ..... 188
Plitting in Steam Boilers ..... 49
Placer Co. Mines, 9, 50, 90, 110, 130, 170, 190, 210, 230, 250, 270, 300, 322, 402, 422, 446, 466, 487, 510, 526.
Placer Mining on a Small Scale ..... 315
Placer Mining in California, Waste Products of. 396
Plumas Co. Mines, 9, 70, 90, 110, 150, 190, 230, 250, 300, 322, 342, 382, 446, 466, 487, 510, 526.
Plumas Co. Rainfall ..... 87
*Portable Electric Hoists ..... 247
Postoffice Address of California Mine Owners and Superintendents, 336, 358, 383, 399, 416, 443, 485, 507.
Powder, Giant ..... 107
*Power House, Largest Electric ..... 353
Practical Experience With Patio Process ..... 482
Pratt, N. W. ..... 249
Presses Succeeding Hammers ..... 148
Preserving Small Skins ..... 443
Prices, Effect Upon of Improved Methods ..... 148
Printers' Ink ..... 82
Prisons of Siberia ..... 308
Private Mining Corporations ..... 503
Process, Gold Extraction ..... 373
Prospector, Book for ..... 101
Prospectors' Assay Outfit ..... 460
Providence vs. Champion ..... 334
Pumice Stone Deposits ..... 83
*Pumping Machinery ..... 333

Q

Quicksilver, Yield '95 ..... 43

R

*Racycle Crank Hanger ..... 267
Railway Systems, Largest ..... 399
Rawhide Gearing ..... 421
Raymond, R. W. ..... 185
Real and Unreal Business Paper ..... 319
Recorder, County Liability of ..... 374
Recuperative Power of the American Miner ..... 63
*Reeds' Dry Placer Machine ..... 201
*Relay Water Wheel Governor ..... 501
*Replogle Governor Works ..... 501
Revealing Hidden Solids ..... 148
Reversal in Invention ..... 68
Revival of River Mining ..... 334
Rhodes, Cecil ..... 34
Rickard, T. A. ..... 284
Rideout, N. A. ..... 212
Rigaud's Gold Process ..... 393, 414, 437, 459
Risdon Iron Works ..... 463
*River Reclamation in California ..... 333
River Improvement ..... 2, 42
River Mining, Present and Future ..... 419
Riverside Co. Mines, 9, 50, 110, 130, 150, 190, 210, 230, 250, 342, 382, 402, 487.
*Roadmaking Machine ..... 393
Robinson G. M. Co.'s Report (S. A.) ..... 335, 439
Roentgen Rays, 142, 148, 168, 187, 188, 207, 208, 222, 227, 247, 268, 290, 294, 396, 524.
Rope and Belt Transmission of Power ..... 484
*Ropeway at Empire Nevada ..... 141
Ropp Furnace, A Correction ..... 396
Rothwell, J. E. ..... 25
Rulings of Secretary of Interior ..... 2
Russia's Mineral Output, '95 ..... 3
*Rustic Bridge ..... 65

S

*Sacramento-Folsom Electric Transmission ..... 413
Sacramento River Improvement ..... 262
Sacramento Co. Mines ..... 342, 487
Sails, Perforating for Speed ..... 524
San Bernardino Co. Mines, 50, 130, 170, 230, 250, 270, 342, 362, 382, 402, 422, 466, 487, 510, 526.
San Benito Co. Mines ..... 210
San Diego Co. Mines ..... 9, 31, 50, 70, 110, 130, 150, 170, 225, 230, 250, 270, 300, 322, 342, 362, 402, 422, 446, 487, 526.
Santa Barbara Co. Mines ..... 362, 526
Salamander, A Human ..... 167
Salt Storm ..... 129
Salt Lake & Ogden Railway Co. ..... 247
*Scenery in California ..... 481
Schools of Mines ..... 62
Scientific Activity, Present ..... 208
Seattle, Washington, Water Supply of ..... 26
Secretary of Mines Wanted ..... 457
Selling Mines ..... 357
Shasta Co. Mines ..... 9, 30, 50, 70, 90, 110, 130, 150, 170, 190, 210, 230, 250, 270, 300, 322, 342, 362, 382, 402, 422, 446, 466, 487, 510, 526.
Shot, Longest Distance Fired ..... 188, 419
Siam Mines ..... 92
*Siemens & Halske Electric Drills ..... 338
*Siemens Halske Co. ..... 127
Sierra Co. Mines, 9, 91, 111, 130, 150, 170, 190, 210, 230, 250, 322, 342, 402, 422, 446, 466, 526.
Silver from Silver Bromide ..... 6
Silver, Increased Demand for ..... 522
Silver Mines a Good Investment ..... 147
Silver Product U. S. '95 ..... 99
Silver in Politics ..... 502
Silver Coinage, Resumption of ..... 98
Silver Sulphides, Assay of ..... 265
Silver Chloride in Roasted Ore, Effect of Washing Upon ..... 204, 396
Silver, Cost of Production ..... 223
Silver Prices Now ..... 283
Silver Ore Lixiviation in Mexico ..... 316
Silver Situation ..... 477
*Single-Valve Cross Compound Engine ..... 21
Siskiyou Co. Mines ..... 9, 30, 50, 70, 91, 111, 122, 130, 150, 170, 190, 210, 230, 250, 270, 300, 322, 342, 362, 382, 402, 422, 446, 466, 487, 510, 526.
Solar Energy, Theories on ..... 357
Soldering Glass ..... 148
Smythe, W. H. ..... 264

PAGE.

Smelting Tin in Singapore ..... 484
Smelter Projects ..... 282
Solar Heat, Power from ..... 524
Some Mill Records ..... 149
Sonoma Co. Mines ..... 111
Sonntag, Julian ..... 304, 459
South African Trade ..... 394
South African Gold Output ..... 3
South African Mines ..... 11, 91, 123, 171, 183, 251, 271, 283, 301, 343, 383, 403, 423, 447, 466, 503, 512.
South African Mine Balance Sheet ..... 26
South African Mining Law ..... 83
South American Mines ..... 211, 494
South African Mining and Political Troubles ..... 223
South African Mine Staff Salaries ..... 315
South Dakota Mines ..... 3, 11, 31, 51, 91, 151, 210, 231, 271, 301, 323, 363, 382, 403, 447, 466, 488.
Splint Factory ..... 399
Spring Valley Mine Decision ..... 262
Stamps, Number in Present Operation in California ..... 315
Starr, Geo. ..... 283
Stealing Inventions of Others ..... 290
Steam, Why It Fuses Soft Plugs ..... 359
Steam Raising, Chemistry of ..... 248
Steam Locomotives Without Fireboxes ..... 228
Steam Boilers, Equipment, Etc. ..... 505
Steam and Electricity ..... 127
Steamship Evolution ..... 208
Steel Wagon Roads ..... 248
Steel Rails, Life of ..... 27
Steel, Burnt ..... 28
Steel and Cast Iron Pipe ..... 421
Steel Worked by a New Process ..... 484
Steel Tubing ..... 484
Stellar System, Latest ..... 227
Stetefeldt, C. A. ..... 232
Storch, Dr. I. B. ..... 47
Storage Battery Traction ..... 187
Strassenbahnwagenunitergestelle ..... 318
Sulphur, How Mined ..... 229
Superintendents of California Mines, Postoffice Address of ..... 336, 358, 383, 399, 416, 443, 485
Supreme Court Decision, Providence vs. Champion ..... 334
Supreme Court Decision, Co. Recorder ..... 374
Survey, Geological ..... 393
Sylvanite ..... 163, 395

T

Tailings, Worked Over ..... 262
Tall Buildings in San Francisco ..... 243
Taxing Unpatented Mining Claims ..... 355
Taylor & Co., Jno. ..... 192
Telegraphing Through Space ..... 294
Telegraphy, Most Rapid ..... 87
Telegraph of Twentieth Century ..... 8
Telephone Weather Bulletins ..... 49, 68
Telephone Construction in Mountains ..... 350
Tellurium, Hints in Regard to ..... 48
Tellurium Separation from Copper Residue ..... 239
Tellurides ..... 83
Temperature, Internal of Rocks ..... 120
Temperature, Variations of ..... 174
Temperature, Lowest When Hot Body Visible ..... 209
Tesla, Nikola ..... 169, 294, 421
Theory of Light ..... 482, 504, 524
Thermometer, A New ..... 89
Thirty-six Years Old ..... 414
Thurber, H. K. ..... 313
Tibbits, J. H. ..... 134, 364
Timber Preservation ..... 442
*Tin Smelting in Singapore ..... 484
Torpedo, A Novel Target-Seeking ..... 525
Traction Engine, Attachment to ..... 48
"Tramp Corporations" ..... 83
Trans-Siberian Railway ..... 49
Transmission of Power by Belt and Rope ..... 484
*Transporting Mining Machinery ..... 121
Training of a Mining Engineer ..... 86
Treasury Department Rulings ..... 21, 122, 315
Treadwell, G. A. ..... 315
Trinity Co. Mines, 9, 31, 50, 70, 111, 122, 131, 150, 170, 190, 230, 250, 270, 300, 322, 342, 362, 382, 446, 466, 487, 527.
Tsetse Fly ..... 421
Tuolumne Co. Mines ..... 31, 91, 111, 131, 150, 170, 190, 210, 230, 250, 270, 322, 342, 362, 332, 402, 422, 446, 487, 510, 527.
Tunnel, The Butterfield ..... 105
Tunnels, Cost of Four Greatest ..... 188
Turbines at Niagara ..... 248
Twentieth Century, When Begun ..... 29
Type Setting, Greatest Record ..... 285

U

Union Iron Works ..... 143, 192, 373, *437
*Union Gas Engine Co. ..... 181
*Union Ore Concentrator ..... 231
Unpatented Mining Claim, Taxes on ..... 42
Use and Abuse of Dynamite ..... 460
Utah's Mining Law ..... 459
Utah's Mineral Output '95 ..... 3
Utah Mines, 10, 32, 51, 71, 91, 111, 121, 151, 171, 191, 210, 231, 251, 271, 300, 322, 343, 363, 382, 423, 447, 466, 510, 527.
Utica Mine ..... 223
Utilizing Scorchers ..... 148

V

Vacuum-Type System Electric Lighting ..... 438
Valentine, Jno. J. ..... 47
Values of Foreign Coins ..... 67
Visionary Scheme ..... 129
Vitalistic Theory of Matter ..... 267
Venezuela, Industry, Mining and Commerce of. 47
Venezuela Mines ..... 132
Venezuela's Title ..... 145
*Vulcan Ropeway ..... 141
Vulcan Iron Works Fire ..... 401

W

Wages in Different States ..... 45
Wanted, a Sec'y of Mines ..... 457
Washington State Miners ..... 202
Washington's Assessed Valuation ..... 252
Washington Mines ..... 10, 31, 91, 111, 151, 171, 191, 230, 250, 300, 322, 343, 362, 402, 422, 447, 466, 487.
*Washburn-Moen Mfg Co. ..... 359, 424
Washing with Water Silver Chloride in Roasted Ore ..... 204, 396
Wasted Sun Force ..... 149
Waste Products of Placer Mining in California 396
Water, to Purify ..... 524
*Water Wheel Governor ..... 501
Water, Methods of Procuring ..... 484
Water-Tube Boilers for War Ships ..... 249
Waterloo Mining Co. Litigation ..... 333
*Watchman's Clock ..... 265
Waves Deep Sea, Height of ..... 188
*Wire Ropeway at Nelson, B. C. ..... 81
Wells-Fargo Treasure Reports ..... 23
Welsh Tin Makers ..... 482
Welding by Electricity ..... 294
Western Federation of Miners ..... 415
Westinghouse Electric and Mfg Co. ..... 69, 112, 134, 152, 207, 306.
Wind Measured by Its Sound ..... 247
Wiring the Sahara ..... 189
Witwatersrand Dist., S. A., Gold Yield '95 ..... 403
*Wood's Dry Placer Machine ..... 107
World's Greatest Gold Field ..... 67
Wright, Jno. M. ..... 11
Worlds Will Cease to Revolve ..... 379
World's Greatest Gold Lode ..... 184
Wyoming Mines ..... 71, 151, 171, 271, 322, 343, 363, 423, 447, 510, 527.

Y

Yale, C. G. ..... 63, 335
Yuba Co. Mines ..... 170, 230, 270, 300, 343, 362, 402, 487
Yuma, Mines Tributary to ..... 225

Z

Zinc Product U. S. '95 ..... 223
